2. The combination of the blades of a pair of shears, a pivot-screw therefor, one of the blades being perforated back of the pivot, a bearing-block mounted in said perforation and resting upon the other blade, a spring-plate, a confining-screw therefor, said spring-plate resting upon the bearing-block and extending to the pivot-screw and engaging it so as to prevent it from turning, substantially as described.

602,361. WINDOW. BENJAMIN F. RICHARDS, Chicago, Ill. Filed Apr. 22, 1897. Serial No. 633,387. (No model.)

Claim.—1. An improved window-frame including side members formed of laterally-yielding material, means for securing the entire length of one vertical edge of each side to the building so as to seal the joints between said edges and the building, and devices operatively connected to the free portions of the yieldable frame sides for turning the same on their secured edges, substantially as shown and described.

2. A window-frame having its sides formed of yieldable material, the sides being secured at one edge and adapted to yield in swinging movement at said edge, the other edges of the frame being free, and adjusting means for swinging the sides, in combination with sashes adapted to be removably held in the frame by means of the adjustment, substantially as shown and described.

3. An improved window-frame, including fixed top and bottom members, laterally-adjustable side members arranged therebetween, and an adjustable connection between the sides and the top and bottom members respectively, substantially as shown and described.

4. In a window-frame having laterally-adjustable sides for the purpose of holding the sashes in place, the combination of top, bottom and side members, the side members being arranged between the top and bottom members, the last two members being slotted, screws extended through the slots for securing the sides, and adjusting means, substantially as shown and described.

5. In a window-frame, the combination of slotted top and bottom members, side members arranged between the top and bottom members, transversely-extended bars secured to the sides adjacent their ends, screws extended through the slots of the top and bottom and taking in the bars for adjustably securing the parts together, and adjusting means for the sides, substantially as shown and described.

6. A frame having its sides formed of spring metal or analogous material, in combination with bars fixed behind the sides, and adjusting devices carried by the bars for springing laterally the sides, substantially as shown and described.

7. A frame having its sides formed of spring material, in combination with bars fixed behind the sides, and screws adapted to be adjusted in the bars for springing the sides, substantially as shown and described.

8. A window-frame having its sides adapted to move laterally for removably holding the sashes in the frame, in combination with screws adapted to adjust the sides laterally, substantially as shown and described.

9. A window-frame having its sides adapted to move laterally for removably holding sashes in the window-frame in combination with screws rotatably mounted in the sides, and fixed nuts which the screws engage, substantially as shown and described.

10. A window-frame having the outer edges of its vertical sides formed with laterally-extending flanges, said flanges being adapted to be secured to the building or other structure, the sides having a springing or turning movement on said edges and adapted to removably secure the sashes in the frame, and devices for adjusting the sides laterally, substantially as shown and described.

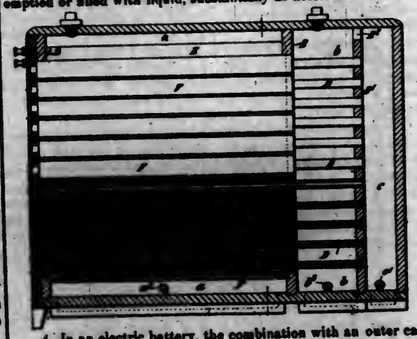
11. The combination with a window-frame having fixed top and bottom members and laterally-adjustable side members, and a jamb-lining separate from the frame but adapted at its upper and lower ends to unite with the top and bottom members of the frame, the lining having no connection with the frame sides and in no way impeding their lateral movement, substantially as shown and described.

12. The combination with the window-frame having adjustable sides for the purpose described, of a jamb-lining detachably secured to the top and bottom of the frame, substantially as shown and described.

13. The combination with a window-frame, of a jamb-lining independent of but detachably secured to the frame, the bottom of the lining being formed with a projecting lip adapted to extend into the frame and overlap the bottom thereof, substantially as shown and described.

14. The combination of a window-frame having the edge of its top member formed with a vertically-extended flange, and a jamb-lining separate from the frame and having its top member formed with a loop-flange adapted to inclose the frame-top flange, substantially as shown and described.

15. In a window-frame, the combination of vertical side A formed of spring metal and having its longitudinal edges turned laterally, bars E arranged transversely behind the side and at their ends secured to laterally-turned edges thereof, and devices carried by the bars for springing laterally the sides, substantially as shown and described.



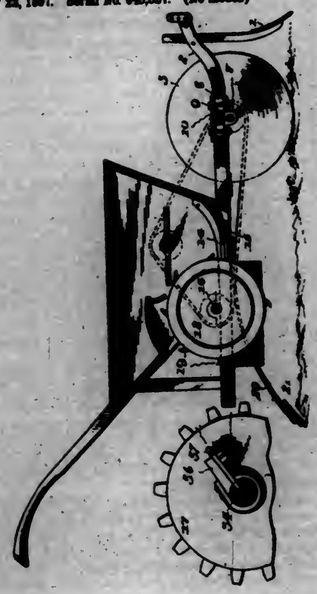
16. In a window-sash, the combination of the rails and stiles each formed of a single piece of sheet metal bent to tubular form with the edges slightly separated or open to admit the glass, and the angle-irons at the corners of the sash over which the rails and stiles fit and against which the glass bears and upon which the same is supported in proper position within the sash, substantially as shown and described.

602,362. GALVANIC BATTERY. WALTER ROWNTREE, Birmingham, England. Filed Dec. 16, 1896. Serial No. 615,986. (No model.)

Claim.—1. In a hermetically-sealed electric battery, the combination of the depolarizing-liquid compartment and the liquid expansion chamber located in juxtaposition to one another within the sealed battery, and tubular carbon elements communicating with said expansion-chamber, substantially as and for the purposes described.

2. In a two-fluid electric battery having a hermetically-sealed outer vessel, the combination with the depolarizing-liquid compartment and the liquid-expansion chamber located in juxtaposition to one another within the sealed vessel, of carbon elements communicating with the depolarizing-liquid compartment, and porous tubes surrounding said carbon elements and opening into the depolarizing-liquid compartment, substantially as described.

3. A two-fluid electric battery having a hermetically-sealed outer casing, a depolarizing liquid compartment and a liquid-expansion chamber arranged beside each other within said casing, an active-liquid compartment, a series of carbon tubes extending horizontally through the metal element compartment and opening into the liquid-expansion chamber, porous tubes surrounding said carbon tubes where they pass through the active-liquid compartment and communicating with the depolarizing-liquid compartment, and a means for enabling each series of the said compartments to be simultaneously emptied or filled with liquid, substantially as described.

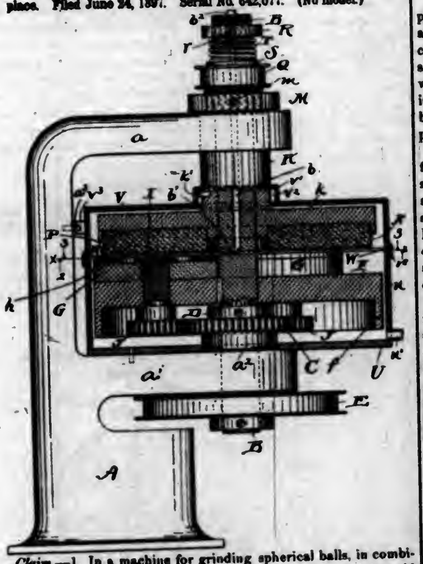


4. In an electric battery, the combination with an outer casing having a plurality of series of cells and passages connecting the bottom of each cell with the bottoms of the contiguous cells of the same series, of loose gravity closing-valves controlling said passages, the arrangement being such that the valves remain closed as long as the level of liquid in a series of the cells remains equal, but which are automatically displaced upwardly so as to open the said passages when the level of the liquid in which the said loose valves are situated falls below that of the liquid in an adjacent cell, substantially as described and for the purpose specified.

602,363. PROCESS OF MAKING FERTILIZERS. WILLIAM R. ROWLANDS, Sancombe, England. Filed Aug. 10, 1897. Serial No. 647,734. (No specimens.)

Claim.—The herein-described process of producing manure, consisting in fermenting waste leather, then mixing it with crude phosphate and finally agitating the mass with the addition of sulfuric acid in quantity sufficient to decompose the phosphate.

602,364. PLANTER. EUGENE M. ROUPE, Marshallville, Ga. Filed July 22, 1897. Serial No. 645,527. (No model.)



Claim.—1. In a machine such as described, means for throwing the shaft in and out of gear consisting of a recess made in the shaft, a longitudinally-movable bolt attached to the side of the wheel, said wheel being located on the shaft, a spring connected to said bolt and adapted to normally hold the end of the bolt in said recess, a means for securing the bolt in its outer position when the shaft is out of gear.

2. In a planter, a hopper having a suitable dropping device, a wind-board located on each side of said dropping device, a means for attaching said wind-boards to the planter consisting of a hinge fixed at one section to the framework, the other section being free and having protrusions, said wind-board adapted to rest under said free section, the protrusions of the section adapted to enter the wind-board, a device for securing the free end when the wind-board is located thereunder.

3. In a machine such as described a means for throwing the shaft in and out of gear consisting of a recess made in the shaft, a wheel located on said shaft, a perforated guide located on said wheel, a longitudinally-movable bolt located in the perforation of said guide, a set-screw located in said guide and adapted to impinge the said bolt, a spring connected to said bolt and adapted to normally hold the end of the bolt in said recess, the set-screw adapted to impinge the bolt and hold it in its outer position when the shaft is out of gear.

602,365. BALL-GRINDING MACHINE. ROBERT SCHULER and LEON F. SCHULER, Cleveland, Ohio, assignors to Frederick Schulze, same place. Filed June 24, 1897. Serial No. 642,077. (No model.)

Claim.—1. In a machine for grinding spherical balls, in combination, a rotating disk, a plurality of smaller disks carried by said first-mentioned disk and independently rotatable thereon, said smaller disks being adapted to carry balls to be ground, and a grinding-wheel adapted to contact with balls so carried, substantially as described.

2. In a machine for grinding spherical balls, a rotating disk F, a plurality of smaller disks G supported by said disk F and compelled to rotate therewith, means for giving said smaller disks an independent rotation about their own axes, and ball-races H carried by said smaller disks, in combination with a grinding-surface adapted to contact with balls in said races, substantially as described.

3. In a machine for grinding spherical balls, in combination, a disk F, means for rotating the same, a plurality of smaller disks supported by said disk and carried by it and also independently rotatable thereon, means for causing said independent rotation when said disk F rotates, ball-races carried by said smaller disks, a grinding-surface adapted to contact with balls in said races, and means for rotating said surface in the opposite direction to the rotation of the disk F, substantially as described.

4. In a machine for grinding spherical balls, a frame, a shaft B journaled therein, a disk F carried by said shaft B, a plurality of smaller disks carried by said disk F and adapted to carry balls, said smaller disks having axial shafts I journaled in said disk F, a stationary gear C, a gear J on each of said shafts I in mesh with said gear C, in combination with a grinding-surface adapted to contact with balls carried by said disks G, substantially as described.

5. In a machine for grinding spherical balls, in combination, a rotatable disk F, smaller disks G carried thereby, but adapted to rotate on their own axes, ball-races on said disks G, a rotating disk *k* carrying grinding material adapted to contact with balls in said races, the said disk *k* having the capacity for axial movement, and a stop for limiting said movement in the direction toward the ball-races, substantially as described.

6. In a machine for grinding spherical balls, in combination, a frame, a shaft B journaled therein, a disk F secured to said shaft, a plurality of smaller disks carried by said disk F and adapted to rotate about their own axes, ball-races on said smaller disks, a sleeve K surrounding said shaft B and journaled in said frame and capable of longitudinal movement through the same, a disk *k* secured to said sleeve and having a grinding-surface adapted to contact with the balls in said races, and a collar on said sleeve adapted to limit the movement of said disk in the direction toward said races, substantially as described.

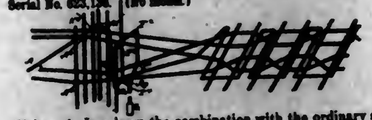
7. In a machine for grinding spherical balls, in combination, a plurality of circular ball-races, means for causing the same to revolve about their centers, and means for giving the ball-races as a whole a circular translation, a grinding-ring adapted to contact with balls in said races, the outer corner of said grinding-ring being in contact with the highest point of the outermost balls in said races, and the inner corner being in contact with the highest point of the innermost balls in said races, substantially as described.

8. In a machine for grinding spherical balls, in combination, a plurality of circular ball-races, means for causing the same to revolve about their centers and means for giving the ball-races as a whole a circular translation, a grinding-ring adapted to contact with balls in said races, the outer corner of said grinding-ring being in contact with the highest point of the outermost balls in said races, and the inner corner being in contact with the highest point of the innermost balls in said races, and means for rotating said grinding-ring and for pressing the same against said balls, substantially as described.

9. In a machine for grinding spherical balls, in combination, a frame, a shaft B journaled therein, means carried by said shaft for supporting a plurality of circular ball-races and giving them rotation about their centers, and a circular translation about the axis of said shaft B, a sleeve K journaled in said frame and surrounding said shaft B, and grinding material connected with said sleeve K adapted to contact with balls in said races, means for rotating said sleeve, and a spring compressed between said sleeve, and an adjustable collar R on said shaft B, substantially as described.

10. In a machine for grinding spherical balls, in combination, a frame, a shaft B journaled therein, means carried by said shaft for supporting balls to be ground, a sleeve K surrounding said shaft B and journaled in said frame, a disk secured to said sleeve and carrying grinding material adapted to contact with said balls, said sleeve and grinding material being capable of movement toward or from said balls, a collar on said sleeve limiting its movement toward said balls, a collar R on said shaft B, and a spring T compressed between said collar and said sleeve and thereby pressing the grinding material toward said balls, substantially as described.

11. In a machine for grinding spherical balls, in combination, a frame, a shaft B journaled therein, means for rotating said shaft, a disk F carried by said shaft, a plurality of smaller disks G supported by said disk F and adapted to carry balls, shafts I axially secured to said disks G and journaled in said disk F, a stationary gear O surrounding said shaft B and secured to the frame, gears J secured to said shafts I and meshing with said gear C, a sleeve K journaled in the frame and surrounding the shaft B, a grinding-ring N adapted to contact with balls carried by the disks G, means for securing said grinding-ring to the sleeve K, said sleeve being capable of movement toward or from the balls being ground, a collar on said sleeve limiting its movement toward said balls, and a spring pressing said sleeve toward said balls, substantially as described.

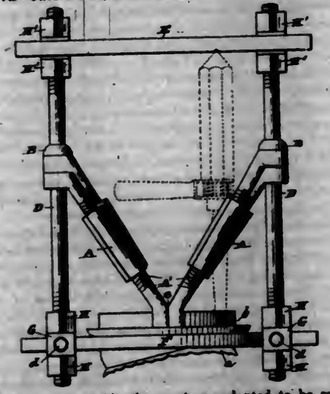


12. In combination, with a machine for grinding spherical balls, having ball rotating and grinding parts, of a casing surrounding said parts, and an entrance-pipe and an exit-pipe communicating with the interior of said casing, substantially as described.

13. In a machine for grinding spherical balls, in combination, a frame, a shaft journaled therein, means carried by said shaft for supporting balls and causing them to travel, a grinding-ring surrounding said shaft and adapted to contact with balls so carried, there being a tubular hole in said shaft having its exit near the balls so carried, a pipe or tube connected with said tubular hole, a casing surrounding said ball-supporting parts and said grinding-ring, and a tube or pipe communicating with the interior thereof, substantially as described.

14. In a machine for grinding spherical balls, in combination, a frame, a shaft B journaled therein, means carried by said shaft for supporting a plurality of circular ball-races, a grinding-ring surrounding said shaft and adapted to contact with balls in said races, a two-part stationary casing inclosing said ball rotating and grinding parts, said casing being separable upon a line near said ball-races, a tubular hole in said shaft B having its exit near said ball-races, a pipe or tube connected with said hole, and a pipe or tube connected with said casing, substantially as described.

15. In a ball-grinding machine, in combination, a frame, a shaft B journaled therein, ball-rotating mechanism carried by said shaft, one part of a stationary casing surrounding said ball-rotating mechanism and supported by said frame, a grinding-ring surrounding said shaft B and adapted to contact with balls carried by the ball-rotating mechanism and capable of movement toward and from said balls, a second part of said casing surrounding said ball-grinding ring and engaging with said first part, means for preventing the rotation of said second part and means whereby movement of said grinding-ring and its attached parts from said balls may compel said second part to move with them and thereby separate the two parts of the casing, and an entrance and an exit to said casing for allowing an in-and-out passage of fluid, substantially as described.

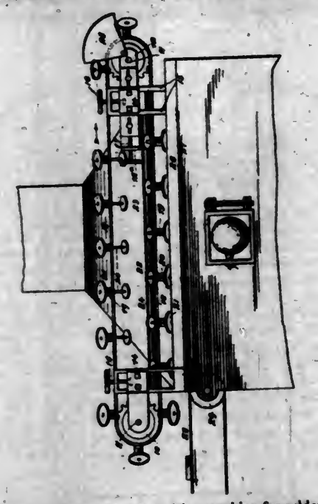


602,366. SELVAGE-WEAVING DEVICE FOR LOOMS. JOHANN K. SCHUMACHER, Wermelskirchen, Germany. Filed Feb. 12, 1897. Serial No. 623,136. (No model.)

Claim.—1. In a loom the combination with the ordinary shafts, carrying the warp-threads, of a dupe-shaft having a heddle longer than the distance of the bars of said shaft from each other, said heddle adapted to be held taut by a weight and surrounding a number of warp-threads and carrying a binding-thread in its eye to and fro around said warp-threads to form a true selvage when bound in by the wefts, substantially as described.

2. In a loom, the combination with the ordinary shafts, carrying the warp-threads, of a dupe-shaft having a heddle longer than the distance of the bars of said shaft from each other, provided with a weight adapted to glide on it freely, said heddle surrounding a number of warp-threads and carrying a binding-thread in its eye, an auxiliary heddle in one of the ordinary shafts through which the binding-thread is led and adapted to be carried with it to and fro and around said warp-threads and to form a true selvage when bound in by the wefts, substantially as described.

602,367. BRACE-HOLDER. STEPHEN SHANAHAN, Charleston, W. Va. Filed Dec. 30, 1897. Serial No. 664,531. (No model.)



Claim.—1. In combination, a clamp adapted to be secured to the head of a valve or service box, a frame supported by said clamp, and braces carried by the frame and engaging the upper end of the valve or service box, substantially as described.

2. In combination, a clamp adapted to be secured to a valve or service box, a frame supported by said clamp, braces extending from said frame to the edge of the box, said braces being adjustable, and stops for limiting the upward movement of the braces, substantially as described.

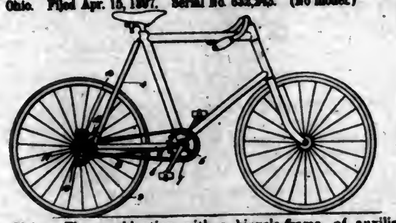
3. In combination, a clamp adapted to be secured to a valve or service box, uprights or standards supported by the clamp, a cross-piece connected with the upper end of the standards and braces between the standards and the upper edge of the box, substantially as described.

602,368. SOLDERING-MACHINE. BERTRAND H. BROOT, Vancouver, Canada. Filed June 1, 1897. Serial No. 638,018. (No model.)

Claim.—1. In combination with a machine for soldering cans of uneven radii, having a solder-trough arranged longitudinally above a furnace and beneath a runway for cans, and sprocket-belt wheels adjustably arranged above and at either end of the said runway, shackle-links arranged at intervals upon a sprocket-belt taking round the said wheels, spindles 20 arranged to loosely journal in apertures fixed at an angle in said links 19, of self-adjusting can-receptacles 21 arranged on the depending ends of the spindles 20, and pinions 22 rigidly fixed near the opposite ends of the spindles and made to engage a fixed rack in their track, substantially as set forth.

2. In an apparatus for soldering cans of uneven radii, by means of rolling movement over a receptacle of heated solder, the combination of standards 15 having adjustable frames arranged thereon, said frames carrying wheels 10 having a sprocket-belt passing thereabout, shackle-links 19 inserted at regular intervals in said belt, the projecting portions of said links being turned laterally, of pinions or shafts passing through apertures therein, which apertures are at angles of approximately twenty degrees to the plane of the sprocket-belt, of can-receiving sockets 21 adjustably arranged on the ends of the shafts or spindles 20, of means for controlling said spindles from lateral movement and means for imparting rotary motion to the same while passing over a solder-trough, whereby the can-receptacles will be rolled along a common runway, as set forth.

3. In an apparatus for can-soldering, having wheels arranged at either side and a sprocket belt or chain passing over a common runway, spindles arranged along said chain, the same being provided with can-receptacles on their depending ends which receptacles are self-adjusting as to radius, pinions 22 rigidly fixed near the opposite ends of the said spindles, a rack 23 engaging the pinions in their lower path, a guide-rod 24 made to engage the upper portions of the projecting ends of the spindles 20 in proximity to the pinions, while engaging the rack 23, substantially as set forth.



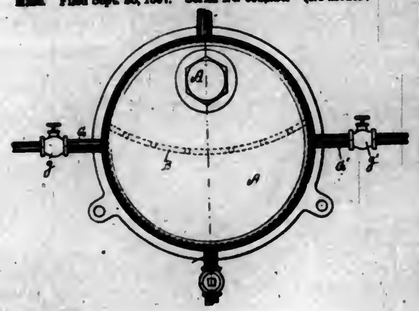
4. In a machine for soldering cans having sprocket belt-wheels and a belt taking round the same, and can-conveyers arranged at intervals along said belt, the combination of spindles passing through apertures therein, of can-receptacles adjustably arranged on the ends thereof and means for revolving the same at a uniform speed, as set forth.

5. In a machine for soldering cans, can-receptacles 21, spider-castings 21ª suitably secured thereto, the same having slots therein, spindles 20 having flat shanks passing through the said slots and collars arranged on either side of the said castings, and means for passing the said can-receptacles over a common runway by a rolling movement, substantially as and for the purposes set forth.

6. In a can-soldering machine having belt-wheels arranged at either side of a fixed trough, a frame adjustably arranged and made to support one of the belt-wheels, a sprocket-belt having can-conveyers thereon and having a fixed angle to the line of the said wheels,

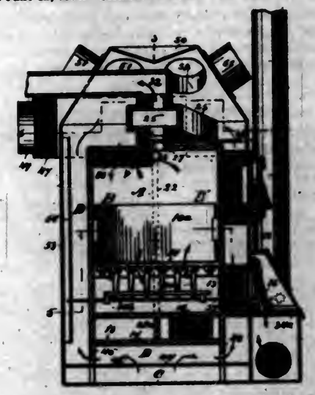
a hood or guide 25 secured to the branches of the frame 12, the same being made to engage and prevent cans from being detached from the conveyer while taking round the arc of the wheel 10, as and for the purposes hereinbefore set forth.

602,869. BICYCLE-FRAME. AMOS B. SIMONDS, Youngstown, Ohio. Filed Apr. 15, 1897. Serial No. 632,243. (No model.)



Claim.—The combination with a bicycle-frame, of auxiliary frames each having a curved guideway, a forwardly-projecting lug on each auxiliary frame by which it is attached to the back stay and the rear fork of the frame, forwardly-projecting lugs located respectively above and below the first-mentioned lug, braces attached to said lugs and connected with the main frame of the bicycle, a block fitted to slide in the curved guideway of each auxiliary frame, each block being formed at its ends with recesses capable of receiving portions of the auxiliary frame as the block slides therein, cushions mounted within the said recesses and adapted to engage with the corresponding portions of the frame, a stud attached to the upper portion of each block at the outer side, studs located at the lower outer portion of each auxiliary frame, an elastic band passing around the said studs and a wheel having the ends of its axle fitted in openings formed in the said blocks, substantially as described.

602,870. GARDEN-TOOL. LIZZIE B. SMITH, Belle Plain, Iowa. Filed Aug. 27, 1897. Serial No. 649,716. (No model.)

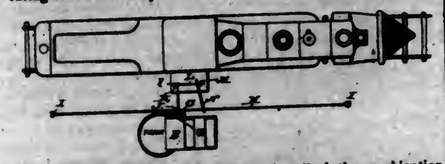


Claim.—A garden-tool having a handle, a head provided with a shank fitted to the handle, the head being flattened and provided with locking-teeth on its upper face adjacent to its upper edge, the head being also provided with two locking-pins projecting from its upper face, a clamping-plate having a recess at its inner end, the recess receiving a portion of the shank of the head, the clamping-plate also having two orifices respectively receiving the locking-pins of the head, a bolt passed between the head and clamping-plate to hold the two rigidly together, and a tool proper having two holes respectively receiving the locking-pins and having a shank portion provided with teeth coacting with the teeth of the head, such shank portion being pressed firmly between the head and clamping-plate.

602,871. HYDRAULIC LUBRICATOR. JOHN E. SPENCER, Salem, Mass. Filed Sept. 30, 1897. Serial No. 653,223. (No model.)

Claim.—The herein-described lubricator for hydraulic motors consisting of a hollow shell or casing having within the same a perforated diaphragm adapted to support a lubricant and dividing the interior of the casing into two compartments, the compartment below the diaphragm affording a sediment-chamber, one or more water-inlet pipes leading into the upper part of said sediment-chamber, a blow-off pipe leading from the bottom of the same, a water-delivery pipe leading from the top of the compartment above the diaphragm, a filling-orifice formed in the casing and a closing device therefor, substantially as described.

602,872. FURNACE. EMORY R. STARR, Bowling Green, Ohio. Filed June 12, 1897. Serial No. 640,489. (No model.)

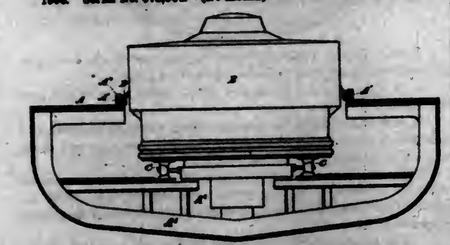


Claim.—1. In a furnace, the combination, with a fire-pot, and an air-supply for the fire connected with the said fire-pot near the bottom, of a casing surrounding the fire-pot, forming vertical and horizontal combustion conducting flues, each vertical flue having direct communication with the fire-pot near its upper portion, and each combustion-flue being provided with an outlet, exit-flues connected with the outlets of the combustion-flues, the exit-flues having a branch connected with the upper portion of the fire-pot, an offtake-flue connected with the exit-flues, and a damper located in the branch of the exit-flues between the said flues and the fire-pot, substantially as described.

2. In a furnace, the combination, with a fire-pot, an air-supply connected with the fire-pot beneath its grate, a casing for the fire-pot, forming upright and horizontally-connected flues for the products of combustion, the upright flues being provided with direct communication at their upper portions with the fire-pot, and being also provided at their tops with outlets, and a partition dividing the said upright and horizontal flues into two separate compartments, of a main outlet for the products of combustion, branch pipes connected with the said main outlet and with the outlets of the vertical sections of the combustion-flues at the sides of the fire-pot, a connection between the branch pipes and the interior of the fire pot at the top, a dome above the fire-pot, a flue for the air to be heated surrounding the fire-pot and its casing, and a fresh-air inlet connecting with the bottom portion of the air-heating flues, substantially as described.

3. In a furnace, the combination, with a fire-pot, an air-supply for the fire pot, fire-plates removably attached to the fire-pot, combustion-flues at the sides of the fire-pot, being in communication therewith, an offtake for the products of combustion, branch pipes from the offtake connected with the said combustion-flues, and a branch connection between the branch pipes and the fire-pot, of a casing surrounding the fire-pot, provided with outer box air-inlet flues, inner flues located between the box-flues and the fire-pot, also adapted to conduct air to be heated, bottom air-flues in connection with each other, one bottom flue being connected with the box-flues and the other with the inner air-flues, a dome located over the fire-box, receiving the heated air from the inner flues, and means, substantially as described, for introducing cold air into the said box-flues and permitting an egress of the heated air from the dome, as described.

602,873. WATER-TANK. WILLIAM M. STEVENSON and WILLIAM K. BAILEY, Honey Grove, Tex. Filed June 16, 1897. Serial No. 641,016. (No model.)



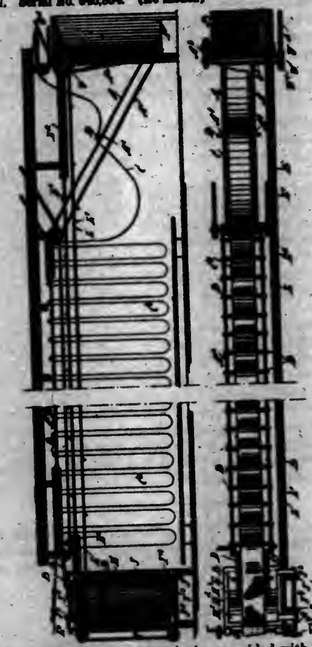
Claim.—1. An apparatus substantially as described comprising the pumping devices, the guide-line alongside the same, the posts at the ends of said guide-line, the pumping-cable having a ring sliding on the guide-wire and a second ring for connection with the locomotive, the locomotive having a bar for securing said second ring such bar being pivoted at one end, a pivoted link by which to secure the other end of the bar and a lever pivoted to the locomotive and arranged at one end to engage the posts at the end of the guide-line and at its other end to trip the link from engagement with the securing-bar substantially as described.

2. In an apparatus substantially as described, the combination with the locomotive of a cable-securing bar pivoted at one end and bent between its ends into hook shape forming a seat for the cable-ring, a link for securing the other end of said bar and a tripper for releasing said link substantially as described.

3. The combination with the locomotive and the pumping-cable having a ring, of the securing-bar on which the said ring is loosely fitted said bar being pivoted at one end, a latch for securing the opposite end of the bar, and a tripper for releasing said latch substantially as described.

602,874. TURRET-JOINT FOR NAVAL VESSELS. WILLIAM D. SEVERS, Jersey City, N. J. Filed June 4, 1896. Renewed Mar. 15, 1898. Serial No. 673,961. (No model.)

Claim.—1. In a war vessel having a turret arranged to turn horizontally, a diaphragm extending across the otherwise open space between it and the deck and held loosely between horizontal faces above and below on one of the parts so that such diaphragm bridges the space and is securely defended against displacement downward or upward, while allowing both a revolving and a bodily horizontal movement and maintaining a water-tight joint, as herein specified.



2. In a war vessel having a turret arranged to turn horizontally, a diaphragm extending across the otherwise open space between it and the deck and held loosely between horizontal faces above and below on one of the parts so that such diaphragm bridges the space and is securely defended against displacement downward or upward, which allows both a revolving and a bodily horizontal movement, with provisions for the parts to also yield vertically, all combined and arranged for joint operation, and maintaining a water-tight joint, substantially as herein specified.

3. In a war vessel having a turret arranged to turn horizontally, an annular diaphragm comprising a body D of rubber or analogous elastic waterproof material, and a metal shoe E fixed on the edge thereof and having its upper and lower faces plane and parallel, in combination with rigid parts A^4, A^5, fitting loosely to such faces both above and below, all arranged to serve substantially as herein specified.

4. In a war vessel having a turret arranged to turn horizontally, a series of segments M and bolts N, properly formed to fit together and apply around and tightly embrace the turret so as to hold reliably, and a diaphragm D connecting such segments with the deck of the ship and maintain a water-tight joint with liberty for the turret to turn and to move bodily, all substantially as herein specified.

5. In a war vessel, having a turret arranged to turn horizontally, an annular diaphragm comprising a body D of rubber or analogous elastic waterproof material made in segments firmly united, one edge of such diaphragm being faced above and below and received loosely between parallel annular parts so that the turret may revolve and be moved bodily horizontally by the sliding of such parts, and that liberty is afforded by the elasticity of the diaphragm for vertical movements relatively to each other and a water-tight joint be maintained, all substantially as herein specified.

602,875. LATH-CARRYING DEVICE FOR WALL-PAPER OR OTHER MACHINES. JOHN H. SNYDAM, Sr., New Brunswick, N. J., assignor of one-half to Irving B. Brown, same place. Filed June 15, 1897. Serial No. 640,834. (No model.)

Claim.—1. A lath-carrying device provided with a return lath-carrier, and a turning device arranged to give the sticks a quarter-turn, the said turning device receiving the sticks from the carrier and delivering them to the feed of the sticking-machine, substantially as shown and described.

2. A lath-carrying device provided with a return lath-carrier leading from the discharge end of a sticking-machine to the feed end, and a turning device receiving the sticks from the carrier and delivering them to the feed of the sticking-machine, the said turning device having a carved surface adapted to engage the end of a lath, substantially as shown and described.

3. A lath-carrying device, comprising a lath-receiver at the end of a sticking-machine, for receiving the sticks from the latter, a turning device within the said lath-receiver, for giving a quarter-turn to the sticks, an elevator receiving the turned sticks from the said receiver, a return carrier-chain receiving the sticks from the said elevator, a turning device receiving the sticks from the said carrier, and a feed-hopper receiving the sticks from the said turning device and delivering them to the carrier-chain of the sticking-machine, substantially as shown and described.

4. A lath-carrying device, provided with a lath-receiver at the end of a sticking-machine, the said lath-receiver being provided with a turning device for giving the stick a quarter-turn, substantially as shown and described.

5. A lath-carrying device, provided with a lath-receiver having an incline, and sets of inclined sticks at the lower end of said incline, for giving a lath a quarter-turn, the said sticks discharging the laths upon a delivery device forming part of the said receiver, substantially as shown and described.

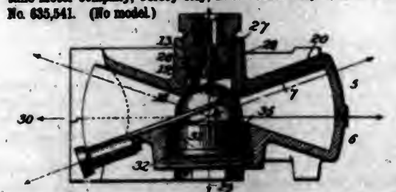
6. A lath-carrying device, comprising a lath-receiver having a turning device, an elevator receiving the laths from the said receiver, and a return carrier-chain having lugs, and receiving said laths from the said elevator, substantially as shown and described.

7. A lath carrying device, comprising a lath-receiver having a turning device, an elevator receiving the lath from the said receiver, a return carrier-chain having lugs, and receiving said laths from the said elevator, and a transferring device intermediate of the said chain and elevator, and comprising inclines and guide-rails, substantially as shown and described.

8. A lath-carrying device, provided with a turning device comprising sets of inclined sticks, and stop-pins at the lower ends of the said sticks, substantially as shown and described.

9. A lath-carrying device, provided with a lath-turning device, comprising a carrier-chain having lugs, and a block having a curved edge adapted to engage the outer end of a lath, the other end being pressed on by a lug on the said chain, substantially as shown and described.

10. A lath-carrying device, provided with a lath-turning device, comprising a carrier-chain having lugs, and a block having a curved edge adapted to engage the outer end of a lath, the other end being pressed on by a lug on the said chain, the said block having a step-bottom, with the steps running diagonally, substantially as shown and described.



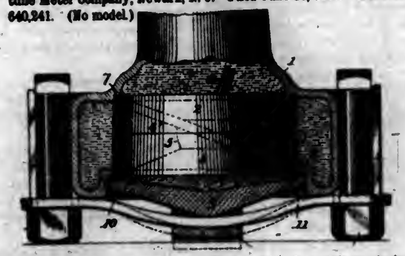
11. A lath-carrying device, provided with a lath-turning device, comprising a carrier-chain having lugs, a block having a curved edge adapted to engage the outer end of a lath, the other end being pressed on by a lug on the said chain, the said block having a step-bottom, with the steps running diagonally, and a roller mounted to revolve opposite the lowermost step, and forming a slot between the two for the lath to pass downward, substantially as shown and described.

12. A lath-carrying device, provided with two return lath-carrying chains traveling in unison, and a turning device at the adjacent ends of the said chains, for turning a lath delivered by one chain and placing the turned lath on the other chain, substantially as shown and described.

13. A lath-carrying device, provided with a lath-carrying chain having lugs, a trough in which travels the upper run of the said chain, and an adjusting device for the lath, and provided with an arm mounted to swing and extending into the said trough above the upper ends of the lugs, substantially as shown and described.

14. A lath-carrying device provided with a lath-receiver at the discharge end of a sticking-machine, the said lath-receiver being provided with a turning device for the sticks, a return lath-carrier, and a turning device, receiving the sticks from the return-carrier, substantially as shown and described.

602,376. MECHANISM FOR CONTROLLING ACTION OF OSCILLATING DISKS. JOHN THOMSON, Brooklyn, N. Y., assignor to the Neptune Meter Company, Jersey City, N. J. Filed May 7, 1897. Serial No. 635,541. (No model.)



Claim.—1. The combination with the casing, disk and ball, of the thrust-block resting upon the ball, and having its base formed flat and to a right angle to the thrust-resisting surfaces.

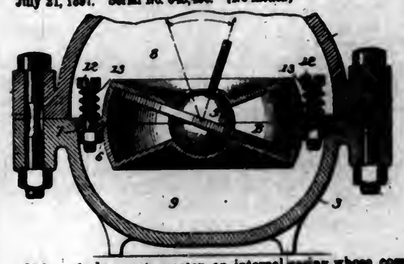
2. The combination with the casing, disk, ball and conical thrust-block, of a bearing for said thrust-block capable of adjustment in the direction of the axis of the cone, substantially as set forth.

3. The combination with the casing, disk and ball, of the thrust-block and the adjustable bearing therefor, both of which are adapted to be removed from the exterior of the disk-chamber casing, substantially as described.

4. The combination with the casing, disk and ball, of the vertically-adjustable bearing having its exposed beveled face 35, set beneath the face of the frustum.

602,377. APPARATUS FOR PREVENTING DAMAGE TO WATER-METERS. JOHN THOMSON, Brooklyn, N. Y., assignor to the Neptune Meter Company, Newark, N. J. Filed June 10, 1897. Serial No. 640,241. (No model.)

Claim.—1. In a water-meter, the combination with a closing-head, of resilient means for holding the head in position.



2. In a water-meter, the combination with the main casing, the disk-casing and the head, of a resilient clamp arranged to bear upon the head and maintain it in proper position.

3. The combination with the main casing, the disk-casing and the head, of a clamp comprising resilient material secured to the casing and pressing upon the head.

4. The combination with the main casing, the disk-casing and the head, loosely fitting the main casing and bearing against the disk-casing, of a resilient clamp comprising cross-strips secured to the main casing and pressing upon the head, substantially as described.

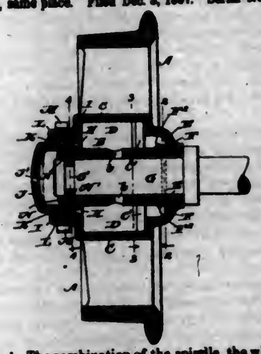
5. In a disk water-meter, the combination of a main casing, a separable disk-casing, a closing-head bearing against the disk-casing to secure it together and to its seat, and a resilient clamp attached to the main casing and impinging against the head, substantially as described.

602,378. WATER-METER. JOHN THOMSON, Brooklyn, N. Y., assignor to the Neptune Meter Company, Jersey City, N. J. Filed July 21, 1897. Serial No. 645,486. (No model.)

Claim.—1. In a water-meter, an internal casing whose component sections are secured together by resilient means.

2. In a water-meter, an internal casing attached to its seat in a main casing by resilient means.

3. In a water-meter, an internal casing whose component sections are secured together and also attached to a seat, or to a bearing, in a main casing by resilient means.



4. The combination with the disk-casing of a screw arranged to secure the sections of the disk-casing together, having a spring interposed between its head and one of the sections of the disk-casing; substantially as specified.

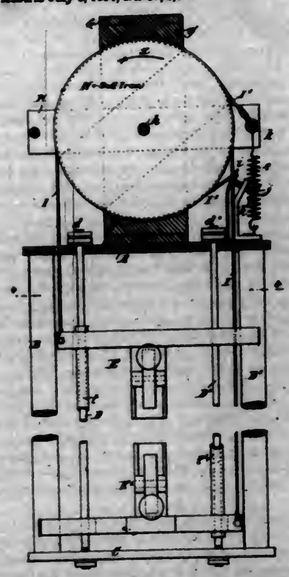
5. The combination with the disk-casing and a section of the main casing, of a screw arranged to secure the disk-casings together and also to a seat, or to a bearing, in the main casing, having a spring interposed between its head and the disk-casing; substantially as specified.

6. In a water-meter, the combination with the main casings, of elongated flange-bolts whose normal diameters are reduced to the form of a curve, in longitudinal section; substantially as described.

7. In a water-meter, the combination with the main casings, of elongated flange-bolts, having definitely-weakened sections, and a sleeve or tube interposed between the flange and the head or nut of the bolt; substantially as described.

602,379. SELF-OILING WHEEL. IVOR B. TITUS and JOHN W. EMMEN, Huntington, W. Va., assignors to the Emmen Manufacturing Company, same place. Filed Dec. 3, 1897. Serial No. 660,895. (No model.)

Claim.—1. The combination of the spindle, the wheel, the check-blocks engaging the spindle and abutting at their ends and having in their outer sides at such ends recesses, the recesses in the meeting ends of the adjacent blocks uniting in forming ports for the oil substantially as shown and described.



2. The improvement herein described comprising the spindle, the series of blocks engaging the spindle, abutting at their ends and having at their ends recesses forming ports for the oil, and means for securing the blocks in engagement with the spindle substantially as set forth.

3. A wheel having its hub formed with a shell and a journal-tube providing an intermediate oil-receptacle, the shell being extended inwardly beyond the journal-tube, spaced lugs connecting such inner extension of the shell with the inner end of the journal-tube and outwardly-extending arms in the oil-receptacle in advance of the said spaced lugs substantially as set forth.

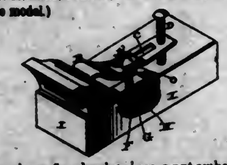
4. The combination of a spindle having a groove the wheel, the check-blocks having each a wing fitting in the groove of the spindle and a wing which overlaps the end of the spindle and the cap overlapping such blocks at its inner end and secured to the wheel whereby to hold the blocks in place substantially as set forth.

5. A wheel having a journal-tube and a shell the latter being extended at its inner end beyond the inner end of the journal-tube and contracted in advance of said end forming a contracted passage, the spaced lugs connecting the ends of the shell and journal-tube at the inner end of said contracted passage, and the rib in advance of said lugs and operating as a guard whereby to limit the passage of oil to the openings or ports between the spaced lugs substantially as set forth.

602,380. ELECTRIC-ARC LAMP. EDGARD WERER, Paris, France, assignor to Paul Mersch, same place. Filed Sept. 11, 1897. Serial No. 651,361. (No model.) Patented in France Apr. 30, 1897, No. 266,669, and in Austria July 6, 1897, No. 47/3,570.

Claim.—1. In voltaic-arc lamps or regulators, having carbon-holders connected by a cord or small chain, one of which carbon-holders is heavier than the other so as to actuate them, the arrangement of a disk H, around which passes the said cord, of armatures J and J' mounted loose upon the spindle of this disk, and connected with a mechanical brake acting upon the disk and submitted to the action of a spring or of a counterweight, and of an electromagnet F F' arranged in shunt upon the main circuit, and between the polar masses *g* and *g'* of which is arranged the disk H and the armatures J J' above referred to; the object of the said arrangement being, when the voltage increases at the lamp-terminals and the electromagnet receives a proportional quantity of the current, to release the mechanical brake by the attraction of the armatures and to exert a magnetic braking upon the disk, in such a manner that the carbons approach each other slowly, regularly and without jerks, as above specified.

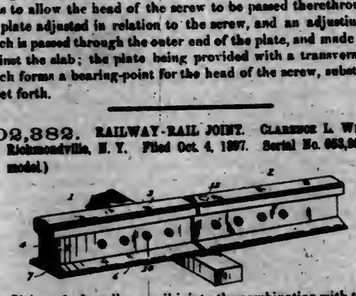
2. In an arc-lamp, the combination of a frame, two carbon-hold-



ers slidable thereon toward and from each other, a flexible connection attached to each carbon-holder, a disk over which said connections are wound, a brake-cord for the disk, a non-magnetic frame swinging loose on the axis of the disk and having connection with said brake-cord, an armature in connection with said frame, and an electromagnet with which the armature coacts, the electromagnet being in proximity with the disk, and the disk being magnetic for coaction with the electromagnet.

3. The combination of an electromagnet, a magnetic disk in the field thereof, a brake-strap for the disk, a non-magnetic frame swinging on the axis of the disk and connected with the brake strap, an armature in connection with the frame and coacting with the magnet, two carbon-holders, and connections between said carbon-holders and the disk.

4. The combination of an electromagnet having two pole-pieces arranged one above the other, a magnetic disk located between and in the field of said pole-pieces, a brake-strap for the disk, a non-magnetic frame swinging on the axis of the disk and connected with the brake-strap, a spring actuating said non-magnetic frame, two armatures attached to the frame and located one on each side of the disk and coacting with the pole-pieces, two carbon-holders, and a cord attached to each carbon-holder, the cord being wound oppositely over the disk.



5. The combination with a frame, of an electromagnet, a magnetic disk in the field of said magnet, a brake for the disk, an armature coacting with the magnet and controlling the brake, the magnet serving to retard the revolution of the disk, and a carbon-holder having connection with the disk.

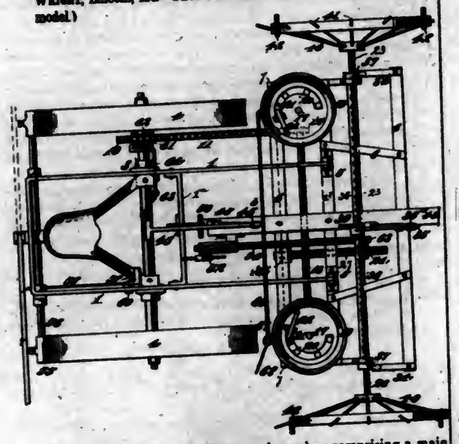
602,381. PLUMBER'S CLAMP. FRANK WHITE, New York, N. Y., and FRANK J. MURPHY, Pomona, Cal. Filed May 7, 1897. Serial No. 635,463. (No model.)

Claim.—In a clamp for plumbers' use, a nut embedded in the lead in the slab, and a headed screw which has its inner end passed down through the nut, combined with the clamping-plate which is slotted so as to allow the head of the screw to be passed therethrough and the plate adjusted in relation to the screw, and an adjusting-screw which is passed through the outer end of the plate, and made to bear against the slab; the plate being provided with a transverse raise, which forms a bearing-point for the head of the screw, substantially as set forth.

602,382. RAILWAY-RAIL JOINT. CLARENCE L. WITHERBEE, Richmondville, N. Y. Filed Oct. 4, 1897. Serial No. 653,957. (No model.)

Claim.—1. In railway-rail joints, the combination with the abutting ends of two adjoining rails hollowed or channeled longitudinally, and having a longitudinal tongue in the wall of said channel, of a bar provided with a longitudinal groove in the side thereof, said bar adapted to fit in said channel, to break joint with said abutting ends and to secure same in their proper relative positions, substantially as set forth.

2. In railway-rail joints, the combination of the abutting ends of two adjoining rails, said rails hollowed or channeled longitudinally in the web thereof, and a bar adapted to fit in said channel, to break joint with the said abutting ends, the said bar notched or serrated in its upper edge and adapted to be moved longitudinally out of engagement with either rail by means of a tool inserted through an orifice in the head of said rail, substantially as set forth.



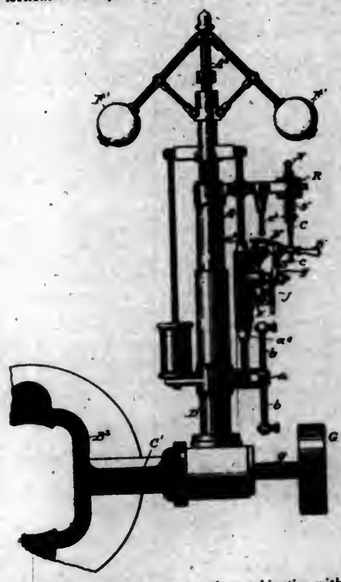
3. In rail joints, the combination with the channeled abutting ends of two adjoining rails, of a locking-bar fitted in the channels of said rails and connecting the same and adapted to be moved out of engagement with either rail by means of a tool inserted through an opening in the head of one of the rails, substantially as described.

4. In a rail-joint, the combination of the abutting ends of two adjoining rails provided with alined channels and locking-tongues, of a locking-bar fitted in the channels of said rails and connecting the

same and provided with a groove to receive said rail-tongues, substantially as described.

5. In railway-rail joints, the combination of the rails having their abutting ends channeled and one or both provided with an opening in the head thereof leading down thereinto, a locking-bar fitted in the said channels and connecting the rails, said bar adapted to be moved out of engagement with either rail by means of a tool inserted through the opening, and a plug adapted to be inserted in said opening to close the same, substantially as described.

602,888. COMBINED PLANTER AND MARKER. JAMES C. WRIGHT, Lincoln, Mo. Filed Oct. 11, 1897. Serial No. 654,757. (No model.)



Claim.—1. A combined planter and marker comprising a main frame, an axle mounted in said frame, the supporting drive-wheels fixed to the axle, the second frame pivoted to the forward ends of the main frame, the hopper-plates having exits and mounted on the second frame, the seed-guides beneath the exits, the cam-shaft, having cams fixed thereto and mounted in the seed-guides, the dropping-levers pivoted to the seed-guides and having extensions bearing upon the cams, the marker-wheel shaft supported from the second frame, the furrow openers extending from the seed-guides to the second frame, the marker-wheels fixed to the marker-wheel shaft, means for connecting the hopper-plates with the axle and means for connecting the marker-wheel shaft with the cam-shaft; substantially as described.

2. A combined planter and marker comprising a main frame, an axle mounted in said frame, the supporting drive-wheels fixed to the axle, the second frame pivoted to the forward ends of the main frame, the hopper-plates having exits, the hopper-shaft mounted on the second frame and having bevel-pinions, the toothed circular plates having seed-openings and meshed by the bevel-pinions and rotating on the hopper-plates, the interposed washers, the hoppers secured to the circular plates, and having an outlet to the seed openings, the seed-guides beneath the exits of the hopper-plates, and connection between the axle and the hopper-shaft; substantially as described.

3. A combined planter and marker comprising a main frame, an axle mounted in said frame, the supporting drive-wheels fixed to the axle, the second frame pivoted to the forward ends of the main frame, the hopper-plates having exits and mounted on the second frame, the seed-guides beneath the exits, the cam-shaft having cams fixed thereto and mounted in the seed-guides, the dropping-levers pivoted to the seed-guides and having extensions bearing upon the cams, the marker-wheel shaft, the marker-wheels fixed to the marker-wheel shaft, the upright secured to the second frame, the hand-wheel mounted on the upright, means for connecting the hopper-plates with the axle, connections between the marker-wheel shaft and the cam-shaft, and connection between the hand-wheel and the marker-wheel shaft; substantially as described.

602,884. AUTOMATIC SAFETY STOP DEVICE. JAMES K. WRIGHT, New York, N. Y. Filed Mar. 15, 1898. Serial No. 673,913. (No model.)

Claim.—1. In an automatic safety device, the combination with the governor, of a rod or spindle made in two sections and independently movable with respect to each other, one of which sections is connected with the governor and the other with the valve operating mechanism, means for connecting the two sections together, and mechanism operated by the movement of the governor-balls away from the normal plane to release said connecting means, thereby separating the two sections of the spindle or rod, substantially as described.

2. In an automatic safety device, the combination with the governor, of a rod or spindle made in two sections, and independently movable with respect to each other, one of which sections is connected with the governor and the other with the valve-operating mechanism, means for connecting the two sections together, and mechanism operated by the rising of the governor-balls above the normal plane of operation for maximum speed to release said connecting means, thereby separating the two sections of the spindle or rod, substantially as described.

3. The combination with a divided governor-rod, a shell or casing carried by the upper section thereof, the lower section freely moving within said shell, a clutch-pin normally locking the two sections together, a stop, a connection between said stop and clutch-pin for retracting the pin when the governor-balls rise above the normal plane of operation for the maximum speed, and separating the two sections of the rod, substantially as and for the purpose set forth.

4. The combination of a divided governor-rod, the upper section provided with a shell, and a lower section having an enlarged head working in said shell and provided with a recess or groove therein, a pin slidably mounted on the shell and normally in engagement with the said recess or groove thereby locking the two sections together, a lever fulcrumed on the shell and connected to the pin, a stop adapted to engage one arm of the lever to operate the same and withdraw the pin when the governor rises above the normal plane of operation for the maximum speed, substantially as described.

5. The combination with a governor rod or spindle, having an upper and a lower section movable in respect to each other, a clutch device normally locking the two sections together, means for causing the clutch device to release the sections when the governor-balls move away from the normal planes of operation, and means for preventing the operation of said clutch device as the engine is stopped, when desired.

6. The combination with a governor rod or spindle, having an upper and a lower section movable in respect to each other, means for causing said clutch device to release the sections when the governor-balls move away from the normal planes of operation, and means for preventing the operation of said clutch device upon stopping the engine under ordinary conditions, and means for automatically resetting the device for emergencies, upon starting the engine.

7. The combination with a divided governor-rod consisting of an upper section having a shell or casing, a lower section working freely therein, a spring mounted in the shell and casing and connected with the lower section and normally tending to separate the sections, a clutch for locking the two sections together, a lever having one arm adapted to be connected to said pin, a stop adapted to engage the other arm of said lever when the governor-balls move away from the normal planes of operation, and means for separably connecting the lever and clutch pin so that they may be caused to move together or the pin allowed to remain stationary as the lever is moved.

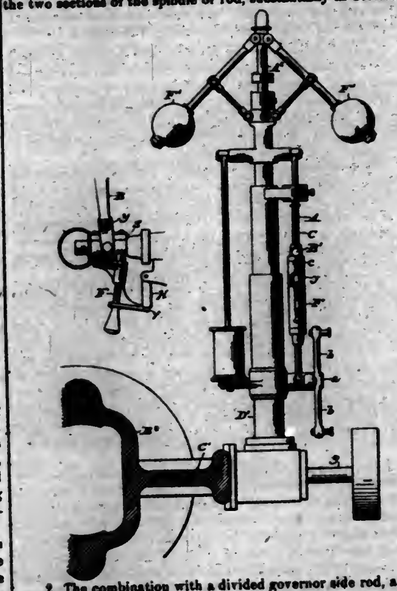
8. The combination with a divided governor rod or spindle consisting of an upper section and a lower section, a pin for connecting the two together, two stops, and connections between said stops and pin for operating the same, when the governor-balls move away from the normal planes of operation, and means for rendering said connections inoperative when desired to stop the engine under ordinary running conditions.

9. The combination with a divided governor rod or spindle consisting of an upper section and a lower section, a pin for connecting the two together, two stops and connections between said stops and pin for operating the same, when the governor-balls move away from the normal planes of operation, means for rendering said connections inoperative when desired to stop the engine under ordinary conditions, and means for automatically resetting the device upon the starting of the engine.

10. The combination with the governor, and the valve-operating mechanism of the steam-engine, connections between said governor and valve mechanism, of mechanism for releasing said connections when the governor-balls move away from the normal planes of operation, and locking devices interposed between said releasing mechanism and valve connections, whereby said connections may be locked against release, when it is desired to stop the engine under normal conditions.

11. The combination with the governor and the valve-operating mechanism of a steam-engine, connections between said governor and valve mechanism, of mechanism for releasing said connections when the governor-balls move away from the normal planes of operation, a locking device interposed between the releasing mechanism and valve connections, and means for automatically releasing said locking device so as to set the releasing mechanism for action upon the starting of the engine.

12. In an automatic stop device for engines, the combination with the governor, of a divided rod consisting of two sections, one section being connected to the governor and the other section to the valve-operating mechanism of the engine, a clutch-pin for locking the sections together, a sleeve slidably mounted on said pin, a lever having an arm connected to said sleeve, a stop with which said arm is adapted to engage, a locking-pin for locking the sleeve and clutch-pin together, and a catch adapted to engage and hold said pin out of engagement with the clutch-pin, substantially as described.



13. In an automatic safety stop device for engines, the combination with the governor, of a rod consisting of two sections, one of said sections being connected with the governor and the other to the valve mechanism, a clutch-pin for locking the two sections together, a sleeve slidably mounted on said clutch-pin, a lever having an arm connected to said sleeve, a stop with which said arm is adapted to engage, a locking-pin for locking the sleeve and clutch-pin together, a catch for holding said locking-pin out of engagement with the clutch-pin, and means for causing the locking-pin to engage the clutch-pin when the engine is started, substantially as and for the purpose set forth.

14. In an automatic safety stop device for engines, the combination with the governor, of a rod consisting of two sections, one of said sections being connected with the governor and the other with the valve mechanism, a clutch-pin for locking the two sections together, a sleeve slidably mounted on said clutch-pin, a lever connected to said sleeve, a spring normally pressing one arm of said lever upward, thereby normally locking the two sections of the rod together, and a stop adapted to engage said arm when the governor-balls rise above the plane of maximum speed, and thereby cause the clutch-pin to release the two sections, substantially as described.

15. In an automatic safety stop device for engines, the combination with the governor, of a rod consisting of two sections, one of said sections being connected with the governor and the other with the valve mechanism, a clutch-pin for locking the two sections together, a sleeve slidably mounted on said pin, a lever having one arm connected with said pin, a spring normally engaging the other arm of said lever and normally causing the clutch-pin to lock the two sections of the rod together, a stop-weight located above said spring-actuated arm, and means for releasing said weight as the rod rises above its normal position, whereby the weight falls upon said arm, substantially as described.

602,885. AUTOMATIC SAFETY-STOP FOR ENGINES. JAMES K. WRIGHT, New York, N. Y. Filed Dec. 3, 1897. Serial No. 660,669. (No model.)

Claim.—1. In an automatic safety device, the combination with the governor, of a rod or spindle made in two sections, and independently movable with respect to each other, one of which sections is connected with the governor and the other with the valve-operating mechanism, means for connecting the two sections together, and mechanism operated by the falling of the governor-balls below the normal plane to release said connecting means, thereby separating the two sections of the spindle or rod, substantially as described.

2. The combination with a divided governor side rod, a shell or casing carried by the upper section thereof, the lower section freely moving within said shell, a clutch-pin normally locking the two sections together, a stationary stop, a connection between said stop and clutch-pin for retracting the pin when the governor-balls fall below the normal plane, and separating the two sections of the rod, substantially as and for the purpose set forth.

3. The combination of a divided governor-rod, the upper section provided with a shell, and a lower section having an enlarged head working in said shell and provided with a recess or groove therein, a pin slidably mounted on the shell and normally in engagement with the said recess or groove, thereby locking the two sections together, a lever fulcrumed on the shell and connected to the pin, a stationary stop adapted to engage one arm of the lever to operate the same and withdraw the pin when the governor falls below the normal plane, substantially as described.

4. The combination with a governor rod or spindle, having an upper and a lower section movable in respect to each other, a clutch device normally locking the two sections together, means for causing the clutch device to release the sections when the governor-balls fall below the normal plane, and means for preventing the operation of said clutch device as the engine is stopped, when desired.

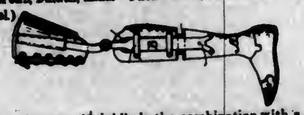
5. The combination with a governor rod or spindle, having an upper and a lower section movable in respect to each other, means for causing said clutch device to release the sections when the governor-balls fall below the normal plane, and means for preventing the operation of said clutch device upon stopping the engine under ordinary conditions, and means for automatically resetting the device for emergencies, upon starting the engine.

6. The combination with a divided governor-rod consisting of an upper section having a shell or casing, a lower section working freely therein, a spring mounted in the shell or casing and connected with the lower section and normally tending to raise the same upward, a clutch for locking the two sections together, a lever having one arm adapted to be connected to said pin, a stop adapted to engage the other arm of said lever when the governor-balls fall below the normal plane, and means for separately connecting the lever and clutch-pin so that they may be caused to move together or the pin allowed to remain stationary as the lever is moved.

7. The combination with a divided governor rod or spindle consisting of an upper section and a lower section, a pin for connecting the two together, a stop and connections between said stop and pin for operating the same when the governor-balls fall below the normal plane, and means for rendering said connections inoperative when desired to stop the engine under ordinary running conditions.

8. The combination with a divided governor rod or spindle consisting of an upper section and a lower section, a pin for connecting the two together, a stop and connections between said stop and pin for

operating the same, when the governor-balls fall below the normal plane, means for rendering said connections inoperative when desired to stop the engine under ordinary conditions, and means for automatically resetting the device upon the starting of the engine.



9. The combination with the governor, and the valve-operating mechanism of a steam-engine, connections between said governor and valve mechanism, of mechanism for releasing said connections when the governor becomes inoperative, and locking devices interposed between said releasing mechanism and valve connections, whereby said connections may be locked against release, when it is desired to stop the engine under normal conditions.

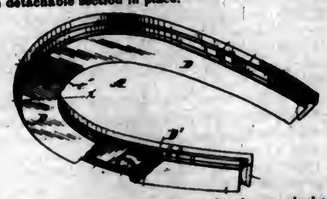
10. The combination with the governor and the valve-operating mechanism of a steam-engine, connections between said governor and valve mechanism, of mechanism for releasing said connections when the governor becomes inoperative, a locking device interposed between the releasing mechanism and valve connections, and means for automatically releasing said locking device so as to set the releasing mechanism for action upon the starting of the engine.

11. In an automatic safety stop device for engines, the combination with the valve mechanism and governor, of a rod comprising two sections, one connected to the governor and the other to the valve mechanism, connections between said sections normally securing them together, means for releasing said connections to separate the sections when it is desired to cut off the steam, a stop-rod adapted to engage said releasing mechanism to effect the release of said connections, a magnetic coil around a portion of said rod, and means for closing an electric circuit through said coil to energize the same and draw the rod within the field of force of said coil, substantially as described.

12. In an automatic safety stop device for steam-engines, the combination with the governor and valve mechanism, of a rod comprising two sections, one connected to the governor and the other to the valve mechanism, connections between said sections normally securing them together, means for releasing said connections to separate the sections when it is desired to cut off the steam, a stop-rod having a rope or chain connected thereto at its upper end and adapted to engage said releasing means to effect the release of said connections a magnetic coil around a portion of said rod, and means for closing an electric circuit through said coil.

602,886. **ARTIFICIAL LIMB.** MARTIN B. DOUALDSON and WILLIAM KEMPSH, Duluth, Minn. Filed Oct. 16, 1897. Serial No. 655,412. (No model.)

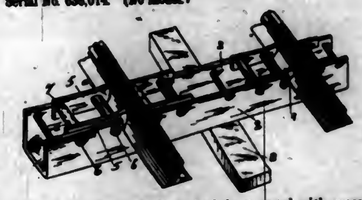
Claim.—1. In an artificial limb, the combination with a suitable lower supporting portion, of rigid side straps secured to said lower portion, a socket adapted to be suspended between said straps for supporting the stump, the said socket being provided with recesses upon opposite sides for receiving the said side straps, elastic supporting-straps secured to the inner surfaces of the rigid straps and adapted to engage and support the socket between the said rigid straps, whereby the elastic supporting-straps are completely surrounded and protected by the said socket and the said rigid straps, substantially as described.



2. In an artificial limb, the combination with a suitable foot portion, of straps mounted thereon, a socket adapted to be supported between the said straps, and having side recesses formed on its outer surface for receiving the said side straps and latches secured to said socket and adapted to bridge the said recesses and extend transversely across the said straps to confine them within the recesses and prevent the buckling of the said straps, substantially as described.

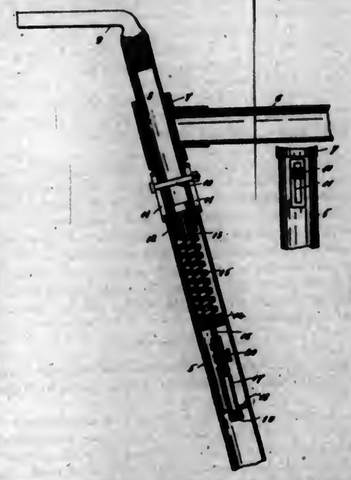
3. In an artificial limb, the combination with a suitable foot-supporting portion, of straps mounted thereon, a movable socket adapted to be suspended between the said straps, elastic supporting-strips interposed between the socket and the straps for supporting said socket between the straps, and pivoted latches secured to said socket and adapted to extend transversely to hold them across the straps in position and prevent their buckling, substantially as described.

4. A socket for an artificial limb, comprising layers of rawhide and leather, caps or abutment-blocks secured to the upper end of the socket, strips of wood secured in place over the leather and abutting against the said caps or abutment-blocks and an outer covering of suitable material, substantially as described.



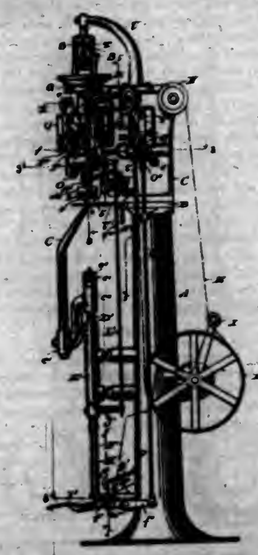
602,887. **CUSHIONED HORSESHOE.** PETER KRUMSIEK, Boston, Mass. Filed Apr. 23, 1897. Renewed Mar. 21, 1898. Serial No. 674,668. (No model.)

Claim.—1. In a horseshoe, a section adapted to be attached to the hoof, a detachable section consisting of a spring and a yielding substance inclosing said spring and adapted to be sprung into place on the attached section, and means on the attached section for holding the detachable section in place.



2. In a horseshoe, a section adapted to be attached to the hoof and provided with a recess on its under side, a detachable section consisting of a spring and a yielding substance inclosing said spring and adapted to be sprung into place on the attached section in said recess, and inwardly-turned flanges on the attached section for holding the detachable section in place in said recess.

602,888. **RAILROAD-TIE.** JOHN A. SCHNABEL, Fairman, Ill., assignor to Sarah Mathilda Schnabel, same place. Filed May 11, 1897. Serial No. 636,014. (No model.)



Claim.—A railway-tie formed of sheet metal with recessed, vertical, parallel side flanges integral with the bottom, in combination with through-bolts connecting said side flanges, sleeves on said bolts intermediate said flanges, parallel rail-clamping bars on the through-bolts at the opposite ends of the sleeves and on opposite sides of the rail, intermediate the ends of the sleeves and the side flanges of the tie, and clamped by said sleeves and through-bolts against the side flanges of the tie, and angle-iron chairs having pendent, vertical end flanges secured to the sides of the tie, said chairs extending from one side to the other under the recesses in the side flanges in the tie, substantially as described.

602,889. **SEAT OR SADDLE SUPPORT FOR BICYCLES, &c.** SAMUEL C. WHITLOW, Newburg, N. Y. Filed Feb. 26, 1897. Serial No. 624,955. (No model.)

Claim.—A seat or saddle support for bicycles, comprising the combination with a bicycle-frame of a tubular rod 8 having an arm 9; a bolt 10 mounted in said tubular rod and passing through slots 11 in the tubular rod 5, of the frame; a plug 12 mounted in the tubular rod 8; a shaft 13 adapted to pass therethrough; a head 14, connected therewith; a spring 15 mounted on said shaft; a rod 16 secured to said head; a tube 17 in which the rod 16 is slidably mounted; a set-screw 20 to engage the same; a cross-bar 19 mounted in the tubular rod 5 said tube 17 being provided with a pin 18, substantially as and for the purpose set forth.

602,890. **SHOE-NAILING MACHINE.** ORRELL ASHTON, Lawrence, Mass., assignor to John Ashton and James Derbyshire, same place, and James W. Brooks, principal trustee, Peterboro, and F. F. Stanley, associate trustee, Boston, Mass. Filed May 12, 1897. Serial No. 634,960. (No model.)

Claim.—1. In a shoe-nailing machine, in combination, a spindle, coacting rolls for feeding the wire through the spindle, and means for positively rotating each of said rolls independently of the other.

2. In a shoe-nailing machine, in combination, a spindle, coacting rolls for feeding the wire through the spindle, and a rack-bar for positively rotating each of said rolls independently of the other.

3. In a shoe-nailing machine, in combination, coacting rolls for feeding the wire through the spindle, a pinion connected to each of said feed-rolls, and a rack for positively engaging and rotating both said pinions.

4. In a shoe-nailing machine, in combination, coacting rolls for feeding the wire through the spindle, pinions connected to said feed-rolls, a rack for positively engaging and rotating each of said pinions, independently of the other, and a sleeve on which said rack is mounted.

5. In a shoe-nailing machine, in combination, coacting rolls for feeding the wire through the spindle, a pinion for each roll, pawls carried by said pinions for engaging the rolls and a double-toothed rack arranged between and engaging said pinions to rotate them.

6. In a shoe-nailing machine, the combination of the wire-guide spindle and wire-feed including coacting feed-rolls in connection therewith, a sleeve reciprocating on said spindle, a bar carried by the sleeve to positively operate said feed-rolls independently of each other, and an automatically-adjustable stop arranged to limit reciprocation of said sleeve.

7. In a shoe-nailing machine, the combination of the wire-guide spindle, and wire-feed mechanism in connection therewith, including feed-rolls, a sleeve reciprocative on said spindle, a bar carried by the sleeve to positively operate both feed-rolls of the wire-feed mechanism independently of each other, an automatically-adjustable stop arranged to limit reciprocation of said sleeve and suitable means for putting the aforesaid sleeve out of action without stopping the machine.

8. In a shoe-nailing machine, the combination of the wire-guide spindle having a depending housing provided with a wire-delivery nipple, transverse arbors in the housing, partial pinions and ratchet-sleeves loose on the arbors, pawls carried by the partial pinions and operative in conjunction with the ratchet-sleeves, feed-rolls for the wire fast to said ratchet-sleeves, and a sleeve loose on said spindle and provided with a depending rack-bar in mesh with said partial pinions.

9. In a shoe-nailing machine, the combination of the wire-guide spindle, a sleeve loose on said spindle and provided with means for feeding the wire through the spindle, a spring-controlled stem loose in suitable guides, means connecting the stem and spindle-engaging sleeve, a cam operative in conjunction with the stem, an automatically-adjustable stop arranged to limit reciprocation of said spindle-engaging sleeve in proportion to thickness of material being nailed, and a latch-bar for engagement with the aforesaid stem to hold the latter out of action.

10. In a shoe-nailing machine, the combination of the wire-guide spindle and wire-feed mechanism in connection therewith, a sleeve reciprocative on said spindle, a bar carried by the sleeve to operate in conjunction with the wire-feed mechanism, a lever disconnected from the sleeve and fulcrumed to the machine-head to operate as a stop for limiting the reciprocation of said sleeve, a yielding shoe-horn support, and a link connecting the shoe-horn support with the aforesaid lever.

11. In a shoe-nailing machine, a wire reel comprising heads having their inner sides provided with grooves struck on a circle, and a stationary segmental plate of sheet metal that is normally of greater radius than said grooves but has its edges forced therein, this plate constituting a frictional resistance to prevent turning of said reel except when wire is being drawn therefrom.

12. In a shoe-nailing machine, a pair of spring-controlled pivotal devices each provided with an offset arm having a branch, adjusting means in the arm branch, a clip mounted on said arm, a wire-cutting knife clamped in the clip to abut the adjusting means in said arm, branch, a lever connected with said pivotal devices, and a cam-disk operative to tilt the lever at predetermined intervals.

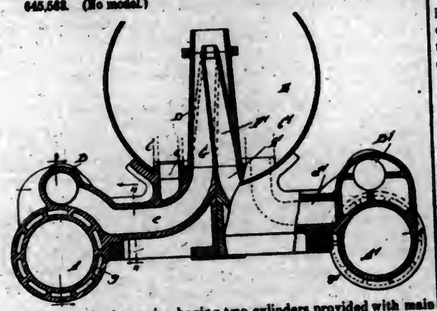
13. In a shoe-nailing machine, the combination of a pair of spring-controlled pivotal supports for knife-holding clips, a lever connected to said support, a contact-block in connection with said lever, a rotative disk and adjustable cam-lugs extending from the periphery of the disk to operate against said contact-block on the lever and adjustable about a concentric circle inside the periphery of the cam.

14. In a shoe-nailing machine, the combination of a yielding support, a bracket having a sleeve-arm thereon loosely engaging the support, a screw-plug in the upper end of the sleeve-arm at rest on said support to constitute a pivot, a set-nut for the screw-plug and a shoe-supporting horn connected to the bracket.

15. In a shoe-nailing machine, the combination with a wire feed mechanism, a wire-cutting mechanism and a shoe-horn supporting and adjusting mechanism; of a longitudinally-adjustable carrier, a ratchet-wheel mounted on and extended beyond the carrier to impinge a shoe on the horn, an oscillating arm mounted on the carrier and provided with a pawl engaging the ratchet-wheel, a detent for said ratchet-wheel, and means for oscillating said arm, a lever fulcrumed to the machine-head and having universal-joint connection with the link, a spring connecting the lever and machine-head, and a rotative cam exertive against said lever in opposition to the resistance of the spring.

16. In a shoe-nailing machine, the combination with a wire-feed mechanism, a wire-cutting mechanism and a shoe-horn supporting and adjusting mechanism, of a longitudinally-adjustable carrier, a ratchet-wheel loosely mounted on and extended beyond the carrier to impinge a shoe on the horn, an oscillating arm also mounted on the carrier and provided with a pawl engaging the ratchet-wheel, a detent for said ratchet-wheel, a lever fulcrumed to the machine-head and in link connection with the pawl-arm, a spring connecting the lever and machine-head, a rotative cam operative against said lever and resistance of the spring, and a stop in adjustable connection with the aforesaid lever to vary the time of action by the cam, whereby the throw of the pawl-arm is correspondingly regulated.

17. In a shoe-nailing machine, a horn, means for forcing nails into the work and a feeding device for engaging the edge of the sole, comprising an inverted frusto-conical wheel having a toothed periphery, and means for imparting an intermittent rotation to the wheel.

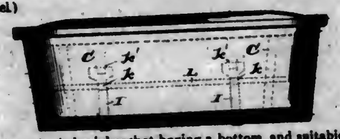


602,891. **COMBINED LAMP BURNER AND WICK.** VICTOR DÜRELER, New York, N. Y., assignor to John Hartjen, same place. Filed June 3, 1897. Serial No. 639,251. (No model.)

Claim.—A wick, consisting of a wick-body, an incombustible tip, a metallic sleeve connecting the body and tip, and a felt filling-piece interposed between the tip and the wick-body and cemented to the same and to the metallic sleeve, substantially as set forth.

602,891.

602,892. STEAM-ENGINE. WILLIAM F. CLEVELAND and ROBERT W. CLEVELAND, Rounthwaite, Canada. Filed July 22, 1897. Serial No. 645,563. (No model.)



Claim.—1. An engine having two cylinders provided with main or piston exhausts, and auxiliary or valve exhausts, arranged in such a manner that the main exhaust of one cylinder produces a suction on the auxiliary exhaust of the other cylinder, substantially as shown and described.

2. A steam-engine comprising two cylinders provided with main or piston exhausts, a valve-chest for the said cylinders and having auxiliary or valve exhausts arranged relative to the said main or piston exhausts, so that the main exhaust of one cylinder produces a suction on the auxiliary exhaust of the exhaust-chest of the other cylinder, substantially as shown and described.

3. A steam-engine provided with two cylinders having main or piston exhausts, steam-chests for the said cylinders, and provided with auxiliary or valve exhausts, and a blast-pipe having a set of nozzles for the said main or piston exhausts, and a set of nozzles for the said auxiliary or valve exhausts, the nozzles being arranged in such a manner that the nozzle for the main exhaust of one cylinder is within the nozzle for the auxiliary exhaust of the other cylinder, substantially as shown and described.

4. A steam-engine provided with two cylinders having main or piston exhausts, steam-chests for the said cylinders, and provided with auxiliary or valve exhausts, a blast-pipe having a set of nozzles for the said main or piston exhausts, and a set of nozzles for the said auxiliary or valve exhausts, the nozzles being arranged in such a manner that the nozzle for the main exhaust of one cylinder is within the nozzle for the auxiliary exhaust of the other cylinder, and a partition for dividing the nozzle for the main exhaust of one cylinder and the nozzle for the auxiliary exhaust of the other cylinder from the corresponding set of nozzles on the opposite side of the partition, substantially as shown and described.

602,893. COFFIN. JOHN DONAHUE, Knoxville, Tenn., assignor, by direct and mesne assignments, to the Hall & Donahue Coffin Company, of Tennessee. Filed Apr. 8, 1897. Serial No. 631,275. (No model.)

Claim.—1. A burial-casket having a bottom and suitable walls connecting said bottom to an integral wooden top rim formed by shaping a board to conform to the exterior lines of the casket, and having the central portion of the board removed on lines conforming to the desired interior shape of the casket, the cut being in a plane through the board slanting inward, whereby the removed central portion when laid upon the rim portion will completely close the opening therethrough and serve as a cover for the casket, substantially as described.

2. A burial-casket having an integral wooden top rim and a wooden bottom whose external configuration and dimensions conform to the internal configuration and dimensions of the top rim, and walls connecting the rim and bottom, substantially as described.

3. A coffin comprising among its members the bottom, the integral wooden top rim, a metal sheathing surrounding the edges of the bottom and rim and secured thereto, an inner metal lining upon the bottom, and an inner metal lining to the sheathing secured to the upper surface of, and at a point removed from the edge of the bottom and also secured to the rim, substantially as described.

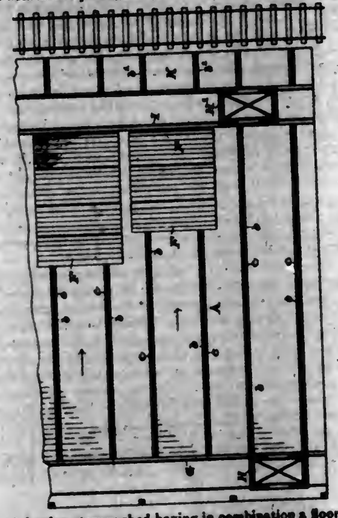
4. A burial-casket having an integral wooden top rim and wooden bottom, sheet-metal sides extending along the outer edge of the rim and the edge of the bottom, and a sheet-metal lining attached to the inner edge of the rim and the upper surface of the bottom at a point removed from the edge thereof, substantially as described.

5. A coffin comprising among its members a bottom, a rim whose internal configuration and dimensions conform to the size and shape of the bottom, whereby they may be formed from the same piece of material, and sheathing surrounding and directly engaging the edges of the bottom and rim, and vertically-disposed braces secured at their upper ends to the rim and at their lower ends to the bottom, said braces lying within said sheathing, substantially as described.

6. A coffin comprising among its members the bottom, the rim whose internal configuration and dimensions conform to the external configuration and dimensions of the bottom, whereby they may be cut from the same piece of material, vertically-disposed braces connected at their lower ends to said bottom, and at their upper ends to the rim, and sheathing surrounding and directly engaging the edges of the bottom and rim and surrounding said braces, a sheathing upon the upper side of the bottom, and a lining extending around the inner faces of the braces, said lining being secured to the bottom sheathing and to the inner edge of the rim, substantially as described.

602,894. NUT-LOCK. BUTLER EGGAR, Sunbury, Pa., assignor to Thomas M. Righter, trustee, Mount Carmel, Pa. Filed June 11, 1897. Renewed Mar. 9, 1898. Serial No. 673,147. (No model.)

Claim.—1. The combination with a threaded bolt or rod, a nut, and a part to be clamped, one of the opposing faces of the nut and clamping part having a tapering tangential groove opening at its larger end at the side of the nut, of a ball adapted to fit in said groove and to bear against the opposing face when the nut is screwed up to said part, and a keeper having a leg entering the larger end of the groove and bearing upon the ball, a spring tending to draw the leg into the groove, and means for connecting the keeper to the nut or part to be clamped, substantially as described.



2. The combination with a threaded bolt or rod, a nut, and a part to be clamped, one of the opposing faces of the nut and clamped part having a tapering tangential groove opening at both ends at the sides of the nut, of a ball adapted to fit in the groove and to bear against the opposing face when the nut is screwed up to said part, and a keeper having a leg entering the larger end of the groove, a hook engaging the smaller end of the groove and an intermediate spring, substantially as described.

3. The combination of a threaded bolt or rod, a nut, and a part to be clamped, one of the opposing faces of the nut and clamped part having two tangential grooves inclined and tapered in opposing directions, said grooves opening at their larger ends at the sides of the nut, of balls adapted to fit in said grooves and to bear against the opposing face when the nut is screwed up to said part, whereby said nut is prevented from turning in either direction, substantially as described.

602,895. LUMBER-STORAGE PLANT. VICTOR L. BRUNNER, Baltimore, Md., assignor, by direct and mesne assignments, to the Baltimore Dry Kiln Company of Baltimore City, of Maryland. Filed June 23, 1897. Serial No. 642,617. (No model.)

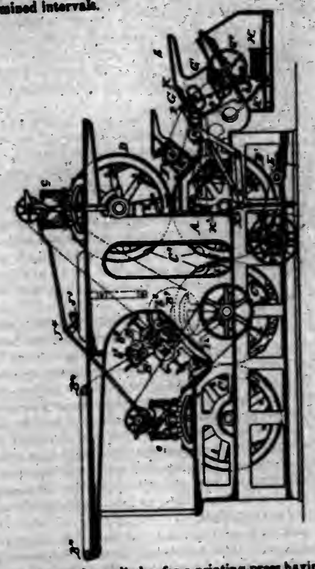
Claim.—1. The herein-described method of storing lumber in sheds or yards consisting of piling the lumber in stacks or piles on bars which rest on freely-revoluble rollers mounted in bearings located over the floor area of the shed or yard—arranging said piles in compact or close ranks without intervening wagon or car avenues, and said piles being movable bodily.

2. The herein-described method of storing lumber in sheds or yards consisting in piling the lumber in stacks or piles on bars which rest on freely-revoluble rollers practically covering the entire floor area of the shed or yard—said piles being close together and in compact ranks extending from the receiving end to the delivery end of the shed or yard and said piles being movable bodily without handling the boards comprising the pile.

3. A lumber-storage shed having in combination a floor or horizontal support provided with freely-revoluble rollers projecting above its top surface, said rollers being arranged in a plural series of parallel lines, and movable bars which rest upon said rollers and adapted to support and carry lumber piled on said bars.

4. A lumber-storage shed having in combination a floor or support having freely-revoluble rollers projecting above its top surface, said rollers being arranged in a plural series of parallel lines; a crosswise track at the receiving end of said shed; a crosswise track at the delivery end; a transfer-car movable on said crosswise tracks, said car having at its top two series of rollers which revolve freely in a vertical plane at right angles with respect to the car-wheels, and said two series of rollers spaced apart to register with one series of said parallel-line rollers; and movable bars each having on its under side a longitudinal channel to fit on said rollers.

5. In a lumber-storage plant a transfer-truck having a frame mounted on wheels to traverse a rail-track; bars on top of said frame extending crosswise at right angles with respect to the track-wheel; and rollers mounted on said crosswise bars and revolving freely, said rollers serving for channel-bars to support the lumber.



6. A transfer-truck for lumber-stora; e plants having parallel bars at opposite sides; track-wheels mounted between said parallel bars; end parallel bars resting on top of said side bars and crossing them; and freely-revoluble rollers mounted between said end cross-bars.

7. In a lumber storage plant the combination of a shed; freely-revoluble rollers fixed on the floor of said shed; lumber-supporting bars resting on said rollers; a crosswise track at each end of the shed; a longitudinal track at one side of the shed extending between and connecting the said crosswise tracks at the ends; and a car to operate on the longitudinal tracks—said car to transfer trucks with piled lumber on them.

602,896. PERFORATING PRINTING-PRESS. HENRY P. FOSTER, Philadelphia, Pa., assignor to the Foster Printing Company, of Pennsylvania. Filed Aug. 23, 1894. Serial No. 521,060. (No model.)

Claim.—1. Perforating-cylinders for a printing-press, consisting of two shafts, each having adjustably secured thereto at points intermediate of its length radially-adjustable L-shaped bars in which the bars of one of the cylinders is provided with grooves on diametrically opposite sides and the bars of the other cylinder with perforating cutters or blades, and a series of spring-fingers on each of the cylinders arranged upon each side of the grooves and perforating-blades, whereby the paper is held on each side of the line of perforations during the perforating operation and the distance between the perforations is adjustable.

2. An impression-cylinder for a printing-press having a series of impression-surfaces or beds arranged about its periphery, a series of nippers arranged at the forward end of each of the beds, and a series of pivoted adjustable transverse frames also arranged at the forward part of each of the beds and with which the nippers operate, in combination with power devices for operating the nippers at predetermined intervals.

3. An impression-cylinder for a printing-press having a series of impression-surfaces or beds arranged about its periphery, a series of nippers arranged at the forward end of each of the beds, and a series of pivotally-adjustable transverse frames also arranged at the forward part of each of the beds and with which the nippers operate and having pins projecting outwardly upon which the paper sheets are clamped by the nippers, and adjusting devices to adjust the position of the frames holding the said pins whereby all of the nipper-seats and pins are adjusted simultaneously.

4. An impression-cylinder for a printing press having a series of impression-surfaces or beds arranged about its periphery, in combination with a series of nippers arranged at the forward end of each of the beds, a series of laterally-adjustable parts or nipper-seats provided with outwardly-projecting pins with which the nippers operate, pivoted frame holding said nipper-seats and adjusting devices for adjusting the said frames to bring the pins in proper relative position with respect to the beds and nippers.

5. In an impression-cylinder, the combination of nippers arranged at the forward part of the bed or impression-surface thereof, a circumferentially-adjustable frame carried by the impression-cylinder also at the forward part of the bed and a series of laterally-adjustable nipper seats carried by the frame adapted to receive the rear or free end of the nippers.

6. In an impression-cylinder, the combination of nippers arranged at the forward part of the bed or impression-surface thereof, a circumferentially-adjustable frame carried by the impression-cylinder also at the forward part of the bed, a series of laterally-adjustable nipper-seats carried by the frame adapted to receive the rear or free-end of the nippers, pins projecting outward from the said adjustable frame, and adjusting devices for simultaneously adjusting the frame and all of its pins relative to the forward part of the bed.

7. In a perfecting printing-press, the combination of printing and impression cylinders with an assembling device for assembling the printed sheets, delivery devices for delivering the assembled sheets, a folding-machine for folding the assembled sheets delivered to the delivery devices, a frame structure for holding the several parts in fixed relation, and adjusting devices for adjusting the folding device relatively to the delivering devices whereby the line on which the sheets are folded may be varied as desired.

8. In a perfecting printing-press, the combination of printing devices for printing the sheets of paper on both sides, an assembling device for assembling the printed sheets one upon the other, delivery devices for delivering the assembled sheets from the assembling devices to folding devices, folding devices for folding the printed sheets, a frame structure supporting the printing device assembling device

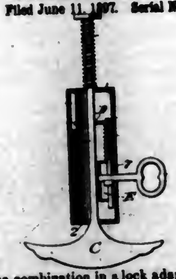
and delivery devices, and means to adjust the frame of the folding devices relatively to the frame of the assembling and delivery devices.

9. A printing-cylinder for a printing-press consisting of a cylinder having a series of parallel circumferential dovetail-shaped or undercut grooves, transverse abutments secured to the surface of the cylinder against which the type-plates are adjusted, intermediate clamping-blocks adapted to the circumferential grooves to clamp the type-forms firmly to the surface of the type-beds of the cylinder, and means to apply pressure simultaneously upon the series of clamping-blocks and press them at the same time toward the transverse abutment whereby the several parts are adjusted simultaneously and held firmly in position.

10. A printing-cylinder for a printing-press consisting of a cylinder having a series of parallel circumferential dovetail-shaped or undercut grooves, transverse abutments secured to the surface of the cylinder against which the type-plates are adjusted, intermediate clamping-blocks adapted to the circumferential grooves to clamp the type-forms firmly to the surface of the type-beds of the cylinder, means to apply pressure upon the clamping-blocks and press them toward the transverse abutment consisting of a pivoted plate having its ends adapted to press upon the clamping-blocks, a shaft provided with cam projections adapted to press upon the clamping-plate at intervals in its length, and a device for adjusting the cam-shaft and locking it in position.

11. In a perfecting printing-press, devices for printing the sheets of paper successively upon both sides, assembling devices for assembling the sheets so printed consisting of a revolving cylinder having a series of projecting pins, a series of nippers working in connection with said pins, a rock-shaft adapted to operate the nippers simultaneously, a cam device to open the nippers at predetermined intervals to receive the sheets and press them upon the pins, cam devices for operating the nippers to remove them from the assembled sheets after a definite number of revolutions have been made, power devices for throwing the last mentioned cam into and out of operative position at specified intervals, and delivery devices for delivering the assembled sheets from the assembling devices after a given number of sheets have been assembled.

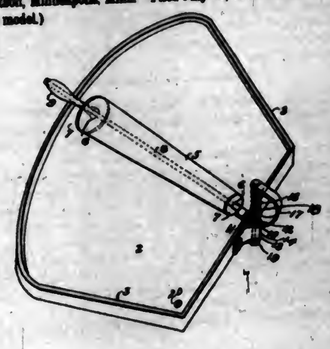
12. In a perfecting printing-press, devices for printing the sheets successively upon both sides, assembling device for assembling the sheets so printed consisting of a revolving cylinder having a series of projecting pins and nippers, a rock-shaft adapted to operate the nippers simultaneously, lever and roller devices for rocking the rock-shaft, cam devices operating upon one of the rollers to open the nippers at predetermined intervals to receive the sheets and press them upon the pins, laterally-adjustable cam devices working with the other roller for operating the nippers to remove them from the assembled sheets after a definite number of revolutions have been made, power devices for throwing the last-mentioned cam laterally into and out of operative position at specified intervals, and delivery devices for delivering the assembled sheets from the assembling device after a given number of sheets have been assembled.



13. In a perfecting printing-press, devices for printing the sheets of paper successively upon both sides, assembling devices for assembling the sheets so printed consisting of a revolving cylinder having a series of projecting pins, a series of nippers working in connection with said pins, a rock-shaft adapted to operate the nippers simultaneously, a cam device to open the nippers at predetermined intervals to receive the sheets and press them upon the pins, cam devices for operating the nippers to remove them from the assembled sheets after a definite number of revolutions have been made, power devices for throwing the last-mentioned cam devices into and out of operative position at specified intervals, delivery devices for delivering the assembled sheets from the assembling devices after a given number of sheets have been assembled consisting of a revolving cylinder provided with nippers, cam devices operated by the power devices to open the nippers for the purpose of receiving the assembled sheets from the assembling devices, and a cam device to open the nippers for the purpose of liberating the assembled sheets from the delivery-cylinder.

14. In a perfecting printing-press, devices for printing the sheets of paper successively upon both sides, assembling devices for assembling the sheets so printed consisting of a revolving cylinder having a series of projecting pins, a series of nippers working in connection with said pins, a rock-shaft adapted to operate the nippers simultaneously, a cam device to open the nippers at predetermined intervals to receive the sheets and press them upon the pins, cam devices for operating the nippers to remove them from the assembled sheets after a definite number of revolutions have been made, power devices for throwing the last-mentioned cam devices into and out of operative position at specified intervals, delivery devices for delivering the assembled sheets from the assembling devices after a given number of sheets have been assembled consisting of a revolving cylinder provided with nippers, cam devices operated by the power devices to open the nippers for the purpose of receiving the assembled sheets from the assembling devices, a cam device to open the nippers for the purpose of liberating the assembled sheets from the delivery-cylinder, and a fly-frame adapted to receive the assembled sheets from the delivery-cylinder.

15. In a perfecting printing-press, devices for printing the sheets of paper successively upon both sides, assembling devices for assembling the sheets so printed consisting of a revolving cylinder having a series of projecting pins, a series of nippers working in connection with said pins, a rock-shaft adapted to operate the said nippers at predetermined intervals to receive the sheets and press them upon the pins, cam devices for operating the nippers to remove them from the assembled sheets after a definite number of revolutions have been made, power devices for throwing the last-mentioned cam device into and out of operative position at specified intervals, delivery devices for delivering the assembled sheets from the assembling devices after a given number of sheets have been assembled consisting of a revolving cylinder provided with nippers, cam devices operated by the power devices to open the nippers for the purpose of receiving the assembled sheets from the assembling devices, a cam device to open the nippers for the purpose of liberating the assembled sheets from the delivery-cylinder, a fly-frame adapted to receive the assembled sheets from the delivery-cylinder, and a folding device adapted to receive the assembled sheets from the fly-frame.



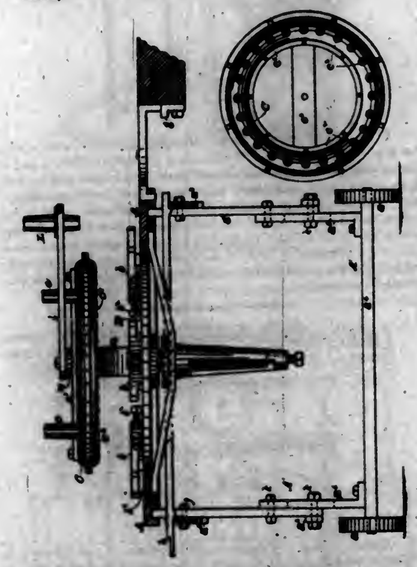
16. The combination of printing devices for printing sheets of paper having an impression-cylinder for delivering the printed sheets to the assembling devices, assembling devices for assembling said sheets of paper, folding devices for folding the assembled sheets of paper, creasing devices for imparting a pressure to the folded paper sheets when being folded, and means operated by a cam rotating with the impression-cylinder acting on the creasing devices for removing said pressure after the crease is made, whereby the folded sheets are fed through the folding-machines without blurring the printed portions thereof.

602,397. AUTOMATIC BICYCLE-LOCK. GEORGE L. GRASS, Kingston, Canada. Filed June 11, 1897. Serial No. 640,364. (No model.)

Claim.—The combination in a lock adapted to be inserted in the tubular framework of a bicycle or other vehicle, with a shaft passing through the lock-case bearing a plate adapted to be pressed against the tire of a wheel, of a movable disk having an aperture in which the shaft fits closely, springs exerting pressure upon the shaft and upon one edge of the disk in a direction away from the wheel, an inner lock-case adapted to allow a corresponding key to depress the disk and release the shaft, and a connecting device between the disk and the inner lock, substantially as and for the purposes described.

602,398. KNEADER. RUSSELL B. GRIFFIN, Mexico, Mo., assignor of one-half to Charles M. Amsden, Louis T. Watson, and Henry P. Watson, Minneapolis, Minn. Filed July 16, 1897. Serial No. 644,749. (No model.)

Claim.—1. The combination, with a suitable board or working surface, of a rod, having a freely-turning roller arranged thereon and adapted to rest upon and be moved over said board or working surface, a suitable handle provided at one end of the rod, and a spring device pivotally connecting the other end of said rod to said board to permit the vertical movement of said rod and to relieve the jar upon the hand or arm of the operator, substantially as described.



2. The combination, with a suitable board or working surface, of a rod, a roller moved thereon, a suitable handle provided upon the outer end of said rod, a spring device pivotally connecting the inner end of said rod to said board and holding said rod thereon with a yielding pressure, while permitting vertical movement of the same, and means permitting the outer end of said rod to be swung upward away from the surface of said board, substantially as described.

3. The combination, with a suitable board, of the block 10 provided with the hinge 11 and the slot 12, the rod 8 secured upon said block, the freely-turning roll 5 mounted upon said rod, said block 10 being secured to said board by a suitable spring connection, for the purpose set forth.

4. The combination, with the board provided with the post 14, of the bolt 16 passing through said post, the rod 8 pivotally supported upon said bolt, a suitable spring arranged upon said bolt and holding said rod with a yielding pressure, and a suitable roll arranged upon said rod, for the purpose set forth.

5. The combination, with the board, provided with the post 14, the slotted and hinged block 10 resting upon the upper end of said post, the bolt 16 passing through said block and post and provided with the springs 17 and 18, bearing upon said block, the rod 8 secured to said block, and the roll 5 mounted upon said rod and adapted to turn freely thereon, for the purpose set forth.

602,399. COOLING-TABLE FOR GLASS-MOLDS. WILLIAM HALEY, Beaver Falls, Pa., assignor to the National Mold and Casting Company, same place. Filed July 16, 1897. Serial No. 644,754. (No model.)

Claim.—1. A cooling-table for glass-molds comprising, in combination, a table supporting a movable surface adapted to receive a number of molds, means for moving the same to bring the molds successively in proximity to the press, and a blast-chamber arranged above said mold-carrying surface and having outlets adapted to continuously deliver a cooling-blast which impinges upon the molds on said surface, substantially as described.

2. A cooling-table for glass-molds, comprising in combination, a table having a fixed top or shelf, a movable top adapted to receive a number of molds, means for moving the same to bring the molds successively to the desired position adjacent to the press, and a blast-chamber supported above said mold-carrying surface and having outlets adapted to continuously deliver a cooling-blast which simultaneously impinges upon all the molds on said surface, substantially as described.

3. In a cooling-table for glass-molds the combination of a frame, a rotatable top adapted to receive a number of molds, ledges on said top to regulate the position of the molds thereon, and an air-blast chamber supported above said top and having outlets coinciding with the location of the molds, through which outlets a cooling-blast is continuously emitted, substantially as and for the purpose described.

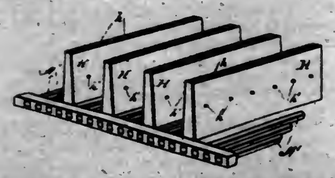
4. In a cooling-table for glass-molds the combination of a frame, a fixed top, a rotatable top having ledges forming recesses in which the molds are placed, a stop on said fixed top projecting in the path of said molds, and an air-blast chamber supported above said top and having outlets coinciding with the position of the recesses on said rotatable top, substantially as described.

5. In a cooling-table for glass-molds the combination of a frame, a fixed top, a rotatable top having ledges thereon to guide the placing of the molds, an air-blast chamber supported above said table and having outlets corresponding with the position of the molds, and a shelf upon which to discharge the molded article before placing the mold on the rotatable top, substantially as described.

6. In a cooling-table for glass-molds the combination of a frame, a fixed top, a rotatable top having thereon ledges to guide the placing of the molds, an air-blast chamber supported above said table and having outlets corresponding with the position of the molds, and a leaf secured to the table and adapted to connect the same with a glass press, substantially as described.

7. In a cooling-table for glass-molds the combination of a frame, a fixed top, a rotatable top having thereon ledges to guide the placing of the molds, an air-blast chamber supported above said table and having outlets corresponding with the position of the molds, and a nozzle adapted to deliver an air-blast upon the fixed top, substantially as described.

8. In a cooling-table for glass-molds the combination of a frame, a fixed top, a rotatable top having thereon ledges to guide the placing of the molds, an air-blast chamber supported above said table and having outlets corresponding with the position of the molds, and a swinging arm carrying a nozzle adapted to deliver an air-blast upon various parts of the fixed top, substantially as described.



9. In a cooling-table the combination of the rotatable cooling-surface, an air-blast chamber supported above the same and emitting air thereon, ledges for guiding the placing of the molds, and adjusting-screws threaded through said ledges, substantially as described.

10. In a cooling-table the combination of a frame, a fixed top, a rotatable top adjustably supported therein, and an air-blast chamber supported above and emitting air upon said rotatable top, substantially as described.

11. In a cooling-table the combination of a frame adjustable for height, a fixed top, a rotatable top supported therein, and an air-blast chamber supported above and emitting air upon said rotatable top, substantially as described.

12. In a cooling-table the combination of a frame supported on trucks, a fixed top therein, a rotatable top supported in the fixed top, and an air blast chamber supported above and emitting air upon said rotatable top, substantially as described.

602,400. ORE-ROASTING FURNACE. HOWARD HARLAN, Richmond, Va., assignor of one-half to S. Dabney Crenshaw, Henrico County, Va. Filed Nov. 10, 1897. Serial No. 658,014. (No model.)

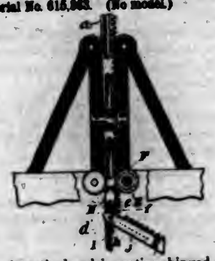
Claim.—1. In a roasting-furnace of the nature described, a closed heating or roasting chamber, bars underneath the same to support the ore and spaced apart to give openings to admit air from below, an outlet-flue at top for conducting the gas to a condensing-chamber, a series of hollow air-conduits resting on the bars over the openings, and consisting of vertical pyramidal-shaped casings with smooth sides provided with perforations, substantially as described.

2. In a furnace of the nature described, having bars to support the ore, and spaced apart to give openings from below, and a flue for conducting the gas to the condensing-chamber, hollow pyramidal conduits resting on the bars over the openings, extending vertically into said chamber, said conduits having smooth sides, a longitudinal opening at top, and perforations in their sides whereby air is admitted to the ore at top and sides of the conduits, substantially as described.

602,401. BOOKBINDING. JOHN R. HEWETT, Wilmington, N. C. Filed May 27, 1897. Serial No. 638,348. (No model.)

Claim.—1. In bookbinding, a pile of leaves or sheets held evenly together by cords cemented in end grooves, whereby they may be separated in sections as described.

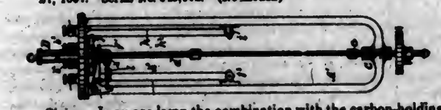
2. The leaves of a round-back book held together by an endless cord cemented in end grooves thereof and passing across from top to bottom and from bottom to top as described.



602,402. STAY-BOLT. JUSTUS JOHNSON and WILLIAM V. LUKENS, Philadelphia, Pa., assignors to Burnham, Williams & Co., same place. Filed Mar. 8, 1897. Serial No. 626,479. (No model.)

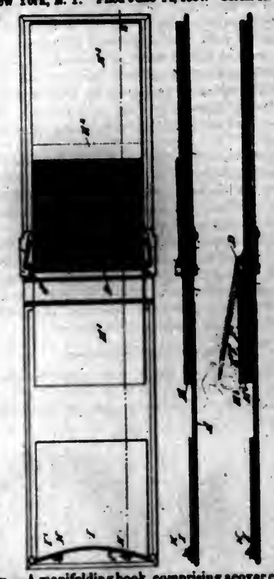
Claim.—1. As a new article of manufacture, a stay-bolt having a deep cavity in one end, the walls of said cavity being denser than the main body of the bolt, substantially as described.

2. A stay-bolt having a screw-threaded section at each end and also having a head at one end, and a deep cavity formed in one end of the stay-bolt, the walls of said cavity being denser than the main body of the bolt, substantially as described.



602,408. RACK AND PINION. FREDERICK J. KUNKEL, Baltimore, Md., assignor to John H. Kunkel & Son, same place. Filed Dec. 16, 1896. Serial No. 615,963. (No model.)

Claim.—1. A toothed rack in sections hinged or pivoted together and adapted to be moved relatively toward and from each other at the joint to a limited extent in a longitudinal direction, one section having a tongue with a beveled end and the other a groove corresponding with the tongue in size and shape, into which the tongue enters as the two sections are moved endwise together, substantially as specified.



2. A section of toothed rack having a tongue with a beveled end and a slot immediately above the tongue, combined with another section provided with a groove adapted for the reception of the tongue and a hole which registers with the said slot, and a pin which enters the slot and hole to complete the union of the two sections, substantially as specified.

602,404. ELECTRIC-ARC LAMP. JOHN MUELLER, Cleveland, Ohio, assignor to the Duplex Hanger Company, same place. Filed Aug. 27, 1897. Serial No. 648,672. (No model.)

Claim.—In an arc-lamp the combination with the carbon-holding devices and a feeding-clamp having sliding engagement with the upper-carbon holder, of a lifting-lever adapted to engage and lift said clamp, a spring acting on said lever to cause it to engage said clamp, a cross-lever pivoted on the lamp-frame, auxiliary levers as i i^2, and thermo-expansive strips connecting the auxiliary levers respectively with the cross-lever and the lifting-lever, and with the cross lever and a binding-post to which the main circuit is connected, substantially as described.

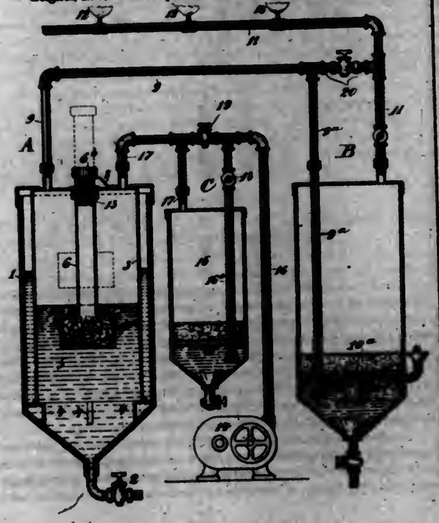
602,405. MANIFOLDING CASH-SALES BOOK. JOHN H. MURPHY, New York, N. Y. Filed June 14, 1897. Serial No. 640,602. (No model.)

Claim.—A manifolding book, comprising a cover consisting of two parts of equal length and a flexible back connecting them, a pad of leaves held in said cover and extending across the back and on both parts of the cover, said leaves being adapted to form a plurality of slips, transfer-sheets secured to the pad at the same point as the leaves, said sheets being one less in number than the number of slips into which each leaf may be divided, and each transfer-sheet extending from the center or back of the cover to a point approximately midway between said center and the free edges of the leaves, substantially as specified.

602,406. BED AND CYLINDER PRINTING-MACHINE. GEORGE T. MURRAY, Corsicana, Tex., assignor of one-third to Gordon Phipps, same place. Filed Nov. 11, 1897. Serial No. 658,262. (No model.)

Claim.—1. In a printing-press, the combination with a bed-plate having at its sides racks, of a revolving cylinder provided at its ends with mutilated gears adapted to engage with said racks at intervals, to move the bed-plate beneath the cylinder, and means for returning the bed-plate to its initial position comprising a rack on the under side of the bed-plate, a mutilated shift-gear adapted to engage with said rack when the teeth of the mutilated gears carried by the cylinder have turned out of engagement with the teeth of their racks, and means for revolving the shift-gear in the same direction to that of the said mutilated gears, substantially as described.

2. In a printing-press, the combination with a bed-plate having at its upper sides racks and on its under side a rack, of a cylinder journaled in the frame, carrying at its ends mutilated gears adapted to engage with the upper racks at intervals, a gear-wheel fixed on the end of the cylinder-journal, a driving-gear journaled on the frame and meshing with said gear-wheel, a shaft journaled in the frame, carrying a mutilated gear adapted to engage at intervals with the under rack, and a gear-wheel fixed on the end of said shaft and meshing with said driving-gear, substantially as described.

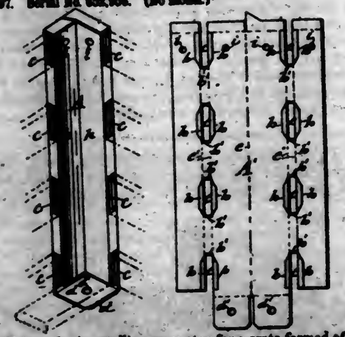


3. The combination with a plate having at its sides racks, and a rack on the under side of said plate, of a revolving cylinder provided at its ends with mutilated gears adapted to engage the racks at the side of said plate at intervals to move the plate in one direction, a mutilated shift-gear adapted to engage with the rack on the under side of said plate when the teeth on the mutilated gears carried by the cylinder have turned out of engagement with the teeth of their racks, and means for revolving the shift-gear and the mutilated gear in the same direction, substantially as described.

602,407. WOOL BOOT. EDWARD ROSS, Mishawaka, Ind., assignor to The Beatty Felting Co., same place. Filed Feb. 1, 1897. Serial No. 621,408. (No model.)

Claim.—In a wool boot the combination therewith of a palmated stay secured to the boot at the side of the ankle portion of the same, and having its separated fingers extending along the boot and independently secured thereto.

602,408. APPARATUS FOR MANUFACTURING CARBURETED HYDROGEN. WILLIAM H. RUSSELL and GEORGE R. RUSSELL, Hasbrouck Heights, N. J. Filed Sept. 14, 1897. Serial No. 651,897. (No model.)



Claim.—1. In a gas apparatus the combination with the hydrogen-generator A, the carburetor B, the pipe 9, connecting said carburetor and generator, the carbureted-air-supply apparatus C, connected with the generator A, of a service outlet leading from the carburetor B, and a valved by-pass connecting said service outlet and said pipe 9, substantially as and for the purpose described.

2. In a gas apparatus, an electrical generator A, for decomposing the acidulated water forming the electrolyte of the generator, said generator comprising a vessel 1, a cup-like electrode 3, inverted in said vessel, a tube 6, mounted in the bottom of the inverted cup 3, and insulated therefrom, said tube being adapted to play longitudinally in its bearing, a foraminous holder or basket 6ª on the lower end of the tube 6, and containing an electrode 7, the said electrode, the liquid electrolyte, and means for producing an electrical connection between the tube 6 and the cup 3, substantially as set forth.

3. In a gas apparatus, the combination with an air-forcing apparatus for forcing air into the generator, of an electrical generator A, for decomposing the water in the electrolyte thereof, said generator comprising a vessel 1, a cup-like electrode 3, inverted in said vessel, a tube 6, mounted in the bottom of the inverted cup 3, and insulated therefrom, said tube being adapted to play longitudinally in its bearing, a foraminous holder or basket 6ª on the lower end of the tube 6, and containing an electrode 7, the said electrode, the liquid electrolyte, and means for producing an electrical connection between the tube 6 and the cup 3, substantially as set forth.

602,409. CRATE-CORNER. MEDARD C. RYAN, Oswego, N. Y., assignor to the Oswego Crate Company, of New York. Filed Sept. 25, 1897. Serial No. 653,056. (No model.)

Claim.—1. A metallic corner-stay for a crate formed of two hollow walls united at a right angle and each of said walls composed of continuous plates extending from the bottom to the top of the crate and forming between them pockets inclosing the ends of the slats, and a vertical strip uniting the free edges of said plates and provided with apertures for the insertion of the ends of the slats, as set forth.

2. A corner-stay for a crate formed of a prolonged paralled-edged sheet-metal blank bent at a right angle along a line at the center of its width and parallel with the longitudinal edges of the blank, and each half at opposite sides of said line bent twice at right angles in the same direction and on lines parallel with the aforesaid central line, and apertures between the two bends of each half for the insertion of the slats, as set forth.

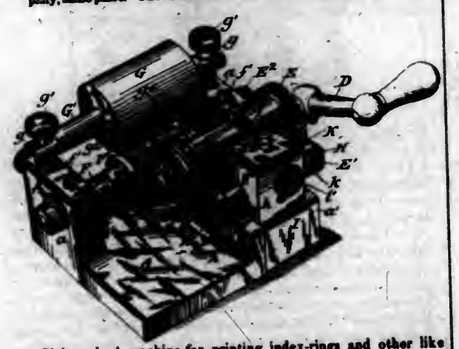
3. As an improved article of manufacture, a corner-stay for a crate formed of a prolonged parallel-edged sheet-metal blank having extensions on its ends, said blank bent at a right angle along a line extending the entire length of the blank central of its width and parallel with the side edges, and each half at opposite sides of said central line bent twice at right angles in the same direction along two lines parallel with the central line and provided between said two lines with apertures for the reception of the ends of the slats and the aforesaid end extensions of the blank bent up at right angles and lapping one upon the other, as set forth and shown.

4. A corner-stay for a crate formed of a sheet-metal blank, and slat-receiving mortises formed by longitudinal slits terminating with divergent slits and the free slitted portions bent at right angles to the plane of the blank and forming the walls of the aforesaid mortises.

602,410. ANT-TRAP. CHARLES W. SELVIDGE, Menia, Tex., assignor of one-half to Joseph Benjamin Purnell, same place. Filed Aug. 10, 1897. Serial No. 647,731. (No model.)

Claim.—The herein-described ant-trap, consisting of the frusto-conical receptacle, exteriorly roughened, and having its top opening provided with a guard-flange, and which is formed at the bottom

with an exterior downwardly-projecting peripheral flange extension *a* which is adapted to be inserted into the ground for the purpose specified, and the interiorly-roughened ingress-tube which extends up through the bottom of the said receptacle, substantially as specified.



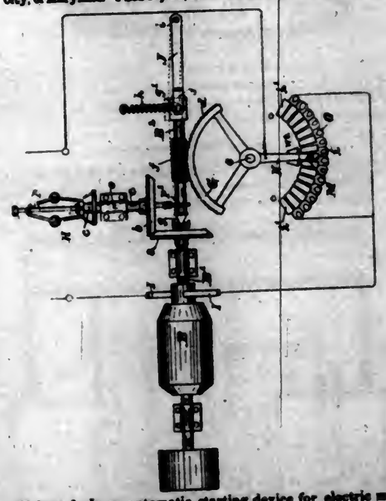
602,411. ENVELOP. SIMON B. STEINBOCH, New York, N. Y. Filed June 19, 1897. Serial No. 641,633. (No model.)

Claim.—An envelop comprising a body portion having wings arranged to fold toward the body portion and overlap and flaps arranged to fold toward the body portion and overlap the wings and one another, the said wings being provided with registering slots one of the said slots being provided with a projection on its wall, one of the flaps being provided with a slot adapted to register with the slots in the wings and the other of the flaps being provided with a tongue having resilient wings at its sides, the said tongue together with its wings being adapted to pass through the said registering slots to lock the envelop closed, substantially as set forth.

602,412. MACHINE FOR PRINTING INDEX-RINGS. CURTIS H. VEEDER, Hartford, Conn., assignor to the Veeder Manufacturing Company, same place. Filed Feb. 12, 1897. Serial No. 623,060. (No model.)

Claim.—1. A machine for printing index-rings and other like articles, said machine comprising a line of type, a carrier to support the same and a rotary shaft geared to the type-carrier to move therewith, said shaft having at its extremity a projection to center and support the ring and a recess or projection to engage a corresponding projection or recess of the ring and to rotate the same positively with the periphery of the ring in contact with the line of type whereby an absolute relation of the printed characters with the teeth or other parts of the ring or other article is secured and the ring may be readily applied to and removed from the shaft, substantially as shown and described.

2. A machine for printing index-rings and other like articles, said machine comprising a rotary shaft, a type-wheel mounted thereon to rotate therewith, a second rotary shaft and gearing connecting said shafts for rotation together, said second-named shaft having at its extremity a projection to center and support the ring and a recess or projection to engage a corresponding projection or recess of the ring and to move the same positively with the periphery of the ring in contact with the line of type, whereby an absolute relation of the printed characters with the teeth or other parts of the ring or other article is secured and the ring may be readily applied to and removed from the shaft, substantially as shown and described.



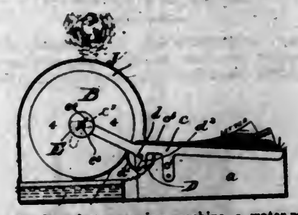
3. A machine for printing index-rings and other like articles, said machine comprising a line of type, a carrier to support the same, a rotary shaft geared to the type-carrier to move therewith, said shaft having at its extremity a projection to center and support the ring and a recess or projection to engage a corresponding projection or recess of the ring and to rotate the same positively, with the periphery of the ring in contact with the line of type, and a swinging bearing, in which said shaft is mounted to rotate, whereby the ring or other article may be moved toward or from a line of type, substantially as shown and described.

4. A machine for printing index-rings and other like articles, said machine comprising a line of type, a carrier to support the same, a rotary shaft geared to the type-carrier to move therewith, said shaft having at its extremity a projection to center and support the ring and a recess or projection to engage a corresponding projection or recess of the ring and to rotate the same positively with the periphery of the ring in contact with the line of type, a bearing-block for said shaft and a bearing-sleeve in which said shaft is mounted for rotation, said sleeve being adjustable longitudinally, substantially as shown and described.

5. A machine for printing index-rings and other like articles, said machine comprising a line of type, a carrier to support the same, a rotary shaft geared to the type-carrier to move therewith, said shaft having at its extremity a projection to center and support the ring and a recess or projection to engage a corresponding projection or recess of the ring and to rotate the same positively, with the periphery of the ring in contact with the line of type, and a brake supplied to said shaft to take up lost motion or backlash, substantially as shown and described.

6. The combination with a type-carrier and an inking-roll, of a shaft supported in proximity to said inking-roll and having a double reversed thread and an ink distributing roll mounted on said shaft, said ink-distributing roll having a recess, a sliding piece or plug supported in said recess and engaging said threaded shaft, a cap to close said recess and a pin parallel with the axis of the roll to secure said cap in place, substantially as shown and described.

602,413. AUTOMATIC DEVICE FOR REMOVING RESISTANCE IN STARTING ELECTRIC MOTORS. GEORGE H. WHITTINGHAM, Baltimore, Md., assignor to the Automatic Switch Company of Baltimore City, of Maryland. Filed Sept. 9, 1897. Serial No. 651,028. (No model.)



Claim.—1. In an automatic starting device for electric motors, the combination of a driving-shaft; a resistance included in the motor-circuit normally or when at rest; a toothed resistance-arm in engagement with said resistance; means adapted to engage said toothed arm when starting the motor but disengaged therefrom when the motor is not running; a centrifugal governor serving to effect the said engagement at the time of starting the motor, whereby the said resistance is cut out; and means for returning the resistance-arm to the point of greatest resistance when stopping the motor.

2. In an automatic starting device for electric motors, the combination of a driving-shaft; a resistance included in the motor-circuit normally or when at rest; a toothed resistance-arm in engagement with said resistance; a movable device to engage the teeth of said arm; and a centrifugal governor to cause the device to engage said toothed arm when starting the motor and to disengage therefrom when the motor is not running.

3. In an automatic device for removing resistance when starting electric motors, the combination of a driving-shaft; a resistance included in the motor-circuit normally or when at rest; a movable arm engaging the said resistance and when at rest free of connection with the driving-shaft; and a centrifugal governor which effects a connection between the driving-shaft and the movable arm, whereby, after such connection, each revolution of the driving-shaft shall impart to the said arm a movement in the direction of cutting out the resistance from the motor-circuit until it is entirely cut out, and then maintain said circuit at the lowest resistance during the run of the motor.

4. In an automatic device for removing resistance when starting electric motors, the combination of a driving-shaft; a resistance in the motor-circuit; a resistance-arm; mechanism for operating the resistance-arm and which when at rest is out of engagement with said arm; and a centrifugal governor which effects the engagement of said mechanism with the resistance-arm.

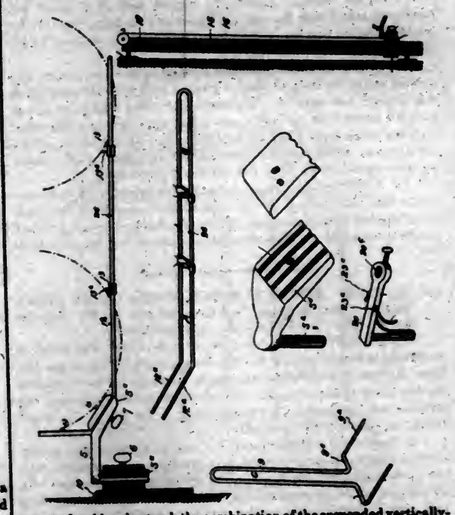
602,414. COPYING-PRESS. JOHN M. MOORE, Atlanta, Ga. Filed June 21, 1897. Serial No. 641,704. (No model.)

Claim.—1. In a letter-copying machine, a water-reservoir, a roller depressibly mounted thereover, a motor acting to rotate said roller, and a blanket secured to and adapted to be wound upon said roller and to be extended therefrom for copying purposes, for the purpose specified.

2. In a letter-copying machine, a water-reservoir, a roller depressibly mounted thereover, means for rotating said roller, a blanket secured to said roller and adapted to be wound thereon and to be extended for copying purposes and a roller mounted elastically and adapted to press said blanket against the periphery of said first-named roller, for the purpose specified.

3. In a letter-copying machine, a water-reservoir, a roller depressibly mounted thereover, means for rotating said roller, a blanket secured to said roller and adapted to be wound thereon and to be extended for copying purposes and a roller mounted elastically and adapted to press said blanket against the periphery of said first-named roller, and an absorptive covering for said pressure-roller, for the purpose specified.

4. In a letter-copying machine, a casing, a water-reservoir therein, a roller depressibly mounted therein over said water-reservoir, a motor adapted to rotate said roller, a blanket adapted to wind upon said roller, a rod in the free end of said blanket, and hooks secured to the frame at the limit of movement of the said thereof in winding upon and unwinding from the said roller, for the purpose specified.



5. In a letter-copying machine, a casing, a pair of levers mounted thereon, a table secured to and between same, a roller journaled on their opposite ends, a motor mounted on one of said levers and operatively connected to said roller, a blanket adapted to be wound upon said roller and drawn therefrom onto said table, and a water-reservoir below said roller, for the purpose specified.

602,415. BICYCLE-STAND. JOSEPH B. MOORE, Denver, Colo. Filed Aug. 13, 1896. Serial No. 602,530. (No model.)

Claim.—1. In a bicycle-stand, the combination of the suspended bracket having a grooved inclined face, the shoe adapted to fit the inclined face of the bracket and provided with counterpart grooves, the horizontal and vertical racks, each composed of two parallel arms adapted to receive the wheels of the bicycle and support the latter in an upright position, said racks being adapted to engage the grooves in the bracket and shoe, and suitable means for connecting the bracket and shoe, substantially as described.

2. In a bicycle-stand, the combination of the suspended swinging bracket having a grooved inclined face, the horizontal and vertical racks each composed of two parallel arms adapted to receive the bicycle-wheels, and having bent extremities adapted to engage the grooves in the bracket and shoe, and suitable means for connecting the bracket and shoe, substantially as described.

3. In a bicycle-stand, the combination of a vertically-adjustable suspended bracket having an inclined face, a shoe adapted to fit the bracket, the horizontal and vertical racks each having parallel arms adapted to receive the bicycle-wheels, said racks being adapted to engage the bracket and shoe which embrace the rack extremities on opposite sides, and suitable means for connecting the bracket and shoe whereby the racks are held securely in place.

4. In a bicycle-stand, the combination of the suspended vertically-adjustable swinging bracket having an inclined face, a shoe adapted to fit said face, the horizontal and vertical racks adapted to receive the wheels of the bicycle and support the same in an upright position, said racks being adapted to engage the inclined face of the bracket, and suitable means for connecting the bracket and shoe which embrace the rack extremities on opposite sides.

5. A bicycle-stand, comprising a rack occupying substantially a horizontal position and composed of two separated arms adapted to receive the bicycle-wheels and provided with suitable stops to hold the wheel securely in place, and suitable means attached to one extremity of the rack for suspending the latter at any desired height above the ground or other surface.

6. In a bicycle-stand, the combination with a suitable socket, of the bracket having an inclined face provided with grooves, and a depending stem adapted to engage and turn in the socket which is located a suitable distance above the ground or other surface, the horizontal and vertical racks having bent extremities adapted to engage the grooves in the inclined face of the bracket, each of said racks being composed of two parallel arms adapted to receive the wheels of the bicycle, the horizontal arm being provided with stops engaging the wheels and holding the machine securely in place, a shoe adapted to engage the inclined face of the bracket and having counterpart grooves adapted to engage the rack extremities, and suitable means for fastening the shoe to the bracket and securing the racks in place, said means consisting of a screw passing through an aperture in the bracket and engaging threaded aperture in the shoe.

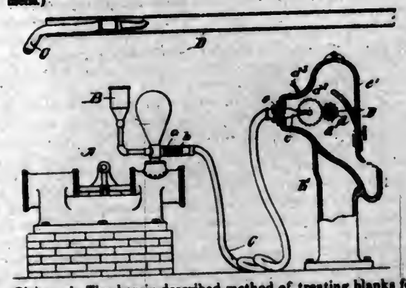
7. The combination with a suitable support, of a vertically-adjustable socket located a suitable distance above the ground or other surface, a bracket having a depending stem adapted to engage and turn freely in the socket, the horizontal and vertical racks, each rack having one extremity adapted to engage the bracket, a shoe adapted to engage the bracket and embrace one extremity of each rack, the said rack extremities being located between the bracket and shoe, and suitable means for fastening the shoe to the bracket and securing the rack in place, substantially as described.

8. In a bicycle-stand, the combination with an upright tube suitably supported, a socket-support having a collar surrounding said tube, the bracket having a stem adapted to engage the socket of said support, a rack detachably connected with said bracket, the rack having separated parallel arms adapted to receive the wheel or wheels of the bicycle, and having suitable stops attached to the arms of the rack for holding the wheel securely in place, and means for vertically adjusting the bracket consisting of a cord or chain having one extremity attached to the bracket, a pulley attached to the upper extremity of the tube over which the cord passes, and a weight at-

tached to the opposite extremity of the cord and adapted to move freely in the tube during the vertical adjustment of the bracket.

9. In a bicycle-stand, the combination with an upright tube or hollow bar, the socket-support movably attached to said tube, a bracket having a stem engaging the socket of said support, a rack detachably secured to the bracket, the rack consisting of parallel arms adapted to receive the wheels of the bicycle and having stops connecting the arms for holding the bicycle securely in place, and means connected with the socket-support and engaging the tube for maintaining the bracket and its attachment at any desired height above the ground or other surface.

10. A bicycle-stand comprising a swinging bracket, suitably suspended above the floor or other surface, a rack suitably attached to said bracket and adapted to engage the wheels of a bicycle and support the latter in an upright position, and suitable means connected with the bracket for limiting the swinging of the bicycle in a horizontal plane, said means being adapted to engage the wall or other upright support upon which the bracket is suspended.



11. A bicycle-stand comprising a suitable suspended support, and a rack suitably attached to said support and comprising two separated parallel arms, and an adjustable stop attached to said arms and adapted to engage a wheel of the bicycle, as and for the purpose set forth.

602,416. METHOD OF MANUFACTURING DRAWN TUBING. WILLIAM A. MCCOOL, Beaver Falls, Pa. Filed Sept. 12, 1896. Renewed Mar. 24, 1898. Serial No. 675,098. (No specimens.)

Claim.—1. The herein-described method of drawing metal, it consisting in removing oxid or scale from a blank by the action of a blast charged with abrading material, in contradistinction to subjecting the blank to the action of an acid, washing the blank in a soda solution, and subjecting the cleaned blank to the action of a draw-bench, substantially as described.

2. The herein-described method of manufacturing drawn tubing, it consisting in removing scale from both the exterior and the interior surfaces of a tubular blank by the action of a blast charged with abrading material, in contradistinction to the use of acid, subjecting said cleaned blank to the action of a draw-bench, and closing the ends of the blank and annealing it, substantially as described.

602,417. METHOD OF MANUFACTURING COLD-DRAWN METALLIC ARTICLES. WILLIAM A. MCCOOL, Beaver Falls, Pa. Filed Oct. 24, 1896. Renewed Mar. 24, 1898. Serial No. 675,099. (No specimens.)

Claim.—1. The herein-described method of treating blanks for the manufacture of drawn tubing, it consisting in abrading the exterior surface of the blank, then compressing the blank radially, then abrading the interior surface of the blank, and then subjecting the blank to the action of the draw-bench, substantially as set forth.

2. The herein-described improvement in the manufacture of drawn tubing, it consisting in drawing a tubular blank through a die and compressing the metal of the blank radially, abrading the interior surface of the blank, and then drawing the blank over a mandrel or through a die, substantially as set forth.

3. The herein-described improvement in the method of manufacturing drawn tubing, it consisting in drawing a tubular blank through a die to compress the metal radially, then abrading the interior of the blank, then drawing the blank over a mandrel or through a die, then heating the blank, and then again abrading the blank to remove any "scale" that has formed thereon, substantially as set forth.

4. The herein-described improvement in the method of manufacturing drawn tubing, it consisting in abrading the exterior surface of a tubular blank, then drawing said blank through a die to compress the metal radially, then abrading the interior surface of the blank, then drawing the blank over a mandrel or through a die, and then heating the blank, substantially as set forth.

5. The herein-described improvement in the method of treating metallic blanks in drawing, it consisting in rotating the blank and while rotating exposing it to a stream of minute globular metallic shot, whereby its surface is uniformly cleaned in contradistinction from subjecting them to the action of acid or other chemical reagents, to remove scale and expose a surface of the pure metal, and then subjecting the blank to compression radially along the cleaned surface to elongate and condense the fibers, substantially as set forth.

6. The herein described method of manufactering blanks for drawn tubing from lap-welded or butt-welded tubes, it consisting in removing "scale" from the exterior of the tube, then compressing the blank radially to loosen the interior "scale," then removing said interior "scale," and then reducing the walls of the tube to uniform thickness by removing surplus metal on lines longitudinally of the blank, substantially as set forth.

7. The herein-described method of preparing blanks for the manufacture of drawn tubing from lap-welded or butt-welded tubes, it consisting in abrading the exterior of the tube, abrading the interior of the tube, and then removing surplus metal from the inner surface of the tube on lines longitudinal of the tube, substantially as set forth.

DESIGNS.

28,461. SKIRT-PROTECTOR. JOHN BAPTISTE POTEZ, Philadelphia, Pa., assignor to the Hensel, Colladay Company, of Pennsylvania. Filed Mar. 1, 1898. Serial No. 672,205. Term of patent 14 years.

Claim.—The design for a skirt-protector substantially as shown and described.

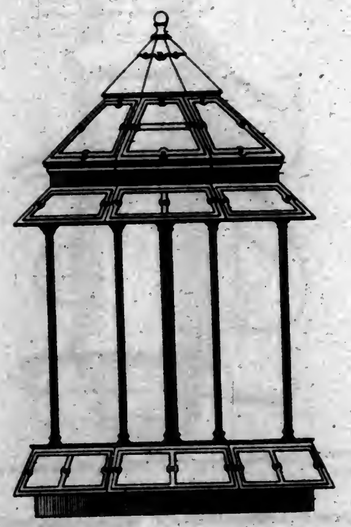
28,462. SKIRT-PROTECTOR. JOHN BAPTISTE POTEZ, Philadelphia, Pa., assignor to the Hensel, Colladay Company, of Pennsylvania. Filed Mar. 15, 1898. Serial No. 673,984. Term of patent 14 years.

Claim.—The design for a skirt-protector, substantially as shown and described.

28,463. SKIRT-PROTECTOR. OLIVER SKILTON PATTON, Philadelphia, Pa., assignor to the Hensel, Colladay Company, of Pennsylvania. Filed Mar. 19, 1898. Serial No. 674,532. Term of patent 14 years.

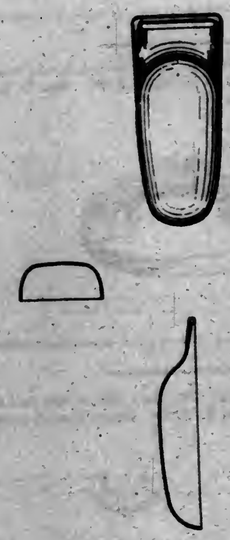
Claim.—The design for a skirt-protector substantially as shown and described.

28,464. PARASOL. OMAR H. ARNOLD, New York, N. Y. Filed Jan. 8, 1898. Serial No. 666,109. Term of patent 3½ years.



Claim.—The design for a parasol as herein shown and described.

28,465. UMBRELLA OR PARASOL CASE. JAMES L. BROWN, Lancaster, Pa. Filed Feb. 12, 1898. Serial No. 670,147. Term of patent 7 years.



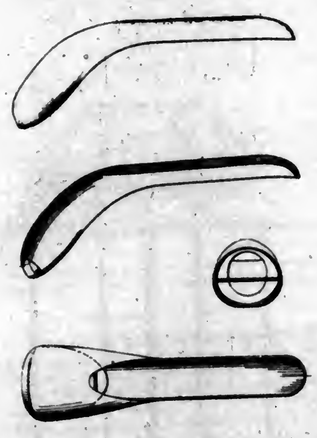
Claim.—The design for an umbrella and parasol case, substantially as shown and described.

28,466. UMBRELLA-STAND. HERBERT BLAWORTH, Cleveland, Ohio, assignor to William Neville, same place. Filed Apr. 27, 1895. Serial No. 547,422. Term of patent 7 years.

Claim.—A design for an umbrella-stand substantially as shown.

28,467. PLATE FOR GARMENT-SUPPORTERS. LOUISE DANA DRAPER, Boston, Mass. Filed Oct. 20, 1897. Serial No. 655,952. Term of patent 14 years.

Claim.—The design for the plate of a garment-supporter herein shown and described.



heating the blank, substantially as set forth.

5. The herein-described improvement in the method of treating

and described.

Claim.—The design for a skirt-protector substantially as shown

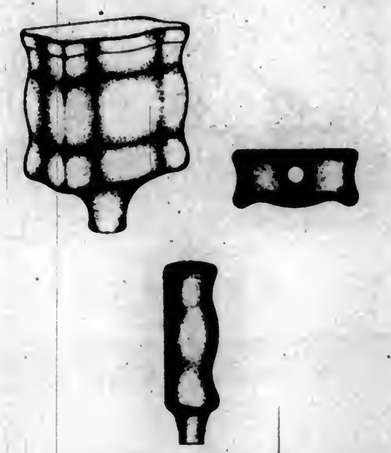
28,468. SHOE-HORN CLAMP. WILLIAM EDWARD GREGORY, Astoria, Oreg. Filed July 10, 1897. Serial No. 644,150. Term of patent 14 years.

Claim.—The design for a shoe-horn clamp herein shown and described.

28,469. METALLIC BORDER. DANIEL A. LOSSER, Wallingford, Conn., assignor to the R. Wallace & Sons Manufacturing Company, same place. Filed Mar. 7, 1898. Serial No. 673,017. Term of patent 7 years.

Claim.—A design for ornamental metallic border as herein shown and described.

28,470. SHADE-SUPPORT. CARTER H. PAGE, Jr., and ERNEST L. BRUNDRETT, Philadelphia, Pa. Filed Mar. 29, 1897. Serial No. 629,362. Term of patent 14 years.



Claim.—The design for a shade-support, substantially as shown and described.

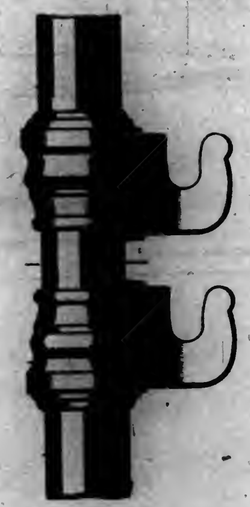
28,471. FUSE-CARRIER. WILLIAM J. NEWTON, New York, N. Y. Filed Apr. 29, 1897. Serial No. 634,471. Term of patent 3½ years.

Claim.—The design for a fuse-carrier, as herein described and shown.

28,472. FLUSH-TANK FOR WATER-CLOSETS. DAVID STEEL WALLACE, Kokomo, Ind. Filed Oct. 4, 1897. Serial No. 654,066. Term of patent 3½ years.

Claim.—The design for a flush-tank for water-closets herein shown and described.

28,473. SEWER'S TREE. WILLIAM HENRY ELLIOTT, Red Bank, N. J. Filed Jan. 18, 1898. Serial No. 667,115. Term of patent 14 years.



Claim.—The design for a sewer's tree, substantially as shown and described.

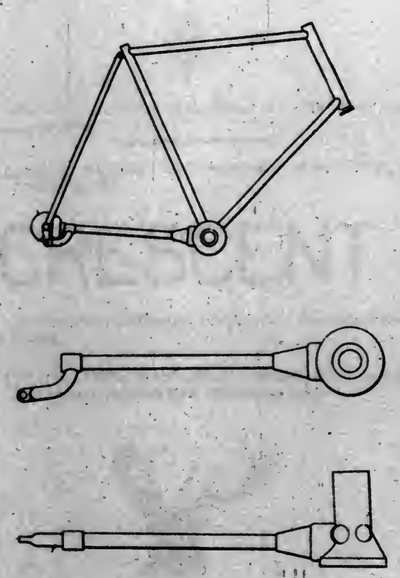
28,474. FENCE-POST. JOHN PETER MOHLER, Burlingham, Ohio. Filed Mar. 5, 1898. Serial No. 672,784. Term of patent 7 years.

Claim.—The design for a fence-post herein shown and described.

28,475. BEDSTEAD-POST. WILLIAM F. BOMBERGER, Philadelphia, Pa. Filed Jan. 20, 1898. Serial No. 667,261. Term of patent 14 years.

Claim.—The design for the post of a bedstead substantially as shown and described.

28,476. BEDSTEAD-POST. WILLIAM F. BOMBERGER, Philadelphia, Pa. Filed Jan. 20, 1898. Serial No. 667,262. Term of patent 14 years.

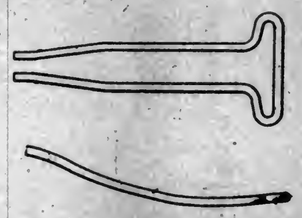


Claim.—The design for the post of a bedstead substantially as shown and described.

28,476.

Claim.—The design for the post of a bedstead substantially as shown and described.

28,477. FRAME FOR BICYCLES. JAMES S. COPELAND, Hartford, Conn. Filed Dec. 13, 1898. Serial No. 615,288. Term of patent 14 years.



Claim.—The design for a bicycle-frame substantially as shown.

28,478. BICYCLE TOE-CLIP. DAVID RASCH, New York, N. Y. Filed Oct. 8, 1897. Serial No. 654,502. Term of patent 7 years.

Claim.—The design for a bicycle toe-clip herein shown and described.

28,479. SADDLE SPRING OR SUPPORT. JONATHAN A. HOWE, Westborough, Mass. Filed Aug. 1, 1898. Serial No. 691,304. Term of patent 7 years.

Claim.—A design for a saddle spring or support, substantially as herein shown and described.

TRADE-MARKS

REGISTERED APRIL 12, 1898.

81,456. BOYS' OUTER CLOTHING. GOLDSMITH BROS. & Co., New York, N. Y. Filed Jan. 4, 1898.

Essential feature.—Grindstone, whether represented by a grindstone or by the word "GRINDSTONE" or by the representation and word combined. Used since July 1, 1897.

81,457. ARTIFICIAL FUR WITH A BODY OF KNITTED OR WOVEN FABRIC AND FUR ON BOTH FACES. CLARENCE W. GROSJEAN, New York, N. Y. Filed Feb. 9, 1898.

Essential feature.—The word "SABLINE," a wavy scroll, a picture of a child above and a pair of gloves below, and an inclosing circle. Used since February 3, 1898.

81,458. PREPARATION FOR THE PAINLESS TREATMENT OF IRRITATED PULPS. GUSTAV SCHARMANN, New York, N. Y. Filed Feb. 12, 1898.

JODO-FORMAGEN

Essential feature.—The compound word "JODO-FORMAGEN." Used since January 1, 1897.

81,459. MEDICAMENTS HAVING AS A BASE FLUID EXTRACT OF MALT. ALLEN & HANBURYS, LIMITED, London, England. Filed Feb. 15, 1898.

BYNO

Essential feature.—The word "BYNO." Used since April, 1892.

81,460. PREPARATION FOR ROUGH OR CHAPPED SKIN. LOVELAND PARSONS, Watertown, N. Y. Filed Oct. 7, 1897.

Essential feature.—The representation of a triangle and a bunch of three callas. Used since July, 1890.

81,461. FAMILY SOAP. ARMOUR & Co., Chicago, Ill. Filed Feb. 23, 1898.

LIGHTHOUSE

Essential feature.—The word "LIGHTHOUSE." Used since October 1, 1897.

81,462. SAFETY-MATCHES. AKTIEBOLAGET SÖDERTELJE TÄNDSTICKSFABRIK, Södertelje, Sweden. Filed Jan. 7, 1898.

Essential feature.—The representation of a tulip. Used since January 20, 1893.

81,463. MATCHES. THE DIAMOND MATCH COMPANY, Chicago, Ill. Filed Feb. 24, 1898.

CRESCENT

Essential feature.—The word "CRESCENT." Used since December 1, 1892.

81,464. PORTLAND AND SIMILAR CEMENTS. THE CEDARSHORE LIME COMPANY, Sandusky, Ohio. Filed Feb. 15, 1898.

Essential feature.—The representation of an elk's head. Used since January 2, 1898.

81,465. STEAM-GAGES. THE ASHCROFT MANUFACTURING COMPANY, Bridgeport, Conn., and New York, N. Y. Filed Feb. 13, 1896.

Essential feature.—The representation of a shield. Used since 1876.

81,466. PLOWS AND THEIR PARTS. SYRACUSE CHILLED PLOW COMPANY, Syracuse, N. Y. Filed Jan. 31, 1896.

78

Essential feature.—The representation of the figures "78." Used since 1876.

THE NORRIS PETERS CO.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE THE CAPITAL CITY DAIRY COMPANY.

Decided March 23, 1898.

1. TRADE-MARKS—"PURITY"—OLEOMARGARIN.
The word "Purity" refused registration as a trade-mark for oleomargarin as it belongs to a class of words which are descriptive or advertising in character and are not registrable as trade-marks.
2. SAME—SAME—SUGGESTIVE MEANING—DECEPTION.
While the word "Purity" is not an adjective in form and may not be commonly employed to describe a quality, nevertheless it cannot be successfully denied that it has a suggestive meaning. If the word is used in a fanciful sense, as contended by applicant's counsel, then it certainly has a tendency to deceive the ordinary buyer.

ON petition.

TRADE-MARK FOR OLEOMARGARIN.

Application for registration filed March 7, 1896, No. 51,008.

Messrs. Finckel & Finckel for the applicant.

DUELL, *Commissioner:*

Applicant appeals from the action of the Examiner of Trade-Marks refusing the registration of its alleged trade-mark for oleomargarin. The mark for which registry is sought consists of the word "Purity."

The Examiner very properly rejected the application for registry, stating that the word belongs to a class of words which are descriptive or advertising in character. While the word "Purity" is not an adjective in form and may not be commonly employed to describe a quality, nevertheless it cannot be successfully denied that it has a suggestive meaning. If the word is used in a fanciful sense, as contended by applicant's counsel, then it certainly has a tendency to deceive the ordinary buyer. Nine housewives out of ten, on seeing an article of food marked "Purity," would conclude that the word was used to indicate a quality claimed to be possessed by the article.

Any manufacturer of oleomargarin would have the right, if true, to mark his manufacture "Pure," and an article that is pure is purity itself.

My attention is called to the fact that the word in question has been heretofore registered by the Office as a trade-mark for bread, mineral waters, etc. Counsel for applicant frankly admits that there is no excuse for continuing a bad practice. In my opinion the Office erred in permitting the registry of the word in prior cases, and, while loath to disturb any well-settled practice of the Office, I shall not hesitate to do so when such prior practice is not, in my opinion, well founded in law.

Viewing the application as I do, the action of the Examiner in refusing registration is affirmed.

OZIAS v. STIMPSON.

Decided February 24, 1898.

APPEAL, LIMIT OF—INTERFERENCE—DECISION OF LOWER TRIBUNAL IN INTERLOCUTORY MATTERS BINDING.
Appeals upon interlocutory matters should not be accepted after the expiration of the limit of appeal. The decision of a lower tribunal in such matters should not be set aside except upon a clear showing of error.

ON motion.

COMPUTING-SCALE.

Application of Orange O. Ozias filed August 23, 1895, No. 560,271. Patent granted Walter F. Stimpson July 23, 1895, No. 543,323.

Messrs. Church & Church for Ozias.

Messrs. T. S. Sprague & Son and *Mr. L. S. Bacon* for Stimpson.

GREELEY, *Assistant Commissioner:*

On June 29, 1897, Stimpson filed a motion to take additional testimony. On November 8 that motion was denied by the Examiner of Interferences, the limit of appeal being fixed for November 18, 1897.

It seems that Stimpson intended to appeal from the decision of the Examiner of Interferences denying his motion, and it appears that his principal attorneys intended to direct the associate attorney to prepare and file such appeal. It further appears that the associate attorney did not understand that he was expected to prepare and file the appeal and became aware that such action was expected of him only after the limit of appeal had expired. He at once made an attempt to secure from the attorneys for Ozias their consent that an appeal should be considered as if filed within the limit of appeal. This consent was not given, and the attorney therefore filed the motion for extension of the limit of appeal. The motion for extension of the limit of appeal was dismissed by the Examiner of Interferences on the ground that he had no jurisdiction, and Ozias filed a motion to dismiss Stimpson's appeal. This motion is now before me.

While the circumstances are unfortunate for Stimpson, it is clear that his appeal, not having been taken within the limit of appeal, must be dis-

98 O G-2-11

missed. While there may be cases in which an appeal may be accepted after the limit of appeal has expired, I am satisfied that this should not be done in case of an appeal in an interlocutory matter. In such matters the decision of the lower tribunal should not be set aside except upon clear showing of error. Appeals from decisions in such matters should be promptly taken, and appellants will be held strictly to the limit of appeal set in the decision.

The motion to dismiss is granted.

DECISIONS OF THE U. S. COURTS.

Court of Appeals of the District of Columbia.

UNITED STATES EX REL. WEDDERBURN v. BLISS, SECRETARY OF THE INTERIOR.

Decided April 4, 1898.

1. ATTORNEYS PRACTICING BEFORE PATENT OFFICE — DISBARMENT — COMMISSIONER OF PATENTS HEARING CHARGES — SECTION 487, REVISED STATUTES, CONSTRUED.

Section 487, Revised Statutes, remits to the Commissioner of Patents the entire cognizance of cases of malpractice occurring before his Bureau and under it the hearing of such cases is to be by him and not by the Secretary of the Interior. It is eminently fitting that this should be so in view of the character of the duties, judicial or quasi-judicial, which are vested in him.

2. SAME—SAME—SUPERVISORY POWER OF THE SECRETARY OF THE INTERIOR OVER THE COMMISSIONER OF PATENTS IN DISBARMENT PROCEEDINGS—"SUBJECT TO THE APPROVAL OF THE SECRETARY OF THE INTERIOR" CONSTRUED.

By section 487, Revised Statutes, there is reserved to the Secretary of the Interior a supervising power over the action of the Commissioner of Patents; but this is no more than an executive or administrative proceeding. The provision that the judgment of the Commissioner shall "be subject to the approval of the Secretary of the Interior" does not make the Secretary a court for the trial of the case, nor does it make him in any proper sense an appellate tribunal before which it would be proper for a party in interest to demand and to be accorded a hearing.

3. SAME—SAME—SAME—SAME.

The meaning of such supervisory power is not that the Secretary must try or hear the cause, but that the judgment of the Commissioner is not to be carried into effect until it receives the approval of the Secretary, and in order to give it this approval, or conversely and by implication his disapproval, the Secretary is necessitated to go over the record of the proceedings that is made up for him according to law or regulation. This, as we have said, is a judicial or quasi-judicial duty on his part; but it is not the equivalent in any sense of the hearing of a cause.

4. SAME—SAME—OFFICER BEFORE WHOM CHARGES ARE TO BE HEARD—SECTION 487, REVISED STATUTES, AND ACT JULY 4, 1884, CONSTRUED.

When the act of July 4, 1884, and section 487, Revised Statutes, are compared and construed together, it is clear that it was not the intention of Congress to repeal section 487 by the enactment of the latter law, and if such was not the intention of Congress then the only reasonable construction of the act of 1884 was that the hearing therein provided to be given to the persons charged with malpractice was the hearing implied to be by section 487 of the Revised Statutes. So far, at least, as the Patent Office was concerned the act of 1884 made no substantial change in the law.

5. SAME—SAME—SAME—"AFTER NOTICE AND OPPORTUNITY FOR HEARING" IN ACT JULY 4, 1884, CONSTRUED.

The provision of the act of July 4, 1884, is not that the Secretary might exclude from practice after notice and hearing of the party charged, which would be the more natural form of expression if it was the intention that the hearing should be before the Secretary in person, but that he might exclude "after notice and opportunity for a hearing," meaning plainly a hearing before some proper officer in such reasonable mode as should be provided by regulation of the Department.

6. SAME—SAME—SAME—SAME.

The word "hearing" in law and in this statute means something more than oral argument. It means, also, the right to adduce testimony. If the sole hearing contemplated by the statute was to be had before the Secretary, the Commissioner of Patents could not hear it at all, and the only duty that could reasonably be imposed upon that officer was that of taking the testimony and reporting it to the Secretary; but this conclusion would be in direct contravention of the section 487 of the Revised Statutes, which explicitly provides that the Commissioner shall determine the matter, subject only to the approval of his action by the Secretary of the Interior.

7. SAME—SAME—SAME—WEIGHT TO BE GIVEN TO DEPARTMENT'S CONSTRUCTION OF STATUTE.

The construction placed by an executive department of the Government upon a statute enacted for its guidance and the regulation of its business must, unless it be plainly erroneous, receive due weight and consideration and should not be disregarded, except for cogent reasons. When, therefore, the Department, which was called upon to administer the act of 1884 and construe that act in connection with section 487 of the Revised Statutes, did so construe it that the notice and an opportunity for a hearing therein provided to be given should be given by the head of the proper Bureau and that the investigation should be conducted by such Bureau officer, subject to the approval of his findings by the Secretary of the Interior, it is not apparent that there was error in that construction.

8. SAME—SAME—MANDAMUS TO COMPEL THE SECRETARY TO GIVE A HEARING—JURISDICTION OF COURT TO ISSUE WRIT DOUBTFUL.

Assuming that mandamus is proper whenever an inferior court or a judicial officer charged with the exercise of discretionary or judicial functions either assumes to exercise jurisdiction when none exists, or refuses to entertain jurisdiction with which he is by law invested, without regard to the question whether there is any appeal from his judgment when rendered and when he has acted, *Held* that it is doubtful whether the refusal of the Secretary to accord to the relator the opportunity to make an argument, especially when it is not shown or in any manner intimated how or wherein the Secretary erred or was mistaken or misled, is to be regarded as a jurisdictional matter for which the writ of mandamus would be proper.

Mr. J. M. Wilson and *Mr. R. Ross Perry* for the appellant.

Mr. W. A. Megrath for the Secretary of the Interior.

OPINION.

This is an application by the appellant here, John Wedderburn, as relator, for a writ of mandamus to require the Secretary of the Interior to give him a hearing in respect of certain proceedings instituted against him for his exclusion from practice before that Department.

It appears from the record that prior to June 14, 1897, the relator was in the enjoyment of a large and apparently lucrative practice as an agent or attorney for the prosecution of claims for patents before the Patent Office Bureau of the Department of the Interior, duly recognized and admitted to practice under the rules of that Department, and that on the day mentioned he was served with a notice from the Commissioner of Patents to show cause, if any he had, why he should not be refused further recognition as such agent or attorney. With the notice charges were served upon him tending to show malpractice on his part, and with the charges were incorporated copies of documents and statements upon which the charges were founded. The relator in due time made answer to the charges, the substantial purport of which was a denial of their truth. Thereupon an extended

and elaborate investigation was had before the Commissioner and Assistant Commissioner of Patents, and a large amount of testimony, both for and against the relator, was taken and reduced to writing, and it seems that a complete record was kept of all the proceedings.

Finally the matter came to a hearing before the Commissioner and Assistant Commissioner. Oral argument was had on both sides before these officers, and written or printed briefs also were invited to be filed. There was a printed brief filed against the relator, but none on his behalf. Thereupon the Assistant Commissioner, at the request of the Commissioner, prepared a synopsis of the testimony and a report of his findings thereon and submitted it to the Commissioner. The Commissioner then, in a long and elaborate opinion in writing, reviewed the whole case and came to the conclusion that the relator had been guilty of malpractice and that he should be excluded from further recognition before the Department. This conclusion, together with his reasons therefor, he reported to the Secretary of the Interior, and the papers were all transmitted to the latter officer for his final action in the case.

As to the regularity of the proceedings thus far there is no complaint whatever by the relator, and it would seem, in view of the abundant opportunity for a hearing that had been afforded to him, that there was no ground for complaint. But he claims that when the Commissioner's conclusions were reported to the Secretary of the Interior he should have had notice of them and an opportunity for hearing before the Secretary, which under the circumstances would mean not an opportunity for the introduction of further testimony, which is not claimed, but an opportunity for argument, either oral or written, before the Secretary in person. This he did not have. He had no notice of the Commissioner's conclusions until after their approval by the Secretary, and he had no opportunity for argument before the Secretary, and this is the burden of his grievance, for which he now seeks the interposition of the courts.

The Secretary of the Interior seems to have examined with great care the decision of the Commissioner of Patents and the report of the proceedings made by the Assistant Commissioner, and he gave them his full approval. Thereupon the Commissioner of Patents issued an order excluding the relator from recognition as an agent or attorney.

The relator then addressed a communication to the Secretary of the Interior, in which he requested him to vacate the order of approval of the Commissioner's report and recommendation and to give the relator an opportunity for a hearing upon the matter before himself. This application was refused, and thereupon the present proceedings were instituted by the filing in the Supreme Court of the District of Columbia of a petition for a writ of mandamus to the Secretary to require the latter to give to the petitioner the opportunity for a hearing before that officer, to which he claimed to be entitled. With the petition were filed exhibits of all the proceedings had in the Department; and these were deemed so full and so fairly set forth that, on behalf of the Secretary of the Interior, as the respondent in the case, it was thought sufficient to file a demurrer in order to bring before the court all the questions of law involved. The Supreme Court of the District of Columbia sustained the demurrer, refused the writ, and dismissed the petition, and from the order of dismissal the present appeal has been prosecuted.

The question in the case is whether the apellant had in the Department of the Interior the hearing upon his case to which he was by law entitled. For, as to the character of the judgment to be rendered upon such hearing, there is of course no pretense that it can be controlled or directed in any manner by the courts of law or that it is subject to review by any other tribunal for any supposed error. The final determination upon such hearing is for the Secretary of the Interior, and not a matter for the consideration of the courts.

That the relator's office of agent or attorney before the Patent Office and the Department of the Interior was a valuable right of which he should not be deprived without due process of law, such as would be applicable to his case, is not controverted. Nor is there controversy as to what, in general, would constitute due process of law in such cases as that to which the relator was summoned to respond. Specific charges, due notice of such charges, an opportunity to make specific answer to them, an opportunity to cross-examine witnesses in support of them, an opportunity to adduce testimony in contradiction of them, and opportunity for argument upon the testimony and upon the law and the facts,—and all this before the proper tribunal, competent to render judgment, and which does, in fact, render judgment—this undoubtedly constitutes due process of law under ordinary circumstances to its fullest extent, and all this was had in the present instance, if it was competent for the Secretary of the Interior and the Commissioner of Patents to give the hearing in the mode to which it was actually given. Upon the claim of the appellant himself, no proper element of due process of law was wanting in the case except the opportunity of submitting the argument, oral or written, to the Secretary of the Interior in person, after such opportunity had been fully availed of before the Commissioner of Patents. But the right to submit argument is a valuable, although perhaps not always an essential, part of the hearing that constitutes due process of law. Whether the appellant was entitled to it in this case, and to the extent of his claim, depends upon the provisions of the statute law that has been enacted upon this subject.

Section 487 of the Revised Statutes of the United States, which substantially embodies the seventeenth section of the Act of Congress of July 8, 1870, consolidating the patent and copyright laws, is to the following effect:

For gross misconduct the Commissioner of Patents may refuse to recognize any person as a patent agent, either generally

or in any particular case; but the reasons for such refusal shall be duly recorded, and be subject to the approval of the Secretary of the Interior.

There had been a previous act of March 2, 1861, (12 Stats., 246,) which in its eighth section contained precisely the same provision, with the exception that the approval of the Commissioner's action was to be by the President of the United States instead of the Secretary of the Interior; but it is not apparent that the change has any significance in connection with the present controversy.

Subsequently by an act of Congress of July 4, 1884, (23 Stats., 98,) which had reference mainly to pensions, but which purported also to be "for other purposes," it was provided as follows:

Section 5. That the Secretary of the Interior may prescribe rules and regulations governing the recognition of agents, attorneys, or other persons representing claimants before the Department and may require of such persons, agents, and attorneys, before being recognized as representatives of claimants, that they shall show that they are of good moral character and in good repute, possessed of the necessary qualifications to enable them to render such claimants valuable service, and otherwise competent to advise and assist such claimants in the presentation of their claims; and such Secretary may, after notice and opportunity for hearing, suspend or exclude from further practice before his Department any such person, agent, or attorney shown to be incompetent, disreputable, or who refuses to comply with the said rules and regulations, or who shall, with intent to defraud, in any manner deceive, mislead, or threaten any claimant, or prospective claimant, by word, circular, letter, or by advertisement.

It seems to be conceded that this provision of law, although contained, as stated, in an act mainly relating to pensions, constituting in itself an independent section of the act, is sufficiently general to apply to all the Bureaus of the Department of the Interior and not alone to practitioners before the Pension Bureau, and it seems also to be conceded that it does not repeal the section 487 of the Revised Statutes which has been quoted, but that it is to be taken in connection with it as being *in pari materia* and that both acts are to be construed together.

In pursuance apparently of the power vested in him by this act of July 4, 1884, the Secretary of the Interior, among other rules, promulgated the following, under which it is understood the investigation of the charges against the relator was conducted:

Rule 9. Whenever an attorney or agent is charged with improper practice in connection with any matter before a Bureau of this Department, the head of such Bureau shall investigate the charge, giving the attorney or agent due notice, together with a statement of the charge against him, and allow him an opportunity to be heard in the premises. When the investigation shall have been concluded, all the papers shall be forwarded to the Department, with a statement of the facts and such recommendations as to disbarment from practice as the head of the Bureau shall deem proper, for the consideration of the Secretary of the Interior. During the investigation the attorney or agent will be recognized as such, unless for special reasons the Secretary shall order his suspension from practice.

The question recurs, did the appellant have the hearing to which he was entitled under these enactments?

If the determination of this inquiry depended exclusively upon the construction to be given to section 487 of the Revised Statutes, it seems to us that there would be no serious difficulty in reaching a conclusion. It is very clear that this section remits to the Commissioner of Patents the entire cognizance of cases of malpractice occurring before his Bureau and that under it the hearing of such cases is to be by him and not by the Secretary of the Interior. It is eminently fitting that this should be so in view of the character of the duties, judicial or quasi-judicial, which are vested in him. (*Butterworth* v. *Hoe*, 29 O. G., 615; 112 U. S., 50.) It is true, however, that by this section there is reserved to the Secretary of the Interior a supervising power over the action of the Commissioner of Patents; but this is no more than an executive or administrative proceeding. The provision that the judgment of the Commissioner shall "be subject to the approval of the Secretary of the Interior" does not make the Secretary a court for the trial of the case, nor does it make him in any proper sense an appellate tribunal before which it would be proper for a party in interest to demand and to be accorded a hearing. Such terms are nowhere in our legislation used for the creation of appellate judicial authority. They are most inapt terms for any such purpose, and they are equally inapt to constitute the Secretary the court of first instance, for which the findings of the Commissioner may serve as the findings of a referee or master in chancery. In the one case of our legislation in which similar or equivalent terms are used for the creation of supervising quasi-judicial authority—the provision for the review of sentences of courts-martial by the President of the United States or by a commanding officer—it has never been heard of that such supervisory authority implies any right on the part of the person in interest to a hearing *de novo* before such supervising power, notwithstanding that the exercise of the power is a quasi-judicial function.

It is very clear to us that under this section 487 of the Revised Statutes, if it stood alone, the Commissioner of Patents, and not the Secretary of the Interior, constitutes the tribunal for the determination of cases of alleged malpractice occurring before his Bureau, and that the hearing, to which an agent or attorney is entitled before exclusion from recognition, is to be had before the Commissioner. The authority of the Secretary is to review the record transmitted to him and to give or refuse his assent to the Commissioner's recommendations, as he may think proper, and for any reason satisfactory to him. In other words, it is for the Commissioner to pass judgment; but that judgment is not to be given effect until it is approved by the Secretary.

What change, if any, does the act of 1884 make in the proceedings? That act undoubtedly sought to place all the Bureaus of the Department of the Interior on the same basis in the matter of the recognition of agents and attorneys and in the matter of their exclusion from practice for misconduct, while section 487 of the Revised Statutes had reference only to the Patent Office. It provides for rules and regulations to be made by the Secretary to regulate the matter of recognition; but it does not in terms provide for any such rules and regulations in regard to the matter of disbarment. The act would seem to have been left intentionally vague in this regard; for, instead of providing that the Secretary might make rules to govern the matter of the exclusion of attorneys, as well as that of

their admission, it provides that, "after notice and an opportunity for a hearing," the Secretary might exclude such attorneys from practice. It leaves it undetermined how and before whom such hearing shall be had, and undoubtedly there is great plausibility in the theory that the hearing is to be had before the person who is authorized to take final action upon it. If we were dealing here with the action of judicial tribunals, we would have no hesitation whatever in so holding. A court authorized to decide necessarily is the court authorized to hear, and it may not delegate to any one its duty to hear any more than it can delegate its functions to decide.

But there is question here of the conduct of the affairs of a great executive department of the Government, and the character of its duties is not to be ignored in the construction of an act of Congress intended merely to regulate the performances of those duties to the best advantage of the people and with entire justice to all concerned. It is well-settled law and a fundamental rule of our governmental system that purely judicial functions cannot be conferred upon an executive officer; but of necessity executive officers are frequently vested with discretionary functions of quasi-judicial character, and these can no more be delegated than can strictly judicial authority. (*Runkle* v. *U. S.*, 122 U. S., 543.) But where it does not distinctly appear what officer is to exercise the quasi-judicial authority conferred by statute and where the tenor of legislation leaves the exercise of it to be determined in great measure by the executive regulation the presumption does not necessarily arise that the head of the department must himself in person exercise the authority so conferred. When we compare the act of Congress of 1884 and the section 487 of the Revised Statutes and construe them together, as it is justly claimed on behalf of the appellant that we should construe them, it is clear that it was not the intention of Congress to repeal section 487 by the enactment of the latter law, and if such was not the intention of Congress then the only reasonable construction of the act of 1884 was that the hearing therein provided to be given to the persons charged with malpractice was the hearing implied to be by section 487 of the Revised Statutes. So far, at least, as the Patent Office was concerned the act of 1884 made no substantial change in the law. It simply provided expressly for the notice and hearing, the right to which had been implied in the previous statute; and that this was the understanding also of the Department of the Interior is clear from Rule 9, which has been cited, for that rule is in entire accordance with section 487 of the Revised Statutes and serves as a construction of the meaning of the act of 1884 as it was understood by the Department.

Now it has been repeatedly held by the Supreme Court of the United States, and it must, therefore, be regarded as settled law, that the construction placed by an executive department of the Government upon a statute enacted for its guidance and the regulation of its business must, unless it be plainly erroneous, receive due weight and consideration and should not be disregarded, except for cogent reasons. (*United States* v. *Johnston*, 124 U. S., 136; *Heath* v. *Wallace*, 138 U. S., 573; *United States* v. *R. R. Co.*, 142 U. S., 615; *Pennoyer* v. *McConnaughy*, 140 U. S., 1; *United States* v. *R. R. Co.*, 148 U. S., 562; *Robertson* v. *Downing*, 127 U. S., 607.) When, therefore, the Department, which was called upon to administer the act of 1884 and construe that act in connection with section 487 of the Revised Statutes, did, by the adoption of its Rule 9, so construe it that the notice and an opportunity for a hearing therein provided to be given should be given by the head of the proper Bureau and that the investigation should be conducted by such Bureau officer, subject to the approval of his findings by the Secretary of the Interior, it is not apparent that there was error in that construction, and we find no reason to antagonize it. Indeed, so far as the intention of Congress in the premises can be inferred from the statute itself, it would seem that this was the only proper construction. For it will be noticed that the provision of the statute is not that the Secretary might exclude from practice after notice and hearing of the party charged, which would be the more natural form of expression if it was the intention that the hearing should be before the Secretary in person, but that he might exclude "after notice and opportunity for a hearing," meaning plainly a hearing before some proper officer in such reasonable mode as should be provided by regulation of the Department.

What Mr. Justice Field, speaking for the Supreme Court of the United States in the case of *Randall* v. *Brigham*, (7 Wall., 523,) said in reference to the general rule of law on this subject would seem to be appropriate here. He said:

All that is requisite for their validity (meaning the validity of proceedings for disbarment of an attorney) is, that, when not taken for matters occurring in open court, in the presence of the judges, notice should be given to the attorney of the charges made and opportunity afforded him for explanation and defense. The manner in which the proceedings shall be conducted, so that it be without oppression or unfairness, is a matter of judicial regulation.

We must conclude that the hearing contemplated by the act of 1884 was accorded to this appellant in this instance in the hearing which he had before the Commissioner of Patents and that the purpose of the statute was amply subserved by that hearing. We cannot hold that the relator was entitled to two hearings—one before the Commissioner and one before the Secretary. He himself does not claim this, at least in the fullest sense of the term "hearing." He does not claim that he had the right to adduce testimony and to go over the case *de novo* before the Secretary, and yet to this he was entitled if his construction of the statute be correct, for the word "hearing" in law and in this statute means something more than oral argument. It means, also, the right to adduce testimony. Now if the sole hearing contemplated by the statute was to be had before the Secretary the Commissioner of Patents could not hear it at all, and the only duty that could reasonably be imposed upon that officer was that of taking the tes-

timony and reporting it to the Secretary; but this conclusion would be in direct contravention of the section 487 of the Revised Statutes, which explicitly provides that the Commissioner shall determine the matter, subject only to the approval of his action by the Secretary of the Interior. The Commissioner does not act in the matter as a master in chancery or other officer whose duty it is simply to facilitate proceedings and to put them in shape for action thereon by the tribunal authorized to decide them. The Commissioner himself is the tribunal in this case. He is the person authorized by law to investigate and decide. He is therefore the person before whom a hearing can most properly and ought to be had before he formulates his conclusions.

The utmost that could be claimed in this connection is that the Secretary of the Interior acts as a kind of appellate tribunal over the Commissioner of Patents; but even if this be conceded—and we think it must be taken with some qualification—it does not follow that a party in interest is entitled to oral argument or to a hearing of any kind before him beyond what is involved in the examination of the record necessary for the exercise of supervisory power. Such argument might be allowed as matter of grace, but it cannot legally be claimed as matter of right. Even in proceedings purely judicial the right of appeal is not matter of absolute right, but is of statutory creation, and therefore may be regulated or limited by statute or by rules of court made in pursuance of statute and may even be taken away entirely; and if it may be so limited and regulated it is competent to exclude argument of any kind, except such as may have appeared in the court of original resort.

But, as we have already intimated, the words of the statute are not those that are usually in the creation of appellate tribunals. It is true that the supervisory power vested in the Secretary of the Interior over the action of the Commissioner is in this instance judicial in its nature and must be exercised by the Secretary himself in person, (*Runkle v. United States*, 122 U. S., 543;) but all usage and all precedent would be vain if we were to hold that he could not exercise it until he heard the party in interest in oral argument. The meaning of such supervisory power is not that the Secretary must try or hear the cause, but that the judgment of the Commissioner is not to be carried into effect until it receives the approval of the Secretary, and in order to give it this approval, or conversely and by implication his disapproval, the Secretary is necessitated to go over the record of the proceedings that is made up for him according to law or regulation. This, as we have said, is a judicial or quasi-judicial duty on his part; but it is not the equivalent in any sense of the hearing of a cause.

Entertaining the view of the case which we have here sought to express, it is unnecessary for us to determine whether, under the decision in the case of *Commissioner* v. *Whiteley*, (4 Wall., 522,) it would be proper in any event to issue the writ of mandamus in this case. In the case of *Commissioner* v. *Whiteley* the rule was laid down quite emphatically by the Supreme Court of the United States, through Mr. Justice Swayne, that the writ of mandamus is only applicable in two classes of cases—first, where there is a refusal to perform a ministerial act involving no exercise of judgment or discretion; second, where the exercise of judgment and discretion are involved and the officer refuses to decide, "provided that, if he decided, the aggrieved party could have his decision reviewed by another tribunal." Unless this decision has been modified by subsequent adjudications by the same tribunal, it would seem to be decisive of this case, for there is certainly no right of review by any tribunal of the decision of the Secretary of the Interior in the premises. It would seem, however, that the decision in the case of *Commissioner* v. *Whiteley* has been somewhat modified in subsequent cases. Certainly an exception was made to it in the case of *ex parte Bradley*, (7 Wall., 364,) in which it was broadly held, without reference to the theory of appellate jurisdiction to review the judgment that might be rendered by an inferior court, the action of such court might be restrained or constrained by the writ of mandamus whenever it undertook to proceed without jurisdiction or the case was one of irregularity against law or of flagrant injustice; but it may be questioned whether these very general expressions have not themselves been modified by subsequent decisions.

Assuming, however, for our present purpose that mandamus is proper whenever an inferior court or a judicial officer charged with the exercise of discretionary or judicial functions either assumes to exercise jurisdiction when none exists, or refuses to entertain jurisdiction with which he is by law invested, without regard to the question whether there is any appeal from his judgment when rendered and when he has acted, we may well doubt whether the present case is one proper for the writ. The purpose here sought is to compel the exercise of jurisdiction substantially denied to exist—the alleged right to a hearing or oral argument before the Secretary in person. But the only possible result of a hearing is ultimate action in the matter by the Secretary in the way of approval or disapproval of the conclusion reached by the Commissioner. Now that action has been had. The Secretary has given his approval to the Commissioner's recommendations, and upon application of the relator for the rescission of his action and for an opportunity to be heard before him he has reiterated his determination and refused to reopen the case. We greatly doubt whether under such circumstances the refusal of the Secretary to accord to the relator the opportunity to make an argument, especially when it is not shown or in any manner intimated how or wherein the Secretary erred or was mistaken or misled, is to be regarded as a jurisdictional matter for which the writ of mandamus would be proper.

But this question it is unnecessary here to decide. We prefer to base our decision on the broader ground that the relator has had the hearing to which he was by law entitled and that it was not an essential part of that hearing or of due process of law in the premises that he should have been permitted to make an argument, either oral or written, before the Secretary of the Interior in person. But we do this all the more readily in the hope and expectation that our decision may be reviewed by the court of last resort and that our error, if error there be, may be there corrected.

We are of opinion that the order of the Supreme Court of the District of Columbia refusing the writ of mandamus in this case was right and that it should be affirmed, with costs, and it is so ordered.

Amended Rules of Practice.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 13, 1898.

The following rules of the Rules of Practice of the United States Patent Office (edition of June 18, 1897) are amended to read as follows:

RULE 135. Upon the filing of the appeal the same shall be submitted to the Primary Examiner, who, if he find it to be regular in form, shall, within *five* days from the filing thereof, furnish the Examiners-in-Chief with a written statement of the grounds of his decision on all the points involved in the appeal, with copies of the rejected claims and the references applicable thereto. The Examiner shall at the time of making such statement furnish a copy of the same to the appellant. If the Primary Examiner shall decide that the appeal is not regular in form, a petition from such decision may be taken directly to the Commissioner, as provided in Rule 145.

RULE 145. Upon receiving a petition stating concisely and clearly any proper question which has been twice acted upon by the Examiner, and which does not involve the merits of the invention claimed, or the rejection of a claim, and also stating the facts involved and the point or points to be reviewed, an order will be made fixing a time for hearing such petition by the Commissioner, and directing the Examiner to furnish a written statement of the grounds of his decision upon the matters averred in such petition within *five* days *after being notified of the order fixing* the day of hearing. The Examiner shall at the time of making such statement furnish a copy thereof to the petitioner. No fee is required for such a petition.

C. H. DUELL,
Commissioner.

Department of the Interior, April 13, 1898.
Approved:
C. N. BLISS,
Secretary of the Interior.

[CIRCULAR.]

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 14, 1898.

Rules 135 and 145 of the Rules of Practice have been amended to require Examiners to file their answers to appeals and petitions within five days after the appeals and petitions have been submitted to them.

In fixing the day of hearing, the docket clerk will give such time as may be necessary, having regard to the distance of parties and the time required by the mails.

The attention of Examiners is called to the requirement in Rule 64, and questions of form will be insisted upon only in applications found to present patentable subject-matter. In requiring division the Examiners will observe the decisions of the Commissioners, and furnish such references and other information as will enable the applicant to divide intelligently. (*Ex parte De la Sala*, 1898 C. D., 3; *ex parte Stearnes*, 1890 C. D., 49.)

C. H. DUELL,
Commissioner.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., April 9, 1898.

SIR: The Secretary of the Interior has ordered that G. W. Chandler, of Norwood, N. Y., be not recognised after this date as attorney or agent in the prosecution of any claim or other matter before this Department or any Bureau thereof.

Very respectfully,
EDWARD M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

Special Examination of Applications.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 15, 1898.

Applications for patents filed in this Office after April 30, 1898, will not be made special because the applicant has filed or caused to be filed in a foreign country an application for the same invention more than seven months prior to the date of filing the United States application.

C. H. DUELL,
Commissioner.

Money by Mail.

Money sent by mail to the Patent Office will be at the risk of the sender. Letters containing money should be registered.

CERTIFICATES OF REGISTRATION ISSUED APRIL 19, 1898.

Labels.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business April 12, 1898.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended.	No. of applications awaiting action.
	In arrears—Between two and three months.			
200	XIV. Metal-Bending, Wire-Working, Coin-Controlled Apparatus, Farriery, Nut and Bolt Locks, etc.	Jan. 17	Mar. 30	247
102	XIX. Stoves and Furnaces	Jan. 14	Mar. 30	414
255	XII. Mechanical Engineering, Store-Service, etc.	Jan. 24	Mar. 29	259
158	XX. Builders' Hardware, Safes, Dentistry, Artificial Limbs, etc.	Jan. 12	Mar. 29	258
149	III. Metallurgy, Metal-Founding, Electro-Chemistry, etc.	Jan. 13	Mar. 28	223
98	XXXIV. Railway-Brakes, Draft Appliances, and Rolling-Stock.	Jan. 15	Mar. 23	263
	Between three and four months.			
120	IX. Hydraulics, Fire-Extinguishers, etc.	Dec. 29	Apr. 5	264
253	X. Carriages and Wagons	Dec. 30	Apr. 4	219
256	V. Fine Arts, Harvesters, Book-Binding, Music, etc.	Dec. 21	Apr. 2	309
111	XXXII. Bottles and Jars, Carbonating Beverages, Shipping and Storing Vessels, etc.	Dec. 13	Apr. 2	307
246	I. Tillage and Fences	Jan. 6	Apr. 1	248
250	VIII. Furniture, Beds, Store Furniture, etc.	Jan. 6	Apr. 1	516
30	IV. Civil Engineering, Fire-Proof Buildings, Fire-Escapes and Ladders, etc.	Jan. 6	Mar. 30	464
38	XXXV. Advertising, Baggage, Packing and Storing Vessels, Games and Toys, etc.	Dec. 14	Mar. 30	412
251	XIII. Metal-Working, Arms and Projectiles, Nails and Spikes, Needles and Pins, Cutlery, etc.	Dec. 13	Mar. 29	246
39	XXXI. Gas, Painting, Hides, Skins and Leather, Alcohol, Oils, Fats, and Glue, etc.	Dec. 31	Mar. 28	339
223	XXVII. Brushing and Scrubbing, Grinding and Polishing, Laundry, etc.	Dec. 30	Mar. 28	307
248	XVIII. Steam-Engineering, etc	Dec. 22	Mar. 28	331
93	XXI. Textiles, etc	Dec. 18	Mar. 28	342
258	VI. Chemistry, Explosives, Medicines, Fertilizers, Sugar and Salt, Surgery.	Dec. 22	Mar. 26	536
109	XXII. Fire-Arms, Fishing and Trapping, Navigation, Signals, etc.	Dec. 21	Mar. 17	327
	Between four and five months.			
35	XXVIII. Pneumatics, Refrigeration, Air and Gas Engines, etc.	Nov. 13	Mar. 30	562
217	XXXIII. *Trade-Marks, etc., †Designs, Drafting, and Optics.	Dec. 10	Mar. 29	169
106	II. Farm Stock, Products, etc	Dec. 10	Mar. 29	545
87	XXVI. Electricity, Generation, Distribution, Motive Power, Electric Railways, etc.	Dec. 6	Mar. 25	220
248	XXV. Artesian and Oil Wells, Mills, Thrashing, Vegetable Cutters and Crushers.	Nov. 26	Mar. 18	508
240	VII. Velocipedes	Dec. 10	Mar. 17	226
91	XVI. Telegraphy, Telephony, Electric Lighting and Signaling.	Nov. 26	Feb. 25	471
	Between five and six months.			
123	XXIX. Wood-Working Machines, Carpentry, Coopering and Roofing, etc.	Nov. 10	Apr. 4	276
211	XV. Plastics, Paper-Making, Paving, Glass, Fuel, Bread-Making, etc.	Oct. 15	Apr. 4	516
105	XI. Boots and Shoes, Clasps, Buckles and Buttons, Harness, Hose and Belting, and Leather-Working Machinery.	Nov. 1	Apr. 1	797
129	XXIV. Sewing-Machines, Apparel, and Toilet.	Nov. 1	Mar. 31	451
95	XXX. Paper Manufactures, Lamps, and Gas-Fittings.	Nov. 3	Mar. 30	409

Applications Under Examination—Continued.

	Between seven and eight months.			
221	XXIII. Instruments of Precision, Acoustics, etc.	Sept. 9	Mar. 15	490
215	XVII. Printing, Type-Writing Machines, and Linotyping.	Sept. 10	Dec. 8	556
	Total number of applications awaiting action			13,953
	Under one month.			
	†Designs	Mar. 12	Mar. 30	205
	Between one and two months.			
	*Trade-Marks	Mar. 5	Apr. 1	345

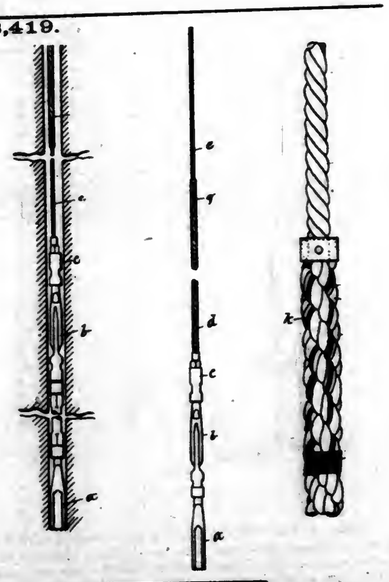
PATENTS

GRANTED APRIL 19, 1898.

602,418. STEAM-ENGINE. Otto Abraham, Pinthow, Germany. Filed July 30, 1896. Serial No. 601,047. (No model.) Patented in Germany Mar. 25, 1896, No. 89,609; in France Apr. 7, 1896, No. 255,396; in England June 17, 1896, No. 13,295, and in Belgium Apr. 7, 1897, No. 130,751.

Claim.—In combination with a cylinder, tight pistons operating in each end of the cylinder, a steam-piston working between the tight pistons, a piston-rod, cross-heads working in guides, guide-rods, stops on the guide-rods, and springs for controlling the action of the pistons, substantially as described.

602,419. WELL-DRILLING CABLE. Samuel Adams, Beaver, Pa., assignor to the Frick & Lindsay Company, Pittsburg, Pa. Filed Feb. 11, 1896. Serial No. 587,912. (No model.)



Claim.—1. A well-drilling cable composed of sections of wire rope and hemp rope connected together and adapted to extend between the power mechanism and drilling-tools, substantially as set forth.

2. A well-drilling cable composed of an upper section of wire rope and a lower section of hemp rope connected to the lower end thereof, and adapted to carry the drilling-tools, substantially as set forth.

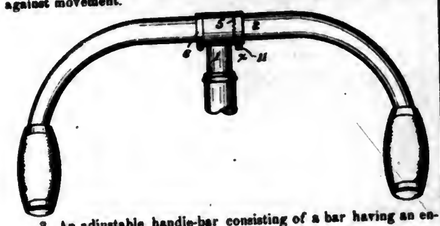
3. A joint for a well-drilling cable composed of sections of wire rope and hemp rope, formed by inserting the wire rope in the end of the hemp rope and plaiting or splicing the wire strands between and over the hemp strands when the hemp strands remain in their ordinary "lay," substantially as set forth.

4. A joint for a well-drilling cable composed of sections of wire rope and hemp rope, formed by inserting the wire rope in the end of the hemp rope and plaiting or splicing the wire strands between and over the hemp strands when the hemp strands remain in their ordinary "lay," and a band surrounding the end of the hemp rope and holding it in "lay," substantially as set forth.

602,419.

602,420. PNEUMATIC-TIRE-REPAIRING DEVICE. William H. Amory, New York, N. Y. Filed June 19, 1896. Renewed Mar. 10, 1898. Serial No. 673,401. (No model.)

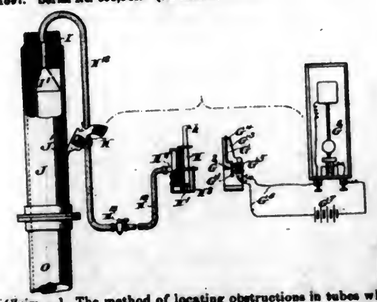
Claim.—1. As an article of manufacture, an elastic strap having fastening devices at its ends adapted to engage with each other and so fastened to said strap that, when it is stretched, a greater strain will be brought upon the edges of the strap than upon the middle thereof.



2. As an article of manufacture, an elastic strap provided at either end with interlocking fastenings, each of which is provided with a rounded portion to which the strap is secured so that when said strap is stretched a greater strain will be brought upon the edges than upon the middle thereof.

602,421. ADJUSTABLE HANDLE-BAR. Robert P. Ball, Bridgeport, Conn. Filed Oct. 21, 1896. Serial No. 610,064. (No model.)

Claim.—1. An adjustable handle-bar consisting of a head in which said bar operates, a collar upon said bar, fixed and movable clutch members, a spring-actuated key-lever pivoted to said movable member and adapted to engage the collar upon the bar aforesaid in a manner to lock said movable clutch member.



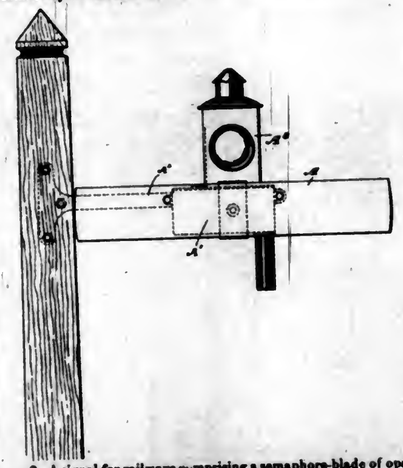
2. An adjustable handle-bar of the class described, consisting of a bar, a collar upon said bar, fixed and movable interlocking clutch members, a spring to permit of the disengagement of said movable member by the rotary movement of said handle bar, a spring-actu-

ated key-lever pivoted to said movable member and adapted to engage the collar upon the bar in a manner to lock said clutch member against movement.

3. An adjustable handle-bar consisting of a bar having an enlargement thereon, a head in which said enlargement operates, serrations upon said head and enlargement registering with each other, a spring-actuated serrated movable clutch member mounted upon the bar and adapted to engage the serrations of the head and enlargement, a key-lever pivoted to said movable member and adapted to operate through an orifice in said clutch member and engage a collar upon the bar in a manner to lock said clutch.

602,422. APPARATUS FOR LOCATING OBSTRUCTIONS IN TUBES. BERNET C. BATCHELLER, Philadelphia, Pa. Filed Sept. 28, 1897. Serial No. 653,340. (No model.)

Claim.—1. The method of locating obstructions in tubes which consists in connecting the tube to be tested with an apparatus for recording time intervals and sound-waves created in the tube, making a loud noise, as by an explosion, in the part of the tube to which the recording apparatus is attached partly closing the connection from the tube to the recording apparatus prior to the making of said loud noise therein so as to avoid an undue strain on the recording apparatus and immediately opening said connection after the sound impulse is created in the tube so as to afford a free passage to the recording apparatus for the sound impulse reflected from the obstruction in the tube.



2. In an apparatus for locating obstructions in tubes—the combination with an apparatus for visually recording time intervals of means for coordinately recording sound-waves said means being connected with the tube to be tested as described and so that sound-waves created in said tube will be visually recorded, and means for wholly or partially interrupting the transmission of the sound-waves from the tube to the sound-recording device.

3. In an apparatus for locating obstructions in tubes consisting of a device for visually recording time intervals and means for coordinately recording sound impulses created in the tube to be tested, the combination of a tubular connection leading from the tube to be tested, a diaphragm open to sound impulses coming through said connection, a stylus actuated by said diaphragm to record the sound impulses and means for varying the opening through the tubular connection to the diaphragm.

4. In an apparatus for locating obstructions in tubes consisting of a device for visually recording time intervals and means for coordinately recording sound impulses created in the tube to be tested, the combination of a tubular connection leading from the tube to be tested, a diaphragm open to sound impulses coming through said connection, a stylus actuated by said diaphragm to record the sound impulses and a guard-plate situated in front of the diaphragm arranged to check its outward movement beyond a point of safety.

602,423. RAILWAY SIGNALING APPARATUS. HENRY BEHR, New Rochelle, N. Y. Filed Aug. 23, 1893. Renewed Sept. 3, 1897. Serial No. 650,534. (No model.)

Claim.—1. A signal for railways, comprising a semaphore-blade having a landscape-background adapted to make a series of continuous revolutions in a substantially vertical plane and to assume a defined predetermined position, means for continuously revolving said semaphore-blade to indicate one condition of the track and means for causing said semaphore-blade to automatically assume a defined predetermined position to indicate a different condition of the track, substantially as set forth.

2. A signal for railways comprising a semaphore-blade of opaque material adapted to make a series of continuous revolutions in a substantially vertical plane, and adapted to assume a defined predetermined position, a lantern located behind the said semaphore-blade, means for continuously revolving the semaphore-blade thereby flashing the light to indicate one condition of the track, and means for causing the semaphore-blade to automatically assume a defined predetermined position to indicate a different condition of the track, substantially as set forth.

3. A signal for railways, comprising a semaphore-blade having a landscape-background adapted to make a series of continuous revolutions in a substantially vertical plane and to assume a defined predetermined position, a motor operatively connected with the semaphore-blade for continuously revolving the semaphore-blade to indicate one condition of the track, and means for causing the semaphore-blade to automatically assume a defined predetermined position to indicate a different condition of the track substantially as set forth.

4. In mechanism for operating a signal, the combination of a primary rotatable shaft, provided with a pinion, a secondary rotatable shaft provided with a wheel having teeth around a portion of its periphery in operative connection with the pinion on the primary shaft and also provided with a spring-tooth in the otherwise toothless portion of its periphery, with means for rotating the primary shaft whereby when the primary shaft rotates the secondary shaft also rotates until its spring-tooth is engaged and whereby the secondary shaft then ceases to rotate in its initial direction, substantially as set forth.

5. In mechanism for operating a signal, the combination of a primary rotatable shaft, provided with a pinion, a secondary rotatable shaft provided with a wheel having teeth around a portion of its periphery in operative connection with the pinion on the primary shaft and also provided with a spring-tooth in the otherwise toothless portion of its periphery, with means for rotating the primary shaft whereby when the primary shaft rotates the secondary shaft also rotates until its spring-tooth is engaged and whereby the secondary shaft then ceases to rotate in its initial direction, and means for rotating the secondary shaft in reverse direction when the primary shaft ceases to rotate, whereby the primary shaft is restored to its normal position, substantially as set forth.

6. In mechanism for operating a signal, the combination of a primary rotatable shaft provided with a lug and with a pinion, a secondary rotatable shaft provided with a recessed disk adapted to engage the lug except when the recess and lug register and also provided with a wheel having teeth around a portion of its periphery in operative connection with the pinion on the primary shaft and also provided with a spring-tooth in the otherwise toothless portion of its periphery, with means for rotating the primary shaft, and means for rotating the secondary shaft in reverse direction when the primary shaft ceases to rotate, substantially as set forth.

7. In mechanism for operating signals, the combination of a primary shaft provided with a clutch, one member of which is loosely sleeved thereon, a pinion and lug fixed upon said primary shaft, a secondary shaft provided with a recessed disk adapted to engage the lug on the primary shaft except when the recess of the disk and the lug register, a wheel fixed on the secondary shaft having teeth around a portion of its periphery and a spring-tooth on the otherwise toothless portion of its periphery, engaging the pinion on the primary shaft, substantially as set forth.

602,424. BURNER FOR ACETYLENE GAS. JOHANN S. BILLWILLER, Unteraegeri, Switzerland. Filed Jan. 26, 1897. Serial No. 620,676. (No model.) Patented in Switzerland Nov. 28, 1896, No. 13,268.

Claim.—1. The combination with a gas-burner, of a hood or shield constructed of a material that is a good conductor of heat, arranged above the burner and provided with one or more apertures in line with and of greater diameter than the corresponding burner orifice or orifices, the material of said hood in the immediate vicinity of said aperture or apertures, being protected on the flame side by a material that is a bad conductor of heat, for the purpose set forth.

2. A burner constructed of a material that is a bad conductor of heat, in combination with a hood or shield constructed of a material that is a good conductor of heat arranged above said burner, and provided with one or more jet-apertures in line with and of greater diameter than the corresponding burner orifice or orifices, for the purpose set forth.

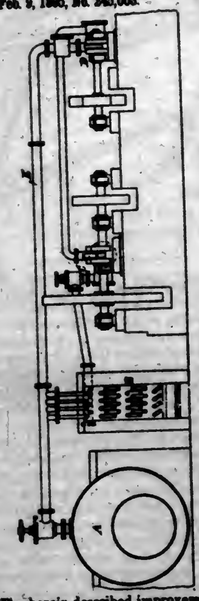
3. A burner constructed of a material that is a bad conductor of heat, in combination with a hood or shield constructed of a material that is a good conductor of heat, arranged above said burner and provided with one or more apertures in line with and of greater diameter than the corresponding burner orifice or orifices, the material of said hood in the immediate vicinity of the aperture or apertures being protected on the flame side by a material that is a bad conductor of heat, for the purpose set forth.

602,425. SHUFFLE-HOE. CHARLES M. BROWN, Ocala, Fla., assignor to Augusta F. Brown, Decatur W. Davis, and William Holder, same place. Filed July 6, 1897. Serial No. 643,674. (No model.)

Claim.—1. A shuffle-hoe comprising a head, hangers attached to said head, two series of horizontal cutters sharpened front and rear and carried by the hangers and arranged in alternate relation one to the other, and a suitable operating handle or staff attached to the head to move the head and cutters back and forth in the service of the implement, substantially as described.

2. A shuffle-hoe comprising a head, a series of double-armed hangers attached diagonally to the head, two series of horizontal cutters sharpened front and rear and attached to the front and rear arms of the hangers and with the cutters of one series in alternate relation to the cutters of the other series, and an operating staff or handle attached to the head and serving to reciprocate the head and cutters back and forth in the service of the implement, substantially as described.

3. A shuffle-hoe comprising a head, hangers attached to said head, the front and rear series of horizontal cutter-blades attached to the hangers with one series of cutter-blades in alternate relation to the other series of cutter-blades, each cutter-blade having working edges at the front and rear sides thereof, and a suitable operating-handle attached to the head and serving to reciprocate the implement back and forth in the service thereof, substantially as described.



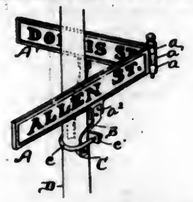
4. In a shuffle-hoe, the hangers each consisting of a single piece provided with parallel members and with a central attaching-shank, combined with a head to which the hangers are fastened, and cutters sharpened front and rear and attached to the parallel members of said hangers, as and for the purposes described.

5. A shuffle-hoe comprising a head, a series of hangers arranged diagonally to the head and fastened thereto, and two series of cutters attached to the hangers and arranged in alternate relation to each other, each cutter comprising a substantially square plate having cutting edges on each side thereof, as and for the purposes described.

6. A shuffle-hoe comprising a cross-head, hangers passed through said head diagonally thereto and carrying the two series of cutters, which are sharpened at their front and rear edges, and a common fastening-plate attached to said cross-head, as and for the purposes described.

7. A hand-operated shuffle-hoe comprising a longitudinal head, a handle, two series of horizontal cutters sharpened front and rear and arranged one in rear of the other and with the cutters of one row arranged in alternate relation to the cutters of the other row, and means for uniting the individual cutters rigidly to the head, substantially as and for the purposes described.

602,426. STEAM-ENGINE. SAMUEL CRAWOOD, London, and SAMUEL R. CRAWOOD, Bolton, England. Filed Dec. 28, 1897. Serial No. 664,072. (No model.) Patented in England Oct. 31, 1893, No. 20,583, and in France Feb. 9, 1895, No. 245,003.



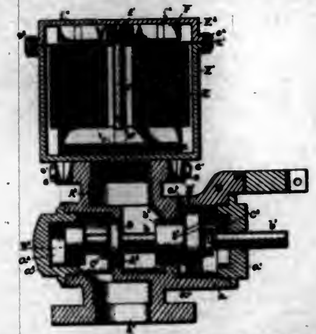
Claim.—1. The herein-described improvement in the art of obtaining motive power from high-pressure superheated steam, which improvement comprises the following steps, viz: first, working superheated steam expansively in an engine so as to reduce the temperature of the exhaust-steam below that of the water in the generator; second, compressing the resulting comparatively cool low-pressure steam as it escapes from the engine after doing its work to the initial pressure of the generator; third, returning this compressed steam without reducing its temperature to the generator; fourth, reheating this steam; fifth, passing it again through the superheater to heat it still further, and, sixth, reusing this reheated superheated steam in the engine.

2. The combination, substantially as hereinbefore set forth, of a steam boiler or generator, a superheater connected therewith, an engine connected with the superheater, a compressor directly connected with the exhaust-pipe of the engine and a return-pipe directly connecting the compressor and generator, for the purpose specified.

602,427. CORNER STREET-SIGN. GEORGE G. COCKBURN, Cleveland, Ohio, assignor to T. H. Brooks and W. H. Shepard, same place. Filed May 17, 1897. Serial No. 636,963. (No model.)

Claim.—A corner street-sign consisting of two sign-plates hinged together at their ends, and each plate lettered on both sides provided with an ear a^2 upon its lower edge, and which ear is recessed upon both of its sides, combined with the bent legs B which have their upper ends so shaped as to fit in the recesses in the ear, and their lower ends bent to bear vertically against a suitable support; and a clamp which surrounds the support and secures the lower ends of the legs rigidly thereto, substantially as shown and described.

602,428. IRONING-TABLE. SARAH J. COGGINS, Mount Morris, Ill. Filed June 4, 1896. Serial No. 594,273. (No model.)



Claim.—1. In an ironing-table, the combination of the pairs of crossing legs, the continuous rod for pivotally connecting together said legs, the protecting or side boards with their lower converging edges hinged together and adapted to permit passing between them thereat of said pivoting-rod and having at their outer ends, near the upper edges, pins or projections entering coincident apertures in the upper ends of said legs, the ironing-board and means for supporting said ironing-board in position between said protecting-boards, near their upper edges, substantially as set forth.

2. In an ironing-table, the combination of the pairs of crossing legs, the continuous rod for pivotally connecting together said legs, the protecting or side boards with their lower converging edges hinged together and adapted to permit the passing between them thereat of said pivoting-rod and having at their end, near the upper edges, pins or projections entering coincident apertures in the upper ends of said legs or supports, the ironing-board having secured to its under side, at one end, a cross-bar and supported at its opposite end upon, but not attached to, a second cross-bar, said cross-bars having apertures in their ends engaging upstanding hooks on the inner sides of said protecting-boards, at their upper edges, said pivoting-rod having one end headed and a thumb or binding nut at its opposite end, and said ironing-board also having at the opposite end to that to which is secured its cross-bar, means for suspending that end upon one of the hooks upon one of said protecting-boards, substantially as described.

3. In an ironing-table, the combination of two pairs of legs, having openings therein at points adjacent to their upper ends, protecting-boards hinged together at their lower edges and having pins projecting outwardly from their upper outer edges fitting within the openings in said legs and engaging the inner surfaces thereof, a rod or bar having a screw-threaded nut at one end, connecting said pairs of legs at points intermediate of their ends, and lying between said boards at points adjacent to their lower edges, a head upon the other end of said rod, and means for supporting an ironing-board, substantially as specified.

602,429. VALVE-CONTROLLER. ARTHUR B. COLGATE, New York, N. Y., assignor to the Signal Control Company, Brooklyn, N. Y. Filed Sept. 19, 1896. Renewed Oct. 1, 1897. Serial No. 653,747. (No model.)

Claim.—1. The combination with a main valve designed to be held to its seat by the pressure from the inlet, of a valve-stem provided with an actuating-piston working in a separate chamber and adapted to be actuated by the pressure from the inlet to open the main valve, another piston on said valve-stem working in a chamber to cushion the opening stroke of the main valve, a passage from the inlet to the chamber of the actuating-piston, and an auxiliary valve for controlling said passage, substantially as set forth.

2. The combination with a main valve designed to be held to its seat by the pressure from the inlet, of a valve-stem provided with an actuating-piston working in a separate chamber and adapted to be actuated by the pressure from the inlet to open the main valve, another piston on said valve-stem working in a chamber to cushion the opening stroke of the main valve, a head or enlargement on the outlet side of said valve-stem, a passage from the inlet to the chamber of the actuating-piston, and an auxiliary valve for controlling said passage, substantially as set forth.

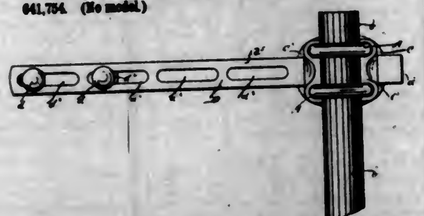
3. The combination with a main valve designed to be held to its seat by the pressure from the inlet, of a valve-stem provided with an actuating-piston working in a separate chamber and adapted to be actuated by the pressure from the inlet to open the main valve, another piston on said valve-stem working in a chamber to cushion the opening stroke of the main valve, a passage from the inlet to the chamber of the actuating-piston, an auxiliary valve for controlling said passage, and an electromagnet for operating said auxiliary valve, substantially as set forth.

4. The combination with a main valve designed to be held to its seat by the pressure from the inlet, of a valve-stem provided with an actuating-piston working in a separate chamber and adapted to be actuated by the pressure from the inlet to open the main valve, another piston on said valve stem working in a chamber to cushion the opening stroke of the main valve, a passage from the inlet to the chamber of the actuating-piston, an auxiliary valve for controlling said passage, said valve being held to its seat by the pressure from the inlet, and an electromagnet for opening said auxiliary valve, substantially as set forth.

5. The combination with a main valve designed to be held to its seat by the pressure from the inlet, of a valve-stem provided with an actuating-piston working in a separate chamber and adapted to be actuated by the pressure from the inlet to open the main valve, means for permitting the operation of said main valve manually, a piston at the other end of the valve-stem working in a chamber to cushion the opening stroke of the main valve, a passage from the inlet to the chamber of the actuating-piston, and an auxiliary valve for controlling said passage, substantially as set forth.

6. The combination with a main valve, of a valve-stem provided with an actuating-piston working in a separate chamber and adapted to be actuated by the pressure from the inlet to open the main valve, a passage from the inlet to said chamber, and an auxiliary valve for controlling said passage, said auxiliary valve being slightly overbalanced and held to its seat by pressure from the inlet, substantially as set forth.

7. The combination with a main valve, of a valve-stem provided with an actuating-piston working in a separate chamber and adapted to be actuated by the pressure from the inlet to open said valve, a passage from the inlet to said chamber, and an auxiliary valve for controlling said passage, said auxiliary valve having a surface upon which the pressure within the valve-chamber acts to produce a rapid closing of the auxiliary valve and located so as not to affect the opening movement of said valve, substantially as set forth.



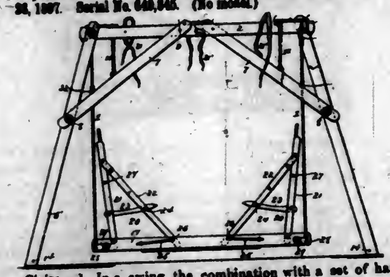
8. The combination with a main valve, of a valve-stem provided with an actuating-piston working in a separate chamber and adapted to be actuated by the pressure from the inlet to open the main valve, a passage from the inlet to said chamber, and an auxiliary valve for controlling said passage, said auxiliary valve on the inlet side being slightly overbalanced to hold it to its seat, and having a surface on the outlet side which greatly overbalances the valve to produce a rapid closing thereof, substantially as set forth.

9. The combination with a main valve, of a valve-stem provided with an actuating-piston working in a separate chamber and adapted to be actuated by the pressure from the inlet to open the main valve, a passage from the inlet to said chamber, an auxiliary valve for controlling said passage and whose valve-stem projects through the valve-casing, means engaging with said valve-stem to open the auxiliary valve, and a hood or thimble d^9 on said valve-stem, substantially as and for the purpose set forth.

10. The combination with a main valve, of a valve-stem provided with an actuating-piston working in a separate chamber and adapted to be actuated by the pressure from the inlet to open the main valve, a passage from the inlet to said chamber, an auxiliary valve for controlling said passage and whose valve-stem projects through the valve-casing, means engaging with one end of said valve-stem to open the auxiliary valve, a hood or thimble d^9 on that end of the valve-stem, and a collar d^7 packing d^8 and packing-ring d^{10} through which the other end of said valve-stem works, substantially as and for the purpose set forth.

11. The combination with a main valve, of a valve-stem provided with an actuating-piston working in a separate chamber and adapted to be actuated by the pressure from the inlet to open the main valve, a passage from the inlet to said chamber, an auxiliary valve for controlling said passage, an electromagnet for operating said auxiliary valve, a practically water-tight casing for said magnet, a plate x' and connected tube x^2 through which extends a rod from the armature to the stem of the auxiliary valve, and a packing at the outer end of said tube x^2, substantially as and for the purpose set forth.

602,430. WEED-CUTTER ATTACHMENT FOR CULTIVATORS. PATRICK W. CONCORAN, Forest, Ill. Filed June 22, 1897. Serial No. 641,754. (No model.)



Claim.—A weed-cutter attachment for cultivators having the bar D with right angles d^1 d^2, parallel arms d^4 d^5 and the slots d^6 in the arm d^5 whereby it may be clamped to two standards of the cultivator and to the weed-cutter shank in the manner shown and described.

602,431. BRUSH. ARTHUR W. COULTER, London, England. Filed June 7, 1897. Serial No. 639,707. (No model.)

Claim.—In a brush a rigid detachable metallic bristle-plate, a series of cylindrical perforations, projecting burs at the back of said perforations having apertures of less diameter than the perforations, bristles inserted in the said perforations, retaining-wires securing the bristles, and means for readily securing the bristle-plate to the remaining portion of the brush.

602,432. SWING. JOHN G. J. DAVIS, Augusta, Ga. Filed Aug. 26, 1897. Serial No. 649,845. (No model.)

Claim.—1. In a swing, the combination with a set of hanger-rods, and a seat supported at their lower ends, of braces connecting these hanger-rods in pairs and bowing them outward between their ends whereby to afford ample clearance between the rods and the sides of the seat.

2. In a swing, the combination with a set of hanger-rods pivotally suspended at their upper ends, and a seat supported by them at their lower ends, of a pair of crossed braces connecting these rods in pairs these braces having a sliding pivotal connection at one end and a loose connection with the rods at the other end, and means for confining the ends of the braces in their relation to the hanging-rods whereby to spread the rods apart between their ends to clear the sides of the seats.

3. In a swing, the combination with hanging-rods having loops in their lower ends, of a platform having pins thereon adapted to enter the loops in the lower ends of the rods, and pivoted keepers for holding the loops upon the pins, substantially as set forth.

4. In a swing, the combination with a platform or bottom, of extensible hanging-rods, loops pivotally connected therewith, pins on the platform adapted to enter these loops, and means for holding the loops on the pins, substantially as set forth.

5. In a swing, the combination with a platform, of hanging-rods, and braces having a sliding pivotal connection with the rods, the free ends loosely embracing the rods, substantially as set forth.

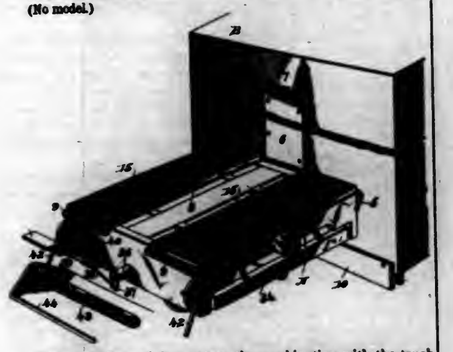
602,433. VEIL-HOLDER. ELLEN DETWILER, Ironbridge, Pa. Filed Mar. 16, 1897. Serial No. 627,797. (No model.)

Claim.—1. The herein-described veil holder or clasp having flat-surfaced base, intermediate and outer veil-engaging leaves, a clamp connected with the base-leaf for securing the holder or clasp to a hat-crown, and yielding means for hingedly connecting said leaves, to allow swinging, and also longitudinal and transverse movement in parallel planes, thereof, substantially as specified.

2. The herein-described veil holder or clasp having flat-faced coextensive base, intermediate and outer veil-engaging leaves, a clamp carried by the base-leaf for engaging a hat, and yielding means for hingedly connecting said leaves in series to allow swinging, and also longitudinal and transverse movement in parallel planes, thereof, and adapted to normally maintain said leaves in registration with their corresponding edges flush with each other, said means consisting of springs, each having an intermediate and terminal spaced tongues, extending in parallel directions, and respectively engaged with the contiguous edges of adjoining leaves, and reversed open coils connecting the intermediate tongue respectively with the terminal tongues, and each consisting of a plurality of twists or members spaced apart to allow axial expansion and contraction of the coils, substantially as specified.

602,434. SIGNALING DEVICE FOR RAILWAY-CARS. FRANK W. DUNN, Detroit, Mich. Filed Sept. 26, 1897. Serial No. 653,210. (No model.)

Claim.—1. The herein-described circuit-closing device, comprising a casing adapted to be secured to the car above the heads of the passengers and provided with openings in the top and front, the insulated pivoted contact-lever having one end projected through the front opening, the insulated contact-plate secured inside the casing in the path of the movement of the lever, the insulated spring for normally holding the lever and plate apart, the circuit-wires entering the casing through the top opening and connected respectively to the lever



and contact-plate, and a cord attached to the projecting end of the lever and depending in reach of the passengers, substantially as described.

2. The herein-described circuit-closing device comprising a hollow metal casing provided with lugs or ears to receive screws to secure it to the wall of the car above the heads of the passengers, said casing being open in the rear and provided with an opening, C, in the front, an opening, D, in the top and openings in the sides, the lever, F, provided with insulated trunnions journaled in the openings in the sides of the casing and having a bent forward end projecting through the opening, C, in the front of the casing, a spring, M, secured in the block of insulating material in the interior of the casing, a stop-block, O, of insulating material engaging said spring, the contact-plate, L, secured in a block of insulating material in the interior of the casing in the path of movement of the lever, and the line-wires, Q and R, passing through the opening, D, in the top of the casing, the former connecting to the lever, F, and the latter to the contact-plate, L, substantially as described.

602,485. MINING-CAR AND RAILWAY SYSTEM THEREFOR.

JOHN DWYER, Butte, Mont. Filed Mar. 10, 1897. Serial No. 626,827. (No model.)

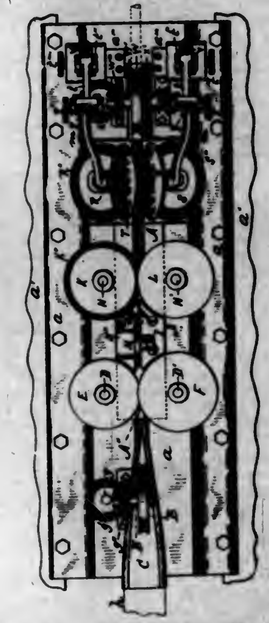
Claim.—1. In a mining system, the combination with the truck and body of the car, of plates spaced apart and rigidly secured to the truck and having knuckles at their opposite ends, a plate firmly attached to the car-body and fitting snugly between the spaced plates, and of a corresponding length therewith and having knuckles at its ends, and pins or rods removably fitted into the alining knuckles of the plates to secure the parts of the car together and form a support for the body to tilt upon, substantially as set forth.

2. In a mining system, the combination with the truck and body of a car, of plates spaced apart and firmly secured to the truck and having knuckles at their ends, a plate rigidly attached to the body and fitting snugly between the spaced plates and having knuckles at its ends to aline with the knuckles of the spaced plates, pins or rods passing through the alining knuckles of the plates to secure the body in place, and removable to admit of the body tilting from either end, and rubber strips applied to the top side of the spaced plates and thicker than the plate applied to the body, substantially as shown for the purpose set forth.

3. In a mining system, two or more separate and independent cars constructed for conjoint use placed side by side and having their contiguous portions intermatching, whereby the cars are held against vertical displacement and are free to separate, substantially as set forth for the purpose described.

4. In a mining system, the combination of two or more separate and independent cars constructed for conjoint use placed side by side, and strips overlapping the joint formed between contiguous portions of adjacent cars and rigidly secured to the opposite sides thereof, whereby the cars are prevented from independent vertical movement but are free to separate laterally under conditions, substantially as described.

5. In a mining system, the combination of two or more separate and independent cars arranged side by side and having vertical end pieces, and having the contiguous edges of their bottoms intermatching, keepers applied to an end of one car, and a bolt or rod slidably mounted in keepers applied to the end of the other car and adapted to engage with the keepers of the first-mentioned end, substantially as set forth for the purpose described.



6. In a mining system, the combination of tracks extending parallel for a given distance, thence branching or diverging, and cars mounted upon the tracks side by side and having their contiguous portions intermatching and readily separable when the cars reach the diverging or branching portions of the tracks, substantially as set forth.

7. In a mining system, the combination of tracks extending parallel for a given distance, thence branching or diverging, cars mounted upon the tracks and having their contiguous portions intermatching and readily separable when the cars reach the diverging portions of the tracks, means for securing the cars prior to unloading, and provision for admitting of the car-bodies tilting, substantially as specified.

8. In a mining-car, the combination of a brake-beam, a shaft having connection with the brake-beam, a lever having one end connected with an arm of the said shaft, and a foot-lever mounted upon the same support with the lever and engaging with the free end thereof, and adapted to fold, substantially as and for the purpose set forth.

602,486. CIGARETTE-MACHINE.

JOHN O. HAYES, Fall River, Mass., assignor of one-fourth to John Marshall, same place. Filed June 3, 1897. Serial No. 638,821. (No model.)

Claim.—1. In a continuous-cigarette machine in which the strip or wrapper-tube is fed into the machine with its edges upturned and one higher than the other, the combination of the following mechanisms: mechanism arranged to turn the broader edge or flap of the wrapper-tube horizontally over and across the upturned narrower edge or flap; mechanism for folding said broader edge or flap down around and against the narrower edge or flap; mechanism for folding the two flaps thus formed down into a seam on opposite sides of the center or opening into the wrapper proper; and crimping mechanism entirely outside of the wrapper-tube arranged to unite the several thicknesses or plies of paper which compose the seam thereby produced.

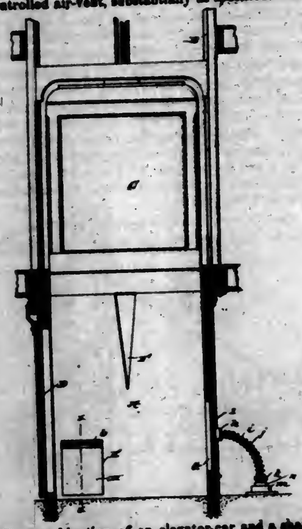
2. In a continuous-cigarette machine, a bed provided with a trough or groove A′ for the reception of the tobacco rod and strip; the horizontally-arranged disk-wheels E and F having the under edges of their peripheries formed with curved grooves continuing and completing the circle of which said trough describes an arc, said disk-wheel F being provided with the peripheral lip F‴ arranged to overlap the edge of the disk-wheel E and thereby fold one edge or flap of the wrapper-tube horizontally over and across the opposite edge or flap; and mechanisms for feeding the tobacco rod and strip between said wheels and for rotating the latter, substantially as described.

3. In a continuous-cigarette machine, a bed provided with a trough or groove A′ for the reception of the tobacco rod and strip; the horizontally-arranged disk-wheels E and F having the under edges of their peripheries formed with carved grooves continuing and completing the circle of which said trough describes an arc, said disk-wheel F being provided with the peripheral lip F‴ arranged to overlap the edge of the disk-wheel E; the vertically-arranged disk-wheel H provided with the beveled periphery H′; the guide plate I formed with the groove I′; and mechanisms for feeding the tobacco rod and strip between said disk-wheels E, F and between the beveled disk-wheel H and guide I, whereby one edge or flap of the wrapper-tube is folded over the opposite edge or flap and down at an acute angle therewith, substantially as set forth.

4. In a continuous-cigarette machine, a bed provided with a trough or groove A′ for the reception of the tobacco rod and strip; mechanism arranged and adapted to operate therewith to turn the strip into tubular form and to fold one edge or flap of the wrapper-tube over the other edge or flap and down at an acute angle therewith; the shaping-block J secured to the bed in advance of said mechanism and provided with the inner vertical edge J′ arranged centrally over the tobacco rod, said edge being formed with the beveled surface J″ facing the advancing strip or wrapper; the guide-plate I set opposite the shaping-block J and having an inner vertical edge; and mechanism for feeding the tobacco rod and strip along said trough or groove, whereby one edge or flap of the wrapper-tube is folded over and down against the outer surface of the opposite edge or flap, substantially as described.

5. In a continuous-cigarette machine, a bed provided with a trough or groove A′ for the reception of the tobacco rod and strip; mechanism arranged and adapted to operate therewith to turn the strip into tubular form and to fold one of the edges or flaps of the wrapper-tube over and against the outer surface of the opposite edge or flap; the horizontally-arranged disk-wheels K and L provided with the carved grooves K′ and L′ on the under edge of their peripheries, said wheel K being formed with the peripheral tongue K″, and said wheel L being formed with the peripheral groove L″ the under wall of which extends approximately to a sharp edge L‴, said tongue K″ being adapted to extend into said groove L″; mechanism for feeding the tobacco rod and strip along said trough; and mechanism for imparting rotation to said disk-wheels, whereby the welt-seam above described is produced and formed to extend on opposite sides of the entrance to the body of the wrapper-tube, substantially as set forth.

6. In a continuous-cigarette machine, a bed provided with a trough or groove A′ for the reception and passage of the tobacco rod and strip; mechanism adapted to operate therewith to turn the strip into tubular form and to form a seam which extends on opposite sides of the center or entrance to the body of the wrapper-tube; the oppositely-inclined disk-wheels R, S formed on their under edges with the peripheral grooves R′ S′ and on their upper edges with the beveled crimping-surfaces R″ S″; the oppositely-inclined disk-wheels T, U formed with the peripheral crimping edges T′ U′ and arranged to press upon the upper side of the seam while the crimping edges of the wheels R, S press up against the under side of the seam between said seam and the body of the wrapper; mechanism for imparting rotation to the four said disk-wheels; and mechanism for feeding the tobacco rod and tube with the seam formed thereon along said trough, substantially as described.



7. In a continuous-cigarette machine, the adjustable crimping mechanism, comprising the bed A provided with the trough A′; the oppositely-inclined lower disk-wheels R, S; the oppositely-inclined upper disk-wheels T, U; the gear-wheels *n* provided with the integral arms *m* supporting studs upon which the upper disk-wheels revolve; the disks *n′* adjustably secured to said gear-wheels by means of bolts and curved slots *n‴*; arms *l* extending from said disks *n′* and pivotally supported by standards *l″* adapted to be moved laterally on the base of the machine; worms *q* supported by said disks *n′* and engaging said gear-wheels *n*, and adjustable springs adapted to regulate the tension of the upper pair of crimping-disks upon the lower pair, substantially as set forth.

602,487. SAFETY APPLIANCE FOR ELEVATORS.

FREDERICK T. ELLINGWOOD, Newark, N. J. Filed Feb. 3, 1896. Serial No. 578,509. (No model.)

Claim.—1. The combination of an elevator-car and a shaft or well, an air-cushion at its bottom provided with two air-vents and also provided with suitable means for preventing the escape of air through one vent until the other vent fails to permit the air to escape with sufficient rapidity to prevent the sudden stop of a falling car, substantially as specified.

2. The combination of an elevator-car, and a shaft or well, an air cushion at its bottom provided with an inwardly-opening valve for the admission of air and also provided with an open air-vent and a valve-controlled air-vent, substantially as specified.

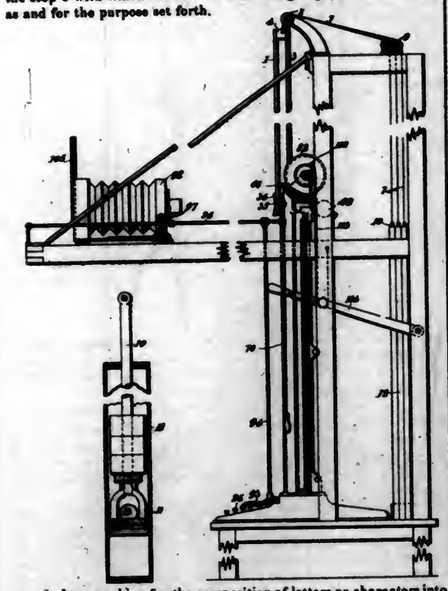
3. The combination of an elevator-car and a shaft or well, an air-cushion at its bottom provided with two air-vents and also provided with a downwardly and outwardly movable valve controlling one of said vents, substantially as specified.

4. The combination of an elevator-car, a shaft or well, an air-cushion chamber at the bottom of the shaft or well having two air-vents, and a spring-backed valve connected at its lower end in a hinged manner to the outside of one wall of the chamber below one air-vent whereby it is adapted to open outwardly and downwardly, substantially as specified.

5. The combination of an elevator-car, a shaft or well, an air-cushion chamber at the bottom of the shaft or well having two air-vents, a valve connected at its lower end in a hinged manner to the outside of one wall of the chamber below one air-vent whereby it is adapted to open downwardly and outwardly, a pedestal, a cup adjustably connected with the pedestal, a bowed guide-rod resting in the cup and extending loosely through an aperture in the valve, and a spring surrounding said rod and interposed between the cup and the valve, substantially as specified.

602,488. SHIPPING-BOX.

JACOB G. FOX, Bay City, Mich., assignor to Richard A. Smith, same place. Filed June 26, 1897. Serial No. 642,236. (No model.)



Claim.—In a shipping-box, the combination of the permanent lower box-section consisting of the bottom, end and side sections secured together, with the supplemental end sections hinged by their lower edges to the upper edges of the said permanent end sections, and provided on the inner sides of their lateral edges with the metal stripe 11, the supplemental side sections hinged by their lower edges to the bottom of the permanent box-section and provided on their ends with the outwardly-projecting metal hooks 10, adapted for engagement with the said stripe 11, when the supplemental sides are in a vertical position, and a cover having downwardly-projecting end sections for passing over the upper edges of the said hinged end sections and with side sections projecting downwardly for resting upon the upper edges of said hinged side sections, and means for retaining said cover in position substantially as set forth.

602,489. MEANS FOR COMPOSING CHARACTERS AND PRODUCING PHOTOGRAPHIC NEGATIVES THEREFROM.

WILLIAM FRIESE-GREENE, London, England, assignor to the Automatic Photo Printing Syndicate, Limited, same place. Filed Feb. 26, 1896. Serial No. 580,656. (No model.)

Claim.—1. In a machine for the composition of letters or characters into words or the like and having a number of movable character-bearing strips released successively from holding-up stops and arrested at the required heights by arresting-stops as set forth, the combination with such strips, and arresting-stops, of separately-movable holding-up stops, an engaging piece 34 withdrawing said holding-up stops successively, keys 26 representing the different characters, key-bars 23 operated by said keys, horizontal bar 27 with which the said key-bars are in contact, and connections between said horizontal bar and the engaging piece 34, whereby whenever any one of said keys 26 is operated the corresponding key-bar 23 depresses the horizontal bar 27 and the engaging piece 34 is pulled and withdraws the stop 6 with which it is for the time being engaged, substantially as and for the purpose set forth.

2. In a machine for the composition of letters or characters into words or the like and having a number of movable character-bearing strips released from holding-up stops and arrested at the required heights by arresting stops and having a set of keys and key-bars by means of which said holding-up stops and arresting-stops are operated and having also a traversing carriage which moves from one vertical row of arresting-stops to the next row of said stops at every manipulation of any of said keys, substantially as set forth, the combination with said keys, key-bars, holding-up stops, arresting-stops, and traversing carriage, of a "space-key" and corresponding key-bar inactive relatively to said holding-up stops, and the depression of which effects the feed of said traversing carriage but does not act upon any holding-up stop or any arresting-stop whereby one of the movable strips remains in its normal position substantially as and for the purpose set forth.

3. In a machine for the composition of letters or characters into words or the like and having a number of movable character-bearing strips released from holding-up stops and arrested at the required heights by arresting-stops and having a set of keys and key-bars by means of which said holding-up stops and arresting-stops are operated and having also a traversing carriage which moves from one vertical row of arresting-stops to the next row of said stops at every manipulation of any of said keys and having also a "space-key" and corresponding key-bar inactive relatively to said holding-up stops, and the manipulation of which effects the feed of said carriage but does not act upon any holding-up stop or any arresting-stop substantially as set forth, the combination with the movable character-bearing strips and said holding-up stops separately movable of means for simultaneously withdrawing all the holding-up stops that have not been withdrawn and simultaneously lowering the corresponding strips to any required extent whereby "spaces" are introduced between the words and the line is justified, substantially as and for the purpose set forth.

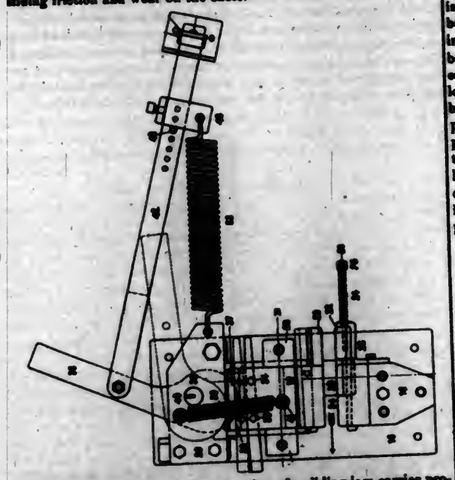
4. The combination with a machine for composing a line of letters or characters by means of a number of character-bearing strips which are moved into the respective positions to bring into alinement the characters required to make up a line, substantially as set forth, of a camera facing said machine and having its object-glass at the same height as that in which the line of characters is composed in said machine, a hand-operated device on said machine and connections between said device and said camera whereby when said device is operated the shutter of the camera is moved and causes an exposure, and the photographic plate or film is then moved and its next section thereby brought into line with the said slot substantially as and for the purpose hereinbefore described.

602,440. PROPELLING MECHANISM. CORNAVE L. GALBRAITH, New York, N. Y. Filed Apr. 20, 1897. Serial No. 634,469. (No model.)

Claim.—1. An improved propeller mechanism of the class described, comprising the upright standard or framework, the propeller-shaft carrying a sprocket wheel or gear, a sprocket drive-wheel or gear carried upon a shaft mounted at the top of the upright standard or framework, said shaft being provided with an opposite end crank, a sprocket chain or connecting mechanism extending between the gears, pitmen connected with the crank end of the drive-wheel shaft, and treadles extending from said pitmen rearwardly at each side the driving-gear mechanism, substantially as and for the purpose set forth.

2. An improved propeller mechanism of the class described, comprising the upright standard, the propeller-shaft having its front end bearing in the lower portion of said standard and provided with a sprocket-wheel, a sprocket drive-wheel mounted upon a shaft bearing on the top of the standard and provided with a rearwardly-projecting crank-arm or handle, the shaft of said drive-wheel being provided with a pedal-crank at its front end, a sprocket-chain connecting said gears, the pitmen respectively connected to said cranks at each side the mechanism and pivotally jointed, and the treadles connected with the pitmen and extending rearwardly at each side the driving mechanism, substantially as and for the purpose set forth.

602,441. REAPING-MACHINE. JOHN A. GORDON, Sharpsburg, Iowa. Filed June 17, 1897. Serial No. 641,189. (No model.)



Claim.—1. In a reaping-machine or harvester, the combination, with a platform for supporting the cutting apparatus formed of two parts arranged end to end, each said part comprising a frame having longitudinal bars at its front and back and a bottom secured to the said bars; of arms pivoted to the said longitudinal bars and permitting one part to be folded up onto the other part, the arm at the front of the platform being arranged behind the front bars inside the frames, and the bottom portion of one of the said frames being provided with an opening *c* for the said arm to work in, substantially as described and shown.

2. In a reaping-machine, a platform for supporting the cutting apparatus, formed in two parts arranged end to end, the longitudinal bars of one part having projections on their end portions which engage with notches in the longitudinal bars of the other part, in combination with arms pivoted to each of the said parts and permitting one part to be folded up onto the other part, substantially as set forth.

3. In a reaping-machine, the combination, with a platform for supporting the cutting apparatus, formed in two parts arranged end to end and provided with longitudinal bars, the outer part of the platform having also a narrow opening *c*; of arms pivoted to the rear sides of the said longitudinal bars and permitting the outer part of the platform to be folded up onto the inner part, the front arm being arranged to work in the said opening *c*, substantially as set forth.

602,442. ROLLER-TOBOGGAN. CHARLES H. GRANT, Hull, Mass. Filed July 20, 1897. Serial No. 645,376. (No model.)

Claim.—1. In a cable-grip, the combination of jaw-carriers, jaws adapted to slide in said carriers, means for imparting a direct positive grip of the jaws upon the cable, and elastic cushioning devices for effecting an elastic connection between the cable and the car without sliding friction and wear on the cable.

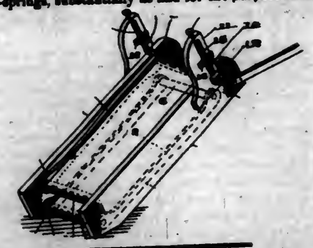
2. In a cable-grip, the combination of a sliding-jaw carrier provided with a sliding jaw, a traveling and sliding jaw, an operating-lever having an eccentric head, and spring-actuated mechanism for holding said lever normally in open position.

3. In a cable-grip, the combination of a sliding-jaw carrier provided with a sliding jaw, a traveling and sliding jaw carrier having a traveling and sliding jaw, and provided with a wear-adjusting key adjustably fastened thereto, an operating-lever having an eccentric head, said a filler-block disposed between said eccentric head and the adjusting-key.

4. In a cable-grip, the combination of a sliding-jaw carrier provided with a sliding jaw, a traveling and sliding jaw carrier having a traveling and sliding jaw, and provided with a wear-adjusting key adjustably fastened thereto, an operating-lever having an eccentric head, a filler-block disposed between said eccentric head and adjusting-key, and means for holding said filler-block in close contact with the eccentric head and adjusting-key.

5. In a cable-grip, the combination of a sliding-jaw carrier provided with a sliding jaw, a traveling and sliding jaw carrier having a traveling and sliding jaw, and provided with a wear-adjusting key adjustably fastened thereto, an operating-lever having an eccentric head, a bearing-plate for operating-lever, a filler-block disposed between said eccentric head and adjusting-key, and a spiral spring having one end thereof attached to said bearing-plate and the other end to said traveling and sliding jaw carrier for holding said filler-block in close contact with the eccentric head and adjusting-key.

6. In a cable-grip, the combination of a sliding-jaw carrier provided with a sliding jaw, a traveling and sliding jaw carrier provided with a traveling and sliding jaw, an operating-lever having an eccentric head, spring-actuated connecting mechanism connecting said traveling and sliding jaw carrier and said eccentric head, and a spring-actuated pull-back rod for said lever.



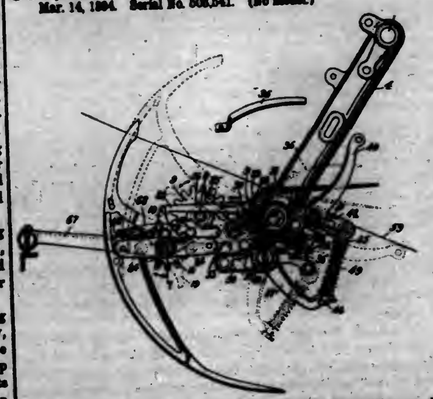
7. In a cable-grip, the combination of a sliding jaw, a traveling and sliding jaw, an operating-lever for said jaws, a pull-back rod for said lever having an adjustable block secured thereto, and a spiral spring connecting said adjustable block with the bearing-plate of said lever.

8. In a cable-grip, the combination of a sliding-jaw, a traveling and sliding jaw having a tongue interlocking with said sliding jaw, an automatically-operating lever for said jaws, and spring-actuated means for limiting the longitudinal movement of said jaws and for forcing them back into normal position.

9. In a cable-grip, the combination of a sliding jaw, a traveling and sliding jaw having a tongue interlocking with said sliding jaw, an automatically-operated lever for said jaws, a stop for limiting the longitudinal movement of said jaws, a stud passing through said stop and fastened at one end to said sliding jaw, and having a nut at its opposite end, and a spiral spring disposed between said nut and stop for drawing said jaws back into normal position.

602,443. BINDER. WILLIAM F. GRIMMY, Brucesville, Ind. Filed Feb. 3, 1897. Serial No. 621,737. (No model.)

Claim.—The combination with an elevator-frame, and a lower primary conveyer or apron supported therein, of an upper frame having its lower member fixed to the elevator-casing and its upper member hinged to said lower fixed member, a series of rollers journaled in said upper frame with certain rollers in the hinged section or member thereof, bracket-plates fixed to the elevator-frame at the upper end thereof and extending outwardly therefrom and provided with longitudinal slots coincident with slots in the elevator-frame, slidable bearings or boxes fitted and guided within the slots of the bracket-plates and receiving the journals of the upper terminal roller for the pressure apron or conveyer, pressure-springs arranged in the slots of the bracket-plates and bearing upon the slidable boxes or bearings, keepers fastened to the bracket-plates to span the slots therein and confine the pressure-springs in place, and the tension-screws supported in the bracket-plates and provided with followers that bear upon the pressure-springs, substantially as and for the purposes described.



602,444. WIRE FENCE. JAMES F. HAFFEY, Tiffin, Ohio, assignor of one-half to Everett C. Frost, same place. Filed Sept. 20, 1897. Serial No. 652,448. (No model.)

Claim.—A fence having runners, a sheet-metal stay intersecting the runners and provided at its point of intersection with transverse crimps forming seats, of which the depth is greater than the diameter of the runners, and of which the mouths or open sides are contracted to a width less than the diameters of the runners to prevent accidental displacement thereof, the stay between its transverse crimps being longitudinally crimped upon the opposite side from the transverse crimps, substantially as specified.

602,445. GRAIN-BINDER. PAUL HARRIS, Chicago, Ill. Filed Mar. 14, 1894. Serial No. 503,541. (No model.)

Claim.—1. In a grain-binder and in combination with a needle-shaft and needle, of a pivoted compressor-bar, a compressor-hook carried thereby, a lever arranged beneath the binder-deck and pivoted intermediate its ends below and adjacent to said needle-shaft, connections between one arm of said lever and said compressor-bar,

a gear-wheel having a cam-flange adapted to engage the other arm of said lever, means for rotating said flanged wheel periodically, comprising a gear having pins adapted to engage teeth on said flanged gear, and means for locking said flanged gear during its period of rest; as and for the purpose set forth.

2. In a grain-binder and in combination with the needle-shaft and needles and gearing for operating the same, of a compressor-bar, a lever arranged beneath the binder-deck, and pivoted intermediate its ends below and adjacent to said shaft, spring connections between one arm of said lever and said compressor-bar for yieldingly supporting the latter, and means, also arranged beneath the binder-deck, for periodically engaging and releasing the other end of said lever, comprising a flanged wheel, a gear having spaced pins projecting from the face thereof, arranged to engage teeth on said flanged wheel, and formed with a flanged hub adapted to engage the periphery of the teeth on said flanged wheel to lock the same during its period of rest, and means for operating said pin-wheel; as and for the purpose set forth.

3. In a grain-binder a star-shaped gear having a cam-flange thereon, a drive-gear therefor and means for rotating the same, pins and a flanged hub carried by said drive-gear said pins adapted to engage the star-shaped gear and impart a step by-step rotary motion thereto, the periphery of the points of the star-shaped wheel adapted to engage said flanged hub and to be locked against rotation during the periods of rest thereof, in combination with a bell-crank lever, a pivoted compressor-bar and adjustable spring connections between said bar and lever as and for the purpose set forth.

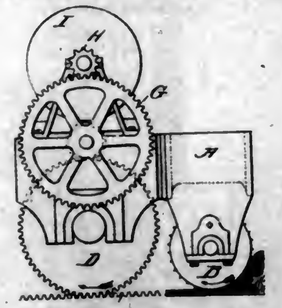
4. In a grain-binder a packer shaft and means for rotating the same, a needle-shaft and gearing intermediate said shafts for rocking said needle-shaft, a tripping mechanism for periodically throwing said intermediate gearing into and out of action comprising a pivoted trip-lever and an auxiliary or supplementary finger secured to said trip-lever, as and for the purpose set forth.

5. In a tripping mechanism for a grain-binding machine a pivoted trip-lever provided with flanges in combination with an auxiliary finger adapted to be secured thereto between said flanges, as and for the purpose set forth.

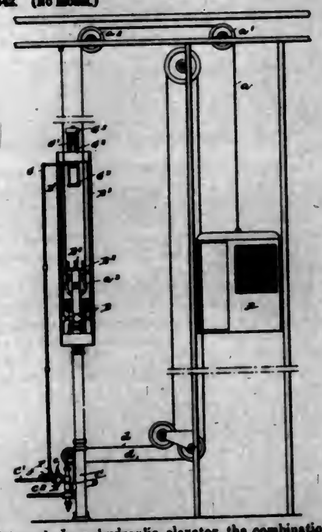
6. In a grain-binding machine, a framework, a housing, gearing, packing, knotting and compressing mechanisms, said housing supported at one end by said framework, means for adjusting said housing along said framework, a support for the outer end of said housing, provided with an open face, constituting a saddle, a bracket pivotally supported on the harvester-framework and extending outwardly therefrom, and adapted to receive said open-faced saddle to support said housing, whereby said bracket may be rocked about its pivots and move in said saddle when said housing is adjusted in a straight line along said harvester-framework; as and for the purpose set forth.

7. In a grain-binding machine a framework, having a hinged bracket, a housing supported at one end by said framework, an open-sided casting carried by said housing at the opposite end thereof, adapted to rest on and be supported by said hinged bracket, whereby said hinged bracket may be rocked to permit adjustment of said housing upon said framework in a straight line; as and for the purpose set forth.

602,446. IDENTIFICATION-BUTTON. MARVIN A. D. HARRIS, Brooklyn, N. Y. Filed Apr. 24, 1897. Serial No. 633,670. (No model.)



Claim.—In a button, the body A having the cavity *a*, and the flexible fastener C set therein and having the free ends C', C adapted to be folded upon and hold an identification-slip M, in combination with a removable cap B matching to said body and tightly closing said cavity, and means for detachably securing said body to a garment, all substantially as herein specified.



602,447. METHOD OF AND APPARATUS FOR ROLLING PLATE-GLASS. CHARLES C. HARTUNG, St. Louis, Mo., assignor to Edward Walsh, Jr., same place. Filed Sept. 3, 1896. Serial No. 604,706. (No model.)

Claim.—1. The herein-described method of making plate-glass, which consists, first, in forming the sheet of approximately the same thickness throughout its length, breaking up the upper surface of the sheet by forming indentations therein, which indentations run at right angles to the wavy lines of shrinkage, said indentations being formed while the sheet is being spread, permitting said indented upper surface to remain undisturbed for a short period, during which the molten glass flows, endeavoring to close said indentations, and finally smoothing said upper surface to entirely obliterate said indentations; substantially as described.

2. In an apparatus for rolling plate-glass, the combination with a table or bed having cog-racks arranged along its sides, of a carriage having a longitudinally-corrugated advance roller for initially spreading the molten glass into plate form, of approximately the same thickness throughout the length of the sheet of glass, a smooth following roller in said carriage having gear-wheels arranged at its ends for cooperating with the racks, said rollers moving in a plane parallel to the plane of the surface of the table; substantially as described.

602,448. AUTOMATIC STOP FOR HYDRAULIC ELEVATORS. FRANK B. HERRMAN, Winnetka, Ill. Filed Oct. 22, 1896. Serial No. 609,642. (No model.)

Claim.—1. In a hydraulic elevator, the combination with the elevator apparatus and the operating-cylinder, of a valve in connection with the operating-cylinder and a cylinder for the valve, a second cylinder connected with the valve-cylinder and containing liquid under pressure adapted to hold said valve open against a constant-pressure supply, and means operated by the moving part of the elevator mechanism adapted to relieve the pressure in the second cylinder and its connections, whereby the constant pressure becomes effective to shift said valve.

2. In a hydraulic elevator, the combination with the elevator apparatus and the operating-cylinder, of a valve in connection with the operating cylinder and a cylinder therefor, a piston connected with said valve, there being a constant pressure on one side of said piston tending to close the valve, a second cylinder and pipe connection between it and the part of the valve-cylinder opposite the other side of said piston, means for maintaining a pressure on the last-mentioned side of said piston normally in excess of the constant pressure tending to close said valve, and means operated by the moving part of the elevator mechanism adapted to relieve the pressure in the second cylinder and its connections, whereby the constant pressure becomes effective to shift said valve.

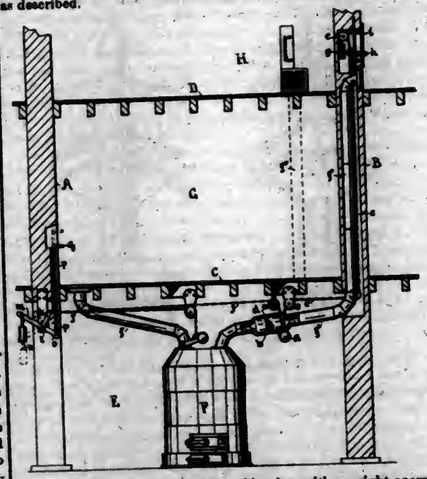
3. In a hydraulic elevator, the combination with the elevator apparatus, the operating-cylinder, of a valve in connection with the operating-cylinder and a cylinder for the valve, a second cylinder connected with the valve-cylinder and containing liquid under pressure adapted to hold said valve open against the means acting to close it, and devices operated by the moving part of the elevator mechanism adapted to relieve the pressure in the second cylinder and its connections, to permit the said means to act to close said valve.

4. In a hydraulic elevator, the combination with the elevator apparatus and the operating-cylinder, of a valve in connection with the operating-cylinder controlling the supply or discharge of the operating-cylinder, a cylinder for the valve, means tending to close the valve, a second cylinder connected with the valve-cylinder and containing liquid under pressure adapted to hold said valve open against the means acting to close it, and devices operated by the moving part of the elevator mechanism adapted to relieve the pressure in the second cylinder and its connections, to permit the said means to act to close said valve.

5. In a hydraulic elevator, the combination with the elevator apparatus, the operating-cylinder, and the main controlling-valve, of a second valve controlling the supply or discharge of the operating-cylinder, a piston connected with said valve, means tending to close the valve, a cylinder, a pipe connection between the cylinder and one side of said piston, a plunger in the second cylinder, means to cause the plunger to exert a pressure upon the liquid in the cylinder and its connections to hold said valve open against the means acting to close it, and devices operated by the moving part of the elevator-operating mechanism to withdraw said plunger and relieve said pressure, to permit the said means to act to close said valve.

602,449. BORING-TOOL. HUGH HILL, Anderson, Ind. Filed Apr. 15, 1897. Serial No. [illegible]. (No model.)

Claim.—1. A tool of the class described having a bar, a bar-holder provided with a bar-seat and means for securing the bar therein, said bar-holder being adapted to rest upon the transverse or cross slide of a tool-post, and a tongue pivotally mounted upon the bar-holder to engage a slot in the tool-post, substantially as specified.



2. A tool of the class described, having a holder provided with extensions or feet adapted to rest upon the transverse or cross slide of a tool-post, and a tongue adapted to extend through a tool-post slot, and resting upon said extensions or feet, substantially as specified.

3. A tool of the class described, having a holder provided with horizontal extensions or feet adapted to rest upon the transverse or cross slide of a tool-post, the intervals between said extensions or feet being adapted to receive the tool-post, and said extensions or feet having opposite flat upper surfaces, and a tongue adapted to extend through a tool-post slot and bearing terminally upon said flat surfaces of the extensions or feet, substantially as specified.

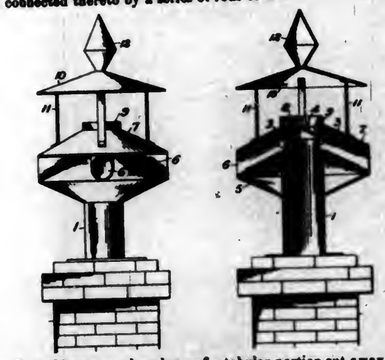
4. A tool-holder of the class described, having a holder provided with extensions or feet adapted to be arranged upon the transverse or cross slide of a tool-post upon opposite sides of the tool-post, and a tongue adapted to extend through a tool-post slot and rest terminally upon the upper sides of said extensions or feet, said tongue being pivotally mounted at one end upon one of said extensions or feet, substantially as specified.

602,450. DAMPER-CONTROLLER AND AUTOMATIC INDICATOR. CYRUS S. HOOD, Corning, N. Y. Filed May 21, 1897. Serial No. 637,643. (No model.)

Claim.—1. In a heating system, the combination, with a regulating valve or damper, of two separate motion-transmitting connections, one of said connections leading to a central point of control and the other connection leading to a point of control remote from the first, means for holding the connections in tension whereby when either one of the connections is operated in either direction to adjust the valve or damper a corresponding movement is imparted to the other connection, and a wall-plate or other device at each point of control which by the relative position of the connection thereto forms an indicator to show the position of the valve or damper substantially as described.

2. In a heating system, the combination, with a weight-operated valve or damper, of two motion-transmitting connections, one of said connections leading to a central point of control and the other connection leading to a second point of control remote from the first, weights attached to the connections to hold them in tension, the combined effects of said weights being opposed to and approximately equal to the weight operating upon said valve or damper, operating-handholds on the connections at the points of control, and a wall-plate or other device at each point of control which by the relative position of the connection thereto forms an indicator to show the position of the valve or damper substantially as described.

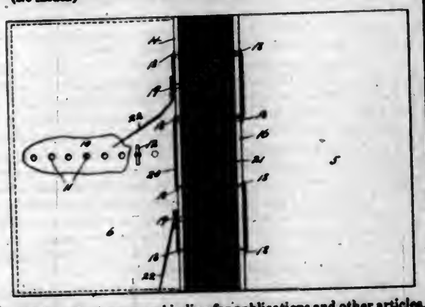
3. In a heating system, the combination, with a weight-operated valve or damper, of two motion-transmitting connections, one of said connections leading to a central point of control and the other connection leading to a second point of control remote from the first, weights attached to the connections to hold them in tension, means for adjusting the pull of one of said weights whereby the combined effect of the two connection-weights is rendered approximately equal to that of the valve or damper weight and an equilibrium of the parts established for the purpose set forth, operating-handholds on the connections at the points of control, and a wall-plate or other device at each point of control which by the relative position of the connection thereto forms an indicator to show the position of the valve or damper substantially as described.



4. In a heating system, the combination, with a weight-operated valve or damper, of two motion-transmitting connections, one of said connections leading to a central point of control, and the other connection leading to a point remote from the first, weights attached to the connections to hold them in tension, a bell-crank lever in the line of one of the connections to the horizontal arm of which one of said weights is movably attached, a third arm on said lever, a rod coupled to said arm and extending upward to one of the points of control, operating-handholds on the connections at the points of control and a wall-plate or other device at each point of control which by the relative position of the connection thereto forms an indicator to show the position of the valve or damper substantially as described.

5. In a heating system, the combination, with a weight-operated valve or damper, of a motion-transmitting connection, said connection leading to a central point of control, a bell-crank lever in the line of said connection, to the horizontal arm of which a weight is movably attached, a third arm on said lever, a rod coupled to said arm and extending upward to the point of control, and an operating-handhold on the connection at the point of control substantially as described.

602,451. CHIMNEY-CAP. JOSEPH HOULE, Bradford, Mass. Filed Jan. 9, 1897. Serial No. 618,836. (No model.)

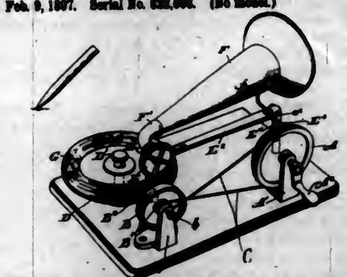


Claim.—1. A chimney-cowl made up of a tubular portion, cut away at its upper end, forming a series of openings, a cone-shaped cap fitting within the upper end of said tubular portion, a series of angularly-arranged air-conduits open at both ends, terminating at points adjacent to said cap and in line with the lower edges thereof and with said openings, a guide of sheet metal in the shape of the frus-

tum of a cone open at its upper end, secured to the upper side of said air-conduits, and a cone-shaped hood located above said guide and connected thereto by a series of rods or bars.

2. A chimney-cowl made up of a tubular portion cut away at its upper end, a cone-shaped cap secured to the upper end of said tubular portion, an enlargement on the outside of said tubular portion, having inclined upper and lower sides, angularly-arranged air-conduits supported upon said enlargement terminating at points adjacent to the upper end of said tubular portion in line with the lower edge of said cap and with said cut-away portion, a guide of sheet metal in the shape of the frustum of a cone open at its upper end, secured to the upper side of said air-conduits, and a cone-shaped hood located above said guide and connected thereto by a series of rods or bars.

602,452. COVER OR BINDER FOR MAGAZINES, &c. WLADYSLAUS JENDRIK, Brooklyn, N. Y. Filed Sept. 27, 1897. Serial No. 653,231. (No model.)

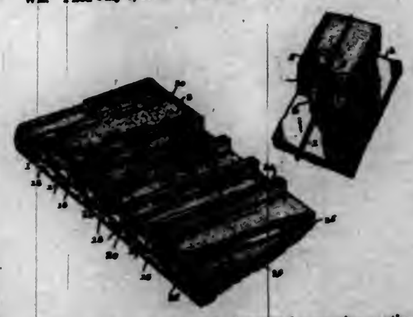


Claim.—1. A cover or binding for publications and other articles, consisting of two sides or boards one of which is provided with a space or chamber which opens backwardly, a flexible back connected with the other side, and adapted to be inserted into said space, and two flexible binding-strips one of which is secured to said flexible back, adjacent to the side with which it is connected, and the other being flexibly secured to the side in which said space or chamber is formed, substantially as shown and described.

2. A cover or binding for publications and other articles, consisting of two sides or boards one of which is provided with a space or chamber which opens backwardly, a flexible back connected with the other side, and adapted to be inserted into said space, and two flexible binding-strips one of which is secured to said flexible back, adjacent to the side with which it is connected, and the other being flexibly secured to the side in which said space or chamber is formed, and means for securing the flexible back in said space or chamber, and for adjusting the position thereof, substantially as shown and described.

3. A cover or binding for publications and other articles, consisting of two sides or boards one of which is provided with a space or chamber which opens backwardly, a flexible back connected with the other side, and adapted to be inserted into said space, and two flexible binding-strips one of which is secured to said flexible back, adjacent to the side with which it is connected, and the other being flexibly secured to the side in which said space or chamber is formed, and means for securing the flexible back in said space or chamber, and for adjusting the position thereof, and said binding-strips being provided with transverse perforations or openings, and a cord which is adapted to be passed therethrough, and through the publications or other articles, substantially as shown and described.

602,453. GRAMOPHONE-NEEDLE. JOSEPH W. JOHN, Philadelphia, Pa., assignor to himself and Joseph A. Vincent, same place. Filed Feb. 9, 1897. Serial No. 622,602. (No model.)



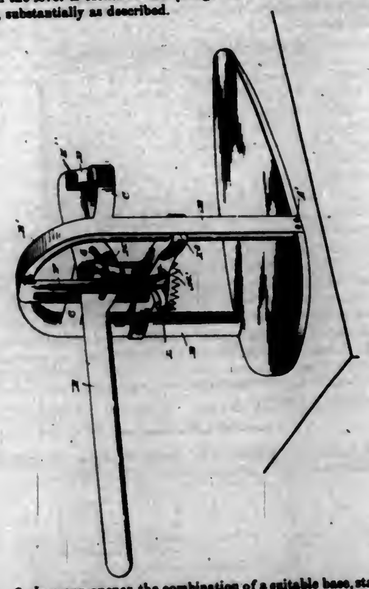
Claim.—1. A gramophone-needle having its working end reduced, said end being of the same diameter throughout its length, the same being adapted to the groove of the record.

2. A gramophone-needle having its working end reduced, said end being of the same diameter throughout its length and beveled at the point, the same being adapted to the groove of the record.

3. A gramophone-needle comprising a shank having one or more reduced ends of the same diameter throughout their length, the same being adapted to the groove of the record.

4. A gramophone-needle comprising a shank, F, a hub, F', pivotally secured thereto, provided with a plurality of points, said points being of the same diameter throughout their length the same being adapted to the groove of the record.

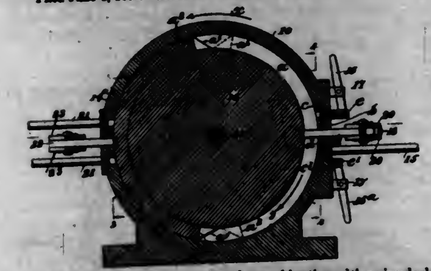
602,454. BOILER-COVERING. GEORGE KELLY, Mineral Point, Wis. Filed July 6, 1896. Serial No. 598,161. (No model.)



Claim.—1. The herein-described means for securing sections of lagging to steam-boilers and other surfaces to be protected, consisting of wires secured to the said boiler, hooks having their ends bent, the bent ends being right-angularly disposed to each other, and one of the bent ends adapted to engage with the said wires, and binding-wires arranged to lay over the lagging and engage with and be coiled around the other bent end of the hooks, substantially as shown and described.

2. A lagging composed of a layer of strips, a second layer of strips superposed on and breaking joint with the first layer and the strips of the second layer spaced apart from each other, and other strips fitted into the spaces between the strips comprising the said second layer and projecting beyond the surface thereof, substantially as shown for the purpose set forth.

602,455. CAN-OPENER. WILLIAM S. KIRK, Ada, Ind. Ter. Filed June 26, 1897. Serial No. 642,441. (No model.)

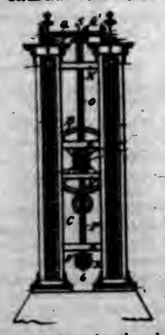


Claim.—1. In combination with the uprights, the plunger guided thereby, the lever pivoted to a rigid projection from the uprights and attached to the plunger, and guideways depending from the upright frame whereby they perform the double function of guideways for the lever and ejectors for the knife substantially as described.

2. In a can-opener, the combination of a base, standards secured on said base, a brace for said standards, a sliding plunger working on said standards, a knife carried by the plunger, and a lever pivoted at one end to said brace and connected with said plunger, whereby when the lever is oscillated the plunger and the knife will reciprocate, substantially as described.

3. In a can-opener, the combination of a suitable base, standards secured on said base, an arch connecting said standards, combined guides and ejectors carried by said arch, a plunger working on said uprights, a knife carried by said plunger, and an oscillating lever connected with said plunger for operating and working between said combined guides and ejectors, substantially as described.

602,456. ROTARY ENGINE. STEPHEN KERSHNER, Blue Hill, Nebr., assignor of one-fourth to Ferdinand Kershner, Marion, Iowa. Filed June 8, 1897. Serial No. 639,871. (No model.)



Claim.—1. In a rotary engine, the combination with a circularly-bored cylinder and a rotatably-supported cylindric piston-block therein, said piston-block having spaced circumferential channels extending partially around the piston-block at opposite sides thereof, said channels being of an equal depth throughout their length of abutment-bars adapted to work through the side of the cylinder, and alternately enter and leave the circumferential channels of the piston-block, as specified.

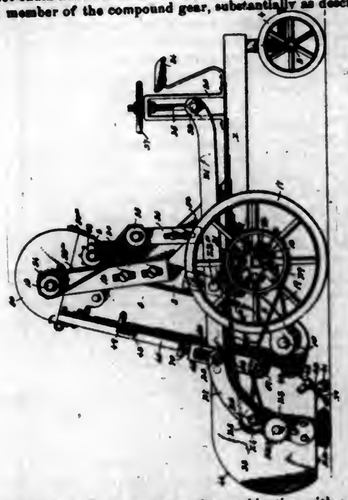
2. In a rotary engine, the combination with a circularly-bored cylinder having an inlet at one side and an exhaust at the opposite side, and abutment-bars pivoted on rocking bars, said latter bars pivoted on a projection from said cylinder, the inner ends of the abutment-bars working through apertures in the cylinder or chest thereon, of a cylindrical piston-block peripherally and laterally engaging the bore of the cylinder and the heads thereon, said piston-block having spaced peripheral channels extending partly around the piston-block at the opposite sides thereof, said channels having each a sloped terminal wall at each end thereof and adapted to alternately receive the inner ends of the slidable abutment-bars, substantially as specified.

3. In a rotary engine, the combination with a cylinder, a shaft rotatable centrally therein, a piston-block secured on the shaft and peripherally engaging the bore of the cylinder, said block having two spaced peripheral channels extending on opposite sides of the block partially around the same, and concentric on their bottoms with the axis of the shaft, each channel ending in an incline at each end, thus leaving cam formations intervening the ends of the channels, of two abutment-bars engaging their inner ends with the channels alternately, and slidable in the side of the cylinder, said bars being supported to reciprocate at their outer ends, an inlet supply-pipe for motive agent at one side of the cylinder, and an exhaust at the opposite side thereof, as specified.

4. In a rotary engine, the combination with a cylinder, a center shaft rotatable therein, a piston-block secured on said shaft, peripherally engaging the bore of the cylinder, said block having two spaced peripheral channels extending on opposite sides of the block and partially around the same, leaving cam formations intervening between ends of the channels, of two abutment-bars at each side of the cylinder, slidable in the walls thereof, and having their inner ends alternately engaged with the channels, both pairs of abutment-bars being supported to reciprocate at their outer ends, an inlet-pipe for motive agent at one side of the cylinder, two exhaust-pipes at the opposite side of said cylinder, and two spaced gate-valves adapted to control the direction of rotation had by the piston-block and center shaft, as specified.

602,457. LOWERING DEVICE. JOHN KRESSER, Duquesne, Pa. Filed May 3, 1897. Serial No. 634,572. (No model.)

Claim.—In a device for lowering the wheels from locomotives, the combination, with the columns located below the tracks on which the locomotive travels, the inclined brace-bars, the braces and the base-plates, of the vertical screws stepped in said base-plates, the shoulders, the balls, the movable nuts on said screws, the brackets, the I-beams, the rails secured thereto, the bevel-pinions secured to said screws, the shafts to which said pinions are secured, and the means for operating said bevel-pinions and shafts to rotate the screws and lower the tracks, substantially as described.



602,458. STREET-SWEEPER. SIMON D. LANYON and JOHN W. TRIPP, Sedalia, Mo. Filed Oct. 14, 1897. Serial No. 655,179. (No model.)

Claim.—1. In a street-sweeping machine, the combination with an upright casing, a wheeled carrying-frame, and an elevator within said casing, of the broom-carrying levers fulcrumed on the frame, a rotary broom mounted on the carrying-levers, driving mechanism for said broom, side fenders, 38, rigidly attached to the carrying-levers and arranged at the ends of the broom, a hood, 44, pivoted to the side fenders and extending from the upright casing rearwardly around the broom; said hood and side fenders forming an inclosure for the broom and adjustable with the carrying-levers to remain in the same relation at all times to said broom, substantially as described.

2. In a street-sweeping machine, the combination of a wheeled frame, an upright casing provided with a receptacle, 7, the broom-carrying levers, the side fenders and hood carried by said levers and forming an inclosure in rear of the casing, a broom mounted on the levers, a driving mechanism for the broom, an elevator, and an inclined plate 39, situated within the side fenders in advance of the broom, hinged at its upper edge to the receptacle, 7, and provided with the ground-rollers, substantially as described.

3. In a street-sweeping machine, the combination with a wheeled carrying-frame, an axle, and a driving-wheel, of the longitudinal carrying-levers fulcrumed on the machine, a broom having its shaft journaled in said levers and provided with a spur gear-wheel, a fixed plate on one side of a carrying-lever, a compound sprocket and gear wheel

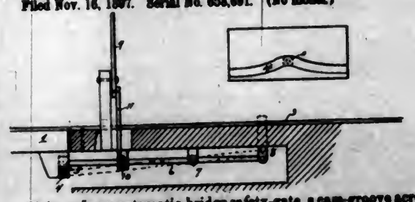
journaled between one lever and the fixed plate and meshing with the gear on the broom-shaft, a sprocket-wheel on the driving-wheel, and a sprocket-chain fitted to said driving sprocket-wheel and to the sprocket member of the compound gear, substantially as described.

4. In a street-sweeping machine, the combination with a frame, a main axle and a broom-shaft, of a wheel mounted on the axle to rotate therewith and carrying a driving-sprocket, a counter-shaft geared to the broom-shaft and having a sprocket-pinion, a driving-chain operatively connected to the driving-sprocket and to the sprocket-pinion on the counter-shaft, a slidable tension-frame carrying a loose guide-roller arranged in contact with one strand of said chain, and a spring which normally lifts the slidable tension-frame and its roller, substantially as described, for the purposes set forth.

5. In a street-sweeping machine, the combination with the main carrying-frame, a driving-wheel, an axle and a broom-shaft, of longitudinal adjusting-levers fulcrumed to the carrying-frame and sustaining the broom-shaft, a driving-sprocket on the driving-wheel, a counter-shaft journaled in the adjusting-levers and geared to the broom-shaft; a driving-chain between the driving-sprocket and the counter-shaft, a horizontal bar rigid with one of said adjusting-levers, a slidable tension-frame mounted on said bar, an idler friction-roller journaled in said tension-frame and engaging with one strand of the driving-chain, and a spring seated against said fixed bar and against the slidable tension-frame, substantially as described.

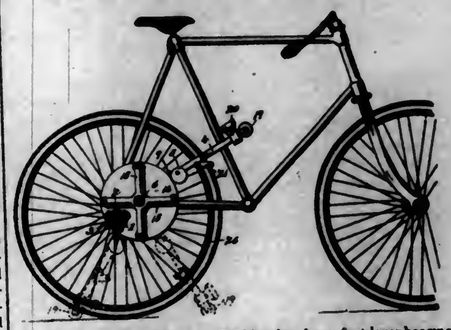
6. In a street-sweeping machine, the combination with a carrying-frame, and a driving-axle provided with a clutch-controlled sprocket-wheel, of adjusting-levers fulcrumed on said carrying-frame, a broom having its shaft journaled in said levers and provided at one end with a gear-pinion, a plate or link arranged parallel to one of said levers and connected rigidly thereto by a spindle and a fixed bar, a pinion and sprocket-wheel journaled on said spindle and arranged for the pinion to gear with the broom-shaft pinion, a driving-chain operatively connected with said sprocket-wheel and with the clutch-controlled sprocket-wheel, a slidable tension-frame loosely mounted on said fixed bar and carrying at its lower end a tension-roller which engages with one strand of the driving-chain, a spindle passing through the head of the tension-frame and seated on the fixed bar, and a spring fitted at its respective ends against the spindle and the head of the tension-frame, substantially as described.

7. In a street-sweeping machine, the combination with a main frame, an upright elevator-casing and a broom, of a closure detachably fastened to the rear of said upright casing, side fenders situated in close lateral relation to the ends of the broom, a pivoted hood attached to the lower part of the upright casing, a trough-like receptacle situated in advance of the upper end of said casing, a hood hinged to the rear closure and arranged to close the upper end of the upright casing and the trough-like receptacle, an endless elevator within said upright casing, a transverse conveyer, and suitable driving mechanism for said elevator and the conveyer, substantially as specified.



8. In a street-sweeping machine, the combination with a main frame, an upright casing and its trough-like receptacle, of the delivery spout or chute extending laterally from the trough-like receptacle and provided with a hinged delivery-section arranged to be fastened detachably to said spout or chute, a broom, an elevator, and a transverse conveyer, substantially as and for the purposes described.

602,459. CURTAIN-STRETCHER. MARCELLUS B. LANE and JOSEPH S. YOUNG, Pittsburg, Pa.; said Young assignor of his right to Anton Lutz, Allegheny, Pa. Filed Mar. 24, 1896. Serial No. 584,695. (No model.)

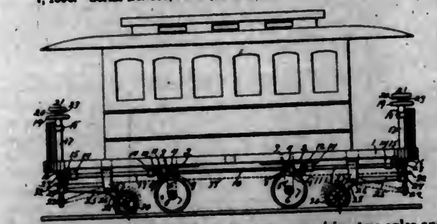


Claim.—As a new article of manufacture, a curtain-stretcher comprising a frame formed in two sections, hinged together, one end and one side of said frame having a series of clasps flexibly fastened thereto; rollers mounted respectively on the opposite end and side, the roller on the side being divided intermediate its length, and adapted to be connected at such point by a slidable collar; said rollers respectively having at one end a ratchet-wheel adapted to engage a spring-pressed pawl and having a series of cords the free ends of each of which are secured to a number of clasps, whereby said cords may be lengthened and shortened by the movement of said rollers, substantially as described.

602,460. SAFETY-GATE. EDRICK W. MASON, Cleveland, Ohio. Filed Nov. 16, 1897. Serial No. 658,691. (No model.)

Claim.—In an automatic bridge safety-gate, a cam-groove across the extremity of the bridge, having its highest point centrally located, in combination with a lever pivoted underneath the landing and extending longitudinally of the roadway, and provided with a forked extremity, vertically-sliding track-bumpers, pivotally secured to the forked extremities, and a transverse lever forked at its inner extremity to engage the longitudinal lever, a falling gate and a link connecting said gate at its outer extremity with the transverse lever, substantially as described.

602,461. BICYCLE. GEORGE C. MATHEWS, Jacksonville, Fla. Filed Jan. 20, 1897. Serial No. 619,924. (No model.)



Claim.—1. In a drive-gear for bicycles, &c., a foot-lever bearing a pedal to receive the pressure by means of which the machine is propelled and of such relative length that when depressed a portion will be brought into contact with the surface over which the machine is advancing for the purpose of checking its speed, substantially as described.

2. In a drive-gear for bicycles, &c., a foot-lever bearing a pedal to receive the pressure, by means of which the machine is propelled and of such relative length that when depressed its end will be brought in contact with the surface over which the machine is advancing for the purpose of checking its speed, and having a roller to receive the impact and travel upon the said surface, substantially as and for the purpose specified.

3. In a drive-gear for bicycles, &c., the combination of a pinion secured to the axle of the drive-wheel, a stud secured at a distance from the drive-wheel axle, an internally-toothed wheel mounted upon the said stud and intermeshing with the aforesaid pinion, a dust-guard secured to the outer side of the power-transmitting wheel, a dust-guard independent of the said wheel and closing its inner side and having openings for the passage therethrough of the stud and drive-wheel axle, an annulus secured to the inner side of the internally-toothed wheel and overlapping the joint formed between it and the inner dust-guard, and a lever mounted upon the aforementioned stud and having a dog to intermittently grip the power-transmitting or internally-toothed wheel, substantially as and for the purpose set forth.

4. In a drive-gear for bicycles, the combination of plates, means for clamping the plates upon opposite sides of the frame-bars at the juncture of the rear braces and bottom runs, the drive-wheel having its axle mounted in the said plates and provided with a pinion, a stud applied to the plates, an internally-toothed rim and a foot-lever mounted upon the stud, the toothed rim intermeshing with the pinion, a spring for returning the foot-lever to a normal position, a stop for limiting the return of the foot-lever, and a dog carried by the foot-lever to grip the toothed rim, substantially as and for the purpose set forth.

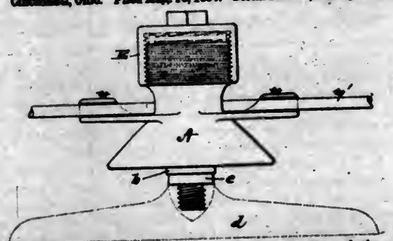
602,462. CAR-TRUCK. JACOB MEHDEM, Hyson, N. Y. Filed Jan. 7, 1896. Serial No. 665,894. (No model.)

Claim.—1. A swinging truck for cars, comprising two axles and flat-faced wheels, said axles being pivotally connected with the car-platform and maintained in parallel relation to each other by means of parallel rods pivoted thereto, and means for swinging said truck, substantially as shown and described.

2. A swinging truck for cars, comprising two sets of flat-faced wheels and their axles, said axles pivotally connected to the car-platform and being connected with each other by means of the parallel bars, and projecting spurs carrying rollers adapted to roll upon the under side of the car-platform, substantially as shown and described.

3. A swinging truck for cars, comprising two sets of flat-faced wheels and axles, said axles pivotally connected to the car-platform and being connected with each other by means of parallel bars, projecting spurs carrying rollers and curved metallic plates fixed to the under side of the car-platform and upon which said rollers are adapted to work, substantially as shown and described.

4. A swinging truck for cars, comprising two sets of flat-faced wheels and axles, said axles pivotally connected to the car-platform and being connected with each other by means of parallel bars, projecting spurs carrying rollers adapted to roll on the under side of the car-platform and beveled gearing adapted to swing said trucks at the will of the operator, substantially as shown and described.

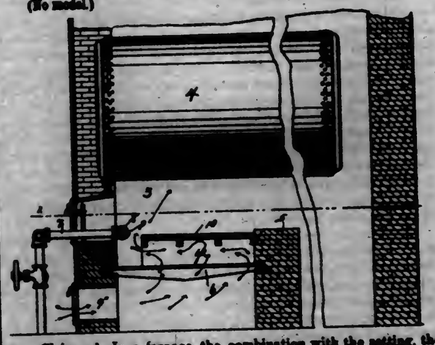


5. Trucks for cars of the class described, comprising two sets of flanged wheels and their axles, said axles adapted to be raised and lowered by means of levers operated by screws, means for connecting said operating-screws, and swinging trucks comprising two sets of flat-faced wheels and axles, said axles pivotally connected to the car-platform and being connected to each other by means of parallel bars, projecting spurs carrying shoulders adapted to roll on the under side of the car-platform, and means for swinging said trucks, substantially as shown and described.

6. A trolley or automobile car comprising a car-platform and superstructure, swinging trucks pivotally connected to said car-platform, said trucks maintained in parallel relation to each other by means of parallel bars, means for operating the same, and auxiliary trucks adapted to be raised and lowered from and to the rails, and means for operating same, substantially as shown and described.

7. A trolley or automobile car, comprising a platform and superstructure, swinging trucks pivotally connected to said platform and maintained in parallel relation to each other by means of parallel rods, beveled gearing adapted to operate said trucks and auxiliary trucks having flanged wheels and operating by means of a lever and screw, substantially as shown and described.

8. A trolley or automobile car, comprising a platform and superstructure, swinging trucks having flat-faced wheels pivotally connected to said car-platform and maintained in parallel relation with each other by means of parallel rods, beveled gearing adapted to operate said swinging trucks and auxiliary trucks having flanged wheels and being operated by means of levers and screws and sprocket-wheels, and an endless chain connecting said operating-screws, substantially as shown and described.

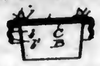


602,463. TROLLEY-WIRE HANGER. WILLIAM A. MCCALLUM, Cincinnati, Ohio. Filed Aug. 16, 1897. Serial No. 648,294. (No model.)

Claim.—1. In a line-hanger of the character indicated, the combination of the holder; the screw-cap having its inner face provided with teeth or corrugations adapted to engage by backward rotation of the screw-cap; the insulated bolt seated in the holder, and provided with teeth or corrugations corresponding with those of the cap; and the interposed compressible disk, substantially as set forth.

2. The combination of the holder, the insulated bolt seated therein and having a toothed or corrugated upper surface; the screw-threaded cap having a corresponding inner face; the suspending end of the bolt threaded oppositely from the cap; and the compressible washer interposed between the cap and the insulated bolt, substantially as set forth.

602,464. FURNACE. FRANK B. MCCLELLAND and BENJAMIN M. PARROTT, Indianapolis, Ind. Filed June 11, 1897. Serial No. 640,267. (No model.)



Claim.—1. In a furnace, the combination with the setting, the grate-bars thereof, and a burner mounted therein over the grate-bars, of a platform mounted over the grate-bars and extending from the fire-wall to within a short distance of and below the burner, the arrangement being such that the incoming air is discharged from beneath said platform at a point beneath and in front of the burner, substantially as described.

2. In a furnace, the combination with the setting and a burner mounted therein, of a platform mounted in said setting and extending forward from the fire-wall to within a short distance of and slightly below the burner, and a second platform extending from the front wall beneath the burner toward the rear to a point vertically beneath the forward end of the first platform, the arrangement being such that the incoming air is discharged from beneath the first-mentioned platform at a point beneath and in front of the burner, substantially as described.

3. In a furnace, the combination with the setting, the grate-bars thereof, and a burner mounted in said setting above the grate-bars, of a platform mounted above the grate-bars and slightly beneath the openings in the burner and extending from the fire-wall forward to a point a short distance from the burner, and a filling mounted in the openings between the forward ends of the grate-bars and extend-

ing toward the rear to a point vertically beneath the forward end of the platform, an air-passage being formed below the grate-bars and between the grate-bars and the platform, all combined and arranged to cooperate substantially as and for the purpose set forth.

602,465. SCREW-CAP SEALING-NOZZLE FOR CANS. EDWIN NORTON, Maywood, Ill., assignor to himself and Oliver W. Norton, Chicago, Ill. Filed June 19, 1896. Serial No. 596,194. (No model.)

Claim.—1. The combination with a screw-nozzle, its sealing-disk, and screw-cap provided with two holes in its flat top or disk portion to receive rivets, of a pair of rivets in separate pieces from the cap and projecting through the cap to form screwing or unscrewing lugs, and having heads and shoulders embracing the cap, the projecting stem or shank portion of said rivets being enlarged at their bases to form said shoulders and projecting above said shoulders to form said screwing or unscrewing lugs substantially as specified.

2. The combination with a screw-nozzle, its sealing-disk, and screw-cap provided with two holes in its flat top or disk portion to receive rivets, of a pair of rivets in separate pieces from the cap and projecting through the cap to form screwing and unscrewing lugs, and having heads and shoulders embracing the cap, said cap having countersinks to receive the heads of the rivets and permit the cap to fit flush upon the sealing-disk, the projecting stem or shank portion of said rivets being enlarged at their bases to form said shoulders and projecting above said shoulders to form said screwing or unscrewing lugs substantially as specified.

602,466. SHIPPING-PACKAGE. EDWIN NORTON, Maywood, Ill., assignor to himself and Oliver W. Norton, Chicago, Ill. Filed Feb. 6, 1897. Serial No. 622,252. (No model.)

Claim.—1. In a shipping-package, the combination with a sheet-metal body of a wood-veneer body with a sheet-metal bottom, having a folded rim, a wood-veneer bottom embraced by the folded rim of the sheet-metal bottom, the lower end of the sheet-metal body being folded over and around and embracing the sheet-metal and wood-veneer bottom so as to secure the combined bottom to the combined body, a sheet-metal cover having a folded rim and a wood-veneer cover embraced by the folded rim of the sheet-metal cover, said sheet-metal body having at its upper end an offset or flange forming a seat for said cover, clips secured to the sheet-metal body and adapted to be folded down upon the cover, screws and nuts for securing the clips to the cover, and wire bands surrounding the wood-veneer body, substantially as specified.

2. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, the lower end of said wood-veneer body abutting against the projecting rim of said wood-veneer bottom, substantially as specified.

3. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, the sheet-metal body having also an offset or flange against which the lower end of the wood-veneer body abuts on one side and against which the rim or margin of the combined bottom fits or abuts on the other side, the lower end of said wood-veneer body abutting against the projecting rim of said wood-veneer bottom, substantially as specified.

4. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and bands surrounding the wood-veneer body, the lower end of said wood-veneer body abutting against the projecting rim of said wood-veneer bottom, substantially as specified.

5. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and a double or combined sheet-metal and wood-veneer cover, said sheet-metal body having an offset or flange against which the lower end of the wood-veneer body abuts and upon which the rim of said cover rests, the ends of said wood-veneer body abutting against the projecting rim of said wood-veneer bottom and wood-veneer cover, substantially as specified.

6. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, wire bands surrounding the wood-veneer body and staples securing said bands and said sheet-metal and wood-veneer bodies together, the lower end of said wood-veneer body abutting against the projecting rim of said wood-veneer bottom, substantially as specified.

7. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and a double or combined sheet-metal and wood-veneer cover, said sheet-metal body having clips secured thereto and adapted to be folded down upon the cover and secured thereto, the ends of said wood-veneer body abutting against the projecting rims of said wood-veneer bottom and wood-veneer cover, substantially as specified.

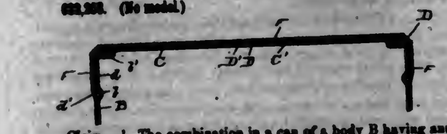
8. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and a double or combined sheet-metal and wood-veneer cover, said sheet-metal body having clips secured thereto and adapted to be folded down upon the cover and secured thereto, said cover having nuts soldered thereto, and screws for securing said clips to said cover, substantially as specified.

9. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and a double or combined sheet-metal and wood-veneer cover, said sheet-metal body having an offset or flange against which the upper end of the wood-veneer body abuts and upon which the rim of said cover rests, the ends of said wood-veneer body abutting against the projecting rims of said wood-veneer bottom and wood-veneer cover, substantially as specified.

10. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and a double or combined sheet-metal and wood-veneer cover, said sheet-metal body having an offset or flange near its upper end against which the upper end of the wood-veneer body abuts and upon which the rim of said cover rests, and bands surrounding said wood-veneer body, the ends of said wood-veneer body abutting against the projecting rims of said wood-veneer bottom and wood-veneer cover, substantially as specified.

11. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and a double or combined sheet-metal and wood-veneer cover, said sheet-metal body having an offset or flange near its upper end against which the upper end of the wood-veneer body abuts and upon which the rim of said cover rests, and clips uniting the body and cover, the ends of said wood-veneer body abutting against the projecting rims of said wood-veneer bottom and wood-veneer cover, substantially as specified.

12. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and a double or combined sheet-metal and wood-veneer cover, said sheet-metal body having an offset or flange against which the upper end of the wood-veneer body abuts and upon which the rim of said cover rests, the ends of said wood-veneer body abutting against the projecting rims of said wood-veneer bottom and wood-veneer cover, substantially as specified.

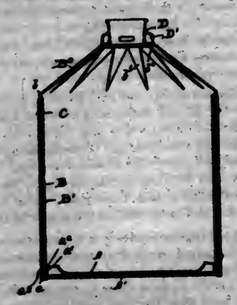


13. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and a double or combined sheet-metal and wood-veneer cover, said sheet-metal body having an offset or flange near its upper end against which the upper end of the wood-veneer body abuts and upon which the rim of said cover rests, said sheet-metal body also having an upright flange forming a seat surrounding the edge of said cover, and clips secured to the body and adapted to be folded down upon the cover, and screws and nuts for removably securing the clips to the cover, the ends of said wood-veneer body abutting against the projecting rims of said wood-veneer bottom and wood-veneer cover, substantially as specified.

14. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and a double or combined sheet-metal and wood-veneer cover, said sheet-metal body having an offset or flange near its upper end against which the upper end of the wood-veneer body abuts and upon which the rim of said cover rests, said sheet-metal body having also an upright flange forming a seat surrounding the edge of said cover, and clips secured to the body and adapted to be folded down upon the cover and screws and nuts for removably securing the clips to the cover, and wire bands surrounding the wood-veneer body, substantially as specified.

15. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and a double or combined sheet-metal and wood-veneer cover, said sheet-metal body having clips secured thereto and adapted to be folded down upon the cover and secured thereto, said sheet-metal cover having a bracing shoulder or flange fitting inside the upper end of said body, the ends of said wood-veneer body abutting against the projecting rims of said wood-veneer bottom and wood-veneer cover, substantially as specified.

16. In a shipping-package, the combination with a double or combined sheet-metal and wood-veneer body of a double or combined sheet-metal and wood-veneer bottom, the lower end of the sheet-metal body being folded over and embracing the rim or margin of said combined bottom, thus securing the combined or double bottom to the combined or double body, and a double or combined sheet-metal and wood-veneer cover, said sheet-metal body having an offset or flange near its upper end against which the upper end of the wood-veneer body abuts and upon which the rim of said cover rests, said sheet-metal body having also an upright flange forming a seat surrounding the edge of said cover, and clips secured to the body and adapted to be folded down upon the cover and screws and nuts for removably securing the clips to the cover, and wire bands surrounding the wood-veneer body, said sheet-metal cover having a bracing shoulder or flange fitting inside the upper end of said body, substantially as specified.



602,467. CAN. EDWIN NORTON, Maywood, Ill., assignor to himself, and Oliver W. Norton, Chicago, Ill. Filed Feb. 6, 1897. Serial No. 622,253. (No model.)

Claim.—1. The combination in a can of a body B having annular groove or bead *b*, of a permanent head C secured to said body and provided with a pouring-opening C' therein, a rotary slip-cover D having a pouring-opening D' therein and provided with a flange *d* fitting over the upper end of said body B and having its lower edge turned into said annular groove *b* to secure said cover D to the body while permitting it to rotate thereon, and a label F pasted upon the can and in part to said rotary slip-cover, to prevent the cover from being turned to open the can without mutilating the label, said label being pasted to the body of the can below said annular groove *b*, and to the flange *d* of said rotary slip-cover above said annular groove and adapted to be severed at said annular groove to enable said slip-cover to be rotated, substantially as specified.

2. The combination in a can of a cylindrical body B having annular groove or bead *b*, of a permanent head C, having pouring-opening C', a rotary cover D having a pouring-opening D' and provided with flange *d* fitting said body B and having inturned lower edge *d'* fitting in said annular groove *b*, and a seam *b'* uniting said body B and head C, and lying within the outer periphery of the body B and below the upper surface of the disk portion of said head C, to enable said cover D and head C to fit flat and close together while the flange *d* fits the periphery of the can-body, substantially as specified.

602,468. SHIPPING-CAN. EDWIN NORTON, Maywood, Ill., assignor to himself, and OLIVER W. NORTON, Chicago, Ill. Filed May 28, 1897. Serial No. 637,675. (No model.)

Claim.—1. A taper-breasted shipping-can comprising in combination the following parts: a sheet-metal body B having an integral tapering breast B^2 furnished with a series of tapering plaits or folds *b'* therein, and an externally-projecting shoulder or bead *b* at or near the junction of the body and its tapering breast; a sheet-metal bottom A having an upright flange or shoulder *a'* fitting within and soldered to the lower end of said sheet-metal body; a wood-veneer bottom A' having the rim or outer edge of said sheet-metal bottom folded over or around its rim or edge; a wood-veneer body B' surrounding said sheet-metal body and fitting at its lower end against the projecting rim of the combined wood-veneer and sheet-metal bottom, and at its upper end against said external shoulder *b* of the sheet-metal body; wire hoops C C surrounding said wood-veneer body; the upper contracted end of said tapering integral breast B^2 having a channel or seat b^2; and a pouring-nozzle comprising an outer shell *d*, an annular base plate or disk d^3 and a pouring or nozzle piece d^4, the lower edges of said outer shell *d* and of said annular disk d^3 fitting within and soldered to said seat b^2 at the upper end of said tapering breast, substantially as specified.

2. The combination with a sheet-metal can-body having an integral tapering breast formed by a series of tapering plaits or folds therein, and provided with an external bead or shoulder *b*, of a wood-veneer body surrounding the sheet-metal body and fitting at its upper end against said external bead or shoulder *b*, and at its lower end fitting against the projecting rim of the sheet-metal and wood-veneer bottom, and a sheet-metal and wood-veneer bottom having its rim projecting laterally under the end of said wood-veneer bottom, substantially as specified.

3. The combination with a sheet-metal can-body having an integral tapering breast formed by a series of tapering plaits or folds therein, and provided with an external bead or shoulder *b*, of a wood-veneer body surrounding the sheet-metal body and fitting at its upper end against said external bead or shoulder *b*, the upper contracted end of said tapering breast having an annular groove or seat formed therein, and a pouring-nozzle having its lower edge or rim soldered in said seat and serving to form a finish for and to strengthen the upper end of said tapering breast, substantially as specified.

4. A sheet-metal can-body B having an integral tapering breast B^2 formed by a series of straight tapering folds or plaits *b'* therein abutting together on radial lines on the outside to brace each other and give a smooth exterior conical surface and finish to the breast, substantially as specified.

5. A sheet-metal can-body B having an integral tapering breast B^2 formed by a series of tapering folds or plaits *b'* therein, the upper contracted end of said tapering and folded or plaited breast being provided with an annular seat to receive a nozzle, and a nozzle secured thereto and comprising an outer shell *d*, an annular flanged

base-disk b^3, and a pouring or nozzle piece d' to which the outer shell is secured at its upper edge and to which the inner flange of said annular disk is secured at the lower end thereof, the lower edge of said outer shell and the outer flange of said annular disk being secured in or to the seat formed in said tapering breast, substantially as specified.

6. A sheet-metal can-body B having an integral tapering breast B^3 formed by a series of tapering folds or plaits b' therein, the upper contracted end of said tapering and folded or plaited breast being provided with an annular seat to receive a nozzle, and a nozzle secured thereto and comprising an outer shell d, an annular flanged base-disk b^3, and a pouring or nozzle piece d' to which the outer shell is secured at its upper edge and to which the inner flange of said annular disk is secured at the lower end thereof, the lower edge of said outer shell and the outer flange of said annular disk being secured in or to the seat formed in said tapering breast, said annular disk and said nozzle-piece having vent-openings through the same, substantially as specified.

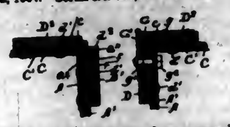
7. The combination with a can of a nozzle D furnished with an annular vent-chamber D', and comprising an outer shell d, a nozzle-piece d', and an annular base plate or disk d^3, said annular disk and said nozzle-piece having vent-openings communicating with said annular vent-chamber, substantially as specified.

8. The combination with a can of a nozzle D furnished with an annular vent chamber D', and comprising an outer shell d, a nozzle-piece d', and an annular base plate or disk d^3, said annular disk and said nozzle-piece having vent-openings communicating with said annular vent-chamber, the upper edge of said outer shell being secured to the nozzle-piece, and the annular disk having at its inner edge a flange fitting and soldered to said nozzle-piece, and at its outer edge a flange fitting within said outer shell, substantially as specified.

9. A shipping-package comprising in combination a sheet-metal bottom and a wood-veneer bottom, the rim of the former being folded over the latter, a sheet-metal body having an integral tapering breast formed by tapering plaits or folds therein, and provided with an external shoulder or bead at or near the junction of the upper end of the body with said tapering breast, and a wood-veneer body surrounding said sheet-metal body and fitting at its upper end against said external shoulder or bead and at its lower end against the projecting rim of the sheet-metal and wood-veneer bottom, the sheet-metal and wood-veneer bottom having its rim projecting laterally under the end of the wood-veneer body substantially as specified.

10. A taper-breasted jacketed shipping-can comprising in combination the following parts: a sheet-metal body and tapering breast having an external shoulder or bead at or near the upper end of the body; a combined sheet-metal and wood-veneer bottom having its rim projecting laterally beyond the sheet-metal body; and a wood-veneer body surrounding the sheet metal body and fitting between said projecting rim of the bottom and said externally-projecting shoulder at the upper end of the sheet-metal body, substantially as specified.

11. A taper-breasted jacketed shipping-can comprising in combination the following parts: a sheet-metal body and tapering breast, having an external shoulder or bead at or near the upper end of the body; a combined sheet-metal and wood-veneer bottom having its rim projecting laterally beyond the sheet-metal body; and a wood-veneer body surrounding the sheet-metal body and fitting between said projecting rim of the bottom and said externally-projecting shoulder at the upper end of the sheet-metal body, and wire hoops C C, substantially as specified.



12. A taper-breasted shipping-can, having its breast and body made from a single piece of metal, provided with a pouring-nozzle and having a hollow projecting bead formed at the upper end of the body portion to stiffen and strengthen the can in place of the usual folds or seam uniting the can-body and its taper-breast, and a metal bottom secured to the body, a wood-veneer body and a wood-veneer bottom having its rim projecting laterally out under the end of the wood-veneer body for it to abut against substantially as specified.

13. A taper-breasted jacketed shipping-can, having its breast and body made from a single piece of metal, and provided with a pouring-nozzle soldered to the upper end of said taper-breast, a hollow projecting bead around the upper end of the body portion, a wood-veneer jacket secured by hoops or bands around the body portion, and a metal and wood bottom secured to the lower end of the can-body, the rim of the metal and wood veneer bottom projecting out laterally under the end of the wood-veneer body for it to abut against substantially as specified.

14. A taper-breasted shipping-can, provided at its upper portion with a pouring-nozzle surrounded by an annular chamber having openings d^6 d^6 between the side walls of said pouring-nozzle and the annular chamber, and having openings d^7 between the lower portion of said annular chamber and the can, whereby the said pouring-nozzle and can are strengthened and ventilated, substantially as specified.

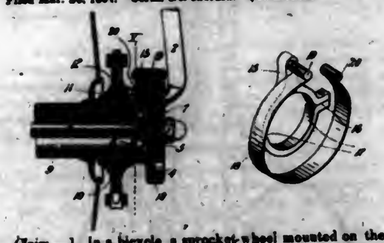
602,469. SHIPPING BOX OR PACKAGE. Erwin Hoover, Maywood, Ill., assignor to himself, and Oliver W. Horton, Chicago, Ill.

Filed May 22, 1897. Serial No. 637,977. (No model.)

Claim.—1. A shipping box or package comprising in combination the following parts: a sheet-metal body and a wood-veneer body, the sheet-metal body having lateral flanges or offsets extending across the end or thickness of the wood-veneer body, a sheet-metal bottom and a wood-veneer bottom, the rim of the sheet-metal bottom being folded over and around the edge of the wood-veneer bottom, and the lower end of the sheet-metal body being folded over and around the combined sheet-metal and wood-veneer bottom to secure the body and bottom together, the wood reinforcing-strips D D' secured together at the corners by metal clips and surrounding the body at its upper and lower ends and provided with nails or fastenings extending through and securing firmly together said sheet-metal body and wood-veneer body and reinforcing-strips, the lower edge of said reinforcing-strips at the lower end of the body projecting below the lower end of the wood-veneer body to form a seat, protection or abutment for the marginal edge of the combined bottom, and a sheet-metal cover and a wood-veneer cover furnished with marginal wood reinforcing-strips D^2, the rim of said sheet-metal cover being folded over and embracing the rim of said wood-veneer cover, and nails or fastenings extending through and uniting said wood-veneer cover, sheet-metal cover and wood reinforcing-strips D^2, the upper edge of said upper reinforcing-strips D' on the body projecting above the upper end of said wood-veneer body and forming a seat or abutment for the edges of the combined cover to fit against, and hinge-straps and fastening-straps secured to the combined cover and combined body, substantially as specified.

2. In a shipping box or package, the combination with a sheet-metal body of a wood-veneer body, reinforcing-strips of wood surrounding the wood-veneer body, and fastenings extending through said strips and sheet-metal and wood-veneer bodies, a wood-veneer bottom and a sheet-metal bottom having its rim folded over the edge of said wood-veneer bottom, the lower end of said sheet-metal body being folded over the rim or edge of the combined bottom, the lower edge of said wood strips at the lower end of the body projecting below the lower end of the wood-veneer body and surrounding the edge of the combined bottom, substantially as specified.

3. In a shipping box or package, the combination with a sheet-metal body of a wood-veneer body, reinforcing-strips of wood surrounding the wood-veneer body, and fastenings extending through said strips and sheet-metal and wood-veneer bodies, a sheet-metal cover and wood-veneer cover furnished with reinforcing-strips D^2, said combined cover fitting and resting at its margin on the end of said wood-veneer body, and the reinforcing wood strips at the upper end of the body projecting above the upper end of the wood-veneer body to form a seat and protection for the edges of the cover, substantially as specified.



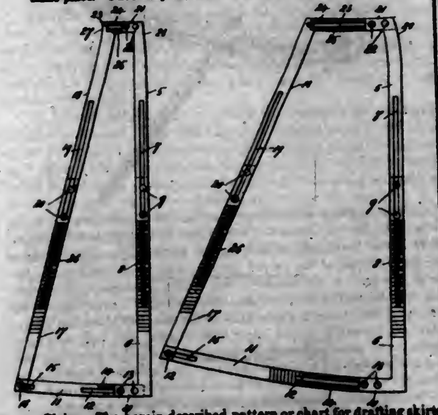
4. In a shipping box or package, the combination with a sheet-metal body of a wood-veneer body, reinforcing-strips of wood surrounding the wood-veneer body, and fastenings extending through said strips and sheet-metal wood-veneer bodies, a sheet-metal cover and wood-veneer cover furnished with reinforcing-strips D^2, said combined cover fitting and resting at its margin on the end of said wood-veneer body, and the reinforcing wood strips at the upper end of the body projecting above the upper end of the wood-veneer body to form a seat and protection for the edges of the cover, hinge-straps F F secured to the reinforcing-strips at the upper end of the body, and hinge-straps F F' secured to the reinforcing-strips on the cover, substantially as specified.

5. In a shipping box or package, the combination with a sheet-metal body of a wood-veneer body, reinforcing-strips of wood surrounding the wood-veneer body, and fastenings extending through said strips and sheet-metal wood-veneer bodies, a sheet-metal cover and wood-veneer cover furnished with reinforcing-strips D^2, said combined cover fitting and resting at its margin on the end of said wood-veneer body, and the reinforcing wood strips at the upper end of the body projecting above the upper end of the wood-veneer body to form a seat and protection for the edges of the cover, hinge-straps F F secured to the reinforcing-strips at the upper end of the body, and hinge-straps F F' secured to the reinforcing-strips on the cover, fastening-straps G secured to the cover having hinged straps G', and screws passing through said straps G' and entering threaded nuts secured to the body, substantially as specified.

6. A shipping-box comprising the following parts, a sheet-metal body A, wood-veneer body A', sheet-metal bottom B, wood-veneer bottom B', sheet-metal cover C, wood-veneer cover C', wood reinforcing-strips D D' D^2, hinge-straps F F', fastening-straps G G', screws g' and nuts g^2, all constructed, combined and cooperating substantially as specified.

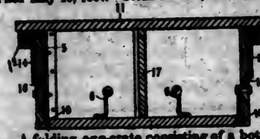
602,470. BICYCLE-BRAKE. Robert S. Orr, Allegheny, Pa.

Filed Mar. 26, 1897. Serial No. 630,402. (No model.)



Claim.—1. In a bicycle, a sprocket-wheel mounted on the rear hub having a limited rotatory motion thereon, a band-wheel rigidly secured to the frame adjacent to the sprocket-wheel, a band-arm rigidly clamped to the hub between the band-wheel and the sprocket-wheel, and a brake-band secured to the band-arm and sprocket-wheel respectively and embracing the band-wheel, substantially as set forth.

2. In a bicycle-brake provided with a band-wheel rigidly connected with the main frame and a brake-band having one end secured to the sprocket-wheel and the other end secured to a band-arm rigidly clamped to the hub of the bicycle-wheel; the lost-motion mechanism for the sprocket-wheel consisting of a key 11 upon the hub 9 and an excessively wide keyway 12 in the hub of the sprocket-wheel, substantially as set forth.



3. In a bicycle, the combination with a sprocket-wheel mounted on the rear hub having a limited rotatory motion, a band-arm rigidly clamped to the hub and a brake-band secured to the sprocket-wheel and band-arm respectively; a band brake-wheel mounted on a threaded axle-shaft having an integral ball-bearing extension and means for securing it in position, substantially as set forth.

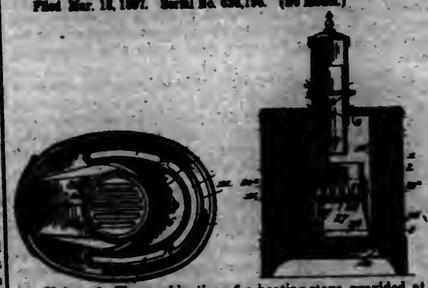
602,471. ADJUSTABLE SKIRT-PATTERN. Almeda A. Pinkham, North Adams, Mass., assignor of one-half to Thomas J. Cassidy, same place. Filed July 22, 1897. Serial No. 645,536. (No model.)

Claim.—The herein-described pattern or chart for drafting skirts comprising a side consisting of two parts 5 and 6 one of which is provided with a longitudinal slot 7 and the other with a scale 8, set-screws 9 secured to said part provided with a scale and adapted to move in the said longitudinal slot 7, the lower end of said part 6 being provided with an angular extension 10, a bar 11, connected therewith, said bar 11 being provided with a longitudinal slot 12, set-screws 13 mounted in said extension 10 and adapted to engage said longitudinal slot 12, said bar being also provided with a scale 14, said bar 11 and extension 10 being so constructed that they will be slightly curved when connected, the outer end of said bar 11, being provided with a longitudinal slot 15; a side piece consisting of a bottom part 17, and an upper part 18 provided with a longitudinal slot 19, screws 20 mounted in said part 17 and adapted to move in the said slot 19, a set-screw 16, mounted in the lower end of said part 17 and adapted to engage said longitudinal slot 15 of the bar 11, the said part 5 being provided with an angular extension 21, at the upper end thereof, set-screws 22 mounted thereon, the said part 18 being provided with an angular extension 24 provided with a slot 23 which said set-screws are adapted to move, said extension 24 being provided with a scale 25, and the said part 17 being provided with a scale 26, substantially as and for the purpose described.

602,472. FOLDING EGG-CRATE. Douglas Reid, New Richmond, Wis. Filed May 19, 1897. Serial No. 637,163. (No model.)

Claim.—A folding egg-crate consisting of a bottom having cavities in its upper face in which suitable eyes are mounted, the side and end pieces of the crate hinged together and having hooks thereon which are adapted to engage the eyes of said bottom, the guide devices 18 mounted on the inner side of said side pieces, the partition adapted to be held in position thereby, the top or cover having rabbeted strips secured to its under face, leaf-springs secured in the rabbets of said strips, angled tongues 14 pivoted to said top in such position as to bear against said strips, said top and end pieces having notches 11' and 16 for the reception of the angles of said tongue, the spindles journaled to the outer sides of said end pieces, said spindles having angled ends, and the parts adapted to be operated, all substantially as and for the purpose set forth.

602,478. VALVE FOR AIR-COMPRESSORS. Frank Richards, New York, N. Y. Filed Jan. 18, 1897. Serial No. 619,637. (No model.)

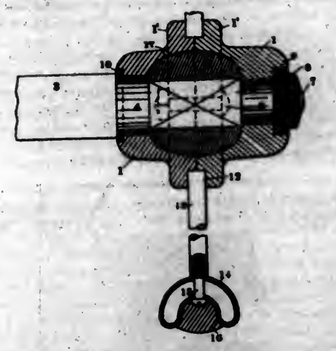


Claim.—1. In combination with the air-compressor base perforated and recessed as explained, the outer casing fitting the perforation and having a flange at the bottom for entering the recess, and the inner removable shell having the flange at the bottom, the latter being arranged to force the flange on the casing against its seat in the recess and to form a joint with the compressor-base, substantially as shown and described.

2. The herein-described appliance for air-compressors, the same being composed of the outer casing having the overhanging ring or projections and a flange at the bottom, the inner removable casing also having a flange at the bottom, the valve-disk, and means for securing the parts in place, the flange on the inner casing being arranged to force the one on the outer casing against its seat in the recess and to form a tight joint with the base of the compressor, substantially as and for the purposes set forth.

602,474. HEATING-STOVE. John L. Ritter, Shenandoah, and Lee H. Hazlewood, Richmond, Va., assignors, by direct and mesne assignments, to said Ritter and James G. Whitlock, Shenandoah, Va.

Filed Mar. 12, 1897. Serial No. 626,196. (No model.)



Claim.—1. The combination of a heating-stove provided at its bottom with a transverse stop-flange and having a door at its front,

a casing detachably arranged on the base of the stove and fitting against the said flange and adapted to be removed to permit the stove to be employed as a wood-burner, said casing forming an ash-pit and extending from the flange to the door, a fire-pot mounted on the casing, and a grate arranged at the bottom of the fire-pot in suitable ways of the casing, substantially as described.

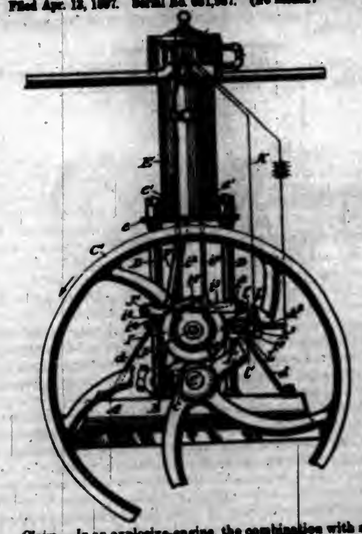
2. The combination of a heating-stove provided at its bottom with a transverse stop-flange and having a door at its front, a detachable casing arranged on the base of the stove and fitting against the said flange and adapted to be removed to permit the stove to be employed as a wood-burner, said casing being provided at its top with an upwardly-extending annular flange 24ª and forming an ash-pit and extending from the flange of the bottom of the stove to the door, a removable fire-pot arranged within the annular flange of the casing, and a grate arranged at the bottom of the fire-pot in suitable ways of the casing, substantially as described.

602,475. WHEEL AND AXLE FOR VEHICLES. RICHARD SCHROEDTER, Chicago, Ill. Filed July 19, 1897. Serial No. 645,090. (No model.)

Claim.—1. In a wheel and axle for vehicles the combination of a hub consisting of the two separable parts 1, cut out to inclose the oval member 2, and having the flanges 1′ with recesses 12 therein which are enlarged toward the middle of the hub; an axle having thereon the member 2; and spokes having their inner ends enlarged to fit the recesses 12, substantially as described.

2. In a wheel for vehicles, the combination of a hub consisting of two separable parts 1, having the flanges 1′ with recesses 12 therein which are enlarged toward the middle of the hub; the tubular metal spokes, having their inner ends flared to fit said recesses and their outer ends interiorly threaded; and a rim having screws thereon engaging said interiorly-threaded parts, substantially as described.

602,476. PROCESS OF CURING HIDES OR SKINS FOR TRANSPORT. JOHN W. SCOTT, Allenville, Queensland. Filed Apr. 13, 1897. Serial No. 633,015. (No specimens.)



Claim.—1. The process of curing hides, skins or furs, whereby the fermentable matter present therein acts upon invert sugar to convert the latter into lactic or butyric acid by fermentation, and drying the hides, skins or furs, after fermentation ceases.

2. The process of curing hides, skins or furs, whereby the fermentable matter present therein acts, at normal temperature, upon invert sugar to convert the latter into lactic and butyric acid by fermentation, and drying the hides, skins or furs after fermentation ceases.

3. The process of curing hides, skins or furs, which consists in first freeing the same from blood and loose bits of skin, immersing them in a solution of a carbohydrate whereby the fermentable matter present in the hides, skins or furs acts upon such carbohydrate to convert it into lactic and butyric acid by fermentation, turning the hides or skins periodically in the liquor until fermentation ceases, and then drying them.

4. The process of curing hides or skins, which consists in first freeing the same from blood and loose bits of skin, immersing them in a solution of a carbohydrate whereby the fermentable matter present in the hides or skins acts upon such carbohydrate to convert it into lactic and butyric acid by fermentation, turning the hides or skins periodically in the liquor until fermentation ceases, then drying the same and treating the dried hides or skins with an oleaginous or fatty substance, substantially as and for the purpose set forth.

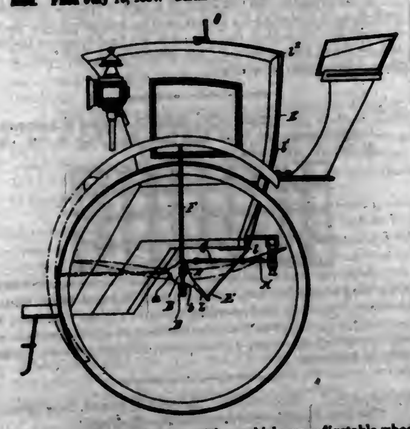
602,477. EXPLOSIVE-ENGINE. JOHN A. SIBON, Brooklyn, N. Y. Filed Apr. 13, 1897. Serial No. 631,967. (No model.)

Claim.—In an explosive-engine, the combination with a cylinder, piston, crank-shaft and connections, of an electric igniter having a normally open circuit, a switch to close said circuit and a finger pivoted upon said switch and movable to a limited extent with respect thereto, said finger projecting into the path of the moving part of the engine.

602,478. DOUBLETREE. JOHN W. SHEPPARD, Chariton, Iowa. Filed Aug. 12, 1897. Serial No. 647,903. (No model.)

Claim.—The combination with a pole, of a doubletree consisting of a metal bar pivoted to the upper face of the pole and having its ends curved rearward and laterally and provided directly in advance of the terminals of the curved portions with pivot-openings, singletrees arranged on the doubletree and having pivot-openings registering with the said pivot-openings, hammer-straps 9 extending across the space between the curved ends of the doubletree and the singletrees and arranged on the upper faces of said ends and the singletrees, pivots passing through the front ends of the hammer-straps and the perforations of the singletrees and the doubletree, fastening devices securing the rear ends of the hammer-straps to the curved ends of the doubletree, rearwardly-extending slotted ears arranged on the lower faces of the ends of the doubletree and secured to the same by the said fastening devices, and the brace 3 arranged on the lower face of the pole, connected to the same by the pivot of the doubletree and having its terminals bent upward and secured to the lower face of the doubletree at opposite sides of the pole, substantially as described.

602,479. WASHBOARD. JOSEPH W. SHEPPARD, St. Louis, Mo., assignor to the Mississippi Glass Company, same place. Filed Nov. 20, 1896. Serial No. 570,473. (No model.)

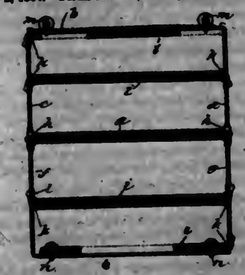


Claim.—1. A washboard consisting of a frame having grooved side rails, a rubbing-surface of friable material having its edges located in the grooves, holding-strips of a length substantially the length of the grooves and of a width less than the space between the rubbing material and side wall of the groove and loosely held in such

spaces between the rubbing-surface and groove-walls, and the securing-bar B having recessed ends in which the ends of the holding-strips are placed.

2. A washboard consisting of a frame having grooved side rails, a rubbing-surface of friable material having its edges located in the grooves, holding-strips of a length substantially the length of the grooves and of a width less than the space between the rubbing-surface and groove-walls, and means for loosely securing the holding-strips in place.

602,480. WHEEL-GUARD FOR VEHICLES. FREDERICK JULIA SPENCER and RAOUL ROUSSEL DE LA CHESNEVERIE, Hanley, England. Filed July 19, 1897. Serial No. 645,184. (No model.)

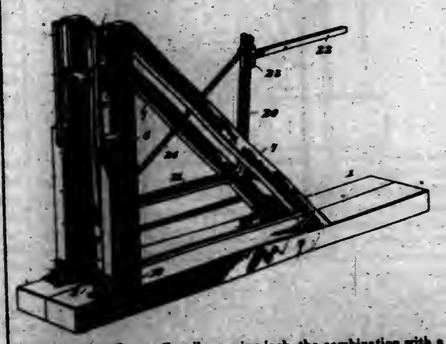


Claim.—1. In combination with a vehicle, an adjustable wheel-guard, a bar supporting the same, a transverse bar rigidly attached to the said bar, bearings supporting the transverse bar revolubly, a spring-controlled cam-plate fixed upon the transverse bar, a projecting arm secured to the said cam-plate, and a draw-line attached to the said projecting arm.

2. In combination with a vehicle-axle a transverse bar revolving in bearings secured on the said axle, bent levers secured to the ends of said bar, wheel-guards secured to said bent levers, a cam-plate fixed upon the said transverse bar, cams on said cam-plate limiting the revolution of said bar, a spring controlling the said cam-plate, and means for revolving the cam-plate against the tension of the spring.

3. In combination with the adjustable wheel-guard N, the bent lever E, the transverse revoluble bar A, the cam-plate B, the draw-spring G, the cam-plate lever I, and the draw-line E.

602,481. FOLDING RACK. JOSEPH H. BLAKE, Meriden, Conn. Filed June 2, 1897. Serial No. 638,132. (No model.)



Claim.—1. A folding rack composed of two rectangular frames each having two side bars and an outer end bar, and both having an inner end bar in common: said frames being hinged together at the terminals of the inner end bar, and adapted to be hung by their outer end bars upon hooks *n n*, attached to a wall at any distance apart within the width of the said frames, substantially as specified.

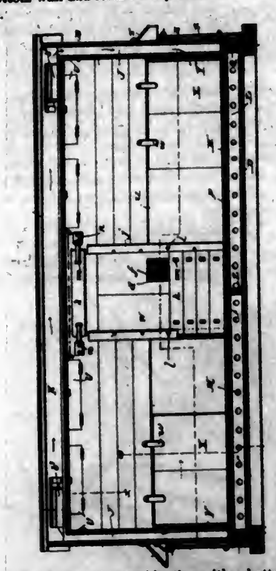
2. A folding rack composed of two rectangular frames each having two side bars and an outer end bar, and both having an inner end bar in common, said frames being hinged together at the terminals of the inner end bar, in combination with movable cross-bars adjustably attached to the side bars on each side, and means for clamping said cross-bars in position on said side bars, substantially as specified.

3. In a folding rack, the rectangular frames each having two side bars and an outer end bar rigidly connected together, and a common inner end bar; said frames being hinged together at the terminals of the inner end bar, in combination with movable adjustable cross-bars *i*, provided with end sockets *k*, having perforated legs sliding upon said side bars, and clamping-cams *l*, adapted to press sidewise upon the side bars and hold the said cross-bars in fixed position, substantially as specified.

602,482. PUMPING-JACK. ORSON U. STANLEHAN, North Baltimore, Ohio. Filed Aug. 31, 1897. Serial No. 650,178. (No model.)

Claim.—1. In an oil-well pumping-jack, the combination with a sill provided with clamping means for engaging a well-casing, of a tilting frame hingedly mounted upon the sill remote from said clamping means, and having front uprights seated at their lower ends upon the sill contiguous to said clamping means, securing devices for detachably fastening the lower ends of the uprights to the sill to maintain the frame in its upright position, and pumping apparatus mounted upon the frame and provided with means for engaging a pump-rod, said pumping apparatus being removed from the path of the pump-rod when the frame is tilted rearwardly, substantially as specified.

2. In an oil-well pumping-jack, the combination with a sill, provided with a clamping means for engaging a well-casing, of a tilting frame having rearwardly and downwardly inclined braces hingedly mounted upon the sill remote from said clamping means, and front uprights seated upon the sill contiguous to said clamping means, and depending vertically from said braces, angle-brackets carried by the uprights and having slotted feet in contact with the sill, securing-bolts engaging the slotted feet to maintain the frame in its normal or upright position, and pumping apparatus carried by the frame for attachment to a pump-rod, substantially as specified.



3. In an oil-well pumping-jack, the combination of a tilting frame, a cross-head mounted upon said frame for reciprocatory movement in the vertical plane of a pump-rod and having a clamp for engaging the pump-rod, and an oscillatory V mounted upon the frame and operatively connected with said cross-head, the frame being adapted to tilt rearwardly when the clamp on the cross-head is disengaged from the pump-rod, substantially as specified.

4. In an oil-well pumping-jack, the combination of a frame, a cross-head mounted for reciprocation in guides on the frame and provided with a clamp for engagement with a pump-rod, a V mounted for oscillatory movement upon the frame and provided at the extremity of one of its arms with means for attachment to an operating-rod, and at the extremity of its other arm with a bifurcated T-head having alined lateral trunnions, and connecting-links or pitmen, terminally mounted respectively upon said trunnions and journal portions of the cross-head, substantially as specified.

602,483. REFRIGERATOR-CAR. HENRY F. STARLEY, New Orleans, La. Filed May 26, 1897. Serial No. 638,503. (No model.)

Claim.—1. In a freight-car, the combination with a bottom wall, a false bottom wall provided with openings and arranged above the

bottom wall so as to serve in conjunction with the same to form a chamber, and the side and end walls having recesses *u*, in their inner sides; of imperforate bottom sections removably secured in the recesses of the side walls and adapted when let down to entirely cover the false bottom wall and form an imperforate bottom, substantially as specified.

2. In a freight-car, the combination with a bottom wall, a false bottom wall provided with openings and arranged above the bottom wall so as to serve in conjunction with the same to form a chamber, the side and end walls having recesses *u*, in their inner sides and the beveled sills at the base of the recesses *u;* of imperforate bottom sections removably secured in the recesses *u*, and having beveled edges engaging the beveled sills and adapted when let down to entirely cover the false bottom wall and form an imperforate bottom, and turning-buttons removably securing said sections in the recesses *u*, substantially as specified.

3. In a freight-car, the combination of the two bottom walls forming a chamber between them, the side walls, the end walls having openings coincident with and communicating directly with the chamber between the bottom walls, the vertical guides connected to the outer end walls at opposite sides of the openings therein, the plug-doors pivotally connected at their upper edges to rods mounted in bearings on the outer sides of said guides and adapted to close the openings in the end walls, and vertically-slidable doors arranged in the guides and having openings therein; the said slidable doors being adapted to rest over the openings in the end walls when the plug-doors are opened and being also adapted, in such position, to hold the plug-doors open, substantially as specified.

4. In a freight-car, the combination of the bottom wall and the false bottom wall having openings and serving in conjunction with the bottom wall to form an ice-chamber, the end walls having openings coincident with the ice-chamber for charging the same with ice, and suitable doors for closing said openings, substantially as specified.

602,484. CLOTHES-TONGS. ELBERT B. STEVENSON, Philipsburg, Canada. Filed Nov. 1, 1897. Serial No. 657,124. (No model.) Patented in Canada Nov. 11, 1897, No. 58,101.

Claim.—A clothes-tongs comprising two members pivotally connected the rear ends of said members forming handles, one of said members being provided at its front end with an offset portion having an inclined face against which the other member is adapted to abut, the meeting faces of said inclined face and the opposite member being arranged to fit one onto the other, substantially as and for the purposes set forth.

602,485. HORSESHOE-PAD. JOHN SWEENEY, New York, N. Y. Filed Jan. 6, 1898. Serial No. 665,733. (No model.)

Claim.—1. A horseshoe-pad composed of a leather plate, a rubber heel, a canvas backing vulcanized into the heel, and stitches that pass through the canvas backing and connect the heel to the plate, substantially as specified.

2. A horseshoe-pad composed of a leather plate, a circumferentially-flanged rubber heel, a canvas backing vulcanized into the heel, an outer line of stitches that connects the heel-flange to the plate, and an inner line of stitches that connects the heel-body to such plate, substantially as specified.

602,486. PNEUMATIC CUSHION. ANTON SHILESWSKI and JOSEPH SHILESWSKI, South Bend, Ind. Filed June 22, 1896. Serial No. 596,412. (No model.)

Claim.—As a new article of manufacture, a pneumatic cushion comprising a bulbular cover-section having the grained portions of gradually-increasing thickness from the crown to the base and a flat base section connected to the cover-section, and an inflation tube and valve for filling the spaces with air under suitable pressure, substantially as described.

602,487. BOX-LOUNGE. ROBERT R. THOMPSON, Bloomington, Ill. Filed June 21, 1897. Serial No. 641,568. (No model.)

Claim.—1. The combination with a box and a cover, of a lever pivoted to the cover and to the box forward of the cover-pivot, and a spring connected to the cover back of the cover-pivot and pulling said cover forward and downward; substantially as described.

2. The combination with a box, of a cover having its rear edge slidingly mounted upon the box, a series of springs tending to draw said rear edge forward, and a series of levers pivoted to the cover and the box, the box-pivots being forward of the cover-pivots; substantially as described.

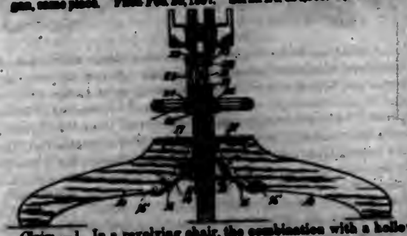
3. The combination with a box having a cover, the rear edge of which is slidingly mounted upon the box, of a series of coiled springs connected at one end to the rear edge of the cover and supported at the other end under tension forward of said point, and a lever pivoted to the cover forward of the point at which the springs are attached and pivoted to the box forward of the point at which it is pivoted to the cover; substantially as described.

4. The combination with a box having a cover slidingly mounted at its rear edge thereupon and having in front of its rear edge means for raising it and preventing backward movement, of an inclined slide for the rear edge of the cover whereby the cover is raised bodily from the box as it slides forward; substantially as described.

5. The combination with the box, A, having the covir, B, mounted upon it, of a bent lever, D, pivoted to the cover and to the box in front of the cover-pivot, and the coiled spring, C, extending from the downwardly-projecting end of the lever to the cover in rear of the lever-pivot and there connected to said cover; substantially as described.

602,488. FILTER FOR RAIN-WATER. WILLIS M. TIER and LEVI TIER, Bethlehem, Pa. Filed June 26, 1897. Serial No. 642,308. (No model.)

Claim.—1. In a filter for rain-water, the combination with a casing interposed in the rain-water pipe and having a door in its side, of an outer strainer made of wire-netting detachably suspended within the casing and movable through the door, and a coarser, automatically-extensible strainer detachably suspended within the outer strainer, and movable therewith, substantially as described.



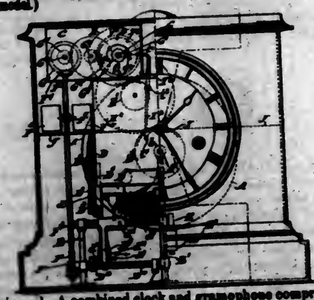
2. In a filter for rain-water, the combination with a casing interposed in the rain-water pipe and having a door in its side, of an outer strainer made of wire-netting detachably suspended within the casing and movable through the door, a coarser, automatically-extensible strainer detachably suspended within the outer strainer, and movable therewith, and a sponge or similar absorbent device supported on a grating in the lower end of the casing, substantially as described.

3. In a filter for rain-water, the combination of a casing provided with a sliding door and adapted to be connected to a rain-water pipe, an outer strainer made of wire-netting detachably suspended within the casing and an inner strainer consisting of a tapering coil of wire detachably suspended within the outer strainer, substantially as described.

4. In a filter for rain-water, the combination of a casing adapted to be connected to a rain-water pipe, and provided with an interior collar at its upper end, an outer strainer of wire-netting having a sleeve at its upper end adapted to be detachably connected to said collar by a bayonet-joint, a handle pivoted on the said sleeve, lugs projecting inwardly from the sleeve, and an inner strainer consisting of a tapering coil of wire having a flange at its upper end adapted to be supported on the said lugs, substantially as described.

5. A strainer for a rain-water filter composed of a tapering coil of wire, the coils at the upper end normally lying close together and the spaces between the lower coils gradually increasing toward the lower end of the strainer, substantially as described.

602,489. REVOLVING CHAIR. CARLOS C. TRAFT and FRANK TRAFT, Fort Washington, Wis., assignors of one-half to James H. Morgan, same place. Filed Feb. 20, 1897. Serial No. 624,263. (No model.)



Claim.—1. In a revolving chair, the combination with a hollow screw-threaded standard fixed on supporting-legs, of a nut turning on the standard, a seat-carrying spindle revolvable in the standard, and a collar about the spindle and on which it is supported, said collar being provided with a leg having a wedge-formed surface bearing against a complementary wedge formed surface in the nut and adapted thereby by reason of the weight on the leg, to lock the nut in place on the standard.

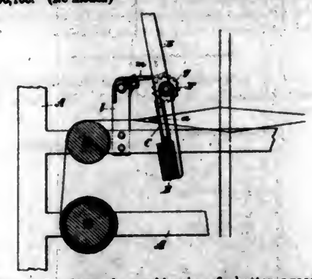
2. In a revolving chair, the combination with a hollow screw-threaded standard fixed on supporting-legs, of a nut turning on the standard said nut being provided with a groove or aperture parallel with its axial bore, a seat-carrying spindle revolvable in the standard, a collar about the spindle and on which it is supported, a leg depending from the collar and provided with a beveled or wedge-formed bearing-surface arranged to bear and wedge against the wall of the groove or aperture in the nut and thereby by the weight thereon to be forced against the standard clamping the nut thereto.

3. In a revolving chair, the combination with a hollow screw-threaded standard fixed on supporting-legs, of a nut turning on the standard, a seat-carrying spindle revolvable in the standard, a collar about the spindle and on which it is supported, a leg depending from the collar and passing through the nut and provided with a wedge-formed surface bearing against a complementary wedge-formed surface in the nut, and a toe on the leg extending under and adapted when lifted to engage the nut.

4. In a revolving chair, the combination with a fixed hollow standard screw-threaded exteriorly and a nut turning thereon, of a seat-carrying spindle revolvable in the standard, a collar loose on and supporting the spindle, a leg depending from the collar at one side and passing through the nut, a toe on the leg arranged releasably to engage the nut, and a pin in the spindle below the collar adapted to prevent the spindle from escaping from the collar.

602,490. COMBINED CLOCK AND GRAMOPHONE. JOSEPH A. VERNEY, Philadelphia, Pa. Filed Feb. 11, 1897. Serial No. 623,206. (No model.)

Claim.—1. A combined clock and gramophone comprising a record-disk mounted upon a rotatable plate, spring mechanism for operating the same, a sound-box provided with a diaphragm and stylus which is adapted to traverse the face of the record, a screw operated by said spring mechanism for conveying the sound-box and stylus across the record-disk in one direction, a second screw for conveying the sound-box and stylus in the opposite direction, cams, one on each of said screws for shifting the parts carrying the sound-box and stylus out of engagement with one and into engagement with the other of said screws, the clock mechanism, a dog mounted upon a shaft of the clock mechanism, a lever controlled thereby, and a notched wheel operated upon by said lever and dog to unlock the spring mechanism of the gramophone.



2. A combined clock and gramophone comprising the clock mechanism, spring means for operating the same, a lever controlled by said clock mechanism, a record-disk mounted upon a rotatable plate, spring means for operating the same, a sound-box provided with a diaphragm and stylus which is adapted to traverse the face of the record, a screw for conveying the sound-box and stylus across the record-disk in one direction, a second screw for conveying the sound-box and stylus in the opposite direction, cams one on each of said screws for shifting the parts carrying the sound-box and stylus from one to the other of said screws and a notched plate secured to the main shaft of the spring mechanism of the gramophone and operated upon by the above-mentioned lever for locking said spring mechanism.

3. A combined clock and gramophone comprising a record detachably secured to a rotatable plate mounted upon a horizontal shaft, a sound-box and stylus acted upon by said record, a lever depending from said sound-box, a screw for acting upon said lever to move the sound-box and stylus in one direction, a screw acting upon said lever to move it and its connecting parts in the opposite direction, pins upon said lever, a cam upon each of said screws for acting upon said pins to shift the lever from one to the other of said screws, a spring-motor connected to said screws through a train of gearing for operating the same, and in like manner to the shaft carrying the record, a disk carried by the main driving-shaft of said motor provided with a series of notches, a pivoted lever having one end adapted to the notches of said plate, the clock mechanism, a dog mounted upon the minute-hand shaft of the clock mechanism and adapted to act upon said lever, substantially as specified.

4. A gramophone comprising a disk containing the record secured to a plate mounted upon a rotatable shaft, a sound-box and a stylus controlled thereby, a traveling support for the sound-box and stylus flexibly connected to a sleeve guided upon a horizontal bar, said sleeve having an arm depending therefrom, a screw adapted to feed the traveling support in one direction, a cam mounted upon the screw and adapted to a pin upon the depending arm for disengaging said arm from said screw, a screw adapted to feed the traveling support in the opposite direction, a cam upon said screw for acting upon a pin on said arm to disengage the same from the last-mentioned screw and move said arm into engagement with the opposite screw,

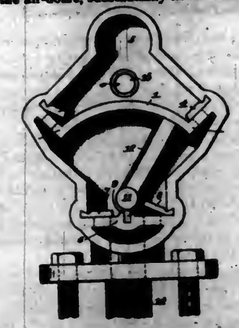
and means controlling the bar upon which traveling support is sleeved for holding the depending arm into engagement with one or the other of the screws with a yielding tension.

602,491. LOOM. JACOB WALDER, Paterson, N. J.; Mary Walder executrix of said Jacob Walder, deceased. Filed July 23, 1896. Serial No. 600,103. (No model.)

Claim.—1. In a loom, the combination of a batten, a reed, a frame for said reed independent of the batten, said reed having movable dents and means for maintaining the dents spaced apart at top and bottom and for limiting the backward-and-forward movement as well as the lateral movement thereof, a removable pattern-cylinder carried by the batten and adapted to contact directly with said movable dents and limit their movement in one direction, means for operating said cylinder automatically and means for connecting the pattern-cylinder with and disconnecting it from the operating means, whereby the pattern-cylinder is rendered interchangeable, substantially as described.

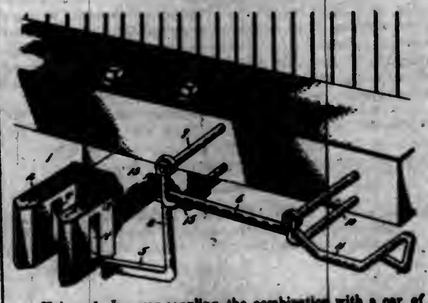
2. In a loom, the combination of a batten, a reed, a frame for said reed independent of the batten, said reed having movable dents and means for maintaining the dents spaced apart and for limiting the backward-and-forward movement as well as the lateral movement thereof, a removable pattern-cylinder carried by the batten and adapted to contact directly with said movable dents and limit their movement in one direction, means carried by the said batten for connecting the pattern-cylinder to and disconnecting it from the batten whereby said pattern-cylinder is rendered interchangeable and means independent of said batten for cooperating with the cylinder-connecting means to operate said cylinder, substantially as described.

3. A reed for looms, comprising a reed-frame, dents movable in the direction of the planes thereof or at right angles to the length of the reed, each of which dents is pivoted at one end in the said reed-frame and free to vibrate at the opposite end and means carried by the reed-frame for limiting the forward-and-backward movement of the dents, said dents projecting at the free ends beyond the reed-frame, substantially as described.



4. A reed for looms, comprising a reed-frame, independently-movable dents freely movable in the direction of their planes or at right angles to the length of the reed, and a spacing-reed carried by the reed-frame, the dents of which spacing-reed form spacing means for the movable dents of the reed proper, substantially as described.

5. A reed for looms, comprising a reed-frame, independently-movable dents freely movable in the direction of their planes or at right angles to the length of the reed, a single pivot upon which said dents are mounted and around which they are adapted to vibrate and a spacing-reed carried by the reed-frame, the dents of which form spacing means for the movable dents of the reed proper.



6. A reed for looms, comprising a reed-frame, independently-movable dents freely movable in the direction of their planes or at right angles to the length of the reed, a single pivot upon which said dents are mounted and around which they are adapted to vibrate, a coiled spring surrounding the said pivot for maintaining the movable dents properly spaced apart at one end, a spacing-reed carried by the reed-frame, the dents of which form spacing means for the movable dents at the free ends thereof, substantially as described.

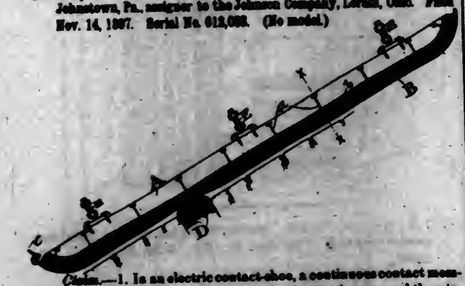
602,492. PUMP. CHARLES G. WHITE, Woodland, Cal., assignor of one-half to J. P. Hink, same place. Filed Apr. 2, 1897. Serial No. 630,426. (No model.)

Claim.—A pump constructed substantially as shown and described, comprising a casing having its sides converging from an intermediate point toward its ends, a crown connecting the upper converging ends and forming an air-dome, an arcuate diaphragm having its end portions inclining upwardly and outwardly and joined to the sides at their point of convergence, inwardly and upwardly opening valves for controlling openings in the said inclined end portions of the diaphragm, a straight diaphragm connecting the lower converging sides, and having a central raised portion provided with a packing, upwardly and outwardly opening valves controlling openings in the ends of the horizontal diaphragm, a rock-shaft journaled in the heads of the casing and having its lower portion forming a tight joint with the said packing, and a straight piston projecting from the rock-shaft and having its free end constructed to work over and against the concave side of the arcuate diaphragm, the casing having an inlet below the straight diaphragm and an outlet above the arcuate diaphragm and below the air-dome, substantially as set forth.

602,493. CAR-COUPLING. LOUIS B. WHITING, Terrell, Tex. Filed Apr. 15, 1897. Serial No. 632,363. (No model.)

Claim.—1. In a car-coupling, the combination with a car, of a draw-head mounted thereon and provided with vertical jaws having transverse slots, a pair of rigid keepers mounted on the car at one side of the draw-head, and an operating-rod constructed of a single piece of rod metal, loosely arranged in the said keepers and provided at its inner end with an integral L-shaped portion adapted to engage the inner keeper and forming a horizontal coupling-pin 5, provided at its outer end with a depending leg to engage the draw-head, the outer end of the rod being bent to form a handle, substantially as described.

2. In a car-coupling, the combination with a car, of a draw-head mounted thereon and provided with a pair of vertical jaws having transverse slots, a pair of rigid keepers extending from the car at one side of the draw-head, and an operating-rod constructed of a single piece of rod metal and provided at its inner end with an integral L-shaped portion forming a coupling-pin and provided at the outer end of the latter with a depending leg to engage the draw-head, said rod being provided at its outer portion with a depending bend 11 forming opposite inner and outer inclined shoulders adapted to engage the outer keeper and capable of sliding readily over the same, substantially as and for the purpose described.



602,494. TRAVELER'S TOILET-CASE. EDWARD B. BRIGGS, Amesbury, Mass. Filed Mar. 26, 1897. Serial No. 629,206. (No model.)

Claim.—In a portable toilet-case, the combination of the hinged registering sections thereof and handle for carrying the same, a transverse diaphragm of the one section forming a water-fount and a compartment for toilet articles, the inlet and the bib of the said water-fount, the waste-reservoir of the other section with outlet therefor, the orifice in the top of the waste-reservoir, and the basin fitted into the said orifice, the said basin having a wasteway, substantially as and in the manner described.

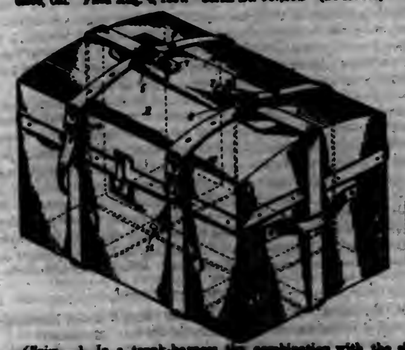
602,494.

602,495. ELECTRIC CONTACT-SHOE. WILLIAM M. BROWN, Johnstown, Pa., assignor to the Johnson Company, Lorain, Ohio. Filed Nov. 14, 1897. Serial No. 612,093. (No model.)

Claim.—1. In an electric contact-shoe, a continuous contact member in combination with a continuous elastic member secured thereto.

2. In an electric contact-shoe, a continuous piece of rubber tubing adapted to carry the contact portion of the shoe and afford the requisite yielding contact between said contact portions and the devices from which the electric current is delivered to the shoe.

3. In an electric contact-shoe, a flexible member secured longitudinally to the vehicle and composed substantially of a piece of rubber tubing, and a continuous contact-strip, secured to said tubing substantially as set forth.

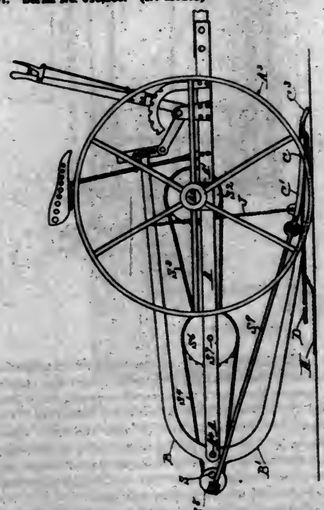


4. A contact-shoe for railway-vehicles comprising a flexible contact-strip, a supporting-frame comprising a bar parallel to said strip, and a cushion extending from end to end between said bar and strip.

5. In an electric contact-shoe, in combination, a continuous piece of flexible tubing, a plurality of rivets passing through one wall thereof, and secured upon the top of a continuous contact-strip, said rivets securing said strip tangentially to the tubing.

6. An electric contact-shoe comprising, in combination, a continuous rigid member, secured longitudinally to the vehicle, a continuous yielding member rigidly secured thereto and a flexible contact-strip secured to said yielding member.

7. A contact shoe for electric railways comprising the block A secured to the vehicle to be propelled, the hose B secured to one side of said block, and the contact-strip C secured to said hose.



602,496. TRUNK-HARNESS. HENRY BRUNNER, Jr., San Francisco, Cal. Filed Aug. 4, 1897. Serial No. 647,114. (No model.)

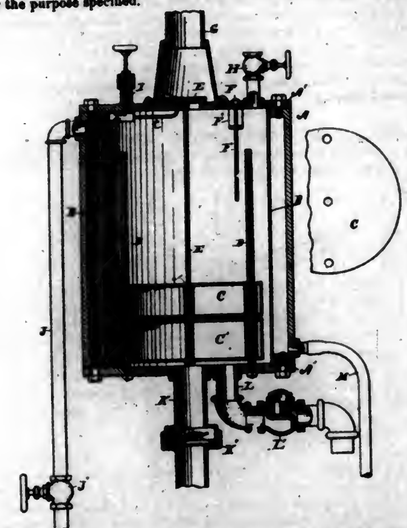
Claim.—1. In a trunk-harness, the combination with the side straps provided with end buckles, the rings or loops secured to the opposite end of the side straps, and the end strap connected to the side straps at such points as to come beneath the trunk, the ends of said strap passing through the rings or loops and fastening to the end buckles of the side straps whereby the straps are made to embrace the top, bottom, sides and ends of the trunk.

2. In a trunk-harness, the combination with the side straps provided with end buckles, of the rings or loops secured to the opposite end of the side straps, the connecting-piece to which the side straps and rings or loops are attached, and of the end strap connected to the side straps at such points as to come beneath the trunk, the ends of said strap passing through the rings or loops and fastening to the buckles of the side straps whereby the straps are made to embrace the top, bottom, sides and ends of the trunk when the harness is secured thereto.

602,497. POTATO-DIGGER. JAMES A. BOSS, Crescent, N. Y., assignor of one-half to Le Roy Vermilyea, Cohoes, N. Y. Filed Jan. 7, 1897. Serial No. 618,282. (No model.)

Claim.—1. In a potato-digger, the combination with a truck and truck-supported plow-beam, of a two-winged plow superimposed upon and pivoted to the beam upon a vertical axis located intermediately of, and in approximately the same horizontal plane with, the wings, and a crank-and-pitman connection between the truck-wheels and each wing of the plow, whereby positive oscillating movements will be communicated to the pivoted plow, substantially as described.

2. In a potato-digger, the combination with a truck and truck-supported plow-beam, of a two-winged plow superimposed upon and pivoted to the beam upon a vertical axis intermediately of and in approximately the same horizontal plane with the plow-wings, operating connections between the truck-wheels and plow for oscillating the wings, and a series of rearwardly-projecting tines secured at their forward ends to the plow, substantially as described.



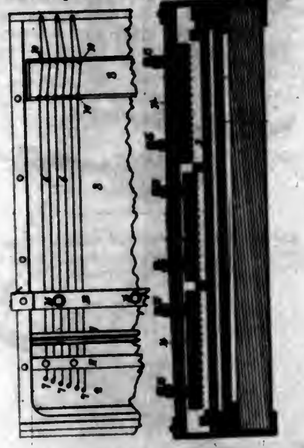
3. In a potato-digger, the combination with a truck and truck-supported plow-beam, of a plow pivoted upon a vertical axis, means for oscillating the plow upon its pivot, and supporting swing connections between the upper end of the plow-beam and the plow located approximately at the center of gravity of the plow, substantially as described.

4. In a potato-digger, the combination with a truck and truck-supported plow-beam, of a plow pivoted upon a vertical axis and comprising a tusk projecting forwardly of the pivot, a pair of diverging wings or shares projecting rearwardly of the pivot on opposite sides, and a plurality of rearwardly-projecting tines, supporting swing connections attached to the wings rearwardly of the pivot, a crank-operated pitman secured to each wing, and operating connections between the crank and the truck-wheels, substantially as described.

602,498. STEAM VACUUM-PUMP. FRED R. CHAMBERS, Meriden, Mich., assignor of one-half to Henry D. Cushman, Three Rivers, Mich. Filed June 1, 1897. Serial No. 638,908. (No model.)

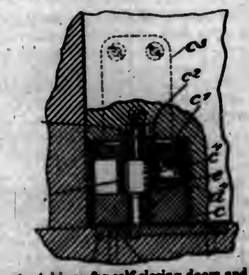
Claim.—1. In a low-pressure steam vacuum-pump the combination of a pump-chamber; a water-jacket around the same; a supply

and delivery pipe at the bottom with suitable valves therein; a steam-inlet at the top with a suitable outwardly-opening valve therein; a float in the bottom of said pump-chamber connected to said valve of only sufficient size to raise the valve against the steam-pressure; an opening in the top of said chamber with an outwardly-opening valve to close the same; an independent float within the chamber to strike the valve to the vent-opening to open the same all coacting together for the purpose specified.



2. In a low-pressure steam vacuum-pump the combination of a pump-chamber; means of cooling the same; inlet and outlet valves therefor; a steam-inlet pipe with outwardly-opening valve therein; a float toward the bottom of said pump-chamber connected to the valve in said steam-inlet of sufficient size to raise the valve against the steam-pressure only; a vent-opening with a valve to close the same; an independent float in the pump-chamber guided to rise and open the vent to admit air and destroy the vacuum and allow the water to escape all coacting for the purpose specified.

3. In a low-pressure steam vacuum-pump the combination of a pump-chamber; inlet and outlet valves therefor; a steam-inlet pipe with outwardly-opening valve therein; a float toward the bottom of said pump-chamber connected to the valve in said steam-inlet of sufficient size to raise the valve against the steam-pressure only; a vent-opening with a valve to close the same; an independent float in the pump-chamber guided to rise and open the vent to admit air and destroy the vacuum and allow the water to escape all coacting for the purpose specified.

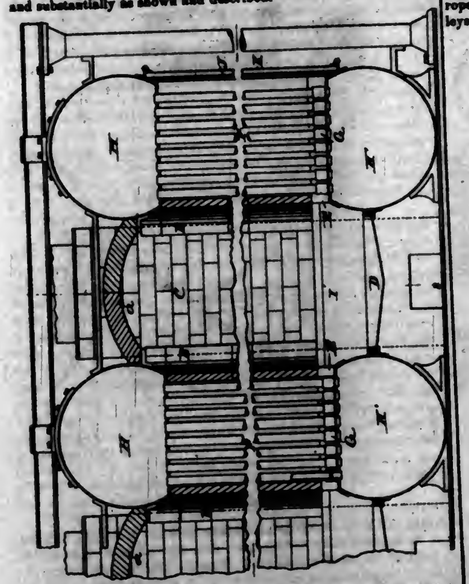


4. In a low-pressure steam vacuum-pump the combination of the outer and inner cylinders A, A, with heads A', A'', forming an inner pump-chamber with water-jacket around it; supply-pipe M, leading to said water-jacket; waste-pipe J, leading therefrom with valve J'; below the line of water-supply; supply-pipe K, with inlet-valve K', leading to the bottom of said pump-chamber; a delivery-pipe L, leading from the bottom of said pump-chamber; a steam-inlet pipe G, leading to the top of said pump-chamber; an outwardly-opening valve E', in the steam-passage having a lever *e*, with weight F', to counterbalance the valve; a spindle I, extending through the wall of the pump-chamber to actuate the lever to open the valve; a float C', in the bottom of said pump-chamber with a rod E, connecting it to valve E', the said float being only of sufficient size to open the valve against the steam-pressure alone; a vent F, with a valve F', to close the same suitably guided to place; an independent float C, to actuate the valve and open the vent in rising and suitable guide-rods D, engaging the floats C, C, to guide the same all coacting together substantially as described for the purpose specified.

602,499. APPARATUS FOR TUNING PIANOS. JOHN B DAYPOST, Cambridge, Mass., assignor to the Ivers & Pond Piano Company, Boston, Mass. Filed Sept. 28, 1897. Serial No. 653,963. (No model.)

Claim.—A mechanical device for stretching the strings of a piano, composed of a support adapted to be temporarily attached to the string-frame of such piano—a pressure bar capable of contact with a plurality of strings simultaneously and carried by said support, and adapted to rock or tilt transversely of said strings—and operating-screws or their equivalents, to vary the degree of pressure exerted by the bar upon the strings, substantially as described.

602,500. HINGE. MORGAN DOBBS and CHARLES J. MATHIAS, London, England. Filed Sept. 20, 1898. Serial No. 652,157. (No model.)



Claim.—1. A hinge for self-closing doors and shutters in which is combined an axial pintle providing an inner bearing for a spherical ball, the plug formed with an inclined plane and surrounding the pintle, the plunger formed with a correspondingly-inclined plane and surrounding the pintle, a loose rising-and-falling spherical ball located in the spiral runway formed by the inclined planes, and a cylindrical casing providing a housing for the plug and for the plunger and also an outer bearing for the spherical ball; substantially as described.

2. A hinge for self-closing doors and shutters in which is combined an axial pintle providing an inner bearing for a spherical ball, the plug formed with an inclined plane and with a sharp depression at the inner end of its inclined plane and surrounding the pintle, the plunger formed with a correspondingly-inclined plane and with a sharp depression at the inner end of its inclined plane and surrounding the pintle, a loose rising-and-falling spherical ball located in the spiral runway formed by the inclined planes, and a cylindrical casing providing a housing for the plug and for the plunger and also an outer bearing for the spherical ball; substantially as described.

3. A hinge for self-closing doors and shutters in which is combined an axial pintle, a cylindrical boss surrounding the axial pintle and providing an inner bearing for a spherical ball, the plug formed with two oppositely-inclined planes and with a sharp depression joining its inclined planes, the plunger formed with two correspondingly oppositely-inclined planes and with a sharp depression joining its inclined planes, a loose rising-and-falling spherical ball located in the spiral and diamond-shaped runway formed by the oppositely-inclined planes, the bush surrounding the pintle within the plug and a cylindrical case providing a housing for the plug and for the plunger and also an outer bearing for the spherical ball; substantially as described.

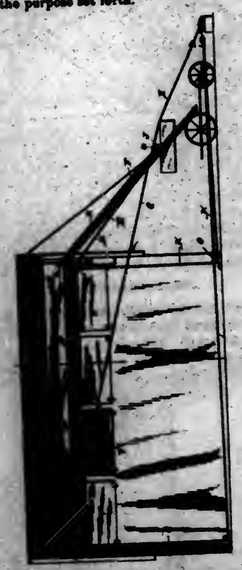
602,501. WATER-TUBE BOILER. ELLIS F. EDGAR, Woodbridge, N. J. Filed Mar. 20, 1897. Serial No. 628,041. (No model.)

Claim.—1. The combination in a water-tube boiler of a furnace, water-and-steam drums H, located one on either side of said furnace and above said furnace, said water-and-steam drums H, having means for supporting between said drums and above the line of tube sheet of said drums wall A, the said furnace being located directly under said wall A, as shown, and between water-tubes connecting said water-and-steam drums H, to water-drums H', all for the purpose set forth and substantially as shown and described.

2. The combination in a water-tube boiler of a furnace, wall A, over said furnace, water-and-steam drums H, and water-drums H', connected by water-tubes, located on each side of said furnace, and walls B, B, located between the water-tubes and combustion-chamber and grate, whereby the gases are forced to pass around walls B, B, at that end of walls B, B, next to the furnace door, between the water-tubes as described and for the purpose set forth, all substantially as shown and described.

3. The combination in a water-tube boiler of a furnace, wall A, over said furnace, water-and-steam drum H and water-drum H', connected by water-tubes, located on each side of said furnace, and walls B, B, draft-flue C, draft-exits L into said draft-flue C, all substantially as shown and described.

4. The combination in a vertical water-tube boiler of a series of water-tubes, located on either side of a furnace, said water-tubes being connected into water-drum H' as shown and described and protected by fire-clay bricks E, as shown and described, having outside casing K and J, and K' and J', as shown and described, walls B, B, as shown and described, draft-flue C and draft-exits L and fire-clay wall A, located over said furnace, all substantially as shown and described.



5. The combination in a water-tube boiler of a series of furnaces, divided by a series of water-tubes, with a deflecting-wall located above said furnaces, and a draft-flue or a series of draft-flues located between the series of water-tubes and at that end of the furnace opposite the fire-door all substantially as shown and described.

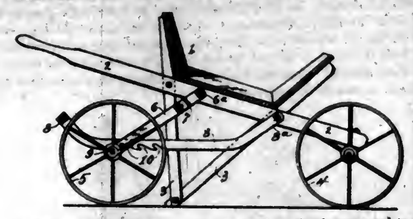
6. The combination in a water-tube boiler, of a series of furnaces, with a series of water-tubes located on either side of said furnaces, and a series of incombustible walls, located above said furnaces, with a draft-flue located between the said furnaces and between the series of water-tubes, with draft-openings into said flue and combustion-chambers on each side of said flue between the furnaces and said flue or flues, all substantially as shown and described.

602,502. APPARATUS AND BUILDING FOR UNLOADING AND STORING GRAIN. GEORGE S. FOSTER, Rock, Ill. Filed June 26, 1897. Serial No. 641,269. (No model.)

Claim.—1. A building for storing grain having horizontal tracks arranged centrally and longitudinally thereof, a wagon-body mounted on a truck traveling on said track, said body having a hinged bottom, bins arranged on each side of the track, doors opening outwardly from said bins and forming a chute with the bottom of the wagon, as and for the purpose set forth.

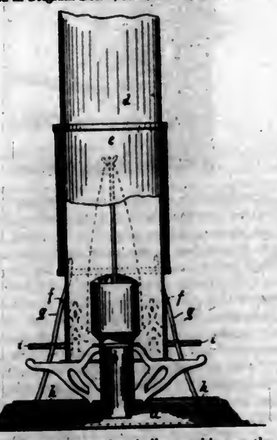
2. In combination, a building, horizontal tracks arranged therein, inclined tracks leading therefrom, the rails of said inclined track being double-flanged, one of the flanges being provided with gear-teeth, a truck carrying double-flanged wheels to run upon said rails, one of the flanges of each wheel being provided with gear-teeth which mesh with the teeth of the rail, grooved pulleys carried by the truck, and ropes secured to the building and arranged to pass around said pulleys, as and for the purpose set forth.

3. In combination, a building, horizontal tracks arranged therein, inclined tracks leading therefrom, a truck adapted to travel upon said tracks, two grooved pulleys carried by the truck, a dumping-bottom adapted to be attached to the truck, ropes arranged to pass around the grooved pulleys, a rope attached to the truck, and means for attaching said ropes to a team, whereby the body may be elevated and conveyed to the desired point, as shown and described.



4. In combination with a building of the character described, horizontal tracks arranged therein, inclined tracks leading to the first-named tracks, the last-named tracks having gear-teeth formed upon one flange thereof, a truck adapted to travel upon the tracks, gear-teeth formed with the truck-wheels and adapted to mesh with the teeth of the inclined track, a dumping-body adapted to be attached to the truck, grooved pulleys carried by the truck, two ropes so arranged as to pass around said grooved pulleys and elevate the truck up the inclined track, and a rope leading from the truck over the pulleys, all of said ropes being adapted for attachment to the team whereby the body may be handled, substantially as and for the purpose set forth.

602,503. CORK-EXTRACTOR. GEORGE S. FOSTER, Rock, Ill. Filed June 26, 1897. Serial No. 642,478. (No model.)

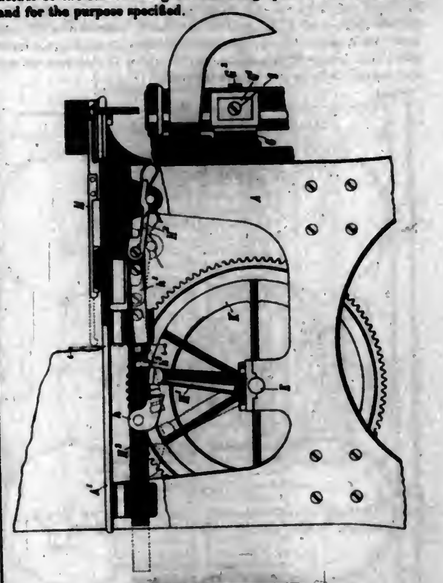


Claim.—A cork-extractor consisting of a strip of tape passed longitudinally around the cork the ends of said tape meeting above the cork an eyelet passed through the ends of said tape securing them together at such a distance from the cork as to prevent the tape from slipping laterally from off the cork, said opening also serving as an opening for the passage of a tool to be used as a handhold, substantially as set forth.

602,504. WHEELBARROW. MARTIN V. GARVER, Bryan, Ohio. Filed Dec. 27, 1897. Serial No. 663,502. (No model.)

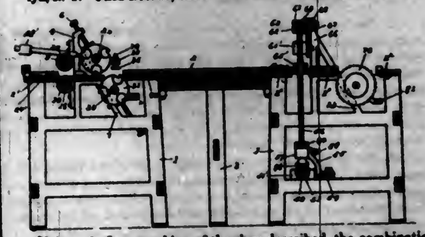
Claim.—In a wheelbarrow, two supporting-wheels arranged tandem, a pair of bars, said bars at one end being pivotally connected to the barrow and at the other end having one of said wheels journaled therein, a spindle for said latter wheel having ends projecting beyond its bearings, a second pair of bars pivotally secured at one end to the barrow, at the other end connected, as a loop, and adapted to be raised by the foot of the operator, and a series of hook portions on said latter bars adapted to engage successively said projecting spindle ends, substantially as and for the purpose specified.

602,505. PROTECTOR FOR INCANDESCENT MANTLES. FRANZ A. P. GRANER, Hamburg, Germany. Filed June 24, 1897. Serial No. 642,092. (No model.) Patented in Germany Mar. 4, 1896, No. 85,308; in England Mar. 9, 1896, No. 5,308; in Austria June 20, 1896, No. 46/2,479, and in Belgium Dec. 9, 1896, No. 12/5,084.



Claim.—The combination of a shell *c* reaching to the height of the mantle to be protected and serving as a guide to the lamp chimney, a base *a* and a centering-tube *b* therein for keeping in place the burner-tube, substantially as described.

602,506. BLANK THREADING AND POINTING MACHINE. JAMES H. HASKINS, Chicago, Ill. Filed May 28, 1896. Renewed Feb. 23, 1898. Serial No. 671,330. (No model.)



Claim.—1. In combination in a blank threading and pointing machine to form a feeding device for the blanks, a feed-slide, a reciprocating bar mounted in bearings upon the machine, pivoted dogs attached to this bar and the bar connected to the feed-slide, and a vibrating post extended into the path of the dogs on the feed-slide, substantially as and for the purpose specified.

2. In combination in a machine for threading and pointing blanks, to form a feeding device for the blanks, a feed-slide, a reciprocating bar mounted in bearings on the machine-frame, a vibrating post that is vibrated by a moving part of the machine, feed-dogs pivotally mounted on the sliding bar and projecting into the path of the vibrating post, the feed-dog which gives the forward advance of the bar being adjustable, substantially as and for the purpose specified.

3. In combination in a blank feeding and pointing machine, with devices for feeding the blanks, a pivoted spring-pressed blank-holder located beside and forming one wall of the feed-slot, at its delivery end, a pinch-lever that acts upon the pivoted spring-pressed slide at certain intervals in the operation of the machine, whereby the spring-pressed lever becomes not only a guide and a retainer, but also a holder of the blank during the threading operation, substantially as and for the purpose specified.

602,507. WOOD MOLDING AND SAWING MACHINE. FRANK M. KENNEDY, Celina, Ohio, assignor of one-half to James W. Stone, Brooklyn, N. Y. Filed Nov. 25, 1895. Serial No. 570,002. (No model.)

Claim.—1. In a machine of the class described, the combination of the revoluble shaft 9; the feed-roller 20 having in one end thereof a chamber 20' and provided with a shaft-opening of greater diameter than that of the contained supporting-shaft, for the purpose specified; a series of radial springs 19' arranged in said chamber as shown, whose inner end forms a bearing upon the said shaft; and a diametric pin 19 fixed in said shaft and having its opposite ends loosely mounted in suitable perforations in the reduced end of said feed-roller, all substantially as described.

2. A roller feed mechanism, comprising a horizontal revoluble shaft 9; a chambered roller having a corrugated periphery and a conical or tapering cylindrical extension whose central bore is of greater diameter than the said shaft on which it is fixed; a diametric pin fixed in said shaft and having its extremities loosely arranged in a radial perforation of greater diameter than said pin for the purpose specified; together with a plurality of radial springs loosely mounted in said roller, whose opposite ends form a bearing upon the said shaft and the chamber-face of said roller respectively, whereby the said roller is adapted for a yielding pressure against the hoop-bar with which it is contacted, all substantially as described.

3. In a hoop molding and sawing machine, the combination of a series of revoluble cutter-heads 25 arranged as shown; a horizontal transverse bar 33 fixed at each end to the supporting-frame and arranged at the rear of said cutter-heads and in close proximity thereto; a plurality of vertically-adjustable presser-bolts 34 mounted in said bar by a screw-threaded connection and rigidly secured in position by a proper jam-nut upon their upper end, and provided upon their lower extremity with a disk 35 adapted to engage the adjacent face of the hoop-bar; and a series of rotatable cutter-heads 31 arranged directly below said disks and adapted to cooperate therewith as described, all substantially as set forth.

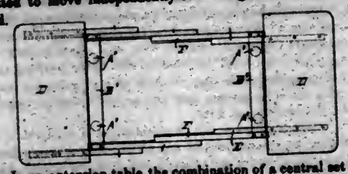
4. In a hoop-making machine, a hoop-bar-tilting device comprising a block 48 provided with a rearwardly-tapering inclined face 48' adapted to receive and tilt the moving bar which is fed through said device as described, having a guide-plate 49 rigidly connected with said block in parallel arrangement, as shown, by the fixed cap or plate 47, and provided with a spring 50 fixed on said cap and having its free end adapted to form a yielding pressure upon the adjacent face of said bar for the purpose of holding it in contact with the supporting-table, whereby the said hoop-bar is tilted to an oblique position for the purpose specified, all substantially as described.

5. In a hoop-making machine a tilting device adapted to convert the bar from a horizontal to an oblique position for the purpose specified, consisting of a block 48 having its inner working face 48' adapted to tilt the bar as described, provided with an inclined guide-plate 49 rigidly connected with said block by a proper connecting-plate and having a spring 50 arranged thereon as shown, and adapted to form a yielding pressure upon the adjacent face of said bar for the purpose specified; together with means for feeding the said bar through said tilting device, all substantially as described.

6. The combination, in a hoop-making machine, of a transverse shaft 51 rotatably mounted in the supporting-frame and having a rigid bevel-gear 53 and the sprocket-wheel 52; the oblique shaft 56' having its upper and lower ends rotatably mounted in a fixed bearing 61' and 57' respectively, on said frame, having near its upper end a fixed roller 65' and upon its lower end a bevel-gear 58 meshing with the said gear 53; the oblique shaft 56 having its extremities rotatably mounted in the journal-boxes 57 and 61 on said frame, the former being pivoted on its support, and the latter being adapted for a limited play against the resistance of a resilient buffer, and provided with a fixed roller 65 in cooperative relation with said roller 65', and having a rigid gear-wheel 60 adapted for an actuating engagement with said gear-wheel 60'; the adjusting-screw 63 mounted in a supporting-bracket, as shown, having a holding-nut 63 and a recessed head 63'; and a rubber buffer 64 fixed in said head and adapted to bear against the face of said journal-box 61, for the purpose specified, all substantially as described.

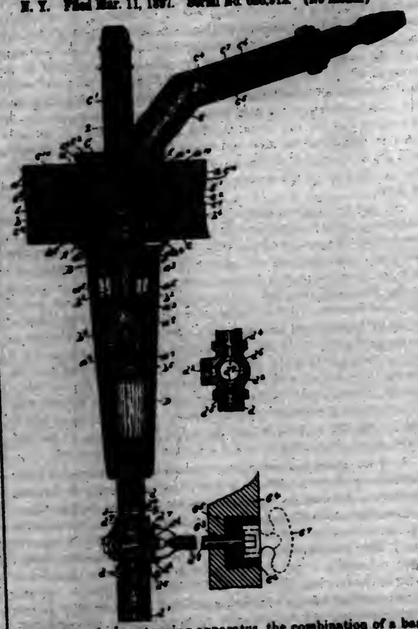
7. The combination of the shaft 51 having the gear 53 and the sprocket-wheel 52; the oblique shaft 56' mounted as described in the bearings 61' and 57', on the supporting-frame, and having near its upper end a fixed roller 65' and upon its lower end a gear 58 meshing with the said gear 53; the oblique shaft 56 mounted as described in the journal-boxes 57 and 61 on said frame, the former being pivoted on its support and the latter being adapted for a limited play against the resistance of a resilient buffer, and provided with a fixed roller 65 in cooperative relation with said roller 65', and having a rigid gear-wheel 60 in mesh with said gear-wheel 60'; and means for imparting to the said feed-roller 65 a yielding pressure for the purpose specified, all substantially as described.

8. The combination of a supporting-shaft; a cylinder loosely mounted on said shaft and provided with a concentric annular recess; springs located in said recess; a pin or projection on said shaft engaging with perforations of larger diameter in said cylinder; and a weighted lever in contact with said cylinder, the whole constituting an adjusting or equalizing roller feed mechanism for feeding wood strips of unequal thickness, together with means for actuating said shaft, all substantially as described.



602,508. HARNESS-BUCKLE. LOUIS H. KIEBEL, Reedsville, Wis., assignor of one-half to F. O. Kiebel, same place. Filed Nov. 16, 1896. Serial No. 612,637. (No model.)

Claim.—A harness-buckle comprising a tongue-bearing member 2, provided with a side bearing-surface, and having a longitudinal keeper including a transverse fulcrum-bar 5 engaged with a strap-loop, whereby the keeper may be tilted to occupy a position perpendicular to the plane of the strap-loop, and a cap 1 pivotally mounted upon the member 2 and having a smooth inner surface spaced from and approximately parallel with the side bearing-surface of said member, the tongue of the member 2 projecting from its bearing-surface in a direction perpendicular to the plane of said keeper, and terminating contiguous to the inner surface of the cap, at a point approximately midway between the ends thereof, substantially as specified.



602,509. EXTENSION-TABLE. WILLIAM H. KLUG, Milwaukee, Wis., assignor to the Wisconsin Furniture Company, same place. Filed Aug. 28, 1897. Serial No. 649,148. (No model.)

Claim.—1. In an extension-table, the combination with the table-legs connected in pairs by cross-rails, of the horizontal connecting guide-bars uniting the pairs of table-legs, and a pair of permanent top boards adapted to meet when the table is closed and provided with bars rigidly attached thereto and slidably engaging the connecting guide-bars between the cross-rails, whereby the top sections are permitted to move independently of the legs, substantially as described.

2. In an extension-table, the combination of a central set of four legs rigidly united by connecting cross-rails and fixed horizontal guide-bars, movable legs connected in pairs by cross rails and provided with sliding guide-bars engaged by the fixed guide-bars of the central legs, and a pair of permanent top boards adapted to meet when the table is closed, and having bars rigidly attached thereto and slidably engaging said sliding guide-bars, whereby the outer legs are permitted to move independently of the central legs, and the top boards independently of any of the legs, substantially as described.

602,510. TAPPING APPARATUS. JOSEPH M. KNAPP, Syracuse, N. Y. Filed Mar. 11, 1897. Serial No. 626,912. (No model.)

Claim.—1. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having inlet and outlet fluid-passages, and an engaging shoulder, a movable key or valve-piece arranged within the tap or bushing at the inner side of the engaging shoulder and provided with inlet and outlet fluid-passages for communicating with the former passages, and means projecting within the tap or bushing and detachably interlocking with the shoulder of the tap or bushing and the key or valve-piece for moving said key or valve-piece, substantially as and for the purpose described.

2. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having inlet and outlet fluid-passages, a movable key or valve-piece arranged within the tap or bushing and provided with inlet and outlet fluid-passages for communicating with the former passages, and a plug formed with shoulders detachably interlocking with the tap or bushing and the key or valve-piece for moving said key or valve-piece, said plug having inlet and outlet conduits for communicating with said passages, substantially as and for the purpose specified.

3. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having a substantially central chamber formed with an engaging shoulder and inlet and outlet openings extending outwardly from the chamber to the exterior of the tap or bushing, a movable key or valve-piece arranged within the chamber at the inner side of the engaging shoulder and having inlet and outlet fluid-passages for communicating with said openings, and means projecting within the inner chamber of the tap or bushing and detachably interlocking with the shoulder of said chamber and the key or valve-piece for moving said key or valve-piece, substantially as and for the purpose set forth.

4. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having a substantially central chamber and inlet and outlet openings extending outwardly from the chamber to the exterior of the tap or bushing, and a movable key or valve-piece arranged in the chamber of the tap or bushing and provided with a conduit or groove opening from the periphery of the key or valve-piece and communicating at one end with the chamber of the tap or bushing and at its opposite end with the inlet-opening of said tap or bushing, said key or valve-piece being also provided with a substantially central chamber and an opening extending outwardly from the chamber to the exterior of the key or valve-piece for communicating with the outlet-opening of the tap or bushing, substantially as and for the purpose specified.

5. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having a substantially central chamber and an inlet conduit or groove and an outlet-opening communicating with the chamber, a movable key or valve-piece arranged in the chamber of the tap or bushing and provided with inlet and outlet fluid-passages for communicating with said inlet conduit or groove and outlet-opening, and a plug detachably interlocking with the tap or bushing and the key or valve-piece for moving the key or valve-piece, said plug having inlet and outlet conduits for communicating with the inlet-conduit of the tap or bushing and the outlet fluid-passage of the key or valve-piece, substantially as and for the purpose set forth.

6. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having a substantially central chamber and inlet and outlet openings extending outwardly from the chamber to the exterior of the tap or bushing, and an inlet conduit or groove opening from said chamber and extending toward the outer end of the tap or bushing, a key or valve-piece arranged in the chamber of the tap or bushing and provided with inlet and outlet fluid-passages for communicating with said openings and conduit or groove, and a plug projecting within the chamber of the tap or bushing and detachably interlocking with the tap or bushing and the key or valve-piece for moving the key or valve-piece, said plug being formed with inlet and outlet conduits for communicating with the inlet conduit or groove of the tap or bushing and the outlet fluid-passage of the key or valve-piece, substantially as and for the purpose described.

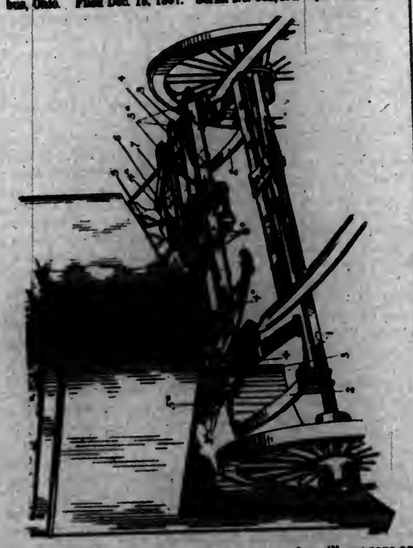
7. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having a substantially central chamber, inlet and outlet openings extending outwardly from the chamber to the exterior of the tap or bushing, and an inlet conduit or groove opening from said chamber and extending toward the outer end of the tap or bushing, a key or valve-piece arranged in the chamber of the tap or bushing and provided with a conduit or groove opening from its periphery for communicating with said inlet conduit or groove and inlet-opening, said key or valve-piece being also provided with a substantially central chamber and an opening exteeding outwardly from the chamber to the exterior of the key or valve-piece for communicating with the outlet-opening of the tap or bushing, and a plug secured within the chamber of the tap or bushing and formed with inlet and outlet conduits for communicating with the inlet conduit or groove of the tap or bushing and the substantially central chamber of the key or valve-piece, substantially as and for the purpose set forth.

8. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having a substantially central chamber provided with a circular engaging face, said tap or bushing being provided with inlet and outlet openings extending outwardly from the inner end of the chamber to the exterior of the tap or bushing, and an inlet conduit or groove opening from said chamber and arranged between the circular engaging face and the inlet and outlet openings, a key or valve-piece arranged in the chamber of the tap or bushing and formed with a circular engaging face, said key or valve-piece being provided with a conduit or groove opening from its periphery for communicating with the former inlet conduit or groove and said inlet-opening, and being also provided with a substantially central chamber and an opening extending outwardly from the chamber to the exterior of the key or valve-piece for communicating with the outlet-opening of the tap or bushing, a plug secured within the chamber of the tap or bushing and provided with annular engaging faces arranged adjacent to the former engaging faces, said plug being formed with inlet and outlet conduits for communicating with the inlet conduit or groove of the tap or bushing and the substantially central chamber of the key or valve-piece, and yielding washers interposed between said engaging faces, substantially as and for the purpose described.

9. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having inlet and outlet fluid-passages, a key or valve-piece arranged within the tap or bushing and provided with inlet and outlet fluid-passages for communicating with the former passages, and a plug projecting within the tap or bushing and detachably interlocking with the tap or bushing and the key or valve-piece for moving the key or valve-piece, said plug having inlet and outlet conduits communicating with said passages, and arranged at an angle with each other, substantially as and for the purpose specified.

10. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having inlet and outlet fluid-passages, a key or valve-piece arranged within the tap or bushing and provided with inlet and outlet fluid-passages for communicating with the former passages, a plug projecting within the tap or bushing and detachably interlocking with the tap or bushing and the key or valve-piece for moving the key or valve-piece, said plug having inlet and outlet conduits for communicating with said passages, and a valve arranged within the inlet-conduit of the plug, substantially as and for the purpose set forth.

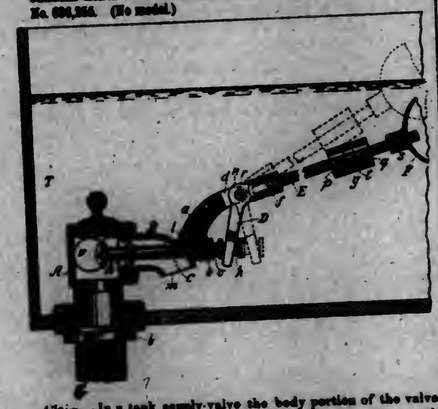
11. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having inlet and outlet fluid-passages, a key or valve-piece provided with inlet and outlet fluid-passages for communicating with the former passages, a plug secured in the tap or bushing and having inlet and outlet conduits for communicating with said passages, said inlet-conduit being provided with an enlarged portion, a tubular valve arranged within the enlarged portion and formed with a yielding wall having a substantially lengthwise slit or slot, and a spiral spring arranged within the tubular valve, substantially as and for the purpose described.



12. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having inlet and outlet fluid-passages, a key or valve-piece provided with inlet and outlet fluid-passages communicating with the former passages, and a plug secured in the tap or bushing and having inlet and outlet conduits for communicating with said passages, the lower end of the inlet-conduit consisting of a chamber surrounding the outlet-conduit, and an opening extending from the chamber to the exterior of the plug for communicating with the inlet fluid-passage of the tap or bushing, substantially as and for the purpose specified.

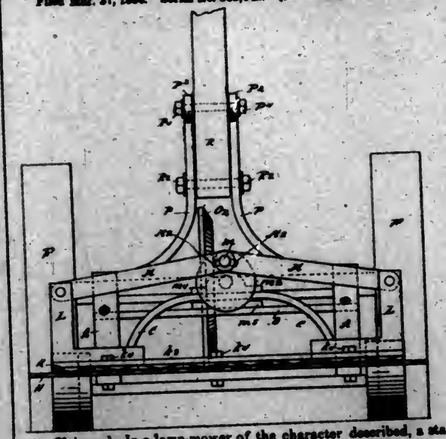
13. In a tapping apparatus, the combination of a barrel or receptacle provided with an aperture in one of its walls, a tap or bushing inserted into the aperture and provided with inlet and outlet fluid-passages, said tap or bushing having its inner face formed with opposite partially-circular grooves and opposite lengthwise grooves extending from the outer end of the tap or bushing to the partially-circular grooves, a key or valve-piece arranged in the tap or bushing and provided with inlet and outlet fluid-passages for communicating with the former passages and a plug for operating the key or valve-piece, said plug having inlet and outlet conduits for communicating with said inlet and outlet fluid-passages, and being formed with opposite laterally-projecting shoulders or lugs, for entering said lengthwise and partially-circular grooves of the tap or bushing, substantially as and for the purpose described.

14. In a tapping apparatus, the combination of a barrel or other receptacle having an aperture in one of its walls, a tap or bushing inserted into the aperture and having a substantially central chamber formed with an engaging face, a key or valve-piece arranged in the chamber and provided with a threaded inner end, means for partially rotating the key or valve-piece, a non-revoluble nut adjustable lengthwise of the threaded end of the key or valve-piece, and a spring interposed between said nut and the engaging face of the tap or bushing, substantially as and for the purpose set forth.



15. In a tapping apparatus, the combination of a barrel or other receptacle having apertures in two of its walls, a tap or bushing inserted into one of said apertures and provided with inlet and outlet fluid-passages, a key or valve-piece arranged in the tap or bushing and having inlet and outlet fluid-passages for communicating with the former passages, means for operating the key or valve-piece, a pipe or conduit communicating with the outlet fluid-passage, of the tap or bushing, said pipe or conduit being provided with a transversely-extending chamber interposed between its opposite extremities, and formed with openings in one end and in its upper and lower portions, a second valve-piece arranged in the chamber and formed with openings for communicating with the former openings, and an operating-piece arranged in the other of said apertures for actuating the second valve-piece, substantially as and for the purpose specified.

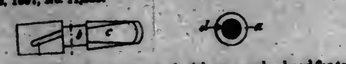
602,511. VEHICLE RUNNING-GEAR. FRANK C. LAND, Columbus, Ohio. Filed Dec. 18, 1897. Serial No. 662,403. (No model.)



Claim.—The herein-described running-gear for milk-wagons and the like, consisting of a platform supported on the front axle, the lower part of the fifth-wheel secured upon said platform in combination with the king-bolt bar projecting considerably beyond the front of the wagon, the upper part of the fifth-wheel of similar shape and size as the lower part of the fifth-wheel secured to the under side of the forward end of the wagon and also projecting beyond the front of the wagon, and a king-bolt passing through the platform and the end of the king-bolt bar, substantially as described.

602,512. TANK SUPPLY-VALVE. HERMANN LOEBER and CHARLES KIESSLING, Milwaukee, Wis. Filed May 12, 1897. Serial No. 636,255. (No model.)

Claim.—In a tank supply-valve the body portion of the valve-casing having a spherical valve between an inlet and outlet port, said portion combined with a discharge-pipe, provided with a sleeve, the same having an opening or passage-way in center bearing a rod C with a removably-connected head *h*, said sleeve bearing a standard with a pivotally-connected disk *n*, the same having an arm D, engaged with the said head of the rod C, and the cap *f* of the disk provided with a socket bearing a detachably-connected stem E mounted with an adjustable float F and chambered weight *g*, said stem being immediately connected with the rod C, substantially as shown, all constructed and adapted for the purpose set forth.

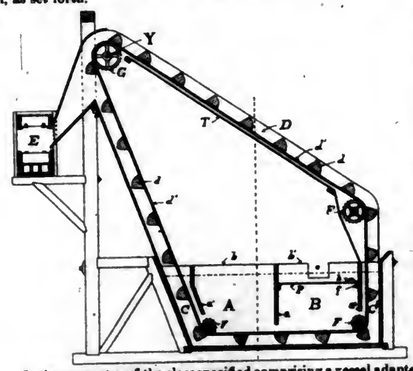


602,518. LAWN-MOWER. HENRY W. MORGAN, Brazil, Ind. Filed Mar. 27, 1896. Serial No. 585,042. (No model.)

Claim.—1. In a lawn-mower of the character described, a stationary cutting-blade, a movable blade mounted thereover, standards secured to said movable blades at each end thereof, pitman-rods connected with each of said standards, the inner ends of said pitman-rods being provided with longitudinal slots and both being mounted on the same crank and being so proportioned that one of said pitman-rods will be engaged during one half of the revolution of said crank and the other pitman-rod will be engaged during the other half of the revolution of said crank, substantially as and for the purpose described.

2. The herein-described lawn-mower comprising two drive-wheels, a main shaft on which the said drive-wheels are mounted, a large beveled gear-wheel mounted on said shaft, a ratchet-wheel mounted at each end of said shaft and a pawl mounted on each of the drive-wheels adapted to engage said ratchet-wheels, a shaft revolubly mounted in the frame which is mounted on said axle, and provided at the rear end with a beveled gear adapted to engage said beveled gear on the shaft of the drive-wheels, and the outer end being provided with a crank to which is secured a crank-pin, a movable cutter-bar mounted in the forward end of the frame and provided at each end with an upwardly-directed standard, pitman-rods pivotally mounted in each of said standards each of which is provided at the inner end with a longitudinal slot and each being mounted upon the said crank-pin, substantially as and for the purpose described.

602,514. TUNING-PIN. HENRY MÖLLER, London, England. Filed July 21, 1897. Serial No. 645,367. (No model.) Patented in England May 6, 1897, No. 11,262.



Claim.—A tuning-pin constructed with an angular head for turning the same, an intermediate cylindrical portion and a conical end portion of larger diameter than said intermediate portion and provided upon the side thereof with a groove, said groove extending diagonally a short distance toward the ends of said conical end portion, substantially as described.

602,515. SEPARATING APPARATUS. AUGUSTUS F. MCCLATCHEY, Aurora, and CHARLES L. KEEN, Chicago, Ill. Filed Sept. 3, 1896. Serial No. 604,156. (No model.)

Claim.—1. An apparatus of the class specified comprising a vessel adapted to hold the mixture, said vessel having an inlet and an outlet, and being provided with a number of settling-partitions, and also with a number of strainers, whereof each strainer is situated

above a settling-partition, and the inlet and outlet being arranged to direct the flow of mixture upward through the strainers; and power-driven conveying mechanism arranged to collect the sediment deposited upon the partitions, and to remove the same from the vessel, as set forth.

2. An apparatus of the class specified comprising a vessel adapted to hold the mixture, said vessel having an inlet and an outlet, and being provided with a number of settling-partitions, and a number of strainers less than the number of settling-partitions, whereof each strainer is situated above a settling-partitions, and the inlet and outlet being arranged to direct the flow of mixture upward through the strainers; and power-driven conveying mechanism arranged to collect the sediment deposited upon the partitions, and to remove the same from the vessel, as set forth.

3. An apparatus of the class specified comprising a vessel adapted to hold the mixture, said vessel having an inlet and an outlet, and being provided with a number of settling-partitions, and also with a number of strainers, whereof each strainer is situated above a settling-partition, and the inlet and outlet being arranged to direct the flow of mixture upward through the strainers, conveying mechanism arranged to collect the sediment deposited upon the partitions, and to remove the same from the vessel; and pressing means situated and connected to receive the sediment from the conveying mechanism, as set forth.

4. An apparatus of the class specified comprising a vessel adapted to hold the mixture, said vessel having an inlet and an outlet, and being provided with a number of settling-partitions, and also with a number of strainers less than the number of settling-partitions, whereof each strainer is situated above a settling-partition, and the inlet and outlet being arranged to direct the flow of mixture upward through the strainers; conveying mechanism arranged to collect the sediment deposited upon the partitions, and to remove the same from the vessel; and pressing means situated and connected to receive the sediment from the conveying mechanism, as set forth.

5. An apparatus of the class specified comprising a series of vats or tanks having an inlet and an outlet, and being arranged and connected to permit the flow of mixture through the entire series, a portion of the vats or tanks being provided with strainers and connected to direct the flow of mixture upward through such strainers; and power-driven conveying mechanism arranged to collect the sediment deposited in the vats or tanks, and remove the same, substantially as set forth.

6. An apparatus of the class specified comprising a series of vats or tanks having an inlet and an outlet, and being arranged and connected to permit the flow of mixture through the entire series; power-driven conveying mechanism arranged to collect the sediment deposited in the vats or tanks, and to remove the same; and pressing means situated and connected to receive the sediment from the conveying mechanism, as set forth.

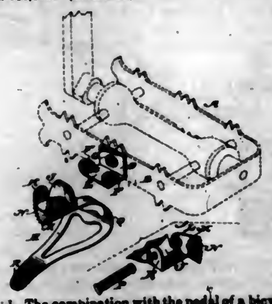
7. An apparatus of the class specified comprising a series of vats or tanks having an inlet and an outlet, and being arranged and connected to permit the flow of mixture through the entire series, a portion of the vats or tanks being provided with strainers, and connected to direct the flow of mixture upward through the strainers; conveying mechanism arranged to collect the sediment deposited in the vats or tanks, and to remove the same; and pressing means situated and connected to receive the sediment from the conveying mechanism, as set forth.

8. An apparatus of the class specified comprising a series of vats or tanks having an inlet and an outlet, and being arranged in a plurality of rows and connected to permit the flow of mixture through the entire series; a number of conveyers, each of which is arranged to collect the sediment deposited in the vats or tanks composing a row, and to remove the same; a main conveyer arranged to receive the sediment from the first-mentioned conveyers; and pressing means situated and connected to receive the sediment from the main conveyer, substantially as set forth.

9. An apparatus of the class specified comprising a series of vats or tanks having an inlet and an outlet, and being arranged in a plurality of rows and connected to permit the flow of mixture through the entire series, a portion of said vats or tanks being provided with strainers and being connected to direct the flow of mixture upward through such strainers; a number of traveling conveyers, each of which is arranged to collect the sediment deposited in the vats or tanks composing a row, and to remove the same; a main conveyer arranged to receive the sediment from the first-mentioned conveyers; and pressing means situated and connected to take the sediment from the main conveyer, substantially as described.

10. A separating apparatus comprising a series of vats arranged in pairs, whereof one vat in each pair contains a strainer, said vats being provided with inwardly-inclined sides forming a trough extending the length of each pair, and being arranged and connected to permit the flow of mixture through the entire series and to direct such flow upward in the vats containing strainers and downward in the vats not so provided; a number of bucket conveyers, each of which is arranged to move in the trough formed at the bottom of each pair of vats, and to collect and remove the solid matter deposited there; a second or main conveyer situated to receive the contents of the bucket conveyer; and one or more roller-presses arranged to receive the solid matter from the main conveyer, substantially as described.

11. In an apparatus of the class specified, the combination with the settling vessel, of the pressing apparatus; a power-driven traveling conveyer leading thereto; a straining-chute connecting the pressing apparatus with the conveyer; and a pan or trough situated below the pressing apparatus, the connecting-chute, and the end of the conveyer, and connected with the vessel, as set forth.

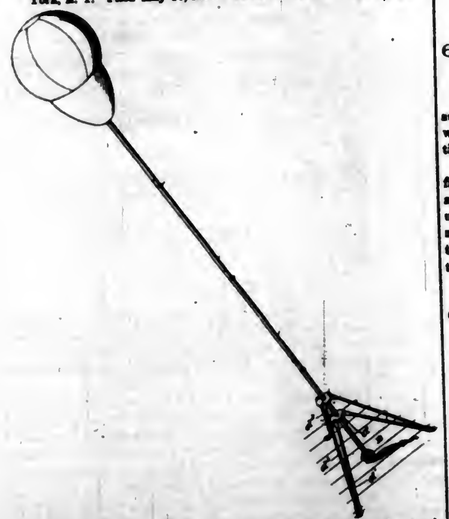


12. In an apparatus of the class specified, a number of vats arranged end to end; a couple of compartments one exterior to each end of the series of vats, the abetting walls of the vats and compartments being exteaded only part way to the bottom of the same; and a traveling conveyer arranged to traverse said vats below the edges of the dividing-walls, and to rise and descend in said exterior compartments, as set forth.

13. In an apparatus of the class specified, the combination with a series of vats, of a traveling conveyer or conveyers having straining means for holding the material collected; and a trough or troughs supported below the conveyer or conveyers and connected at their lower ends with the vats, whereby the drain may return to the latter, as set forth.

14. An apparatus for separating the solid or consistent matters from "distillers' slops" and the like, the same comprising strainers arranged for successively straining the slops and permitting the intercepted solid or consistent matters to gravitate from the same to suitable repositories; means for inducing a flow of the slops through the strainers; and power-driven means for collecting the solid or consistent matters intercepted by the strainers and gravitating therefrom.

15. An apparatus for separating the solid or consistent matters from "distillers' slops" or the like, the same comprising strainers for successively straining the slops; means for inducing a flow of the slops upwardly through the strainers; and power-driven means for collecting the solid or consistent matters intercepted by the strainers and gravitating reversely to the direction of flow of the slops.



602,516. TOE-CLIP. WILLIAM D. MCDANIEL, Philadelphia, Pa., assignor of one-half to Luther S. Green, same place. Filed Oct. 27, 1896. Serial No. 610,190. (No model.)

Claim.—1. The combination with the pedal of a bicycle of a plate D having the member E attached thereto, ears projecting from said member, a toe-clip consisting of a suitable body portion, having ears projecting therefrom, means for holding the clip in position, and an arm or extension attached to one of said ears.

2. In combination with a foot-tread for a bicycle, bearings suitably attached thereto, a stem rotatably mounted on said bearings, a toe-clip which is rigidly secured to said stem, and an arm and teeth thereon, said arm being also rigidly secured to said stem and adapted to rotate the same.

602,517. EXERCISING-MACHINE. BERNARD A. MCFADDEN, New York, N. Y. Filed May 10, 1897. Serial No. 635,770. (No model.)

Claim.—1. In an exercising-machine, the combination of a standard carrying a bag at one end and connected to a suitable support at its other end, a set of non-elastic connections attached to said standard and to the support for maintaining said standard in an upright position, and a set of elastic connections attached to the support and to said standard, substantially as described.

2. A machine for exercising, comprising a standard, a bag arranged on one end of said standard, an attaching device on the other end of the standard adapted to be secured to the floor or ceiling, non-elastic connections adapted to be secured at one end to the floor or the ceiling and at the other end to said standard, and elastic connections also connected to the floor or ceiling and to the standard, whereby a very quick return movement of the bag and the standard may be secured, substantially as described.

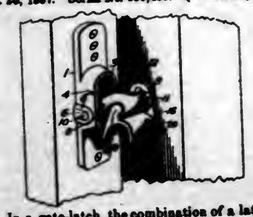
3. An exercising-machine, comprising a resilient sectional standard, a bag arranged on one end of said standard, a universal-joint attaching device on the other end of the standard adapted to be secured to a suitable support, non-elastic connections secured at one of their ends to the standard and adapted to be secured at their other ends to the said support, and elastic connections also secured to the standard and to the support intermediate the bag and non-elastic connections, substantially as described.

4. An exercising-machine comprising a standard, a bag on one end thereof, and an attaching device on the other end of said standard adapted to be secured to a suitable support, a collar or disk secured to the standard intermediate the bag and the support, a series of plates adapted to be secured to the floor or fixture, and a series of connections extending from the said plates to the said collar, substantially as described.

5. In an exercising apparatus the combination of a punching-bag and its supporting-standard; with a protector mounted on the standard below the bag and comprising an inner pneumatic sack c' and an outer cover c^2, said protector being fitted closely to the bag and having a central tube for the passage of the standard, substantially as described.

602,518. LOCK. WILLIAM A. PRITT and REUBEN H. MILLER, Stephensport, Ky. Filed Mar. 11, 1897. Serial No. 627,015. (No model.)

Claim.—A lock, comprising a housing consisting of a bottom member having vertical upturned side flanges 4, horizontally-inturned flanges 6, at one end, the seat 9; and the seat 10, disposed between the flanges 4 and 8, said bottom having a hasp engaging lock devices held within the housing adapted to automatically open and close on the hasp, a cap-plate having angle ends adapted to engage the seats 9 and 10, and provided with a keyway, and a hasp all arranged substantially as shown and described.



602,519. COMPOUND FOR CLEANING WOOD. CHARLES R. POSTLETHWAITE, London, England. Filed Mar. 24, 1897. Serial No. 629,064. (No specimens.) Patented in England July 4, 1895, No. 13,980.

Claim.—1. A compound for cleansing varnished or polished wood surfaces, resulting from the mixing of hydrochloric acid and glycerin with the addition of the flour of a cereal preferably wheat, substantially as herein described.

2. A compound for cleansing varnished or polished wood surfaces, resulting from the mixing of a mixture of hydrochloric acid and glycerin combined in about the proportions of three parts by volume of the former to one part by volume of the latter, and to which mixture is added a suitable cereal flour in about the proportions of thirty ounces by weight of the flour to seventy ounces by weight of the mixture, substantially as herein described.

602,520. GATE-LATCH. FRANCIS A. RAESHART, Helena, Ark. Filed Apr. 23, 1897. Serial No. 633,489. (No model.)

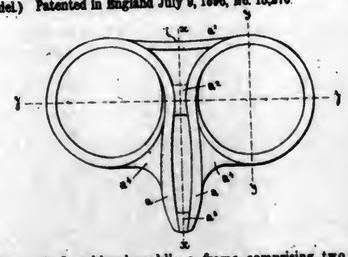
Claim.—In a gate-latch, the combination of a latch-plate having a flanged opening in its middle portion, recesses at each side of the said opening, spaced parallel grooves in the rear face of the plate communicating at their upper end with the said recesses, slots formed in said plate at each side of said opening to form continuations of said recesses and extending into the flange, a latch projecting through said opening and having pivot-pins seated in said slots, a wire spring having substantially parallel sides with coils therein to fit over the said pivot-pins and seat in said recesses, the outer end of the spring engaging the upper face of the latch and the parallel sides of the inner end portion seated in said parallel grooves, and a catch with which the latch engages, substantially as described.

602,521. WATER-HEATER OR CONDENSER. WILLIAM F. RAY, Cincinnati, Ohio. Filed Aug. 24, 1896. Serial No. 603,726. (No model.)

Claim.—A water-heater or steam-condenser embodying a vertical cylinder divided by horizontal partitions into three chambers, the

upper and lower being connected by tubes through the partitions and intermediate chamber; a vertical partition dividing the upper chamber and a similar partition dividing the upper portion of the central chamber to near the bottom; a steam inlet and outlet to the upper chamber entering at opposite sides of its partition and an outlet from the lower chamber; whereby the steam entering the upper chamber passes first downward and then upward through the central chamber; the water entering oppositely passes first downward and then upward around the central partition, and the condensed steam of the operation collects in and is drawn off from the lower chamber, substantially as set forth.

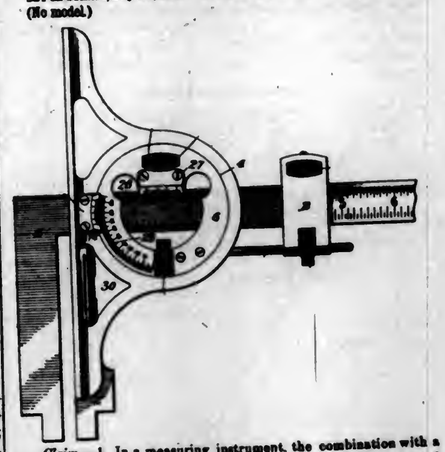
602,522. TENSION DEVICE. HUBERT P. RICHARDS, New Britain, Conn. Filed Aug. 15, 1896. Serial No. 602,861. (No model.)



Claim.—1. A sewing-machine tension device consisting of a disk having a cut-away portion and an inwardly-inclined projection serving as a thread-guide adjacent thereto; a second disk having a cut-away portion opposed to the cut-away portion in the other disk; and means for holding said second disk against the first-named disk.

2. In a tension device the combination with a disk having a cut-away portion and an inwardly-inclined projection, serving as a thread-guide, adjacent thereto, of a complemental disk having a cut-away portion opposed to the cut-away portion in the other disk; means for holding said second disk with yielding pressure against the first-named disk; and means for directing the thread between said disks at the point where the cut-away portions and projection are located.

3. A sewing-machine supporting-arm having thread-tension means thereon comprising a supporting-stem; a fixed member of differential diameters, whereby it forms a pair of thread-bearing faces, said member having a projection or flange forming a thread-guide; a movable member having a cut-away part adjacent to said projection and a part thereof extending in parallelism with one of the bearing-faces of said fixed member; means for holding said members in operative positions relatively to each other; and a thread-guide disposed on said machine-arm below said fixed and movable members, for guiding the thread on its passage from its spool to the tension device, whereby the thread will enter intermediate said disks and at right angles to said flange or projection and have three of its sides in bearing engagement with said device, and thence pass therefrom and across the lower run of the thread adjacent to the entrance part thereof without frictional engagement therewith.



602,523. SADDLE FOR VELOCIPEDES. JOHN W. RICHARDSON, London, England. Filed Apr. 16, 1897. Serial No. 632,426. (No model.) Patented in England July 9, 1896, No. 15,376.

Claim.—1. In a bicycle-saddle, a frame comprising two strips bent around to form loops one end of each strip being secured to the body of the strip, and the other ends of the strips forming substantially parallel projections *a*, wedge-shaped blocks secured between the end portions of the said strips, and blocks secured between the said projections and between the rear parts of the said loops, the upper surfaces of the said loops, blocks and projections being curved to conform to the body of the rider, substantially as set forth.

2. In a bicycle-saddle, a frame comprising two strips bent around in opposite directions to form loops one end of each strip being secured to the body of the strip, and the other ends of the strips forming substantially parallel projections, and connections holding the said parts in position, the upper surfaces of the said parts being curved to conform to the body of the rider, substantially as set forth.

602,524. COMBINATION-TOOL. GLENDON M. ROCKEY and CHARLEY H. STRAIN, Dayton, Ohio. Filed June 14, 1897. Serial No. 640,636. (No model.)

Claim.—1. In a measuring instrument, the combination with a stock provided with a circular opening, of an expansible ring adapted to rotate in said opening, means for clamping the ring against movement, and an arm or bar secured to the expansible ring, substantially as described.

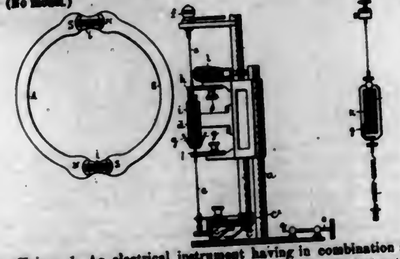
2. In a measuring instrument, the combination with a stock provided with a circular opening, of an expansible ring adapted to rotate in said opening, means for clamping the ring against movement, an arm or bar secured to the expansible ring and adapted to move longitudinally with respect thereto, and devices for holding the arm against such movement, substantially as described.

3. In a measuring instrument, the combination with a stock, of a part adapted to rotate thereon and means for holding said part against rotation, an arm or bar connected to the rotating part, a clamping-post mounted upon the arm, and adjustable connections between the clamping-post and rotating part, substantially as described.

4. In a measuring instrument, the combination with a stock having graduations, of a part rotatively mounted thereon and provided at its edge with a segmental degree-scale, the graduations of which register with those of the stock, devices for rotatively adjusting the rotating part, and an arm connected to said part, substantially as described.

5. In a measuring instrument, the combination with a stock having a circular opening, the edge of which is channeled, of an expansible ring having separated ends mounted in said opening and provided with an exterior flange for engagement with the channel in the edge of the opening, a screw connected to one end of the ring, a thumb-nut between the ends of the ring through which the screw passes, and an arm or bar secured to the expansible ring, substantially as described.

602,525. TANK-VALVE. CHARLES L. SCOTT, McIntire, Iowa. Filed Apr. 26, 1897. Serial No. 634,282. (No model.)



Claim.—1. In a valve for watering-troughs and stock-tanks, the combination of a casing having a raised valve-seat, a central guide-opening, and a series of escape-openings at the side of and communicating with the guide-opening, a valve for closing against the raised seat and having its stem operating in the guide-opening, and a float secured to the outer end of the valve-stem, substantially as set forth.

2. The herein-described valve for the purpose set forth, consisting of a casing having an offstanding nipple and open at its upper end, a cap secured to the open end of the casing and provided with a guide-opening and a series of discharge-openings at the side of and communicating with the guide-opening, and having a rib on its inner side, forming a raised valve-seat, a bolt or stem, a valve secured upon the stem between washers, a spacing-sleeve slipped upon the valve-stem and operating in the guide-opening of the cap, and a float secured upon the projecting end of the valve-stem between washers, substantially in the manner set forth.

602,526. COMPOSITION FOR EXTRACTING GOLD FROM REFRACTORY ORES. ALBERT G. STEPHENS, Colorado Springs, Colo., assignor of one-half to William Whelan, same place. Filed June 30, 1897. Serial No. 643,041. (No specimens.)

Claim.—The herein-described composition to be used to extract gold from refractory ore, causing the gold in the ore to form a chlorid of gold from which the gold in bullion can be readily and economically obtained by any suitable means, consisting of water, five hundred gallons; chlorid of lime, five hundred pounds; bromide of potassium, five hundred ounces; nitric acid, fifteen and five-eighths gallons; muriatic acid thirty-one and one-fourth gallons, as herein specified.

602,527. ELECTRICAL MEASURING INSTRUMENT. HERBERT W. SULLIVAN, London, England. Filed Nov. 6, 1896. Serial No. 611,208. (No model.)

Claim.—1. An electrical instrument having in combination an oscillating coil, a core therefor and magnets in whose field the coil oscillates, having poles with pointed extremities brought into close juxtaposition with portions of the core without interfering with the movement of the coil, substantially as set forth.

2. An electrical instrument having in combination an oscillating coil suspended from an insulating-support, a fixed core therefor, and magnets between which said coil oscillates, having poles with pointed extremities brought into close juxtaposition with the core without interfering with the movement of said coil about the core, substantially as set forth.

3. In an electrical instrument, the combination with an oscillating coil, of an adjustable weight permanently fixed to such coil, substantially as set forth.

4. In an electrical instrument, the combination of an oscillating coil, and an arm of diamagnetic material permanently fixed to said coil, substantially as set forth.

5. In an electrical instrument provided with a suspended oscillating coil, an adjustable mechanical damping device adapted to contact with the suspension wire or thread, substantially as set forth.

6. In an electrical instrument provided with a suspended oscillating coil, the combination therewith of a camel's-hair brush adapted to contact with the suspension wire or thread, substantially as set forth.

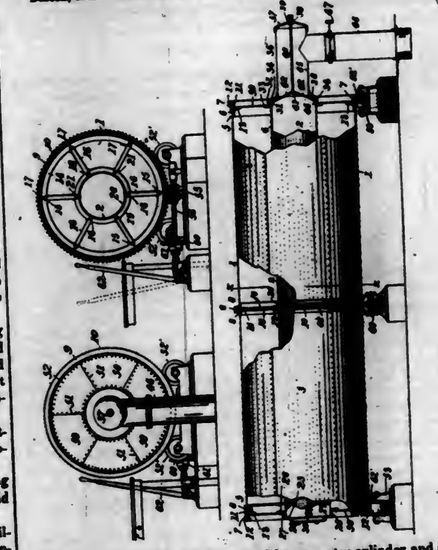
7. In an electrical instrument, the combination with a suspension-coil, of a frame sustaining the same, and means for adjusting the frame longitudinally, substantially as set forth.

8. In an electrical instrument, the combination with a suspension-coil, of a frame sustaining the same, and a standard upon which said frame is adapted to be moved vertically, substantially as set forth.

9. In an electrical instrument, a suspension-coil provided with a divided frame upon which the conductor is wound, and means for connecting the divided portions, substantially as set forth.

10. In an electrical measuring instrument, the combination of two suspended oscillating coils connected in series, substantially as set forth.

11. In an electrical measuring instrument, the combination of a permanent magnet, having poles with pointed extremities brought into close juxtaposition with portions of the core of an oscillating coil in such manner as not to interfere with the movement of such coil; a freely-oscillating coil suspended between the poles of said magnet, a core in position within said oscillating coil, a case for inclosing said magnet, coil and core, and means for adjusting the instrument from without the case, substantially as set forth.



12. In an electrical measuring instrument, the combination of two suspended oscillating coils connected in series and having cores therefor, with magnets arranged so that their poles form two independent and oppositely-directed fields in one of which each of said coils is suspended, substantially as set forth.

13. In an electrical measuring instrument, the combination of two coils in series oscillating about cores, with magnets with poles arranged to form two independent and oppositely-directed fields in one of which each of said coils oscillates, said poles being cut away to permit the free oscillation of the coils while having their pointed extremities in close juxtaposition to the cores of the coils, for the purpose substantially as set forth.

14. In an electrical measuring instrument, the combination of a support with an oscillating coil suspended therefrom, having a pin projecting from top and bottom of said coil; and slotted arms above and below said coil receiving said pins in their slots, for the purpose substantially as set forth.

15. In an instrument for recording electrical measurement by the oscillation of a suspended coil, the combination of a coil and core therefor; a magnet insulated from its support, and having poles in whose field the coil oscillates, and an electrical connection between said coil and said magnets, for the purpose substantially as set forth.

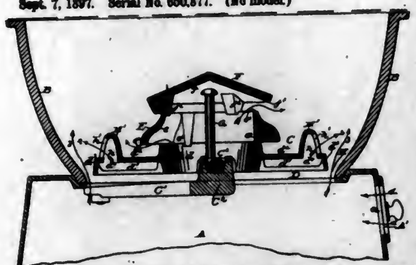
602,528. PNEUMATIC-MALTING DRUM. JAMES A. TILDEN, Hyde Park, Mass., assignor to the Hersey Manufacturing Company, Boston, Mass. Filed Dec. 1, 1896. Serial No. 614,127. (No model.)

Claim.—1. A malting-drum comprising an outer cylinder and an inner perforated cylinder, a gear-ring constituting a part of the outer cylinder and arranged intermediate the ends thereof, and detachable radial arms connecting the gear-ring and the inner cylinder, substantially as described.

2. A malting-drum comprising an inner and an outer cylinder each formed of a series of plate-sections, a ring 7 at one end of the outer cylinder provided with a horizontal flange to which the plate-sections are secured and with a vertical inwardly-extending flange, a ring 24 at the end of the inner cylinder formed with inwardly and outwardly extending flanges 23, 28, and an intermediate horizontal body portion 26, plates 50 secured to the outwardly-extending flange of said ring and the interior flange of the outer ring, and an end plate 30 seated upon the inwardly-extending flange of the inner ring to close the end of the inner cylinder, the horizontal body portion of said inner ring constituting a bearing to which the plate-sections 4 of the cylinder are secured, substantially as described.

3. The combination with a malting-drum having at one end a ring, of an air-receiving head comprising a cylinder closed at one end, a conical ring united to the open end of the cylinder and having a chamfered or grooved edge in which the end ring of the cylinder is adapted to turn, and the bifurcated brace secured to the latter ring and having a movable bearing in the closed end of the said head, substantially as described.

4. A malting-drum, comprising an outer cylinder formed of connected plate-sections, an inner cylinder extending longitudinally through the outer cylinder, a gear-ring intermediate the ends of the



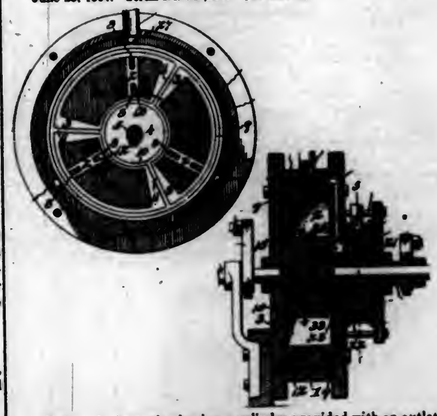
outer cylinder provided upon opposite sides with horizontal flanges to which the plate-sections are secured, and radial arms extending from the gear-ring and secured to the exterior of the inner cylinder, substantially as described.

5. A malting-drum, comprising an inner and an outer cylinder, each formed of connected plate-sections, a gear-ring intermediate the ends of the outer cylinder provided upon opposite sides with horizontal flanges to which the plate-sections are secured, and radial arms extending from the gear-ring and detachably connected to the inner cylinder to permit the removal of said cylinder from the outer one, substantially as described.

6. A malting-drum comprising an inner and an outer cylinder, each formed of connected plate-sections, a gear-ring intermediate the ends of the outer cylinder provided upon opposite sides with horizontal flanges to which the plate-sections are secured and with an internal flange, a flanged ring secured upon the exterior of the inner cylinder, and detachable radial arms connecting the said ring with the gear-ring, substantially as described.

7. A malting-drum comprising an outer cylinder formed of connected plate-sections, an inner cylinder extending centrally and longitudinally through the outer cylinder, a ring intermediate the ends of the outer cylinder provided upon opposite sides with horizontal flanges to which the plate-sections are secured, and radial arms extending from the said ring and detachably secured to the exterior of the inner cylinder to permit the removal of said cylinder from the outer one, substantially as described.

602,529. STOVE AND GRATE. JAPEW S. VAN BUREN, Albany, N. Y., assignor to the Rathbone, Sard & Company, same place. Filed Sept. 7, 1897. Serial No. 650,877. (No model.)



Claim.—1. In a grate-bed of a stove, the lower base section D having a central opening surrounded by the ring-form wall d, the series of fuel-supporting pieces d' d' projected radially from said ring-form wall, the series of fuel-supporting pieces d^3 d^3 alternating with said fuel-supporting pieces d' d' and on a plane above the latter and the annular vertical outer wall d^2, and openings, serving as air-outlets d^5, between the neighboring lateral edges of the said fuel-supporting pieces d' d^3, substantially as described for the purposes set forth.

2. In a grate-bed of a stove, the lower base-section D having a central opening surrounded by the ring-form wall d, the series of fuel-supporting pieces d' d' projected radially from said ring-form wall, the series of fuel-supporting pieces d^3 d^3 on a plane above the fuel-supporting pieces d' and alternating with the latter and provided each with an upwardly-projected air-heating cone H' having its chamber h communicating with a chamber d^4, beneath and provided with an air-outlet h', and the annular vertical outer wall d^2 integral with the respective fuel-supporting pieces d' d^3 in each series, substantially as and for the purposes set forth.

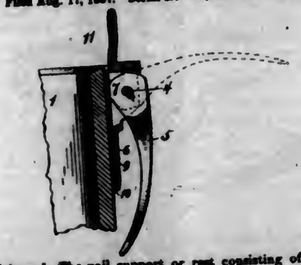
3. In a grate of a stove, the combination with the base-section D comprising the ring-form wall d, surrounding a central opening, the series of lower fuel-supporting pieces d' d', extended radially from said wall d and the series of upper fuel-supporting pieces d^3 d^3, having beneath each an air-chamber d^4 provided with outlets d^5, and the vertical outer wall d^2 connected with the outer ends of the fuel supporting pieces, d' d^3 of the respective series, of the middle section E of the grate-bed consisting of the wall e flaring outwardly all around as it runs downwardly, and supported by means, described, from the upper edge of the ring-form wall d of the section D, and the section F having a conical-form wall f, supported with its base edge f' extended outwardly all around past the upper edge of section E and above the plane of the latter edge, the said sections D E and F being suitably secured together, substantially as and for the purposes set forth.

4. In a stove the combination with fire-pot B, and ash-pit section A, below, of the grate-bed comprising the sections D, E and F, provided respectively with the elements described, and supported above the ash-chamber of the ash-pit section and within the lower end of the fire-pot, and the annular air passage or opening H all around between the outer wall d^4, of the section D and the wall of the fire-pot, substantially as and for the purposes set forth.

602,530. ROTARY ENGINE. CHARLES G. VANCE, Spencer, W. Va., assignor of two-thirds to J. R. Vance and L. S. Goff, same place. Filed June 26, 1897. Serial No. 642,296. (No model.)

Claim.—1. An engine having a cylinder provided with an outlet, a piston provided with radial heads or wings, and an annular rim connecting the heads or wings and spaced from the wall of the cylinder to form an exhaust-chamber, fixed abutments spanning the cylinder between the piston-heads and within said annular rim, to form piston-chambers, and valve mechanism, having duplicate feed-ports in communication with each piston-chamber, and exhaust-ports, one for each piston-chamber, in communication with the cylinder outside of the annular rim of the piston, said feed and exhaust ports terminating in a valve-seat, substantially as specified.

2. An engine having a cylieder, a rocking piston having a core, a connected concentric rim spaced from the annular wall of the cylinder to form an annular exhaust-chamber, and interposed piston heads or wings carried by the core and rim, a plurality of fixed abutments spanning the cylieder transversely between the surfaces of the core and rim in the spaces between the piston heads or wings, and valve mechanism having feed and exhaust ports in communication, respectively, with the intervals between said abutments and with said exhaust-chamber, substantially as specified.



3. An engine having a cylinder, a rocking piston having a core, a concentric rim exteriorly spaced from the annular wall of the cylinder to form an intervening exhaust-chamber, and a plurality of wings interposed between and carried by the core and rim, a plurality of fixed abutments spanning the cylieder transversely in the spaces between the piston heads or wings to form piston-chambers bounded at their sides by the cylinder-heads, and valve mechanism having feed and exhaust ports, in one of the cylinder-heads, in communication with said piston-chambers and the exhaust-chamber, substantially as specified.

4. An engine having a cylinder provided with a plurality of fixed abutments, separating segmental concentric piston-chambers, a rocking piston having a plurality of heads or wings to oscillate respectively in said segmental piston-chambers, and also having a hub and a rim forming the inner and outer walls of the piston-chambers, the rim being spaced from the annular wall of the cylinder to form an exhaust-chamber, a valve-chamber concentric with the spindle of the piston, and having a valve-seat provided with an annular series of feed and exhaust ports, arranged in groups corresponding in number with the piston-chambers, each group comprising feed-ports, in communication with the piston-chambers upon opposite sides of the fixed abutments, and an interposed exhaust-port, communicating with the annular exhaust-chamber, a winged valve seated in the valve-chamber, concentric with the piston for controlling said ports, and operating connections between the piston and valve for communicating oscillatory movement to the latter, substantially as specified.

5. An engine having a cylinder, a rocking piston provided with an annular rim and a plurality of heads or wings, the cylieder being provided with a plurality of fixed abutments, for dividing its interior into a plurality of segmental piston-chambers in which said heads or wings operate, and the rim of the piston being spaced from the annular wall of the cylinder to form an intervening annular exhaust-chamber provided with an outlet-port, a valve-chamber arranged concentric with the piston-spindle and having a valve-seat provided with an annular series of ports arranged in groups, each group consisting of feed-ports in communication with the piston-chambers upon opposite sides, respectively, of a fixed abutment, and an intermediate exhaust-port in communication with the exhaust-channel in the cylinder-head, said exhaust-channel being in turn in communication with the annular exhaust-chamber of the cylinder, a valve for controlling said ports, and operating connections between the piston and the valve, for communicating motion to the latter, substantially as specified.

6. In an engine, the combination with a cylieder, of an oscillatory piston recessed to form a plurality of segmental chambers and interposed piston heads or wings, said chambers being bounded at their outer sides by a rim forming part of and carried by the piston, and being intercepted by transverse partitions connected and carried by the cylinder heads and forming fixed abutments, and valve mechanism for controlling the admission and exhaust of motive agent, substantially as specified.

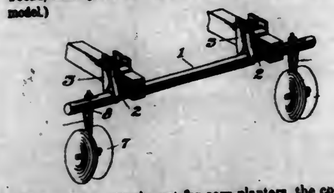
602,531. MILK-PAIL REST. JOHN C. VOLLMER, Jr., Kingston, Ill. Filed Aug. 17, 1897. Serial No. 648,578. (No model.)

Claim.—1. The pail support or rest consisting of the base or bracket formed with a longitudinal open-ended socket, a spring adapted to be received therein, said bracket having a portion extending over the socket to hold the spring in position, and a hinged arm against which said spring presses, substantially as and for the purposes described.

2. The pail support or rest consisting of the base or bracket, a hinged arm, and a leaf-spring to bear against said arm, the base or support being formed with a longitudinal socket for the spring, said base or support being further provided with a vertical open-ended channel, between it and the spring, substantially as and for the purposes described.

602,532. ART OF PLATING SHEET METAL. WILLIAM J. WILSON, St. Louis, Mo. Filed Apr. 6, 1896. Serial No. 586,305. (No specimens.)

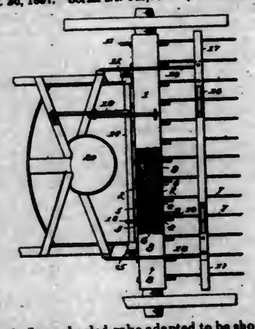
Claim.—1. In coating sheets of metal by immersing them in a bath of melted metal and then drawing them therefrom, with melted metal adhering thereto, causing melted metal drawn from the bath on both sides of the sheets to set and remain, by subjecting it to the action of artificial cooling means while on the sheets in a condition to flow, and forming a thicker coating on one side of each sheet than the other, by subjecting the side on which the thicker coating is desired, to the action of a more powerful cooling means than the other is subjected to.



2. In coating sheet metal by immersing the sheets in a bath of melted metal and then drawing the sheets from the bath, applying artificial cooling means to the melted metal on both sides of the sheets as they are taken from the bath and wiping off the surplus metal along the side edges of said sheets before it hardens, substantially as described.

3. In coating sheet metal by immersing the sheets in a bath of melted metal, and then drawing them out again reducing the oxidation of the surface of the bath by protecting said surface from the outside air, except where the sheets are introduced; applying artificial cooling means to the melted metal on both sides of the sheets as the sheets are taken from the bath, and wiping off the surplus metal accumulated on the side edges of the sheets before it has time to harden.

602,533. METHOD OF PAINTING. JACOB WIESMANN, Chicago, Ill. Filed May 7, 1897. Serial No. 635,574. (No specimens.)



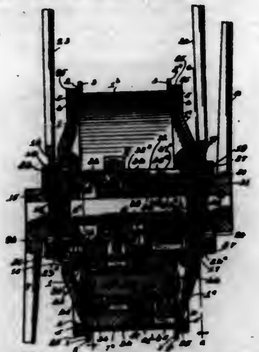
Claim.—The process of coloring metal, stone, wood, glass, &c., which consists in first covering the article so coated with a base of japan or oil and allowing the same to dry; second, in applying on the basic coating a coating of size composed of ten per cent. glue, five per cent. onion extract and eighty-five per cent. water, third, in sprinkling coloring matter carried by a suitable vehicle on said coating of size and finally after the before-mentioned coatings are dry finishing the same with a coat of varnish.

602,534. ATTACHMENT FOR CORN-PLANTERS. ALBA R. YOUNG, Murray, Nebr. Filed June 10, 1897. Serial No. 640,219. (No model.)

Claim.—In an attachment for corn-planters, the combination of a bar having reduced portions which are squared, metal loops or clips engaging the squared portion to provide for connecting the bar to a corn-planter, said bar having slots near its ends, hangers formed with shanks presenting shoulders which bear against the under side of the bar when the shanks are passed through the slots in said bar, the upper ends of said shanks being threaded, and nuts for securing the hangers in an adjusted position upon the bar; together with dished wheels or disks connected to axles supported in bearings at the lower ends of the hangers, substantially as shown and for the purpose set forth.

602,535. HORSE-RAKE. CLARENCE I. ALEXANDER, Como, Tenn. Filed Aug. 26, 1897. Serial No. 649,560. (No model.)

Claim.—1. In a wheeled rake adapted to be shortened, the long and short axle parts, one part having an end sleeve adapted to receive the end of the other axle part, the one part secured within the sleeve by the notted shanks of the spring-teeth passing through coincident holes in the sleeve and in the other axle part whereby to give full width to the rake.



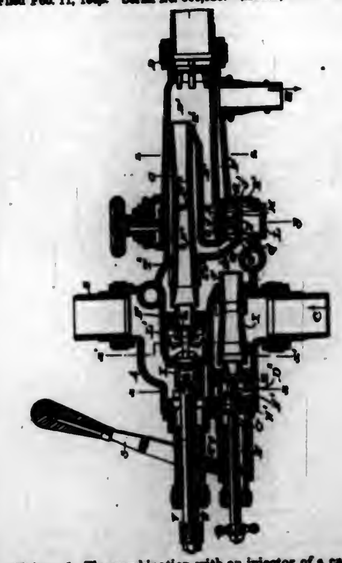
2. In a wheeled rake adapted to be shortened, the long and short axle parts, the longest part having an end sleeve whereby the axle parts are coupled and secured together by the rake-teeth shanks, the provision whereby the rake is shortened which consists in securing

the short axle part upon the sleeved part by the nutted shanks of the spring-teeth vertically passed through coincident holes in the lapped parts, and means for shifting the draft-rod of the shafts upon the longest axle part.

3. In a wheeled rake, the long and short axle parts, the longest part having an end sleeve whereby the two parts are coupled and secured together, by the nutted shanks of the spring-teeth, the means for shortening the rake which consists in securing the short part in the axle lapping upon the upper side of the sleeved part by the nutted shanks of the spring-teeth carried by said short axle part, and means for shifting the draft-rod of the shafts on the axle and means for shortening the clearing-bar of the teeth to conform to the shortened rake.

4. In a wheeled rake adapted to be adjusted in width, the long and short axle parts, having each a sleeve at its end adapted to receive and engage a corresponding end tenon of the coupled parts, in combination with the trailing spring-teeth the nutted shanks of which pass through and secure the coupled axle-sleeve parts.

602,536. BICYCLE. FRED H. RASSETT, Waterbury, Conn. Filed Dec. 16, 1896. Serial No. 615,851. (No model.)



Claim.—1. The combination, in a bicycle having the crank-shaft centrally located with respect to the wheel, a driving-gear on said shaft, a ball-bearing rotatable hub surrounding the internal propelling mechanism, ball-bearing casings embracing said crank-shaft but not in contact therewith, and situated one on each side of said driving-gear, the projecting ends of which casings are supported to the forks of the bicycle, of a non-rotatable yoke-like structure rigidly embracing the inner ends of said casings so as to bind them together, the projecting part of said yoke carrying a pinion-shaft and ball-bearing casings, adjustable ball-bearing cones on said shaft, pinions on said shaft, one of which engages the driving-gear of the main shaft, while the other of said pinions engages a gear secured to the said rotatable hub, the casing on one side of the crank-shaft driving-gear being in two parts and interlocked so that the outer part may be removed without disturbing the inner part, a retaining-band embracing the hub portion of said divided casing, substantially as set forth.

2. The combination, in a bicycle having the crank-shaft centrally located with respect to the wheel, a driving-gear on said shaft, a ball-bearing rotatable hub surrounding the internal propelling mechanism, ball-bearing casings embracing said crank-shaft but not in contact therewith and situated on each side of the driving-gear, the projecting ends of which casings are supported to the forks of the bicycle, of a non-rotatable yoke binding said casings together, a projecting part of said yoke carrying a pinion-shaft and ball-bearing mechanism, adjustable ball-bearing cones on said pinion-shaft, pinions on said shaft, one of which engages the driving-gear of the main shaft, while the other of said pinions engages a gear secured to the said rotatable hub, substantially as set forth.

3. An improvement in bicycles having the motive power—comprising a crank-shaft and driving-gear—located at the center of the wheel, and a rotatable hub surrounding said propelling mechanism, of a casing surrounding said crank-shaft on one side of the driving-gear, ball-bearings between the inner end of said casing and the hub of said driving-gear, a two-part casing having interlocking hubs on the opposite side of said driving-gear with ball-bearing connection between the mouth of one of said casings and the hub of said gear, a band embracing said casing-hubs, to preserve their alinement, a yoke rigidly embracing the inner ends of the casings on each side of said gear, the outer projecting portion of said yoke carrying a ball-bearing pinion-shaft carrying pinions, one of which registers with the said driving-gear of the crank-shaft while the other of said pinions registers with a gear secured to the said rotatable hub, substantially as described and for the purpose set forth.

602,537. INJECTOR. JOSEPH W. GAMBLE, Philadelphia, Pa. Filed Feb. 11, 1898. Serial No. 669,995. (Model.)

Claim.—1. The combination with an injector of a cap, threaded rings attached thereto, a valve-seat engaging one of said rings, a check-valve movable on said seat, a piston movable in the other of said rings and connections common to said piston and valve.

2. In an injector, a casing, a lifting set and a forcing set of tubes, a device adapted to be inserted in said casing and consisting of a plug, threaded rings attached thereto, and adapted to engage suitable portion of said casing, a valve-seat adapted to engage one of said rings, a check-valve movable on said valve-seat, a piston closing the opening through one of said rings and connections common to said valve and piston.

3. In an injector provided with a lifting set and a forcing set of tubes, the combination of a differential check-valve and piston adapted to receive the pressure from the primary set of tubes on the under side of the piston and the pressure from the secondary set of tubes on the valve side of said differential valve and piston.

4. In an injector provided with a lifting set and a forcing set of tubes, the combination of a device consisting of a check-valve having a piston connected thereto, a communication on the valve side of said device with the delivery end of said forcing set and on the piston side of said device, with said lifting set and a communication provided, when said valve is raised, with a chamber closed by a check-valve which in turn communicates with the atmosphere.

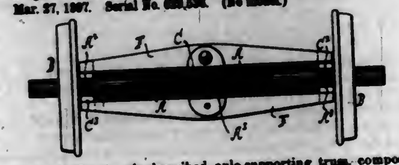
5. In an injector provided with a lifting set and a forcing set of tubes, the combination of a differential valve and its adjuncts constructed substantially as described and a forcing combining-tube, the latter being provided with sufficient vents to enable the steam from the forcing steam-nozzle to pass away, thereby dispensing with all operating mechanism and rendering the injector automatic in its action.

6. In an injector provided with a lifting set and a forcing set of tubes, the combination of a differential valve for the purposes described and means whereby the leakage through the piston of said valve may be taken up by the suction produced by the forcing combining-tubes.

7. In an injector, a lifting set and a forcing set of tubes, a check-valve and a piston connected to said valve, said piston and valve being of different areas, and means for enabling the leakage through the said piston to be taken up by the suction created by the forcing combining-tubes.

8. In an injector, a casing, a lifting set and a forcing set of tubes, threaded rings engaging the interior of said injector, a check-valve and piston of different areas connected together and movable in said rings, means for conducting pressure from the primary set of tubes to the under side of said piston, and means for conducting pressure from the secondary set of tubes to the top of said valve.

602,538. HARROW. GEORGE E. GEDGE, Springfield, Ohio. Filed Aug. 27, 1897. Serial No. 649,684. (No model.)



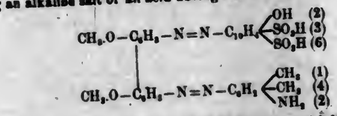
Claim.—1. The combination with a continuous walled tubular bar, of a harrow-tooth extending through the same, of a clamping device having portions above and below said bar and fitting around said tooth, said portions being adapted to substantially conform to and fit one side of said bar, and means for drawing said portions of the clamping device against said tooth, substantially as described.

2. A harrow formed with tubular bars, harrow-teeth extending through said bars, clamping devices for said harrow-teeth consisting of upper and lower portions formed with openings therein through which said harrow-teeth are adapted to pass, the respective portions of said clamping device being adapted to substantially conform to one side of said bar, and means for drawing said upper and lower portions together on the side to which they conform to said bar, substantially as specified.

3. The combination with a tubular bar, a tooth projecting through the same, a clamping device having a portion above and a portion below said bar and connected at one side by a yielding connection and on the opposite side by an adjustable bolt, said portions having parts which extend around and are adapted to substantially conform to one side of said bar, said portions having openings corresponding to said tooth, said portions being adapted to be clamped against said tooth substantially as specified.

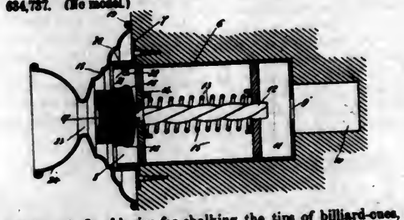
4. The combination with the continuous walled bar *a*, harrow-tooth *b*, said tooth being adapted to pass through openings in said bar, clamping device *c* having openings for said tooth, the adjustable bolt c^3, and a connecting-piece c^4, substantially as and for the purpose specified.

602,539. CAR-AXLE. ROBERT M. HARBOUGH, New York, N. Y., assignor of one-half to George W. Thompson, Brooklyn, N. Y. Filed Mar. 27, 1897. Serial No. 629,536. (No model.)



Claim.—The herein-described axle-supporting truss, composed of the continuous truss-bars extending the length of the axle, and of the sectional truss-heads one at the mid-length and one at each end of the axle, in combination with the divided axle with grooves at the required points to receive the truss-heads, for the purpose set forth.

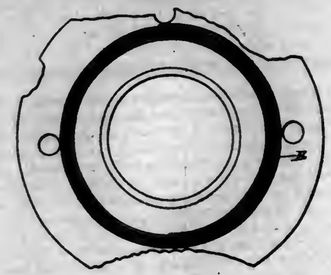
602,540. VIOLET DYE. MYRTIL KAHN, Elberfeld, Germany, assignor to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Dec. 14, 1897. Serial No. 661,965. (No specimens.) Patented in England May 18, 1893, No. 8,973; in France June 22, 1893, No. 231,087, and in Italy Dec. 31, 1893, XXVIII, 35,187, LXIX, 33.



Claim.—1. The process for producing a new tetrazo dyestuff by combining one molecule of tetrazotized dianisidin with one molecule of 2, 3, 6 naphtholdisulfo-acid and further coupling the intermediate product thus obtained with one molecule of paraxylidin.

2. As a new article of manufacture the new tetrazo dyestuff being an alkaline salt of an acid having the formula

representing in the form of the sodium salt a brownish-black powder with a bronze-like luster soluble in water with a brownish-violet color, in concentrated sulfuric acid with a blue color, which changes into bluish-violet on the addition of a small quantity of ice while a blue flaky precipitate is obtained on adding a larger quantity of ice to the sulfuric-acid solution, dyeing unmordanted cotton violet shades.



602,541. DEVICE FOR CHALKING TIPS OF BILLIARD-CUES. WILLIAM KNOLL, Jersey City, N. J. Filed May 1, 1897. Serial No. 634,737. (No model.)

Claim.—1. In a device for chalking the tips of billiard-cues, a casing adapted to be secured to a suitable support, a suitable guide secured to the outer end of said casing, said casing being provided with a partition arranged between the ends of said casing, having a screw-threaded opening, a screw-rod engaging said opening and provided with a reduced outer end, a spring-clip secured to said end and adapted to receive the chalk, a disk loosely sleeved about the reduced end of the screw-rod and a helical spring coiled about said rod and engaging the said diaphragm and said disk, substantially as described.

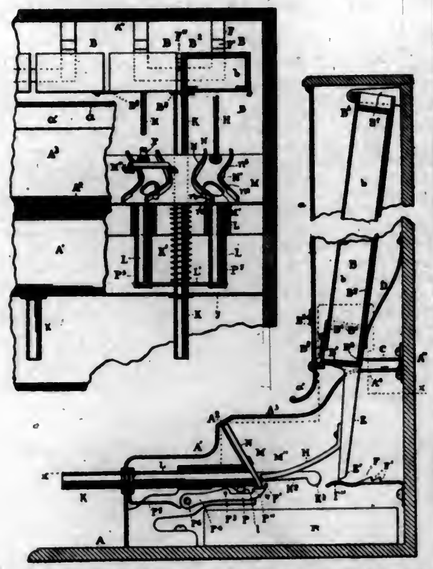
2. In a device for chalking the tips of billiard-cues, a casing provided with an annular flange whereby it is adapted to be secured to its support and having an extension beyond said flange, a cup-shaped guide having an inner annular flange adapted to embrace the said extension and secured thereto by a pin-and-slot connection, said casing being provided with a diaphragm located near the inner end and provided with a screw-threaded opening, a screw-rod engaging said opening and provided with a reduced outer end, a spring-clip secured to said end and adapted to receive the chalk, a disk loosely sleeved about the end of the screw-rod, and a helical spring coiled about said rod and interposed between said disk and the diaphragm, substantially as described.

602,542. METALLIC GASKET. PHILIP F. LEARY, Fall River, Mass. Filed Aug. 24, 1897. Serial No. 649,201. (No model.)

Claim.—A metallic packing or gasket comprising a flat ring made of close coils of wire of uniform cross-section lying in the same horizontal plane, said coils being continuous and securely soldered together, whereby any transverse leakage is prevented.

602,543. COIN-OPERATED VENDING-MACHINE. LOWELL M. MAYNARD, Boston, Mass. Filed Dec. 12, 1896. Serial No. 615,440. (No model.)

Claim.—1. The oscillatory reservoir, B, having rigid arm, E, in combination with the spring-bracket, F, having teeth adapted to engage said arm, and means for releasing said arm therefrom, for the purpose set forth.



2. The combination of the reservoir, B, rigid arm, E, toothed spring-bracket, F, and the push-rod having the lug, K^2 for disengaging said arm and teeth, for the purpose set forth.

3. The combination of the coin-chute, the tubular push-rod, the pendulous reservoir, and the slender rod rigidly connected with said reservoir and terminating with its axis substantially coincident with that of said tubular push-rod, substantially as and for the purpose set forth.

4. In a coin-operated vending-machine, the combination of a reservoir, an arm and means whereby an article is removed from the reservoir when said arm is impressed; a toothed spring-bracket for detaining said arm, the tubular push-rod, the lug connected with said push-rod for disengaging said arm and spring-bracket, and the slender

rod rigidly projecting from said arm and terminating in line with said push-rod, substantially as and for the purpose set forth.

5. In a coin-operated vending-machine, the combination of the inclined plate, the casing having a coin-slot at the upper edge of said plate and parallel therewith, a push-rod at the lower edge of said plate, a detent normally engaging said push-rod, and chute-walls on said plate joining said slot and push-rod terminal and formed with lateral bends intermediate of their ends adapted to permit the unimpeded passage of a coin but to wholly prevent the insertion of a narrow strip by which said detent might be surreptitiously disengaged, substantially as and for the purpose set forth.

6. In a coin-operated vending-machine, the combination of the inclined plate adapted to receive a coin thereon, and having side walls for confining such coin laterally, the longitudinally-movable rod having its end normally flush with said plate and having the lug projecting from its under side, the detent pivoted in substantially the same plane as said lug and provided with the shoulder designed to normally intercept said lug, the upwardly-turned finger held beneath said plate and rod end, and said detent being further provided with the counterweighted arm so balanced that when a light coin or blank is received upon said finger the detent is not depressed, when a proper coin is received thereon the detent is depressed just far enough to release said lug from said shoulder, and when a blank is received exceeding the proper coin in weight the detent is depressed so far that the detent is thereby freed from such blank, substantially as and for the purpose set forth.

7. In a coin-operated vending-machine, the combination of the inclined chute-plate, M, the rod, L, having its end beveled to the same inclination, and the balanced detent having a finger beneath said beveled end, said inclination being such that a coin received upon said detent-finger shall lean lightly back against said beveled end of the push-rod, for the purpose set forth.

8. In a coin-operated vending-machine, the combination of the push-rod, K, having arms, L′, and spring, K′, the tubular rods, L, held by said arms, the chutes, the weighted detents, P having fingers, P′, and the cross-bar, P², rigidly uniting said detents, substantially as and for the purpose set forth.

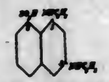
9. In a coin-operated vending-machine, the combination with a plurality of pendulous reservoirs, of turn-buttons affixed thereto and adapted by being turned to cause more than one of the reservoirs to be oscillated when one actuating-coin is inserted, substantially as and for the purpose set forth

10. In a coin-chute, the inclined plate, M, and the chute-wall, N′, having slot, n², in combination with the chute-wall, N, adapted to be swept over the lower part of the chute when a coin is inserted at its upper end, substantially as set forth, and for the purpose set forth.

11. The coin-chute comprising the inclined plate, M, having opening, M′, the chute-wall, N′ having slots, n², n³, and the oscillatory chute-wall, N, substantially as and for the purpose set forth.

602,544. BLUE AZIN DYE. PHILIPP OTT and THILO KROENER, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Sept. 14, 1897. Serial No. 651,583. (Specimens.) Patented in Germany May 21, 1893, No. 79,159; in France June 8, 1893, No. 230,698; in England June 16, 1893, No. 11,893; in Italy Dec. 31, 1893, XXVIII, 35,068, and LXVIII, 490, and in Austria-Hungary June 15, 1894, No. 83,659 and No. 95,231.

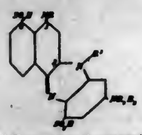
Claim.—1. Process for producing new azin dyestuffs by condensing sulfo-acids of symmetrically-disubstituted 1.3 naphthylenediamins having the sulfo group in position 8 and having the general formula



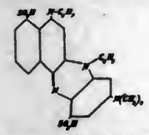
in which formula R and R_1 represent aromatic radicals such as phenyl, tolyl, with disubstituted amidoazo-benzene sulfo-acids of the following formula

in which formula R_2 and R_3 represent fatty radicals, such as methyl, ethyl, substantially as described.

2. Process for producing a new azin dyestuff by heating in the presence of a suitable diluent, which may also act as a solvent, one molecular proportion of diphenyl 1.3 naphthylenediamin 8 sulfo-acid, having the formula:



with one and a half molecular proportion of an alkaline salt of dimethyl-amidoazo-benzene sulfo-acid having the formula

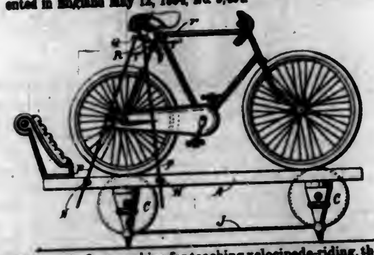


substantially as described.

3. As a new article of manufacture the new azin dyestuffs, obtainable from 8 sulfo-acids of symmetrically-disubstituted 1.3 naphthylenediamins having the sulfo group in position 8 and disubstituted amidoazo-benzene sulfo-acids, being alkaline salts of the acids of the general formula

in which formula R and R_1 represent aromatic radicals, and R_2 and R_3 fatty radicals, representing when dry and pulverized dark powders, dissolving in water yielding blue solutions, soluble in concentrated sulfuric acid with a green color, dyeing unmordanted wool in acid-baths bright and even blue shades which are fast to acids and alkalies and also pretty fast against the action of light, substantially as described.

4. As a new article of manufacture the specific azin dyestuff obtainable from diphenyl 1.3 naphthylenediamin 8 sulfo-acid and dimethyl-amidoazo-benzene sulfo-acid, being an alkaline salt of the acid of the formula



representing when dry and pulverized a dark powder soluble in water with a blue color dissolving in concentrated sulfuric acid with a green color which turns into violet on the addition of a small quantity of ice, while a dark-blue flaky precipitate is separated on adding a larger quantity of ice, insoluble in a ten-per-cent. solution of sodium carbonate and in strong soda-lye, dyeing wool in acid-baths bright blue even shades which are fast to acids and alkalies and also pretty fast against the action of light, substantially as described.

602,545. BICYCLE-CHAIN ADJUSTMENT. GEORGE C. SAVAGE, New York, N. Y., assignor to The Bernoon Manufacturing Company, same place. Filed Apr. 29, 1897. Serial No. 634,460. (No model.)

Claim.—In a hind-wheel bicycle-chain-adjusting device, the combination of solid-ring terminals of the hind-fork frames, an expanding disk tongued and grooved in each terminal, and means for expanding the disks within the terminals, the axle being mounted eccentrically in said disks substantially as described.

602,546. BICYCLE-TRAINER. GEORGE W. TARVER, London, England. Filed Jan. 4, 1897. Serial No. 617,955. (No model.) Patented in England May 12, 1894, No. 9,464.

Claim.—1. In a machine for teaching velocipede-riding, the combination of a frame, rollers supported therein, an endless band passing over said rollers, a supporting-frame for the velocipede secured to the said first-mentioned frame, and means for loosely coupling the supporting-frame to the rear portion of the velocipede so that the velocipede may have tilting and lateral movements relatively to the supporting-frame and rollers.

2. The combination of the supporting-frame, an endless carrier mounted therein, a velocipede-supporting frame secured to said first-mentioned frame, and means for loosely coupling the supporting-frame to the rear portion of the velocipede so that the velocipede may have tilting and lateral movements relatively to the supporting-frame and carrier.

3. The combination of the supporting-frame, an endless carrier mounted therein, a velocipede-supporting frame, devices for adjusting the velocipede-supporting frame vertically relatively to the frame that supports the endless carrier, and means for loosely coupling the supporting-frame of the velocipede to the rear portion of the velocipede so that it may have tilting and lateral movements relatively to the supporting-frame and endless carrier.

602,547. TUBE-WELL. SILAS W. TITUS, Brooklyn, N. Y., assignor to the Pneumatic Engineering Company, New York, N. Y. Filed July 31, 1897. Serial No. 646,581. (No model.)

Claim.—1. The improvement in the art of constructing tube-wells, which consists essentially in sinking a well-tube until the lower end thereof reaches a water-bearing stratum, then passing down through the tube a collapsible expansible shield, and finally expanding and filling said shield with gravel or other permeable material in substitution of the sand or fine material entering the shield from the water-bearing stratum, substantially as set forth.

2. The improvement in the art of constructing tube-wells, which consists essentially in providing a permeable expansible shield in the water-stratum below the lower extremity of the tubing, and then filling said shield with gravel or coarse material which takes the place of the sand in the water of such stratum, substantially as set forth.

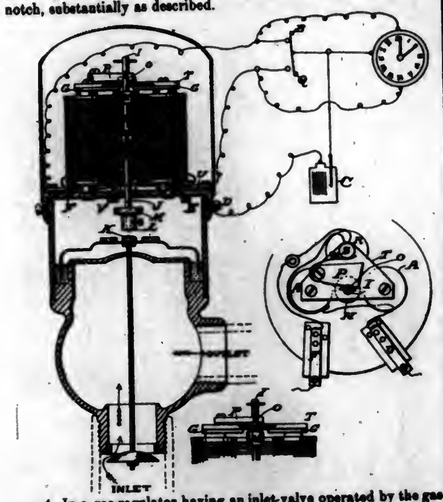
3. The combination in a tube-well of an artificial filter-bed at the foot of said well, and a collapsible shield or umbrella, surrounding said artificial filter-bed substantially as specified.

4. A collapsible shield or umbrella adapted to be inserted through a well-tube to the foot thereof, the said shield being adapted to be opened when in position, and space inclosed thereby to be filled with gravel or coarse material constituting an artificial bed, substantially as specified.

5. A collapsible shield or umbrella adapted to be inserted through a well-tube to the foot thereof, the said shield being adapted to be opened when in position, and space inclosed thereby to be filled with gravel or coarse material constituting an artificial bed, and means whereby said shield may be emptied and withdrawn through the well-tube substantially as specified.

6. The combination in a tubular well of a well-tube, an interior tube, a collar carried by the interior tube at its lower end, a series of ribs pivoted to said collar, a flexible pervious covering carried by the ribs, the said ribs and pervious covering being adapted to close up for the purpose of insertion through the well-tube, and to open when at the foot of the well substantially as and for the purpose set forth.

7. The combination in a tubular well of a well-tube, an interior discharge-tube, an air-tube within said discharge-tube, a collar attached to said air-tube, a series of ribs pivoted to said collar, a flexible pervious covering carried by the ribs, a collar carried by said discharge-tubes, and links pivoted to said collar and said ribs, whereby a longitudinal movement of the discharge-tube relatively to the air-tube will cause the ribs to open or close, substantially as specified.

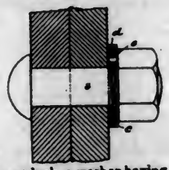


602,548. ELECTRIC CONTROLLER FOR GAS-REGULATORS. WILLIAM R. H. WILLIAMS and PAUL SEILER, San Francisco, Cal. Filed May 13, 1897. Serial No. 636,364. (No model.)

Claim.—1. In a gas-regulator, the combination of a valve for regulating the pressure, a movable partition actuated by the pressure and connected with the valve to adjust the same and regulate the pressure, a weight opposing the pressure of the gas on said partition, a supplemental weight, an electromagnetic device for removing the supplemental weight, an electric circuit to a distant point energizing the electromagnetic devices, and a switch in the circuit at the distant point, controllable at the will of the operator independently of the gas-pressure, substantially as described.

2. In a gas-regulator, the combination of a valve for regulating the pressure, a movable partition actuated by the pressure and connected with the valve to adjust the same and regulate the pressure, a weight opposing the pressure of the gas on said partition, a supplemental weight, an electromagnetic device for removing the supplemental weight, a catch arranged to retain the weight in its position when so removed, an electromagnetic device actuating said catch to release the weight, electric circuits to a distant point energizing the electromagnetic devices, and a circuit-closing switch at the distant point, controllable at the will of the operator and independently of the gas-pressure, substantially as described.

3. In a gas-regulator having an inlet-valve operated by the gas-pressure in the regulator, electromagnets connected with an electric circuit, a weight connected with an armature and adapted to be lifted by the magnets, a notch on the weight adapted to engage a pawl, which serves as an armature to a single-coil electromagnet when the weight is lifted, and an electric circuit connecting with said single-



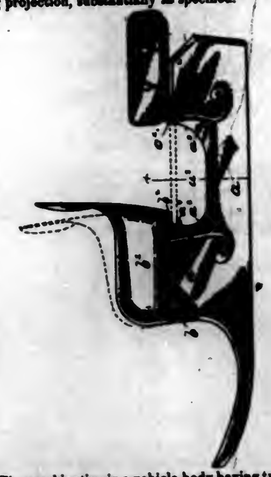
coil magnet whereby the pawl is withdrawn and released from the notch, substantially as described.

4. In a gas-regulator having an inlet-valve operated by the gas-pressure in the regulator, two independent sets of electromagnets electrically connected by separate circuits with a battery, one of said sets of magnets having an armature connected with a weight, which rests when free upon the float in the regulator; means for suspending said weight when lifted by the magnets, and an armature connected with the other set of magnets, by which the weight is released when the latter magnet or magnets are excited, substantially as described.

5. In a gas-regulator having an inlet-valve operated by a float inside the regulator, a supplemental weight adapted to be added to said float or removed therefrom by means of electromagnets being charged or discharged by electric currents, substantially as above described.

602,549. NUT-LOCK. BENJAMIN WOODALL, Wilkinsburg, and THOMAS R. ORR, Pittsburg, Pa. Filed Mar. 24, 1897. Serial No. 630,084. (No model.)

Claim.—1. In a nut-lock, a washer having a seat formed therein between the central opening and the periphery of said washer, a piece of spring metal bent to fit said seat, the ends of said piece of metal having oppositely-inclined projections extending out beyond the inner and outer faces of the washer, substantially as set forth.



2. In a nut-lock, a washer having a seat formed therein between the central opening and the periphery of said washer, a piece of spring metal bent to fit therein, the ends of said piece of metal being cut obliquely and having oppositely-inclined projections extending out beyond the inner and outer faces of the washer, substantially as set forth.

602,550. VEHICLE-BODY. MORRIS WOODHULL, Dayton, Ohio. Filed Feb. 1, 1898. Serial No. 668,735. (No model.)

Claim.—1. The combination in a vehicle-body having two hinged seats each adapted to be swung forward and backward, the rear seat having hinged portions adapted, when in its forward position to lie outside of and substantially parallel to the sides of the body proper, as and for the purpose specified.

2. The combination in a vehicle-body having two hinged seats with a space between them, each adapted to be swung forward and backward, the rear seat being wider than the space between the seats, hinged ends on said rear seat adapted to lie outside of and at an angle to the body proper, and means for pressing said end pieces yieldingly against the body sides when the front seat is in position, substantially as specified.

3. The combination in a two-seated vehicle-body both seats being hinged in front, the rear seat being longer than the width of the body proper and wider than the distance between said seats, of hinged ends for said rear seat adapted to stand outside of the body and to be pressed in toward it when the front seat is down by means of an engaging projection, substantially as specified.

4. The combination in a vehicle-body having two seats one in the front and one in the rear, the rear seat being longer than the width of the body proper, of hinged ends for said seat, of a yielding projection on said front seat adapted to lie against said hinged ends when said seat is swung forward, substantially as specified.

5. The combination in a vehicle-body having a front and rear seat hinged as described said rear seat being longer than the width of the body proper, of end pieces for said seat hinged and adapted, when said seat is forward, to lie in close proximity to and outside of the body proper, of raised decorations on said body adapted, with said seat ends to form an ornamental design, as and for the purpose described.

6. In a vehicle-body having a hinged rear seat as described the combination with a box under said seat, of a beveled top for said box having a hinged door therein and a spring secured to said door to keep the same in a closed position, substantially as specified.

602,551. FRUIT-PICKER. ROBERT A. ANDERSON, Mount Lehman, Canada. Filed Nov. 20, 1897. Serial No. 659,206. (No model.)

Clrim.—1. A fruit-picker, comprising a fixed jaw having means for securing it to the upper end of the pole, the lower end of said jaw being deflected outward from the plane of the pole, and carrying hinge members, and braces connected with such pole, of a jaw pivotally hung in the hinge members of the fixed jaw, said hinged jaw having a lever-arm and an operating-rod connected with such lever-arm extended within convenient reach of the operator, substantially as shown and described.

2. As an improvement in fruit-pickers, the combination of a fixed jaw consisting of a single wire member bent to form a jaw portion proper, having hinge loops or eyes, brace members 12 and 13, and a socket 14, in combination with the jaw 16 pivotally hung in the hinge-eyes of the fixed jaw, said jaw 16 having a lever-arm 19 and means for operating such lever, substantially as shown and described.

3. In a fruit-picker, the combination with the pole 10, the fixed jaw 11, having integral hinge or eye members 15, and brace members 12 projected in a plane from the pole, one of said brace members 12, being formed with a spiral loop 14 terminating in a brace member 13 connected with the upper or cross bar of the jaw 11 proper, the other member 12 being secured to the pole 10, of the jaw 16, formed of a single wire member having one end terminating in an eye 17 engaging one of the loops 15, of the jaw 11, the other end of such jaw 16 passing through the fixed loop 15 of the jaw 11, bent into an eye 18 and engaging the lever member 19 and the operating-rod 21, all being arranged substantially as shown and for the purposes described.

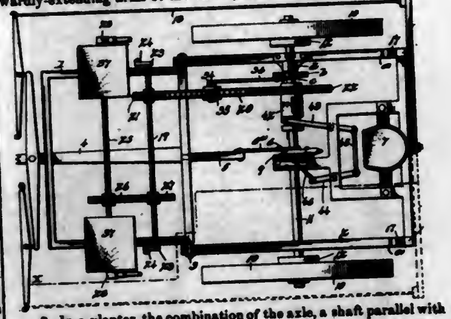
602,552. BICYCLE-WHEEL. JOHN BROWN, Providence, R. I. Filed Aug. 27, 1897. Serial No. 649,750. (No model.)

Claim.—1. A wheel for cycles, having a single rim, a plurality of springs secured upon the outer surface thereof, the outer end of each being free and unconfined and overlapping adjacent springs, and rigid loops surrounding said springs near their fixed ends, substantially as set forth.

2. A wheel comprising a rim provided with a plurality of springs secured thereto at one end, loops secured to said rim and through which said springs pass, and enlarged end portions upon said springs overlapping the other ends of the adjacent springs.

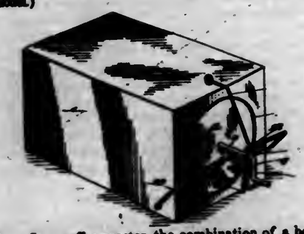
3. A wheel comprising a rim provided with outwardly-extending lateral flanges, a plurality of springs, each of said springs having a shank fitting between said flanges and secured at its end to the rim by means of a bolt, a loop secured to the rim through which the shank passes, while the outer end of the spring is enlarged and curved on its outer face and overlaps the inner end of the adjacent spring.

602,553. WINDOW-SCREEN. WILLIAM H. CASSELBERRY, Williamsport, Pa. Filed Oct. 19, 1897. Serial No. 655,691. (No model.)



Claim.—The combination with a window-frame, a screen-casing, a screen-roller in the screen-casing, a screen secured to the roller, the upper sash, a bar extending inwardly from the upper sash, a catch pivoted to the upper sash, an operating-rod carried by the bar, and a link connecting the operating-rod to the catch, whereby said catch may be caused to engage the screen and draw it down in the act of lowering the upper sash, substantially as set forth.

602,554. CORN-PLANTER. WILLIAM D. CROSS, Climax, Kans. Filed July 7, 1897. Serial No. 643,731. (No model.)

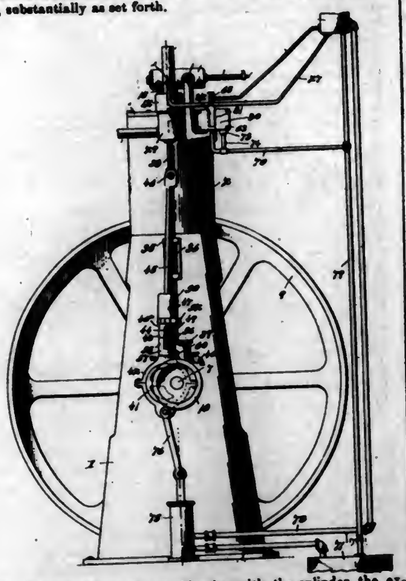


Claim.—1. In a planter, the combination with the runner and wheel frames pivotally connected, the runner-frame having a rear extension, a planting mechanism, a vertical lever fulcrumed upon the wheel-frame and having its lower end extended below the fulcrum, a rod connecting the upper end of the lever with the said rear extension of the runner-frame, and a clutch for throwing the planting mechanism into and out of gear, of a longitudinal lever having one end in direct engagement with the said clutch, a second longitudinal lever having one end connected with the other end of the clutch-lever, and a rod connecting the said second longitudinal lever at its opposite end with the lower end of the aforedescribed vertical lever, substantially as and for the purpose set forth.

2. In a planter, the combination of transversely-aligning hoppers, a seed-dropping mechanism in each hopper, a shaft mounted in line with and below the hoppers and having direct connection with the seed-dropping mechanism of each and having its ends extended, trips applied to the extended ends of the shaft, valves at the lower ends of the grain-spouts having rearwardly-extending arms, spring-actuated bell-crank levers fulcrumed to the grain-spouts and having one arm extending in the path of the trips to be actuated thereby, and links connecting the horizontal arms of the levers with the rearwardly-extending arms of the valves, substantially as set forth.

3. In a planter, the combination of the axle, a shaft parallel with the axle and in connection with the seed-dropping mechanism, gear-wheels upon the axle and shaft, a drive-chain connecting the said gear-wheels, a toothed segment mounted concentric with the axle, an arm secured to the said segment and bearing a roller which is brought forcibly into contact with a portion of the drive-chain to maintain a proper tension thereon, and a stop mounted in a bracket of the frame and adapted to engage with the toothed segment to hold the arm in an adjusted position, substantially as set forth.

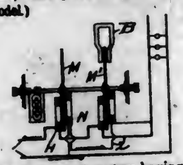
602,555. COFFEE-ROASTER. WILLIAM J. DAVIS and ROBERT L. DAVIS, Hiddenite, N. C. Filed Aug. 14, 1897. Serial No. 648,282. (No model.)



Claim.—In a coffee-roaster, the combination of a box or casing having an open bottom and an opening in one end, a cylinder mounted in the said casing and having a shaft projecting from one end, an adjustable frame or support carrying a bearing adapted to be brought in contact with the said shaft, and a movable hooked arm adapted to engage the said frame and hold the bearing against the said shaft, substantially as described.

602,556. GAS OR GASOLENE ENGINE. THOMAS M. DOYLE, Fort Madison, Iowa, assignor of one-half to Maurice Wahrer, same place. Filed June 3, 1897. Serial No. 639,576. (No model.)

Claim.—1. In a gas-engine, the combination with the engine-cylinder, the exhaust-valve seat and the drive-shaft carrying an eccentric, of a longitudinally-movable valve-stem carrying the exhaust-valve working on said seat, a telescopic pitman connection between the valve-stem and the eccentric, a pair of tappet-collars mounted on one of the pitman-sections, one of which collars is rotatable and bears against the other section of the pitman connection, and both of said collars having registering parts adapted to alternately engage, and a pawl-and-ratchet device rendered active by the swing or vibration of the said pitman connection and connected with the rotatable tappet-collar, substantially as set forth.

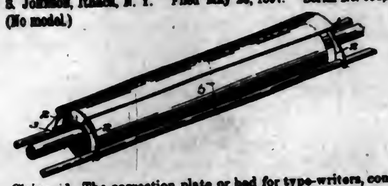


2. In a gas-engine, the combination with the cylinder, the exhaust-valve seat, and a drive-shaft carrying an eccentric, of the reciprocatory valve-stem carrying the exhaust-valve, a telescopic pitman connection between the valve-stem and the eccentric, a pair of tappet-collars mounted on one of the sections of the pitman connection and provided at their adjacent sides with a plurality of alter-

nating fingers or notches, one of said tappet-collars having a loose rotary movement and the other of said collars having a limited circular movement, and means for automatically rotating the rotatable collar, substantially as set forth.

3. In a gas-engine, the combination with the cylinder, the exhaust-valve seat, and the drive-shaft carrying an eccentric, of a longitudinally-movable valve-stem carrying an exhaust-valve working on said seat, a tubular pitman pivotally connected at one end with a valve-stem, an eccentric-rod sliding in said pitman and connected at one end with the eccentric-strap, a pair of tappet-collars mounted on said eccentric-rod and provided at their adjacent sides with an annular series of alternate fingers and notches, one of said collars being capable of a limited circular movement and having a spring connection with the eccentric-strap, and the other of said collars being rotatable and bearing against one end of the tubular pitman and provided with an annular series of ratchet-teeth, a suitably-arranged spring for holding the rotatable collar tightly against the tubular pitman, and a spring-actuated pawl pivotally mounted on the valve-stem and engaging with the ratchet-teeth of the rotatable collar, substantially as set forth.

602,557. ALTERNATE-CURRENT METER. CLARENCE P. FELDMANN, Cologne, Germany, assignor to the Helios Electricitäts Actien-Gesellschaft, same place. Filed Dec. 21, 1897. Serial No. 662,858. (No model.)

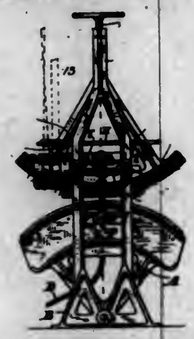


Claim.—In alternate-current meters having no direct supply of current to the movable armature, the combination of a thin layer of magnetic material with the armature of the brake-body connected to the same for the purpose of creating a differential effect of such dimensions that a fixed zero position is produced the sensitiveness of the meter remaining practically unaltered.

602,558. WATERPROOF PAPER. ALFRED HERSHEIM, Berlin, Germany, assignor to the Chemische Fabrik auf Actien, vormals E. Schering, same place. Filed June 7, 1897. Serial No. 639,729. (No specimens.) Patented in Germany July 27, 1895, No. 86,933; in England Nov. 26, 1895, No. 23,635; in France Dec. 16, 1895, No. 253,501; in Belgium Dec. 16, 1896, No. 118,877; in Hungary June 22, 1896, No. 8,310, and in Austria July 10, 1896, No. 46/3,756.

Claim.—The herein-described waterproof paper consisting of a body which is composed of the herein-described modified sulfite cellulose resembling hydrocellulose and a coating of pyroxylin permanently united therewith, substantially as set forth.

602,559. TYPE-WRITING-MACHINE ERASING-PLATE. ARDON S. JOHNSON, Ithaca, N. Y. Filed May 26, 1897. Serial No. 638,973. (No model.)



Claim.—1. The correction plate or bed for type-writers, consisting of the segment of a hollow metallic cylinder, and legs connected to said bed-plate extending to the bars of a type-writer carriage, whereby the plate may be supported in proximity to but out of contact with the roll and afford a convenient table for corrections, substantially as described.

2. The correction bed or plate for type-writers, consisting essentially of a thin plate to extend in proximity to the type-writer roll, and supporting-legs connected to said plate and adapted to bear on some part of the type-writer other than the roll, whereby a convenient correction-bed is afforded out of contact with the sheets carried by the type-writer roll, substantially as described.

3. The correction-bed for type-writers consisting of a curved metallic plate, and forked legs projecting from the corners thereof in position to bear on the parallel bars of a type-writer carriage, substantially as described.

4. The combination with the parallel bars of a type-writing machine, of an erasing-table consisting of a curved plate, and legs connected to said plate and resting on said bars to hold the plate in proximity to but out of contact with the upper surface of the type-writer roll, substantially as described.

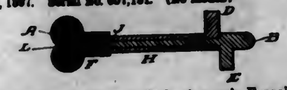
602,560. EMBOSSING-MACHINE. CHARLES H. LEONARD, Indianapolis, Ind., assignor of one-half to William B. Dyer, same place. Filed May 4, 1897. Serial No. 635,042. (No model.)

Claim.—1. In an embossing-machine, the combination, of the frame, the platen, and a segment-shaped die structure formed hollow and containing the combustion-chamber, said structure being formed to bear the die on one side thereof and mounted to rock on bearings located on the opposite side thereof, substantially as set forth.

2. In an embossing-machine, the combination, with a suitable framework and platen and driving mechanism, of a segmental-die support containing a combustion-chamber and having a correspondingly-shaped burner arranged beneath the shell thereof and in close proximity thereto.

3. In an embossing-machine, the combination, of the frame, the platen, a segmental-die support carrying the die mounted to rock on bearings located on its side opposite its die-supporting face, said support being formed hollow and containing a combustion-chamber just below said die-supporting face, and mechanism for operating said platen and die-support uniformly, substantially as set forth.

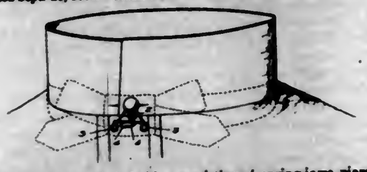
4. The combination, in an embossing-machine, with a suitable frame and platen, of a segmental-die support mounted on a suitable rock-shaft, the segmental surface being of a length as great or greater than the desired length of die, substantially as shown and described, and a correspondingly-shaped burner also carried by said rock-shaft arranged beneath and in close proximity to its shell.



5. In an embossing-machine, the combination, of a frame, the platen, a segmental-die support mounted on bearings which are located at a point distant from the operating heated surface, said die-support being formed hollow and containing a burner located near said operating-surface, whereby said bearings are removed from danger of injury by heat, substantially as set forth.

6. In an embossing-machine, the combination, of the frame, a hollow segmental-die structure containing the heater and mounted to rock on bearings on its side opposite the operating-face, an opposing platen having a curved surface, and also mounted to oscillate on suitable bearings, and guide-bars carried by said frame and extended across below said platen on each side of the center thereof, whereby the material being embossed is guided and held to the proper position, substantially as set forth.

7. The combination, in an embossing-machine, of a suitable framework, a segmental-die support carrying a burner beneath its face, mounted on a rock-shaft or pivot therein, and provided with a rack on its edge, a segmental platen opposed to the die on said die-support and provided also with a rack on its edge, a shaft mounted in the framework alongside said die-support and said platen, and pinions thereon which engage with said racks and thus drive said die-support and platen uniformly, substantially as set forth.



8. The combination, in an embossing-machine, of a suitable framework, a segmental-die structure, an opposing platen, mechanism for driving the same, and mechanism for reversing the motion of the driving mechanism consisting of a shaft having two tight and two loose pulleys, and a straight and a crossed belt, the two loose pulleys being between the two tight pulleys, and suitable shifting mechanism operated by a moving part, substantially as shown and described.

602,561. KEY. JOANNAH J. LOGUE, Los Angeles, Cal. Filed Nov. 3, 1897. Serial No. 657,181. (No model.)

Claim.—In a key, the stem, B, having web, E, projecting therefrom and being integral therewith, and having on either side of said half-web, E, square recesses, *b b*, formed therein; the said stem having removably attached thereto the thumb-piece, A; the thumb-piece being provided with cylindrical projection, F, forming housing for spring, J; the sleeve, H, having half-web, D, projecting therefrom and being integral therewith and having square catches, *h h*, projecting therefrom adapted to enter the recesses, *b b*, on the stem; and the spiral spring, J, all in combination substantially as shown and described.

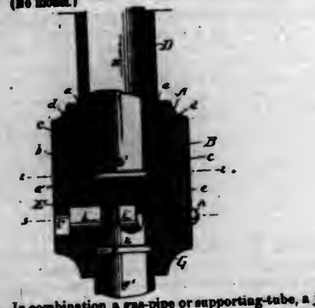
602,562. NECKTIE-HOLDER. FRANK H. MAXAM, Princeton, Ind. Filed Sept. 20, 1897. Serial No. 653,515. (No model.)

Claim.—1. A necktie-holder, consisting of spring-jaws, piercing-points and handles which when compressed will separate the jaws, and the piercing-points, substantially as set forth.

2. A necktie-holder, consisting of the spring-jaws, the piercing-points, the handles for simultaneously separating the jaws and the piercing-points, and a hook at the rear of the spring-jaws, substantially as set forth.

3. A necktie-holder, consisting of the spring-jaws and the handles which are provided with cooeting piercing-points, and a hook arranged at the rear of the spring-jaws, the said parts being formed of a single piece of wire, substantially as set forth.

602,563. IRONING-BOARD. DENNIS McDONOUGH, Eau Claire, Wis. Filed Apr. 20, 1897. Serial No. 633,091. (No model.)



Claim.—1. In combination, an ironing-board, a leg having pivotal connection therewith, a brace pivoted at its upper end to the ironing-board and adapted to have its lower end engaged with the leg, and a dog having pivotal connection with the leg and provided with a series of notches forming shoulders to engage with the lower end of the brace and retain it in place, substantially as set forth.

2. In combination, an ironing-board having its rear end notched, longitudinal cleats secured to the bottom side of the ironing-board upon opposite sides of the notch therein, and having their rear ends notched, a leg provided with a series of transverse openings in its upper end, a pin adjustably connecting the leg with the cleats to admit of the ironing-board being secured against either the top or the bottom side of the table as described, a brace adjustably interposed between the ironing-board and leg, a foot having pivotal connection with the leg and formed with a series of openings, and a fastening for adjustably connecting the foot with the leg, substantially as and for the purpose described.

3. The combination with an ironing-board, and a leg having pivotal connection therewith and slotted at its lower end, of a foot of cam form having pivotal connection with the leg and located in the slot thereof, and having a series of openings, and a pin adapted to pass through one of the series of openings of the foot and corresponding openings in the slotted portion of the leg, substantially as and for the purpose set forth.

602,564. INSULATED PIPE-COUPLING. GEORGE PEIFFER, Philadelphia, Pa. Filed June 19, 1896. Renewed Oct. 5, 1897. Serial No. 654,147. (No model.)

Claim.—1. In combination, a gas-pipe or supporting-tube, a joint for the support of the electrolier, a cap or block for said pipe within said joint, insulating material between the sides of the cap or block and the joint, and between the top of the cap or block and the upper portion of the joint, and a tube of insulating material surrounding the gas-pipe from the joint to the point where the pipe emerges from the ceiling or wall, substantially as specified.

2. A joint comprising an upper section connected to but insulated from the gas-pipe and having notches in its lower end, a lower section having on its upper face a series of grooves or channels registering with said notches, and means for connecting the two sections together, substantially as specified.

3. The combination in a joint of the upper section A, having an angular opening therein, a cap or block B fitting within said opening and adapted to receive the gas-pipe, an insulating-ring *d* between the top of the block and the upper portion of the section A, insulating material between the side walls of the block and the walls of the opening in the section A, a lower section carrying the electrolier, and means for connecting the two sections to each other, substantially as specified.

4. The combination in a joint, of the upper section A, having an angular opening therein, a block or cap B fitting within said opening and adapted to receive the gas-pipe, a gas-pipe *x*, insulating-tube D extending around said pipe from the joint to the point where the pipe emerges from the wall or ceiling, an insulating-ring *d* between the top of the block and the upper portion of the section A, insulating material between the side walls of the block and the walls of the opening in the section A, a lower section, and means for uniting the upper and the lower sections, substantially as specified.

5. The combination in a joint, of the upper section A, having an angular opening therein, a block or cap B fitting within said opening and adapted to receive the gas-pipe, an insulating-ring *d* between the top of the block and the upper portion of the section A, insulating material between the side walls of the block and the sides of the opening in the section A, a disk *c* of insulating material below the

cap or block, a disk E jammed within the joint to hold the various parts in position, a lower section, and means for connecting the two sections together, substantially as specified.

6. An insulated joint for electroliers comprising an interiorly-screw-threaded metal block or cap for direct engagement with the house gas-pipe, an upper coupling-section comprising a metal shell surrounding and inclosing the block and completely insulated therefrom, a shoulder on the shell bearing through insulation directly on the block, and the lower metal coupling-section for the fixture-pipe joined to the upper coupling-section.

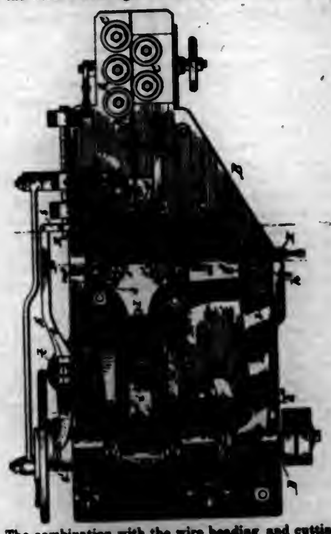
7. An insulated joint for electroliers comprising an interiorly-screw-threaded metal block or cap for direct engagement with the house gas-pipe, an upper coupling-section comprising a metal shell surrounding and inclosing the block and completely insulated therefrom, a shoulder on the shell bearing through insulation directly on the block, and the lower metal coupling-section for the fixture-pipe detachably joined to the upper coupling-section.

8. An insulated joint for electroliers comprising an interiorly-screw-threaded metal block or cap for direct engagement with the house gas-pipe, an upper coupling-section comprising a metal shell surrounding the block and completely insulated therefrom, an insulating-tube surrounding the house gas-pipe and furnishing an additional insulation between the shell and house-pipe, and a lower coupling-section for the electrolier-joint to the upper coupling-section.

9. An insulated joint for electroliers comprising an interiorly-screw-threaded cap or block angular in form and adapted to be screwed directly to the house gas-pipe, an upper coupling-section having an angular opening surrounding and inclosing the block and completely insulated therefrom, and the lower coupling-section for the fixture-pipe joined to the upper coupling-section.

602,565. BICYCLE-TIRE. JACOB REEPMAKER, Rotterdam, Netherlands. Filed Nov. 8, 1897. Serial No. 657,832. (No model.)

Claim.—1. A sheath for pneumatic tires comprising an outer rubber envelop, an inner quilted or reinforced canvas of greater width than the envelop and stitched thereto to form overlapping flaps which project on each side of the envelop and have their edges reinforced by whip-stitches, the reinforcing-strip 4 stitched to the outer of one of the flaps and having one of its edges abutting against one edge of the rubber envelop, the reinforcing-strip 7 secured to the under side of the other overlapping flap, a longitudinal row of eyelets formed through the reinforcing-strip 4 and the overlapping flap to which it is attached, a series of loops secured to the opposite overlapping flap, said loops projecting through said eyelets, and a lacing-cord passed through the ends of the loops to secure them in said eyelets, substantially as set forth.



2. The combination with the rim of a wheel and the sheath of a pneumatic tire, and the lacing-cord for said sheath, said rim having orifices, of the bracket 13 having an orifice, the lever 12 fulcrumed on said bracket and provided with an orifice, and a short arm 10 adapted to clamp said lacing-cord in said bracket, the orifices in the bracket and the rim of the wheel registering, while the orifice in the lever is at one side of the registering-orifices, substantially as set forth.

602,566. NAIL-MAKING MACHINE. JULIUS C. RICHARDSON, Buffalo, N. Y., assignor of two-thirds to Ernest Wende and Lucas H. Van Allen, same place. Filed July 6, 1897. Serial No. 643,620. (No model.)

Claim.—1. The combination with a rotary chuck adapted to intermittently grasp the wire, of a wire-holding device arranged in front of the chuck and serving to hold the wire stock against turning, whereby the wire is twisted between the chuck and the holding device, substantially as set forth.

2. The combination with the wire-cutter, of an intermittently-rotating chuck arranged in front of the wire-cutter and provided with wire-holding jaws which move toward and from the wire for grasping or releasing the wire, and a holding device arranged in front of the chuck and serving to hold the wire stock against turning, substantially as set forth.

3. The combination with the wire heading and cutting devices, of a rotary chuck which is arranged in front of said heading and cutting devices and which intermittently grasps the wire and twists the same, and a bushing arranged in rear of the chuck and provided with a flat-sided seat or opening through which the wire passes and whereby the wire is held against turning, substantially as set forth.

4. The combination with the wire heading and cutting devices, of a rotary chuck-body which is arranged in front of the heading and cutting devices and through which the wire passes, gripping-jaws guided on said body and adapted to move toward and from the wire, a rotary cam-sleeve mounted on said body and provided with inclines engaging with said jaws, and a wire-holding device arranged in front of the chuck-body and cam-sleeve, substantially as set forth.

5. The combination with the wire heading and cutting devices, of a rotary chuck-body which is arranged in front of the heading and cutting devices and through which the wire passes, gripping-jaws guided on said body and adapted to move toward and from the wire, a rotary cam-sleeve mounted on said body and provided with inclines engaging with said jaws for projecting said jaws into an operative position, springs interposed between said jaws and the chuck-body and adapted to retract the jaws into an inoperative position, and a wire-holding device arranged in front of the chuck-body and cam-sleeve, substantially as set forth.

6. The combination with the wire heading and cutting devices, of a rotary chuck-body which is arranged in front of the heading and cutting devices and through which the wire passes, gripping-jaws guided on said body and adapted to move toward and from the wire, a rotary cam-sleeve mounted on said body and provided with inclines engaging with said jaws for projecting said jaws into an operative position, springs interposed between said jaws and the chuck-body and adapted to retract the jaws into an inoperative position, a stop or projection arranged on the chuck-body and engaging with a circumferential slot in the cam-sleeve, and a wire-holding device arranged in front of the chuck-body and cam-sleeve, substantially as set forth.

7. The combination with the wire heading and cutting devices, of a rotary chuck-body which is arranged in front of the heading and cutting devices and through which the wire passes, gripping-jaws guided on said body and adapted to move toward and from the wire, a rotary cam-sleeve mounted on said body and provided with inclines engaging with said jaws, a gear-rim arranged on the cam-sleeve and a reciprocating gear-rack engaging with said gear-rim, substantially as set forth.

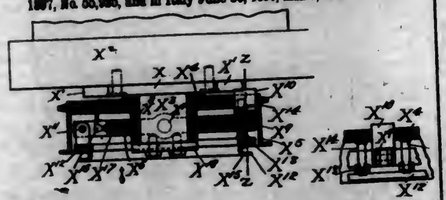
8. The combination with the cutting device, of a wire-twisting device, a rock-lever whereby said twisting device is actuated and which is provided with a longitudinal slot, a pivot for the rock-lever arranged in the slot thereof, and an adjustable support carrying said pivot, substantially as set forth.

9. The combination with the wire-cutter, of an intermittently-rotating chuck arranged in front of the wire-cutter and provided with wire-holding jaws for grasping or releasing the wire, and a holding device arranged in front of the chuck and capable of longitudinal adjustment in the anvil, substantially as set forth.

10. The combination with the wire heading and cutting devices, of a wire-clamping device composed of two jaws one of which is

movable toward and from the other jaw, a slide carrying the movable clamping-jaw and provided with a notch or recess, a rock-lever provided in one of its arms with a notch or recess arranged adjacent to the notch or recess in the slide, and a coupling key or block arranged in the notches or recesses of the rock-arm and slide, substantially as set forth.

602,567. WASHING-MACHINE. HENRY B. ROACH, Paris, Tex., assignor of one-half to George F. Hicks, Frank O. Hicks, and Johnson Hale, Lamar County, Tex. Filed July 21, 1897. Serial No. 645,490. (No model.)



Claim.—1. In a washing-machine, the combination with a suds-box, of a pipe placed beneath the suds-box and inclined throughout its length, a vertical pipe connecting the inclined pipe about midway of its ends with the bottom portion of the suds-box and serving as an inlet and outlet, means for supplying water to the higher end of the inclined pipe, and a controlling-valve at the lower end of the inclined pipe to admit of the suds-water being drained from the suds-box when required, substantially as specified.

2. A washing-machine, comprising an oblong suds-box of approximately elliptical shape in transverse section, having a flattened bottom and provided with a longitudinal passage, and spaces or chambers at its sides and bottom upon opposite sides of the said passage, said spaces being in communication at their lower ends with the passage, and at their upper ends with the interior of the suds-box, perforated steam-pipes located in the lower portion of the spaces or chambers and connected at one end, an inclined supply-pipe located beneath the suds-box and in communication therewith, and provided at one end with a controlling-valve, a drum located within the suds-box, and a rolling top or cover, comprising similar sections slidably mounted in guideways at the ends of the suds-box, substantially as set forth

---

602,568. CLUTCH-GEAR. EDWARD THUNDERCLIFFE, Carlton, Victoria. Filed Sept. 23, 1897. Serial No. 652,895. (No model.) Patented in England Mar. 22, 1897, No. 7,410; in France Mar. 27, 1897, No. 265,443; in Belgium Apr. 3, 1897, No. 127,370; in Canada May 13, 1897, No. 55,695, and in Italy June 30, 1897, XLIV, 411.

Claim.—1. In clutch mechanism for connecting a driving-shaft with a driven element, the combination with said driving-shaft, of a pulley or wheel rotatably sustained in proximity to said driving shaft, a lever pivoted to said pulley, a bolt connected to said lever and adapted to slide through an opening in said pulley or wheel, arms or stops carried by the shaft adapted to be engaged by said bolt, and an operating ring pivoted to the pulley and connected with the said lever, substantially as described.

2. Clutch mechanism for connecting and disconnecting a pulley or wheel to and from the driving-shaft, comprising a pulley or wheel X^{40} loosely mounted on the shaft, a lever X^{50} pivoted to said pulley, a bolt X^{101} connected to said lever and adapted to slide through an opening in said pulley or wheel, arms or stops X^{100} secured on the shaft and adapted to be engaged by said bolt, a spring-latch X^{110} to hold the said lever and bolt in position, and an operating-ring X^{115} pivoted to the said pulley X^{40} and connected to the lever X^{50}, substantially as described.

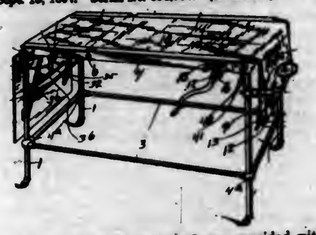
602,569. RELEASING DEVICE. DONALD L. TURNER, Wellington, New Zealand. Filed Aug. 24, 1897. Serial No. 649,204. (No model.)

Claim.—1. A releasing device comprising the clutch, the bolt held thereby, and a casing for holding the clutch closed, said clutch being movable relative to the casing and adapted to fly open when moved out of said retaining-casing, substantially as described.

2. In combination, the releasing-clutch, the bolt engaged thereby, the retaining-casing for holding the clutch closed on the bolt, the spring for holding the clutch within the casing under tension and the rope or draft device connected to the clutch, substantially as described.

3. In combination, a draft connection as a rope or the like, a movable clutch connecting the parts of said draft device and comprising the pivoted members, and a casing for holding the clutch to its work until a predetermined strain is reached, said clutch being located within the casing, substantially as described.

4. In combination, the clutch, comprising the pivoted members, the eyebolt engaged thereby, the spring connected with the eyebolt at one end, and the casing to which the other end of the spring is connected, said casing holding the clutch to its work, the said clutch and spring being arranged within the casing, substantially as described.



5. In combination, the clutch, comprising the pivoted clutch members, the bolt engaged thereby, the spring and the casing with means of adjustment for changing the amount of strain necessary to release the clutch from the casing, the said casing inclosing the clutch and the spring, substantially as described.

6. In combination, the clutch, the two-part casing engaging the same, the eyebolt engaged by the clutch, and the spring connected to the eyebolt and to the casing, the said parts of the casing being adjustable to vary the strain necessary to release the clutch from the casing, the said casing containing the said clutch, eyebolt and spring, substantially as described.

602,570.

Withdrawn.

602,571. SURGICAL TABLE. HIRAM G. BOWERS, Canton, Ohio. Filed Sept. 13, 1897. Serial No. 651,397. (No model.)

Claim.—1. In a surgical table, a frame provided with a top, rollers journaled to the frame and to the downwardly-extending portion of the top, the downwardly-extending portion and a covering connected to the rollers and movable longitudinally upon the top of the table, substantially as and for the purpose specified.

2. In a surgical table, the combination of a table-frame, table-sections hinged together, one of said sections provided with a downwardly-extending portion, a roller carried by said downwardly-extended portion, a roller located at the opposite end of the table, and below the hinged section 7, and the movable top connected to the rollers, substantially as and for the purpose specified.

3. In a surgical table, the combination of a hinged top formed in sections, a supporting-frame, rollers journaled to the frame and to one of the hinged top sections, flexible fabric connected to the rollers and resting upon the hinged table-top sections, and movable longitudinally upon the hinged sections, substantially as and for the purpose specified.

4. In a surgical table the combination of a supporting-frame, parallel bars 4, a shaft journaled to said bars and provided with a pinion, guide-bars loosely mounted upon the shaft carrying the pinion, a rack-bar pivotally connected to one of the hinged table-sections and meshing with the pinion, and one of said table-sections provided with a downwardly-extending portion, a flexible cover resting upon the hinged sections and movable longitudinally upon said hinged sections, rollers journaled to the parallel bars 4, and to the downwardly-extending portion, substantially as and for the purpose specified.

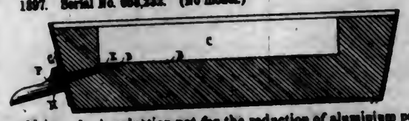
5. The combination of a table-frame, table-sections hinged to the frame, a flexible cover located upon hinged sections of the table and following the movements of the hinged sections and movable longitudinally upon said hinged sections and means for moving the hinged sections and the flexible cover, substantially as and for the purpose specified.

6. The combination of a frame, a table-top formed in sections and the sections hinged together, a flexible movable cover located upon the top of the table-sections, and movable longitudinally thereon and provided with the loops 44, substantially as and for the purpose specified.

602,572. SALIVA-EJECTOR. ARTHUR W. BROWNE and CHARLES M. KENNEDY, Prince's Bay, N. Y., assignors to The S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Aug. 19, 1897. Serial No. 648,750. (No model.)

Claim.—The combination in a saliva-ejector of the coupling-tube provided at one end with means for holding a mouth-tube, and at its opposite end with means for attachment of a flexible tube, and also provided with an enlarged portion consisting of detachable sections united by threaded connection, and forming a strainer-chamber, and a strainer detachably held in said chamber, substantially as and for the purpose set forth.

602,573. DOOR-KNOCKER AND ALARM. ROSCOE D. COCHRANE, Newport, R. I., assignor of three-fourths to J. D. Johnston, same place. Filed Aug. 27, 1897. Serial No. 649,622. (No model.)



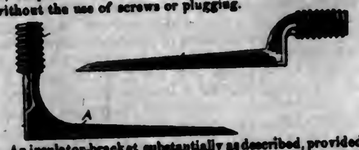
Claim.—A door knocker and alarm consisting of a stationary member secured to a door, a knocker pivoted to the stationary member, a bell, secured to the inside of the door, an enlargement formed on the inner surface of the bell, an arm formed on the bell-support and extending to one side thereof, a spring-striker secured to the arm and extending downward, the lower end thereof being enlarged to form a knob and terminating a short distance from the enlargement on the bell which it is adapted to strike, and a striker-pin pivoted to the striker and extending through the door fitting against the knocker and holding it normally away from the stationary member, as and for the purpose described.

602,574. CHAIR. THOMAS J. DALTON, Boston, Mass. Filed Nov. 10, 1897. Serial No. 657,897. (No model.)

Claim.—In a chair; a wooden arm; a wooden upright; a metal riser having an offset or foot seated on said upright and arm, and extended across the joint therebetween; and means to secure said riser in place, said means comprising a screw driven through said offset into said upright, and a bolt passed through said offset and arm and having a cooperating nut; and a combined brace and shield of wood inserted in the angle between said arm and upright.

602,575. ALUMINIUM-REDUCING POT AND MEANS FOR TAPPING SAME. ANDREW DICKEY, Niagara Falls, N. Y. Filed Nov. 12, 1897. Serial No. 658,232. (No model.)

Claim.—1. A reduction-pot for the reduction of aluminium provided with a taper tap-hole and a wooden or charcoal plug fitted to said taper, and means for excluding said plug from contact with air, substantially as and for the purposes set forth.



2. A reduction-pot for the reduction of aluminium provided with a tap-hole, a wooden or charcoal plug fitting into said tap-hole, and means for preventing oxidation of said plug, substantially as and for the purposes set forth.

3. In an aluminium-reduction pot, the combination of a pot provided with a tap-hole, with a wooden or charcoal plug removably inserted therein, and a coating of clay or equivalent material for excluding the exposed end of said plug from the air, substantially as and for the purposes set forth.

4. In an aluminium-reduction pot, the combination of a pot provided with a taper tap-hole, with a taper wooden or charcoal plug, a plastic cap covering the exposed portion of said plug, and a spout surrounding the exterior opening of said tap-hole, substantially as and for the purposes set forth.

602,576. BRACKET FOR INSULATORS, &c. JOHN B. FLETCHER, Dayton, Ohio. Filed Jan. 4, 1896. Renewed Feb. 2, 1898. Serial No. 668,890. (No model.)

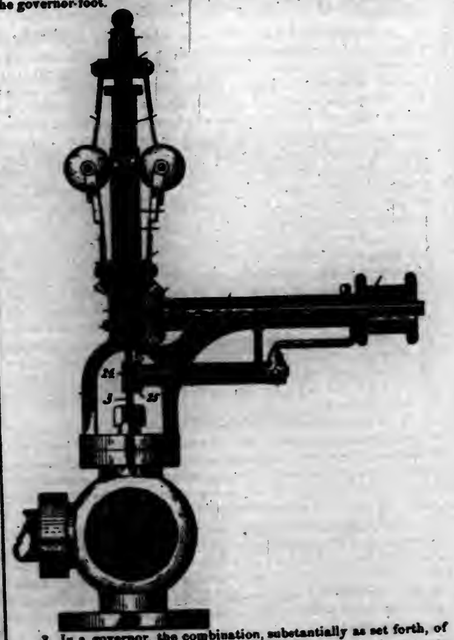
Claim.—1. An insulator-bracket, substantially as described, provided with a head for the insulator or insulator-plug, and a blade having one flat side and two recessed sides and tapering from butt to point, adapted to be driven into a supporting-surface to secure same without the use of screws or plugging.

2. An insulator-bracket, substantially as described, provided with a head for the insulator or insulator-plug, and a blade having one flat side and two recessed sides and tapering from butt to point, with a square shoulder at the butt thereof, whereby the bracket may be driven into a supporting surface without injury to the head and without the use of screws or plugging.

602,577. STOVE. FRANK J. GOULD, Marion, Ind. Filed Dec. 7, 1896. Serial No. 614,722. (No model.)

Claim.—1. A heating-stove comprising a shell for containing fuel divided into two chambers by a false top or diaphragm having an opening, a damper for regulating the size of such opening, a grate extending across the lower end of the shell, the shell being imperforate between the diaphragm and grate, means for introducing fuel through such diaphragm, and means for permitting the introduction of air beneath the grate and into the upper chamber, substantially as described.

2. A heating-stove comprising a shell for containing fuel divided into two chambers by a false top or diaphragm having an opening, a damper that can partially but never completely close such opening, a grate extending under the lower end of the shell, the shell being imperforate between the diaphragm and grate, means for introducing the fuel through such diaphragm, and means for permitting the introduction of air beneath the grate and into the upper chamber.



3. A heating-stove comprising a shell for containing fuel divided into two chambers by a false top or diaphragm having an opening, a damper for regulating the size of such opening, a grate extending across the lower end of the shell, the shell being imperforate between the diaphragm and grate, means for introducing fuel through such diaphragm, means for permitting the introduction of air beneath the grate, and an outlet pipe from the upper chamber, substantially as described.

4. In a stove or furnace, a shell for containing the fuel, a diaphragm that divides the shell into an upper and a lower chamber, said diaphragm having an opening through it, a damper to regulate said opening but which cannot be entirely closed, a funnel above and registering with the opening in the diaphragm, a check-damper above the funnel, an outlet-pipe from the upper chamber, and a grate at the lower end of the stove through which air is admitted, said shell being imperforate between the grate and diaphragm, substantially as set forth.

602,578. STEAM-ENGINE GOVERNOR. WILLIAM H. GUNTHER, Owensborough, Ky. Filed Oct. 7, 1897. Serial No. 654,330. (No model.)

Claim.—1. In a governor, the combination, substantially as set forth, with a governor-head and governor-foot mounted for rotation, of thin flat springs firmly secured to the governor-head and depending therefrom, a ball firmly secured at the lower end of each of said springs, and thin flat springs having their lower ends secured to the governor-foot and having their upper ends articulately connected with said balls through the medium of horizontal pivots.

2. In a governor, the combination, substantially as set forth, with a governor-head and governor-foot mounted for rotation, of thin flat springs firmly secured to the governor-head and depending therefrom, a ball firmly secured at the lower end of each of said springs, bifurcated yokes depending from said balls and articulated thereto by horizontal pivots, and thin flat springs having their upper ends firmly secured to said yoke and having their lower ends firmly secured to the governor-foot.

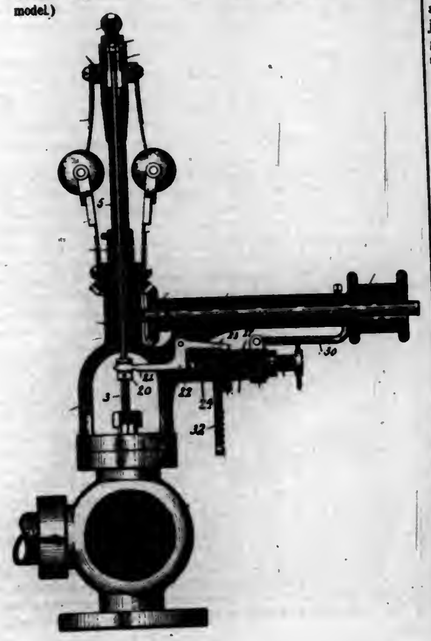
3. In a governor, the combination, substantially as set forth, of a housing having a vertical bearing in its top, a journal-tube concentrically disposed within said bearing and projecting above the same and having its foot firmly secured in the housing at the base of said bearing, a governor-foot mounted for rotation on said tube and having a journal fitting within said bearing and provided with a circumferential groove, a collar engaging said groove, a set-screw in the wall of said bearing and serving to hold said collar rigid in the bearing, a governor-head mounted to turn and move vertically upon the upper portion of said journal-tube, governor-balls connected with said governor-foot and governor-head, a spring to resist the outward movement of the balls, a valve-stem connected with the governor-head, and means for transmitting rotary motion to the governor foot and head and balls.

4. In a governor, the combination, substantially as set forth, of a housing, a journal-tube firmly supported thereby, a governor-foot mounted for rotation on said journal-tube, a governor-head mounted for rotation and for vertical movement on said journal-tube, governor-balls connected with the governor-head and governor-foot, a part surrounding said journal-tube and projecting from the governor-head toward the governor-foot, a helical spring surrounding the journal-tube and compressed between the foot of said last-mentioned part and a shoulder on the governor-foot, and a tube surrounding said spring and having its foot secured to the governor-foot and having its upper end surrounding the upper abutment of the spring.

5. In a governor, the combination, substantially as set forth, of a housing having a vertical bearing and a horizontal bearing with their axes intersecting, a journal-tube firmly supported by the housing concentric with said vertical bearing and projecting upwardly therefrom, a governor-foot mounted for rotation in said vertical bearing, a governor-head mounted for rotation and for vertical movement on said journal-tube, balls connected with the governor-head and governor-foot, a bevel-gear upon the governor-foot, a driving-shaft mounted in said horizontal bearing and having its inner end in bearing engagement within the exterior of said vertical bearing, and a bevel-gear upon the inner end of said driving-shaft with its hub abutting against the inner end of said horizontal bearing.

6. In a governor, the combination, substantially as set forth, of a governor-head arranged for rotation and for vertical movement, a valve-stem engaging upwardly against a surface on the governor-head and free to move downwardly with reference to the governor-head,

a spring serving to support the valve-stem in an upward position against the shoulder on the governor-head, centrifugal devices serving to move the governor-head downwardly, a centripetal device serving to move the governor-head upwardly, and mechanism for forcibly lowering the valve-stem against the resistance of the first-mentioned spring without disturbing the second spring or the governor-head.



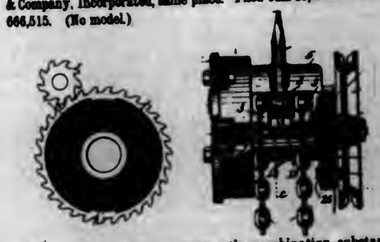
7. In a governor, the combination, substantially as set forth, of a housing, a journal-tube supported thereby, a governor-foot mounted for rotation on the journal-tube, a governor-head mounted for rotation and for vertical movement on the journal-tube, balls connected with the governor-foot and governor-head, a valve-stem within the journal-tube and projecting above the same, upwardly and downwardly presenting shoulders at the top of the valve-stem, a cap-nut upon the governor-head engaging the upwardly-presenting shoulder of the valve-stem, a spring compressed between the downwardly-presenting shoulder of the valve-stem and the upper end of the journal-tube, and mechanism for lowering the valve-stem with reference to the governor-head and against the resistance of said spring.

8. In a governor, the combination, substantially as set forth, of a housing, a journal-tube carried thereby, a governor-foot mounted for rotation on the journal-tube, a governor-head mounted for rotation and for vertical movement on the journal-tube, balls connected with the governor-foot and governor-head, a valve-stem engaging upwardly against a part of the governor-head so as to be forced downwardly as the governor-head moves downwardly, a spring supporting the valve-stem and yieldingly resisting its downward movement, a lip carried by the valve-stem, a cam-shaft mounted in the housing and having a cam engaging said lip, and devices for partially rotating said cam-shaft.

9. In a governor, the combination, substantially as set forth, of a valve-stem connected with the governing parts, a lip carried by the valve-stem, a cam-shaft mounted at right angles to the valve-stem and presenting its end over said lip, a double-lobed cam on said cam-shaft and engaging said lip, and an arm on said cam-shaft to serve in giving the cam-shaft a motion of partial rotation.

10. In a governor, the combination, substantially as set forth, of a housing supporting the governing parts and the driving-shaft, a lip carried by the valve-stem, a cam-shaft mounted in the housing parallel with the driving-shaft and presenting its end over said lip, a cam on said cam-shaft and engaging said lip, an arm projecting from said cam-shaft, and a pulley carried by said arm and adapted to rest upon the governor-belt.

602,579. STEAM-ENGINE GOVERNOR. WILLIAM H GUNTHER, Owensborough, Ky. Filed Oct. 7, 1897. Serial No. 654,340. (No model.)



Claim.—1. In a steam-engine governor, the combination, substantially as set forth, of a tubular projection carried by the governor-housing and having its axis intersecting that of the valve-stem, a lever projecting from said tubular projection to and into engagement with the valve-stem and mounted on a pivot carried by the governor-housing above and at right angles to the axis of said tubular projection, said lever presenting a hip below its pivot and in the line of the axis of said projection, a spring disposed within said tubular projection and engaging the hip of said lever, and an adjusting-screw mounted in said tubular projection and engaging the opposite end of said spring.

2. In a steam-engine governor, the combination, substantially as set forth, of a tubular projection carried by the governor-housing and having its axis intercepting that of the valve-stem, a lever projecting from said tubular projection to and into engagement with the valve-stem and mounted on a pivot carried by the governor-housing above and at right angles to the axis of said tubular projection, said lever presenting a hip below its pivot and in the line of the axis of said projection, a spring disposed within said tubular projection and engaging the hip of said lever, an adjusting-screw mounted in said tubular projection and engaging the opposite end of said spring, a cam mounted on the exterior of said tubular projection, an arm for turning said cam, and an arm formed upon said hipped lever and projecting over and into engagement with said cam.

3. In a steam-engine governor, the combination, substantially as set forth, of a tubular projection carried by the governor-housing and having its axis intercepting that of the valve-stem, a lever projecting from said tubular projection to and into engagement with the valve-stem and mounted on a pivot carried by the governor-housing above and at right angles to the axis of said tubular projection, said lever presenting a hip below its pivot and in the line of the axis of said projection, a spring disposed within said tubular projection and engaging the hip of said lever, an adjusting-screw mounted in said tubular projection and engaging the opposite end of said spring, a two-lobed cam mounted on the exterior of said tubular projection, an arm for operating said cam, a second cam mounted on said tubular projection, an arm connected with said second cam, a pulley carried by the last-mentioned arm and adapted to rest on the driving-belt of the governor, and an arm formed upon said hipped lever and projecting over and into engagement with said two cams.

4. In a steam-engine governor, the combination, substantially as set forth, of a tubular projection carried by the governor-housing parallel with the driving-shaft of the governor and having its axis intersecting that of the valve-stem of the governor, a helical spring disposed within said tubular projection, a cam mounted on the exterior of said tubular projection, an arm projecting from said cam and carrying at its outer end a pulley adapted to rest upon the driving-belt of the governor, a hipped lever pivoted to the governor-housing above the axis of said tubular projection and having a portion projecting from said spring to and into engagement with the stem of the governor, and an arm formed upon said lever and engaging over said cam.

602,580. HOISTING APPARATUS. HARRY S. HASKINS and ZOBIMUS B. COMB, Philadelphia, Pa., assignors to the Edwin Harrington, Son & Company, Incorporated, same place. Filed Jan. 13, 1898. Serial No. 666,515. (No model.)

Claim.—1. In hoisting apparatus, the combination, substantially as set forth, of a spindle to be turned by the application of power in hoisting the load and to turn in the opposite direction as the load is lowered, a friction-brake element turning positively with said spindle, a brake-gear mounted concentric with and loose with reference to said spindle and adapted for frictional cooperation with said friction-brake element, a thread carried by said spindle, a hand-sheave screwed upon said thread and adapted to clamp the brake-gear to said friction-brake element when the hand-sheave is turned in load-hoisting direction, and an idle-pinion gearing with said brake-gear, the teeth of said idle-pinion and said brake-gear having curved or inclined faces to engage when the brake-gear turns in load-hoisting direction, the opposite faces of said teeth being formed so as to lock when the brake-gear starts to turn in load-lowering direction, the space between the teeth being greater than the thickness of the teeth.

2. In hoisting apparatus, the combination, substantially as set forth, of a spindle to be turned by the application of power in hoisting the load and to turn in the opposite direction as the load is lowered, a friction-clamp flange with a threaded hub secured to said spindle, a brake-gear loose upon the hub of the friction-clamp and adapted to frictionally cooperate with said friction-clamp, means for limiting the rotation of said brake-gear to the hoisting direction of motion, a hand-sheave screwed upon said threaded hub and forcibly impinging against the hub of said brake gear when the hand-sheave is turned in hoisting direction, and a bearing engaging the hub of said brake-gear between said brake-gear and hand-sheave.

3. In hoisting apparatus, the combination, substantially as set forth, of a spindle to be turned by the application of power in hoisting a load and to turn in the opposite direction when the load is being lowered, a friction-clamp flange secured to said spindle, a brake-gear loose with reference to said spindle, means for limiting the rotation of said brake-gear to the hoisting direction of motion, a friction-disk and washers interposed between the faces of said flange and brake-wheel, the frictional faces of said flange and friction-disk and brake wheel being provided with spiral grooves having such direction of spirality as to urge oil inwardly when the spindle turns in the load-lowering direction, and a hand-sheave connected with said spindle through the medium of a threaded part having a direction of helicity such as to cause the hand-sheave to press the brake-gear toward said flange when the hand-sheave is turned in the hoisting direction.

4. In hoisting apparatus, the combination, substantially as set forth, of a horizontal bearing and a vertical bearing rigidly united, a suspension-hook having its shank swiveled in said vertical bearing, an arbor having a journal portion engaging said horizontal bearing and having prismatic portions at the ends of said journal portion, a hoisting-sheave fitting upon the prismatic portion of said arbor against each end of said horizontal bearing, a gear fitting one of the prismatic portions of the arbor against one of said hoisting-sheaves, a spindle mounted in bearings having rigid connection with said horizontal bearing, a hand-sheave connected with said spindle, and gearing connecting said spindle with said gear on the arbor.

5. In hoisting apparatus, the combination, substantially as set forth, of a horizontal bearing and a vertical bearing rigidly united, a suspension-hook swiveled in said vertical bearing, a roof-piece rigidly connected with said bearings and carrying a horizontal bearing in line with the first-mentioned horizontal bearing, an arbor mounted in said horizontal bearings, hoisting-sheaves on said arbor, a gear on said arbor, a spindle mounted in bearings rigidly connected with the before-mentioned bearings, gearing connecting said spindle and arbor, and a hand-sheave connected with said spindle.

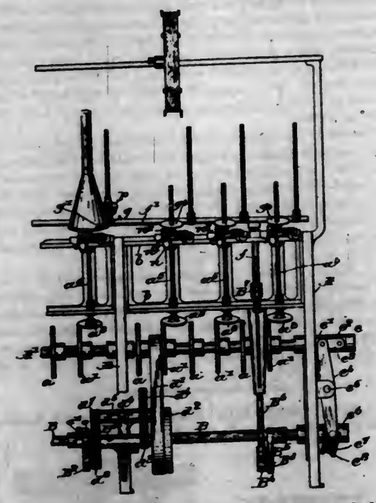
6. In hoisting apparatus, the combination, substantially as set forth, of a vertical bearing, a suspension-hook with its shank swiveled therein, a frame-roof rigidly connected with said vertical bearing, a horizontal bearing in a vertical wall rigidly carried by said frame-roof, an outwardly-open gear-case rigidly carried by said frame-roof, a bonnet closing said gear-case, a hoisting-arbor journaled in said bonnet and in one of said horizontal bearings, a spindle journaled in one of said horizontal bearings and in a bearing in said gear-case, gearing within said gear-case connecting said spindle and arbor, and a hand-sheave connected with said spindle.

7. In hoisting apparatus, the combination, substantially as set forth, of a frame having horizontal bearings and a vertical bearing and a gear-case, a suspension hook having its shank swiveled in said vertical bearing, a hoisting-arbor journaled in bearings supported by said frame, a gear on said arbor within the gear-case, a spindle journaled in the framing, a hand-sheave connected with the spindle, a stud crossing the gear-case, a gear on the arbor within the gear-case, a pinion on the spindle within the gear-case, a gear loose on said stud and engaging said pinion, and a pinion fast with the last-mentioned gear and engaging the first-mentioned gear.

8. In hoisting apparatus, the combination, substantially as set forth, of a frame, a suspension-hook having its shank swiveled in a vertical journal in said frame, a gear-case carried by said frame to one side of said hook, a hoisting-arbor journaled in the frame, a spindle journaled in the frame, gearing within said gear case and connecting said spindle and arbor, a hand-sheave connected with the spindle exterior to the frame, upon that side of the suspension-hook opposite said gear-case, and a lowering-brake on said spindle within the frame.

9. In hoisting apparatus, the combination, substantially as set forth, of a frame having a horizontal bearing, a horizontal bearing in line with the first bearing and of less diameter, a vertical bearing rigidly connected with the other bearings, a suspension-hook having its shank swiveled in said vertical bearing, a gear-case carried by said frame at the side opposite said smaller bearing, an arbor having journals fitting said horizontal bearings and having a prismatic portion between said bearings of a size adapted to pass through the first-mentioned horizontal bearing, a hoisting-sheave on the prismatic portion of said arbor, a bonnet closing said gear and having a bearing engaging a journal on said arbor, a spindle mounted in the frame, a hand-sheave connected with the spindle, and gearing disposed within the gear-case and connecting the spindle and arbor.

602,581. ARTIFICIAL TOOTH-CROWN. MERRILL W. HOLLINGSWORTH, Philadelphia, Pa., assignor to The S. S. White Dental Manufacturing Company, same place. Filed Nov. 24, 1897. Serial No. 659,985. (No model.)



Claim.—An article of manufacture consisting of a crown-post adapted to be fitted in the canal of a natural tooth-root and provided at and near its end which projects outside the said root with an offset spline or feather arranged approximately parallel with the longitudinal axis of the post, for the purpose of making a direct sliding interlocking connection between said post and a porcelain tooth-facing provided with a groove corresponding in cross-section to said spline or feather, and also affording means for attachment of a slotted metallic backing which may be fitted between the said post and the said porcelain facing, substantially as and for the purpose described.

602,582. CROWN-POST FOR ARTIFICIAL TEETH. WOODBURY S. HOW, Philadelphia, Pa., assignor to The S. S. White Dental Manufacturing Company, same place. Filed Dec. 31, 1897. Serial No. 663,809. (No model.)

Claim.—A new and useful article of manufacture consisting of a crown-post provided with longitudinal edge flanges and a roughened or ribbed web between said flanges, substantially as and for the purpose set forth.

602,583. BOBBIN-WINDING MACHINE. WARREN D. HOSE, Laconia, N. H. Filed Feb. 23, 1897. Serial No. 624,570. (No model.)

Claim.—1. In a bobbin-winding machine, a main shaft provided with a series of friction-drivers, a set of spindles having at their lower ends friction-disks adapted to be rotated by said drivers, a driven pulley on said shaft, a second shaft parallel therewith and having loosely mounted on it a pulley provided with a pinion, a belt connecting said two pulleys, a third shaft also parallel to said shaft and provided with a gear and a pinion and operated from the pinion on said pulley, a gear and a cam fast on said second shaft and actuated from the pinion on said third shaft, and a rock-shaft having an arm actuated by said cam, and a second arm having a diagonal or inclined groove, a lever actuated by said groove and loosely connected with said main shaft, the rocking of the said rock-shaft effecting through said lever the sliding of the said main shaft, to vary the speed of rotation of the spindles, substantially as described.

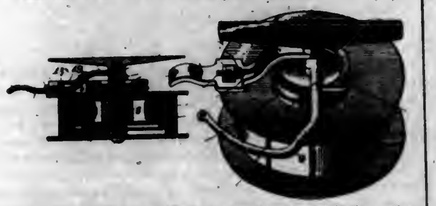
2. In a bobbin-winding machine, a main shaft having two series

of friction drivers, two sets of diagonally-placed spindles having friction-disks cooperating with alternate drivers on the said shaft, a rock-shaft parallel with said shaft and having an arm provided with a diagonal groove c^7, means to rock said shaft, a lever c^4 operated by said groove c^7 and loosely connected at its upper end with said main shaft, to automatically reciprocate said main shaft longitudinally to vary the speed of rotation of said spindle, substantially as described.

3. In a bobbin-winding machine, an arm A^3, and the open-centered guide block A^4 notched to engage said arm, and slotted at one edge into said open center, combined with a slotted thread-guide A^5, and means to connect the said block to said arm either side up, whereby the open slot of the thread-guide may be presented either side up, substantially as described.

602,584. ELECTRIC RAILWAY. HOSEA W. LIBBEY, Boston, Mass. Filed Dec. 10, 1894. Serial No. 531,623. (No model.)

Claim.—1. In an electric railway, the combination, with a closed conduit, of two rows of parallel alternately-arranged metallic bars, insulatingly embedded in the top, and extending from the upper to the lower surface thereof, a supply-wire within the conduit, movable conductors between the wire and the bars, and a magnetic trolley, the free end of which is provided with two contact-points, side by side, and adapted to engage with the alternately-arranged bars, substantially as set forth.



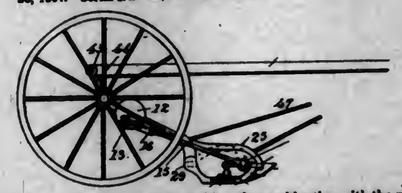
2. In an electric railway, the combination, with a conduit, of two rows of parallel alternately-arranged bars insulatingly embedded in the top thereof, and extending from the upper to the lower surface thereof, a supply-wire within the conduit, movable conductors upon the wire, each of which is provided with two contact-points, one for each row of bars, and a magnetic trolley, the free end of which is provided with two contact-points, one for each row of bars, substantially as set forth.

3. In an electric railway, the combination, with a conduit, of two rows of parallel alternately-arranged bars insulatingly embedded in the top thereof, and extending from the upper to the lower surface, a supply-wire within the conduit, bifurcated conductors upon the wire, the free end of each arm thereof being movable into and out of contact with the bars, a magnetic trolley, the free end of which is provided with two contact-points, one for each row of bars, substantially as set forth.

4. In an electric railway, the combination, with a conduit, of two rows of parallel alternately-arranged bars insulatingly embedded in the top thereof, and extending from the upper to the lower surface, a supply-wire within the conduit, bifurcated conductors upon the wire, a movable cap upon each arm of each conductor, said caps being movable into and out of contact with the bars, and a magnetic trolley, the free end of which is provided with two contact-points, substantially as set forth.

5. In an electric railway, the combination, with a conduit, of two rows of parallel alternately-arranged bars insulatingly embedded in the cover thereof, a supply-wire within the conduit, movable conductors between the wire and the bars, and a magnetic trolley, the free end of which is provided with two wheels, one upon each side thereof, and each in electrical connection therewith, substantially as set forth.

602,585. FISHING-REEL. ELISHA MOORE, Meductic, Canada. Filed Jan. 21, 1897. Serial No. 620,146. (No model.)

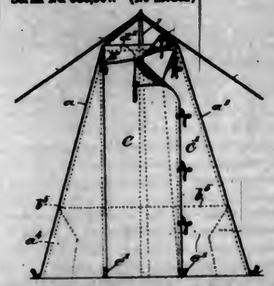


Claim.—1. In a fishing-reel, the combination with the spring-case, a sleeve integral with the same, of a drum provided with a cam-groove and rigidly secured to said sleeve, a swinging guide, and an arm integral with and extending from said guide adapted to engage said groove: substantially as described.

2. In a fishing-reel, the combination of the reel, the spring-case and automatic means for winding the reel, a drum carried by the spring-case provided with a suitable cam-groove, and a swinging guide on said reel having an arm in engagement with said groove, substantially as shown and described.

3. In a fishing-reel, the winding-reel, means for winding the same, a brake for said reel comprising a fixed flexible arm, a roller journaled in said arm and bearing on the reel, and means controlling said roller in one direction only, substantially as described.

4. In a fishing-reel, the combination of the reel, means for winding the same, and a brake for said reel consisting of a flexible arm, a roller journaled in said arm and bearing against said reel, ratchet-teeth provided on the roller, and a spring engaging the said ratchet-teeth, substantially as shown and described.



602,586. MOWING MACHINE. CASCO MORRIS, Red Canyon, Wyo., assignor of one-half to James Greatage, same place. Filed July 28, 1897. Serial No. 646,348. (No model.)

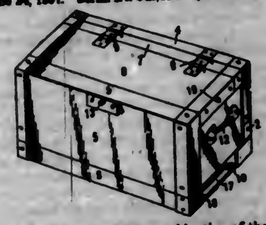
Claim.—1. In a mowing-machine, the combination with the main supporting-frame and cutting mechanism, the driving mechanism and a connection between the driving mechanism and the cutting mechanism, said connection comprising a pitman the rearward end of which is screw-threaded, a coupling consisting of a block having at one end a longitudinal central aperture to receive the pitman and allow it to rotate therein and prevent other movement thereof, the end walls of said longitudinal aperture being countersunk, nuts located upon said pitman and having rounded heads to fit the countersinks to afford an axial bearing for the pitman, set-nuts for locking the aforesaid nuts against longitudinal movement, thereby preventing swinging or lateral movement of the pitman with respect to the block, and means carried by the other end of the block for securing it to the driving mechanism, substantially as set forth.

2. In a mowing machine, the combination with the main supporting-frame and cutting mechanism, the driving mechanism and a connection between the driving mechanism and the cutting mechanism, said connection comprising a pitman the rearward end of which is screw-threaded, a coupling consisting of a block having at one end a longitudinal central aperture to receive the pitman and allow it to rotate therein and prevent other movement thereof, the end walls of said longitudinal aperture being countersunk, nuts located upon said pitman and having rounded heads to fit the countersinks to afford an axial bearing for the pitman, set-nuts for locking the aforesaid nuts against longitudinal movement, thereby preventing swinging or lateral movement of the pitman with respect to the block, said block being bifurcated at its opposite end to form clamping-jaws, and bolts and nuts for clamping said jaws to a part of the driving mechanism, substantially as set forth.

602,587. TENT. THOMAS C. PHELPS, Newton, Mass. Filed Apr. 6, 1896. Serial No. 586,307. (No model.)

Claim.—1. A tent comprising substantially triangular sides, a roof or back of rhomboidal shape to which said sides are secured, said back having its shortest edge at the highest point of the tent, a pocket adjacent said edge, a ridge-pole in said pocket, and means for supporting the tent, substantially as described.

2. A tent, comprising substantially triangular sides having their front edges approximately vertical, a back or roof of rhomboidal form secured to the rearwardly-sloping top edges of said sides, and having its shortest edge at the top of the tent adjacent the uppermost angle of said triangular sides, flaps for closing the entrance of the tent between said vertical edges, a short hood-piece extending from the top edge of the back and adapted to overhang and inclose the top ends of said flaps, and means for supporting the tent, substantially as described.



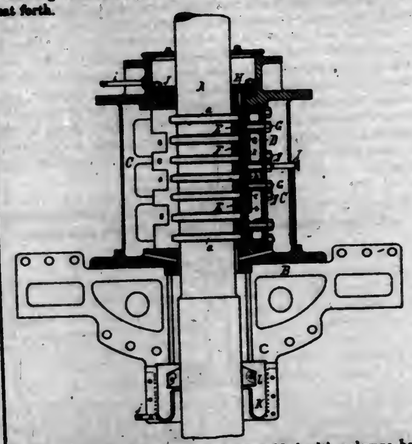
2. A tent, comprising substantially triangular sides having their front edges approximately vertical, a back or roof of rhomboidal form secured to the rearwardly-sloping top edges of said sides, and having its shortest edge at the top of the tent adjacent the uppermost angle of said triangular sides, flaps for closing the entrance of the tent between said vertical edges, a short hood-piece extending from the top edge of the back and adapted to overhang and inclose the ends of said flaps, a fly secured adjacent said hood-piece and adapted to extend rearwardly above said back of the tent, and means for supporting the tent, substantially as described.

4. A tent comprising substantially triangular sides having their front edges approximately vertical, a back or roof of rhomboidal form secured to the rearwardly-sloping top edges of said sides and having its shortest edge at the top of the tent adjacent the uppermost angle of said triangular sides, flaps for closing the entrance of the tent between said vertical edges, said back terminating short of the ground edge of the tent, a back piece depending from the lower end of said back and extending to said sides, and the sides having a projecting corner-piece lapping over and adapted to be secured to said back piece, substantially as described.

5. A tent comprising substantially triangular sides having their front edges approximately vertical, a back or roof of rhomboidal form secured to the rearwardly-sloping top edges of said sides and having its shortest edge at the top of the tent adjacent the uppermost angle of said triangular sides, flaps for closing the entrance of the tent between said vertical edges, a central aperture in said back to receive a supporting tent-pole, and a transverse ridge-bar adjacent and independent of said pole, whereby said bar may be removed without interference with said pole, substantially as described.

6. A tent comprising substantially triangular sides having their front edges approximately vertical, a back or roof of rhomboidal form secured to the rearwardly-sloping top edges of said sides and having its shortest edge at the top of the tent adjacent the uppermost angle of said triangular sides, flaps for closing the entrance of the tent between said vertical edges, said back having a ridge-bar removably contained in a pocket formed on said back and means to support the tent, substantially as described.

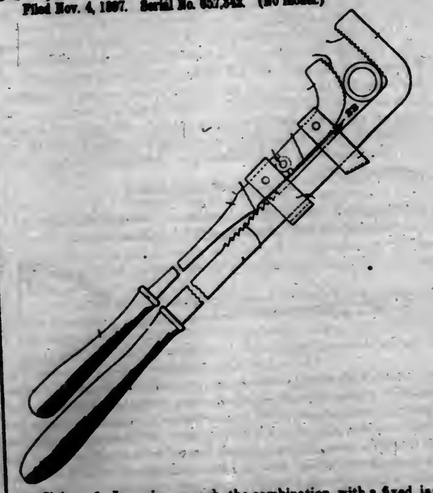
602,588. FOLDING BOX. EDWARD R. PRATT, Andover, S. D. Filed June 24, 1897. Serial No. 642,134. (No model.)



Claim.—In a folding box, the combination of the bottom 1 having end, front and back strips respectively secured rigidly thereto, the front and back hinged to said front and back strips, said front having a flanged portion 5' extending inward therefrom, the top strip 7 and cover 8 hinged to said back by means of a double hinge 9, the spring-metal tongue adapted to be depressed into the recess formed in the inner face of front 5, the bifurcated abutting piece extending over said tongue, the headed arm adapted to engage said tongue and abutting piece, and the parts adapted to be folded, substantially as shown and described.

602,589. THRUST-BEARING. COLEMAN SELLERS, Philadelphia, Pa., assignor, by mesne assignments, to the Niagara Falls Power Company, Niagara Falls, N. Y. Filed Oct. 4, 1897. Serial No. 654,005. (No model.)

Claim.—1. In a thrust-bearing, the combination of a frame and retaining-blocks secured thereto, with removable bearing-segments, and means for securing the same to said retaining-blocks, substantially as and for the purposes set forth.



2. In a thrust-bearing, a frame, concave retaining-blocks secured thereto and concentric with the shaft, concavo-convex bearing-segments concentric therewith, and means by which said segments may be released or secured in removing or replacing the same, without removing the retaining-blocks, substantially as and for the purposes set forth.

3. In a thrust-bearing, a frame provided with columns having their inner faces parallel on planes tangential to a circle concentric with the shaft, concavo-convex segments concentric with said shaft secured to said retaining-blocks by means of bolts, and means by which said segments may be released or secured in removing or replacing the same, consisting of said bolts and a gland of equal diameter with said segments which is removably secured to the frame of the bearing, substantially as and for the purposes set forth.

4. A thrust-bearing consisting of a frame, retaining-blocks secured thereto and having their inner faces concave and concentric with the shaft, a shaft provided with annular projections or thrust-collars, concavo-convex bearing-segments removably secured to said retaining blocks and concentric with said shaft, there being annular recesses therein corresponding to said thrust-collars, and a bearing-metal facing secured thereto and held in place by recesses, substantially as and for the purposes set forth.

602,590. PIPE-WRENCH. LORIN C. SPRINGER, Chicago, Ill. Filed Nov. 4, 1897. Serial No. 657,342. (No model.)

Claim.—1. In a pipe wrench, the combination, with a fixed jaw having a shank having a stem or handle portion and provided with a ratchet, of a movable jaw, means for supporting and guiding said movable jaw on the shank of the fixed jaw, and a second shank pivoted to the movable jaw, provided with a loop or keeper loosely embracing the shank of the fixed jaw, and with a tooth to engage

the ratchet thereof, and having a stem or handle adjacent to and substantially parallel with the stem or handle portion of the shank of the fixed jaw, substantially as described.

2. In a pipe-wrench, the combination, with a fixed jaw having a shank having a stem or handle portion and provided with a ratchet, of a movable jaw provided with a loop or keeper loosely embracing the shank of the fixed jaw, and limiting its motion away from said shank, a spring to force said loose jaw normally toward the shank of the fixed jaw, and a second shank pivoted to the movable jaw, provided with a loop or keeper loosely embracing the shank of the fixed jaw, and with a tooth to engage the ratchet thereof, and having a stem or handle adjacent to and substantially parallel with the stem or handle portion of the shank of the fixed jaw, substantially as described.

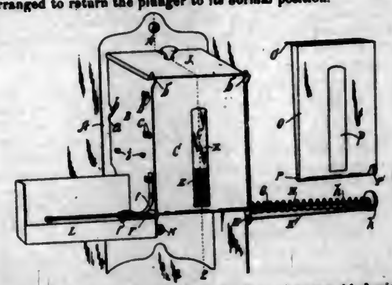
602,591. VEHICLE-SPRING. ORVILLE A. TIBBENLAKE, Norwood, Ohio. Filed Feb. 8, 1897. Serial No. 622,425. (No model.)

Claim.—1. A coil-spring made from a single piece of steel, first bent to a U shape, each end of which is thereafter coiled right and left, and the extreme ends formed to fasten to the body, the end of the U-shaped portion, to wit: the junction of the branches of the portions G, being curved substantially as shown, and engaging a link adapted to receive this curved portion, and permit the arcal slide motion, a twist motion, and the direct movement resulting in the elongation of the spring, substantially as and for the purposes specified.

2. In a spring for vehicles, the combination of a spring having the outer arms G^3, a central U-shaped loop having the legs G^3, G^3, coils G^4, G^4, a coil between each leg G^3 and arm G^5, all integral, and a rigid shackle, and link K, having eye L, and the adjustable hook M having the lip M^4, and the concavo-convex conformation M^6, M^7 of the hook M, against which the loop rests, substantially as and for the purposes set forth.

3. In a spring for vehicles, the combination of a spring having the outer arms G^3, a central U-shaped loop having the legs G^3, G^3, coils G^4, G^4, a coil between each leg G^3 and arm G^5, all integral, and a rigid shackle, and link K, having eye L, and the adjustable hook M having the lip M^4, and the concavo-convex conformation M^6, M^7 of the hook M, against which the loop rests, and the recessed conformation M^4, M^5 in the eye, in which the loop plays, substantially as and for the purposes specified.

4. A spring having outer arms G^3 for attachment to the vehicle-body, and coils G^4 respectively connected to these arms, and the loop G located between the coils and having its ends connected to the adjacent ends of the coils, and having the looped end curved substantially as shown, the entire spring being substantially integral, in combination with a link having an arcal eye with enlarged ends adapted to embrace the loop, the curved end of the loop lying in the link, the link being connected to the running-gear, substantially as and for the purposes specified.



602,592. CLEANER. LAWRENCE J. WIDDISS, Brooklyn, N. Y. Filed Aug. 23, 1897. Serial No. 649,232. (No model.)

Claim.—In a bottle-cleaner, the combination with a shank formed centrally into a ring and angled so as to cross between said ring and the ends of the shank, of a tubular swab removably attached to the ends of said shank, said shank being outwardly curved whereby the swab will be brought into intimate contact with every portion of the bottle, and each end of the shank being doubled upon itself whereby said swab is securely retained in position, substantially as described.

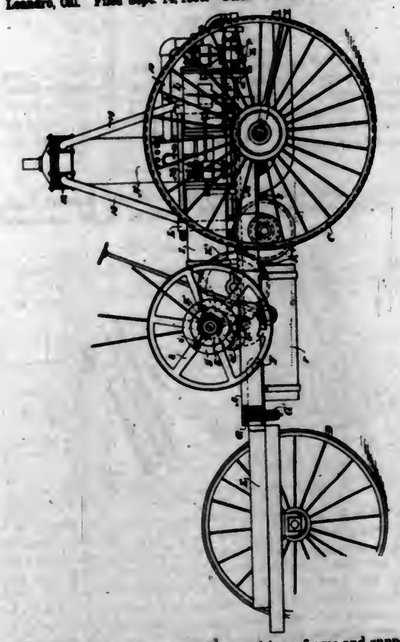
602,593. MATCH-IGNITING DEVICE. CHARLES F. AXELSON, GUSTAVUS A. AXELSON, and ROBERT W. GUNN, Los Angeles, Cal. Filed June 1, 1897. Serial No. 638,052. (No model.)

Claim.—1. In a match-box the combination set forth of a base-plate provided with slots: a match-supply chamber formed of an integral strip of sheet metal returned upon itself and adapted to hold a single row of matches and provided upon its edges with projecting tongues: a bottom provided upon its sides with projecting tongues: side members or supports each provided upon its rear edge with tongues to fit within slots in the base member, and provided with slots to receive the tongues upon the side edges of the match-supply chamber, and the bottom: a cover for the top of the match-supply chamber and the match-box: an igniting-tube projecting from the bottom of one end of the match-supply chamber: a guide-tube projecting from the other end of such chamber: a plunger arranged to reciprocate in the guide-tube and to successively carry matches from the match-supply chamber through the igniting-tube: and a spring arranged to return the plunger to its normal position.

2. The combination set forth of a base-plate provided with the projecting supports having slots therein: a supply-chamber comprising an integral strip of sheet metal returned upon itself and provided at the bend with projecting tongues curved into a tubular shape to form upon one end a discharge-tube and upon the other end, a guide-tube for a plunger, and also provided upon its edges with projecting tongues, the tongues being passed through the slots in the supports and secured.

3. In a match-igniting device, the combination set forth of a sheet-metal base adapted for attachment to a wall and provided with slots: sheet-metal side members each provided with tongues to pass through the slots in the base and also provided with slots for the reception of tongues: a match-supply chamber adapted to hold a single row of matches: a discharge and igniting tube leading from one end of the bottom of such chamber: a guide-tube projecting from the other end of the bottom of such chamber: tongues projecting from the edges of the chamber and passed through the slots in the supports: a plunger arranged to reciprocate in the guide-tube: a coiled spring encircling the guide-tube and arranged to retract the plunger: a cord-guide secured to the support: a cord secured at one end of the outer end of the plunger, passed through the cord-guide and depending therefrom, substantially as set forth.

4. In a match-igniting device, the combination set forth of a base arranged for attachment to a wall: a match-supply chamber secured to the base and adapted to supply matches to a plunger: a discharge-tube leading from one end of the bottom of the supply-chamber: an igniting device projecting into the discharge-tube: a guide-tube projecting from the other end of the bottom of the supply-chamber: a plunger arranged to reciprocate in the guide-tube and adapted to carry matches from the bottom of the chamber out through the discharge-tube: and a receptacle arranged beneath the igniting-tube to receive the burned match ends.



5. In a match-igniting device the combination set forth of a base arranged for attachment to a wall, a match-supply chamber secured to the base and adapted to successively supply matches to a plunger: a discharge and igniting tube projecting from one end of the bottom of such chamber: a guide-tube projecting from the other end of the bottom of such chamber: a plunger arranged to reciprocate in the guide-tube and to carry matches from the bottom of the chamber out through the discharge-tube: a spring arranged to retract the plunger: a cord-guide secured to the chamber: a cord attached at one end of the outer end of the plunger, passed through the cord-guide and depending from the igniting device.

6. In a match-igniting device, the combination set forth of a chamber provided at one end with an igniting-tube and at its other end with a projecting guide-tube: a plunger arranged in the guide-tube: and an auxiliary magazine adapted to contain a single row of matches and to fit within the supply-chamber, and provided with openings in its ends for the entrance of the plunger and the exit of the match.

7. In a match-igniting device, the combination of a match-supply chamber; an igniting-passage through which matches are successively forced from the supply-chamber; means for forcing matches through the igniting-passage; means arranged at the end of the igniting-passage to hold the ignited match; and a receptacle arranged below the match-holder to receive the ashes and match ends of the burned matches.

8. A match igniting device having a chamber provided in its front wall with a sight-slot, and a removable magazine adapted to fit within such chamber and provided in its ends with openings for the entrance of a plunger and the exit of a match, and having in one side a sight-slot corresponding to the sight-slot in the wall of the chamber.

602,594. OIL-VAPOR TRACTION-ENGINE. DANIEL BENZ, San Leandro, Cal. Filed Sept. 14, 1896. Serial No. 605,723. (No model.)

Claim.—1. A traction-engine comprising a frame and supporting and driving wheels upon which it is mounted, an engine consisting of two sets of cylinders mounted in pairs one behind the other and each cylinder having the top and bottom of its open end formed with longitudinal slots or channels, cross-heads or pins projecting from the pistons and slidable in said slots, detachable connecting-rods uniting said cross-heads whereby the cylinders of each pair may be used together or the rearmost piston disengaged and only one pair be employed, connections between the pistons of the foremost cylinders and a crank-shaft, and gearing intermediate between said crank-shaft and the driving-wheels whereby power is transmitted thereto, and a carbureter intermediate of the adjacent ends of the cylinders and connections between the same and said cylinders.

2. A traction-engine comprising in a single structure, pairs of horizontal engines with the cylinders of each pair independently coupled in line, pistons reciprocating in the cylinders, having pins or cross-heads extending from them and rods detachably connecting said rods with the cross-heads, a carbureter, vertically disposed in the space between the adjacent ends of the pairs of cylinders and means connecting said carbureter with each cylinder.

3. In a traction-engine, the main and engine frame mounted upon bearing and traction wheels, an engine supported thereon consisting of two pairs of horizontally-disposed cylinders, each pair having their pistons detachably connected, a vertical carbureter standing in the space intermediate between the adjacent ends of the four cylinders, connections between the carbureter and the inlet-passages, and between the exhaust-passages of each of the cylinders and the carbureter whereby the exhaust products of all the engines in operation are passed therethrough.

4. In a traction-engine, a main frame, bearing and traction wheels upon which it is supported, an engine consisting of two pairs of horizontally-disposed cylinders standing in line, pistons reciprocating therein, exterior connections between each of the lineal pairs of pistons and connections between the foremost pistons and a crank-shaft through which power is transmitted to the traction wheels, means for disengaging the rearmost pistons from the foremost whereby the power of only one pair of cylinders will be used, a vertical carbureter situated between the adjacent ends of the four cylinders, inlet and exhaust passages from the engines connecting with said cylinders and cam-actuated levers whereby the valves are alternately opened and closed at proper intervals.

5. In a traction-engine, a main frame, traction and steering wheels, and intermediate elastic supports between the frame and the wheels as shown, an engine consisting of four horizontal cylinders coupled together in pairs, one behind the other, with detachable connecting-rods between the pistons of the front and rear cylinders, a vertically-disposed carbureter standing between the adjacent ends of the cylinders, supply-pipes extending therefrom to the inlet-valve of each cylinder and passages from the exhaust-valves of the cylinders to the carbureter, supplemental exhaust-pipes connecting with the cylinders and leading therefrom to the exhaust-chamber above the carbureter whereby the hot exhaust products may be partially diverted so as not to pass through the carbureter.

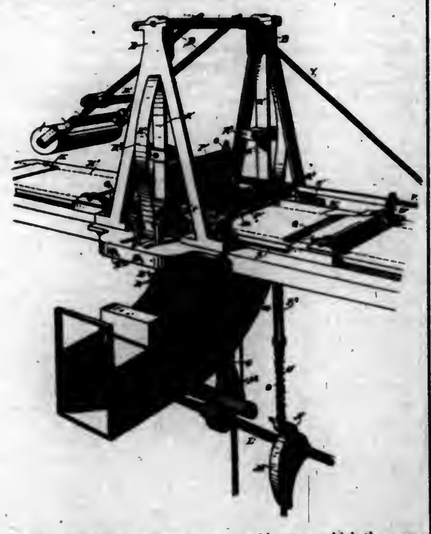
6. In a traction-engine, a main frame, bearing and traction wheels upon which said frame is supported, a supplemental frame having its rear end hinged to the main frame and the front end carrying journal-boxes of a front steering-wheel, springs G and G' forming independent concentric coils and forming a fulcrum connection between the main and supplemental frames, substantially as described.

7. In a traction-engine, main bearing and driving wheels, a frame-work and propelling-engines mounted thereon, a gearing interposed between the engines and the driving-wheels whereby power is applied to advance the machine, a pinion eccentrically mounted so as to be engaged with or disengaged from the main gears, one of said gears being slidable upon a feather in the shaft so as to be indirectly connected with its fellow through the pinion whereby the direction of the machine may be reversed, and a friction-clutch consisting of disks fixed to the sleeve which carries the driving-gear, clamping-rings connecting with the crank-shaft which passes through said sleeve, and mechanism whereby the rings may be clamped to the disk to impart motion to it and the gears are disengaged therefrom to allow the gears to be shifted with relation to the pinion to reverse the engine.

8. In a traction-engine, a frame, driving and steering wheels upon which the frame is supported, a crank-shaft journaled upon the frame, and engines from which power is transmitted to said shaft, gear-wheels intermediate between the crank-shaft and the driving-wheels, and a pinion eccentrically mounted so as to be engaged with or disengaged from the main gears, one of said gears being also slidable upon a feather so as to be indirectly connected with its fellow through the pinion, whereby the movement of the machine may be reversed.

9. A reversing mechanism consisting of a gear-wheel fixed upon a shaft to which power is to be transmitted, a parallel shaft with a gear slidable upon a feather so as to engage the first-named gear to drive directly, a second gear upon the second shaft, and a pinion long enough to remain in mesh with these two gears when they are shifted, said pinion being mounted eccentrically upon a third shaft with a mechanism by which it may be turned to engage the gears upon the first and second shaft as an intermediate, whereby the mechanism is reversed.

602,595. DEVICE FOR FOLDING TOILET-PAPER. WILLIAM H. COOMBS, San José, Cal. Filed Aug. 6, 1897. Serial No. 647,322. (No model.)



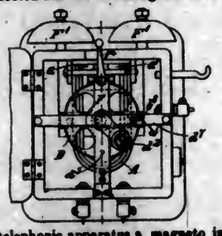
Claim.—1. A machine for folding and interlocking sheets of paper consisting of carriers by which two separate supplies of paper are brought toward each other from opposite ends, means for first raising the sheets and holding them vertically, means for severing the sheets at the top of this fold, and means for alternately folding the vertical severed portion down over the previously-folded opposite sheet.

2. A device for folding toilet-paper consisting of oppositely-moving severing and folding devices, sources of supply at opposite ends of the machine and means for alternately advancing the endless sheets toward the center, severing them and laying the severed sheets alternately over and interlocking with each other.

3. In a device for cutting and folding paper from endless sheets, means for supporting said sheets at opposite ends of the machine, clamps folding so as to press upon the portion of each sheet lying in the center of the machine, vertically-movable casings with means for elevating the same beneath the sheet of paper, whereby the paper is doubled upon itself in a vertical position above the central clamp, a cutter movable with relation to the casings so as to sever the paper on the line of its upper fold, means for returning the vertically-moving casings, and a roller with means for oscillating it alternately from end to end over the severed papers whereby the sheets are alternately folded and interlocked.

4. In a machine for folding paper, vertically-movable rods hav-

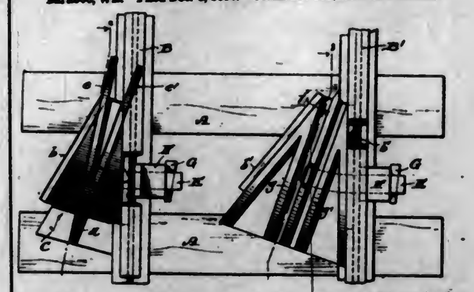
ing knives or cutters secured to the upper ends, casings within which said knives are normally retracted and concealed, said casings having guides through which the movable rods are slidable, and springs whereby the knives are normally retained within the casings, mechanism for raising the casings and knives beneath the sheets of paper as they approach the center, whereby that portion is lifted from the bed and a fold formed at the upper ends, stops whereby the upward movement of the casings is arrested, yielding springs surrounding the knife-carrying rods whereby the knives continue their upward movement after the movement of the casings has ceased, so as to sever the paper at the point in line above the casings.



5. In a device for folding paper, a table over which the paper sheets are movable so as to meet from opposite directions, vertically-moving casings, mechanism by which they are alternately raised to form vertical folds in the sheets, cutters normally concealed within the casings, mechanism whereby they are advanced so as to sever the paper in line above the casings after it has been raised and the fold formed, a roller with frames suspending it from a rock-shaft above the central portion of the bed, mechanism whereby the roller is oscillated so as to sweep across the severed portion of the paper and fold the sheets thus severed alternately toward the center from opposite directions whereby the sheets are interlocked.

6. In a machine for folding paper, a horizontal bed, means for supplying paper in endless sheets from opposite ends, mechanism by which the paper is moved toward the center, folded and severed into sheets, swinging clamps movable so as to press upon the central portion of the sheets, vertically-movable casings and cutters by which the paper is folded at the top and afterward severed, mechanism by which the clamps are raised and separated after the sheets have been cut, a roller mounted so as to reciprocate from one side to the other between the separated clamps in contact with the cut sections so as to fold them alternately over across each other toward the center.

7. In a machine for folding paper, a horizontal bed, clamps adapted to press upon the central portion of the bed to hold the ends of the paper thereon, alternately-reciprocating and vertically-movable casings whereby the approaching bands of paper are folded upwardly from the central clamp and afterward severed at the upper fold, horizontally-reciprocating clamps adapted to seize the approaching portion of the sheet and move the exterior vertical portion raised by the casing toward the center.



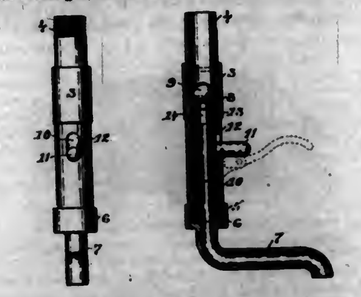
602,596. ELECTRICAL APPARATUS. HORACE H. ELDRED, Brooklyn, N. Y., assignor to Henry B. Metcalf, Pawtucket R. I. Filed Apr. 4, 1896. Serial No. 586,220. (No model.)

Claim.—1. In combination a magneto instrument made up of a magnet and an armature mounted on a shaft; a vibrating arm; means to connect and disconnect that arm with the shaft of the armature of the magneto instrument; mechanism to revolve the armature-shaft; and means to connect and disconnect that mechanism with the armature-shaft; whereby the magneto instrument may be caused to vibrate the arm, when the arm is connected and the revolving mechanism disconnected, and may be used as a generator when the arm is disconnected and the revolving mechanism connected.

2. In a telephonic apparatus a magneto instrument for signaling; a receiver; a signaling-circuit including the armature of the signaling instrument; a telephone-circuit; a switch as S to cut out the receiver and transmitter from the signaling-circuit; and a second switch as S' to bring the receiver into the signaling-circuit all substantially as described.

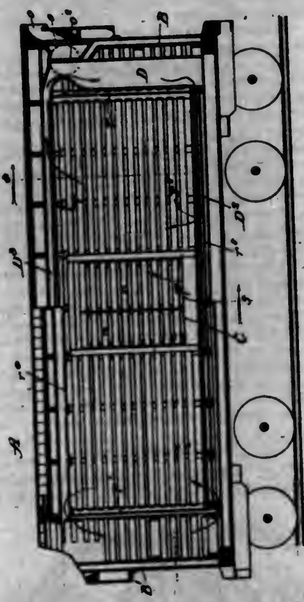
602,597. RAILWAY WRECKING-FROG. MICHAEL FARRELL, Baraboo, Wis. Filed Dec. 8, 1897. Serial No. 661,168. (No model.)

Claim.—1. An outside railway wrecking-frog comprising a horizontal triangular base provided with an upper inclined central rib having diverging branches extended beyond the forward narrow end of the base and so designed that the one innermost at any time may overlap the tread of a track-rail and terminate practically flush therewith, an inside railway wrecking-frog comprising a triangular base provided with upper acute-angle inclined ribs each having its inner side facing a parallel groove and its outer side flush with a longitudinal edge of the corresponding base, and suitable means for securing both frogs in position for service.



2. An outside railway wrecking-frog, comprising a horizontal triangular base provided with an upper inclined rib having diverging branches extending beyond the forward narrow end of the base and so designed that the one innermost at any time may overlap the tread of a track-rail and terminate practically flush therewith, an inside railway wrecking-frog comprising a triangular base provided with acute-angle inclined ribs each having its inner side facing a parallel groove and its outer side flush with a longitudinal edge of the corresponding base, longitudinal side flanges on each frog adapted to fit against webs of track-rails between treads and flanges of the same, a bar in pivotal connection with the under side of each frog, a track-rail clamp-block in sliding engagement with each bar, and a bar-engaging wedge-key arranged to hold each clamp-block in working position.

3. An outside railway wrecking-frog comprising a horizontal triangular base provided with an upper inclined center rib having diverging branches extended beyond the forward narrow end of the base and so designed that the one innermost at any time may overlap the tread of a track-rail and terminate practically flush therewith, an inside railway wrecking-frog comprising a triangular base provided with a longitudinal upper center rib having a taper-point extending beyond the forward narrow end of the base for snug alinement against a track-rail flange and acute-angle inclined ribs that have their inner sides parallel with the center rib in opposite directions therefrom at a predetermined distance, their outer sides being parallel to longitudinal edges of the corresponding base; and suitable means for securing both frogs in position for service.



602,598. FAUCET. FREDERICK P. FIELD, Providence, R. I. Filed Mar. 20, 1897. Serial No. 629,736. (No model.)

Claim.—In a faucet, the combination with the pipe 3 screw-

threaded at the opposite ends, the contracted portion 8 forming a seat for the ball-valve, the slot 12 in said pipe, the curved outlet-pipe 7, the socket 6 on the pipe 7 whereby it is rigidly secured to the pipe 3 and forms a stop for the tube 10, of the tube 10, the slotted extension 13 of the tube, and the pin 11 whereby the tube 10 is supported in the socket and when raised lifts the ball-valve off from its seat and permits the fluid to pass through the slots and the tube to the outlet-pipe to be discharged, as described.

602,599. REFRIGERATOR. RICHARD D. GALLAGHER, Jr., Chicago, Ill. Filed May 14, 1896. Renewed Dec. 13, 1897. Serial No. 661,758. (No model.)

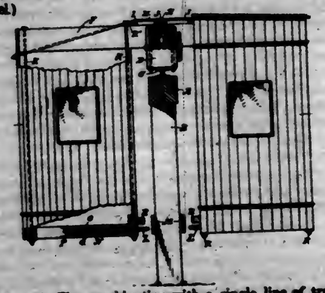
Claim.—1. In a refrigerator, the combination of a storage-chamber, and an external air-flue extending continuously about said chamber without communicating therewith and containing an ice-compartment, said flue having branches, at the sides of said chamber, closed where they meet the end portions of the flue and the inner walls of the flue being formed of sheet metal, or the like, and forming the end and side walls and top and bottom coverings of the storage-chamber, substantially as described.

2. In a refrigerator, the combination of a storage-chamber, an external air-flue extending about said chamber without communicating therewith and closed to the external atmosphere and containing an ice-compartment, and an internal air-flue, of which said chamber forms a part and having communicating with said chamber a vertical flue-section in contact with said ice-compartment, substantially as described.

3. In a refrigerator, the combination of a storage-chamber, an external air-flue extending about said chamber without communicating therewith and closed to the external atmosphere and containing an ice-compartment, and an internal air-flue consisting of said chamber and flue-sections D, D' and D², said sections D and D' being in contact with said ice-compartment, substantially as and for the purpose set forth.

4. In a refrigerator, the combination of a storage-chamber, an external air-flue extending about said chamber without communicating therewith and closed to the external atmosphere, and an internal air-flue consisting of the storage-chamber and the intercommunicating flue-sections D, D', D² and D³ communicating with said storage-chamber, said flue having valve-controlled openings at its opposite ends leading to the outside air, substantially as and for the purpose set forth.

5. In a refrigerator, the combination of a storage-chamber, an external air-flue extending continuously about said chamber without communicating therewith and having compartments B and B' in its opposite end portions, said flue having branches, at the sides of said chamber, closed where they meet the end portions of the flue, and the inner walls of the flue being formed of sheet metal, or the like, and forming the end and side walls and top and bottom coverings of the storage-chamber, and an internal air-flue, of which said chamber forms a part and having a section in each said compartments, a section extending along the top of the chamber and a section extending along the floor of the chamber and formed with a strip *p* expanded between the car-doors, substantially as and for the purpose set forth.

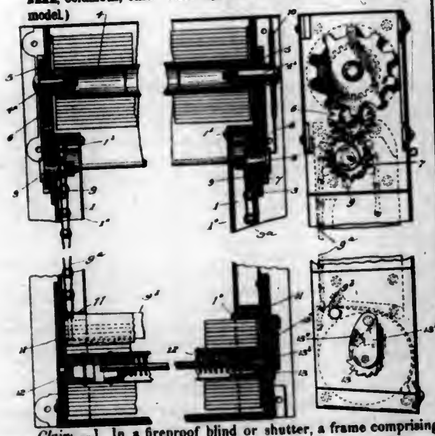


602,600. HANDLE-BAR FOR BICYCLES. GEORGE S. GREEN, Kalamazoo, Mich., assignor, by mesne assignments, to David A. Dangler, Cleveland, Ohio. Filed Feb. 19, 1895. Serial No. 539,008. (No model.)

Claim.—1. In a bicycle, the combination of the handle-bars, B, B, the inner ends of which are flattened into disk-like portions, B', B', having corrugations opposed to each other; the handle-bar post, C, flattened into the disk, C', corresponding in size to the disks, B', having corrugations upon both sides corresponding to the corrugations on the disk portions, B', B'; a bolt, D, extending through said disks to clamp the same together; and an eccentric cam, F, pivoted on said bolt operated by a suitable lever for adjusting the tension on the bolt to permit of quick adjustment of the handle bars, for the purpose specified.

2. In a bicycle, the combination of the handle-bars, B, B, the inner ends of which are flattened into disk-like portions, B' B' corrugated on their faces; the handle-bar post, C, the upper end of which is flattened into the disk C', and suitably corrugated to engage the handle-bars, corresponding in size to the disks, B'; an adjusting-bolt passing through said disks to clamp the same together to permit of an adjustment of the handle-bars, for the purpose specified.

602,601. SINGLE-TRACK RAILWAY AND CARS. JAMES HOPKINS, Oakland, Cal. Filed Aug. 17, 1897. Serial No. 648,509. (No model.)



Claim.—1. The combination with a single line of track and a framework upon which it is supported longitudinally above the surface of the ground, of cars mounted in pairs upon opposite sides of

the track and framework, trucks having wheels journaled at opposite ends adapted to travel upon the rails, transverse timbers centrally swiveled upon the trucks extending through the opposite ends and upper part of each car, hangers supported from the transverse timbers extending downwardly upon the outer and inner sides of the cars respectively and nuts and washer-plates by which the weight of the cars is adjustably supported from said hangers.

2. The combination with a single line of rails, a continuous framework by which the track is supported above the surface of the ground, of cars disposed in pairs upon each side of the track and framework, trucks having wheels journaled at opposite ends and adapted to travel upon the rails, transverse timbers pivoted centrally upon said trucks extending through opposite ends of the upper part of the cars whereby the latter may be suspended therefrom, hangers extending through bridge-plates upon the timbers and through the bottom timbers of the car, wheels journaled horizontally to the lower part of each car in the transverse plane of the swivel-pins of the suspending-timbers, rails or stringers fixed to the supporting-posts of the structure in line with the peripheries of the horizontal wheels whereby the latter may contact with and travel upon said stringers whenever the cars oscillate to one side or the other.

3. The combination with a single line of track and a supporting-framework, of cars suspended in pairs from transverse timbers which pass through opposite ends of the upper parts of the cars, trucks having wheels at each end adapted to travel upon the rail, central pivots by which the transverse timbers are swiveled to the trucks between the wheels, horizontally-disposed wheels or rollers yieldingly journaled to the lower parts of the cars in the transverse planes of the pivot-points of the suspending-timbers, hangers or rods, the upper ends of which are passed through plates fixed upon the transverse timbers and the lower ends through the bottom longitudinal timbers of the cars upon the inside and outside respectively, those upon the inner side being diverged so as to embrace the horizontal rollers between the diverging pairs of rods, substantially as described.

602,602. FIREPROOF BLIND OR CURTAIN. William R. Kinnear, Columbus, Ohio. Filed Apr. 16, 1897. Serial No. 632,479. (No model.)

Claim.—1. In a fireproof blind or shutter, a frame comprising hollow side casings 1 1 having channels or guides for curtains, frames or extensions 3 3 secured to the upper ends of the casings, the curtain and roller 4 journaled in said extensions, gear-wheel 5 on the roller, idler-gear 6 meshing with gear 5, sprockets 9 9 within the casings, the gear 7 on the shaft of sprocket 9 and meshing with gear 6, the frames or extensions 11 11 secured to the lower ends of the casings, the curtain and roller 12 journaled in said frames or extensions 11 11, and chains connected with the lower curtain and passing over sprockets 9 9, substantially as shown and described.

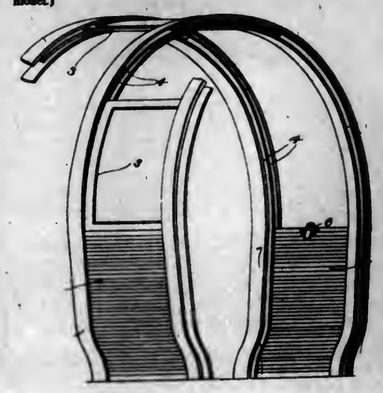
2. In a fireproof blind or shutter, a frame comprising hollow side casings having channels or guides for curtains, rollers containing said curtains journaled in the upper and lower parts of said frame, the lower curtain being spring-actuated to roll said curtain thereupon, sprockets in said hollow sides or casings, chains connecting the lower curtain and said sprockets, and gearing for communicating motion of the upper curtains to the lower, substantially as described.

3. In a fireproof blind or curtain of the kind referred to, a roller and curtain thereon, combined with a hood or cover arranged to rise and fall with the rolling and unrolling of the curtain, substantially as described.

4. A fireproof blind or shutter comprising a frame with plates adjustable on said frame for fitting said shutter in a window.

5. In a fireproof blind or curtain, a frame including side casings for supporting the blind or curtain, bolts secured to the sides of said casings, substantially as described, and plates adjustable on said bolts so as to make the structure fit in the window-opening.

602,608. HOISTING APPARATUS. William G. Miller, Cambridge, Mass. Filed June 11, 1897. Serial No. 640,282. (No model.)



Claim.—1. In an apparatus of the class described, a driving-shaft provided with a medially-arranged clutch device; drums, one on each side of, and adapted to be actuated by, said device, said drums being each rotatable in both directions on said shaft, independently of one another; a flexible draft member and a flexible tension member, respectively connected operatively to one of said drums and adapted to be wound in opposite directions on and off across the periphery thereof; and means to control the operation of said clutch device.

2. In an apparatus of the class described, a plurality of drums mounted on, and respectively capable of actuation in opposite directions by, a common driving-shaft, each independently of the other, one of said drums having a flexible draft member provided with a load-carrier, and an auxiliary flexible member provided with means to maintain it constantly under tension, said flexible members respectively being connected operatively to said drum and adapted to be wound in opposite directions on and off across the periphery thereof, substantially as described.

3. In an apparatus of the class described, a power-shaft having a clutch member fixed thereon and rotatable in the same direction therewith, a friction device separate from said shaft but actuated thereby, a drum loosely mounted on said shaft intermediate said clutch member and friction device, and means to cause engagement between the drum and the clutch member to cause rotation of the former in one direction, and means to cause its engagement by the friction device to permit the latter to rotate the drum in reverse direction, substantially as described.

4. In a hoisting-engine, a power-shaft; a drum loosely mounted thereon and having a surface adapted to be frictionally engaged and driven; a clutch on the shaft, and means to cause engagement between said clutch and the driving-surface of the drum to cause rotation of the latter in one direction; an auxiliary shaft driven from the power-shaft and provided with a friction driving-cone, and means to effect engagement between said cone and the friction driving-surface of the drum to cause rotation of the latter in reverse direction, substantially as described.

602,604. CONVERTIBLE STREET-RAILWAY CAR. George Moore, Boston, Mass. Filed Sept. 14, 1897. Serial No. 651,655. (No model.)

Claim.—1. In a railway-car, the combination of grooved upright frames located in the sides and top of the car-body, the upper portions of said frames being curved in the arc of a circle and the grooves thereof extending across the top of the car, with movable side sections each consisting of a curved window-sash having its side edges fitted to the curved portions of said grooves and adapted to slide therein, and a flexible lower portion sliding in the same grooves with said sash below the latter and filling the space below the sash, substantially as described.

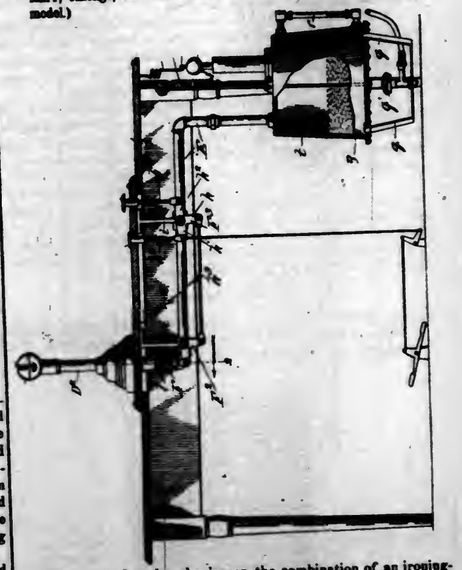
2. In a railway-car, the combination of grooved upright frames located in the sides and top of the car-body, the upper portions of said frames being curved in the arc of a circle and the grooves thereof extending across the top of the car, with movable side sections each consisting of a curved window-sash having its side edges fitted to the curved portions of said grooves and adapted to slide therein, and of a flexible lower portion sliding in the same grooves with the sash below the latter and filling the space below the sash, and having a spring-catch to connect the said sash and flexible portion together in a separable manner, substantially as described.

602,605. CAR-COUPLING. Ralph H. McCadney, Campbell, Cal. Filed Dec. 8, 1897. Serial No. 661,130. (No model.)

Claim.—1. In a car-coupling, the combination of draw-bars pivoted at the rear ends and adapted to be moved about their pivotal points, said bars having heads projecting about equally to each side of the longitudinal center and said heads having rear faces formed at an acute angle whereby when two heads come together said inclined faces interlock, said heads also having a longitudinal open channel d^2, a suspended weight back of each of the draw-bars and connections between the same and the draw-bar whereby when the bars are moved to one side the weight is lifted, said weight acting to return the bars and bring the heads into line.

2. In a car-coupling, draw-bars fulcrumed and movable to and from each other in a horizontal plane, diagonally-disposed meeting faces whereby the heads are separated to pass each other when they contact, hook-shaped projections upon the rear of said heads adapted to interlock when the bars are again brought into line after the heads have passed each other, bell-crank levers having the angles fulcrumed, a weight suspended from a horizontal arm of the lever and connections between the vertical arm of the lever and the hinged draw-bar whereby the weight is lifted when the bars are moved to one side for the purpose of coupling or uncoupling, and acts by gravitation to swing the draw bars and heads into line when the weight is released.

602,606. LATHE-DOG. William Sandford, Chicago, Ill., assignor of one-half to Peter M. Kimmey, same place. Filed June 14, 1897. Serial No. 640,627. (No model.)



Claim.—1. In a lathe-dog, the combination with a body provided with extensions, of a U bolt or clip having its members arranged to operate in openings in said body and extensions, a locking-block supported and carried in the bend of said U bolt or clip and nuts operating on the threaded ends of the U bolt or clip and against the body of the dog, substantially as and for the purpose described.

2. In a lathe-dog, the combination with a body having side extensions and openings through said body and in semicircular form through the extensions, of a U-bolt having its members arranged to operate in the openings in the body and extensions, nuts adapted to operate on the threaded ends of said U-bolt and against the body of the dog and a locking-block supported by said U-bolt and provided with a peripheral groove to receive the same, substantially as described.

3. In a lathe-dog, the combination with a body having side extensions and an angular recess in its face to engage the work, of a U-bolt having its members arranged to operate in openings through the body and extensions, a locking-block supported in the bend of said U-bolt and a projection on said locking-block having a segmental face to engage the work, substantially as described.

602,607. LAUNDRY-IRONER. Alfred B. Smith and John G. Rapp, Chicago, Ill. Filed June 30, 1897. Serial No. 643,014. (No model.)

Claim.—1. In a laundry-ironer, the combination of an ironing-head provided with a chamber, steam-supplying means for said chamber, an outlet-passage from said chamber to the surface of the head, a valve at said outlet and means for opening and closing the valve to control the flow of steam from said chamber through the outlet, substantially as and for the purpose set forth.

2. In a laundry-ironer, the combination of an ironing-head provided with a chamber, steam-supplying means for said chamber, a series of outlets extending between said chamber and the outer surface of the head, a single valve device, controlling said outlets, and means for operating the same to control the flow of steam from said chamber through the outlets, substantially as and for the purpose set forth.

3. In a laundry-ironer, the combination of an ironing-head provided with an internal chamber, an external recess and a passage extending from said chamber to said recess, means for supplying steam to said chamber, and means for opening and closing said passage, substantially as and for the purpose set forth.

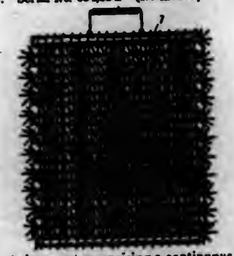
4. In a laundry-ironer, the combination of an ironing-head provided with an internal chamber, an external recess, a perforated cover for the recess and a passage extending from said chamber to said recess, means for supplying steam to said chamber, and means for opening and closing said passage, substantially as and for the purpose set forth.

5. In a laundry-ironer, the combination of a hollow standard, a support for the same, an ironing-head on the standard provided with an internal chamber, means for connecting the said chamber through the standard with a steam-supplier, a steam-outlet passage extending from said chamber to the surface of the head, and means for opening and closing said passage, substantially as and for the purpose set forth.

6. In a laundry-ironer, the combination of an ironing-head having a main chamber, a supplemental chamber, a passage between the chambers and an outlet from the supplemental chamber to the surface of the head, steam-supplying means for the main chamber, and opening and closing means for said passage, substantially as described.

7. In a laundry-ironer, the combination of an ironing-head formed of upper and lower sections separably secured together, a heating-chamber, in the lower section, a chamber in the upper section, and an outlet therefrom to the outer surface of the upper section, a pas-

sage between the chambers, means for opening and closing said passage, and steam-supplying means communicating with the heating-chamber, substantially as described.



8. In a laundry-ironer, the combination of an ironing-head having an internal chamber, an outlet-passage from the chamber to the surface of the head, a hollow standard supporting the head and communicating with a steam-supplier to conduct steam to said chamber, a stuffing-box in the lower part of the standard, a stem passing through said stuffing-box and carrying a valve at said outlet-passage, and raising and lowering means for the stem operating to open and close said outlet-passage, substantially as described.

9. In a laundry-ironer, the combination of an ironing-head having an internal chamber, a steam-supplier, a passage from said supplier to said chamber, a moisture-outlet in the head, a valve governing said outlet, and lever-operating mechanism for the valve in position accessible to the operator, substantially as described.

10. In a laundry-ironer, the combination of an ironing-head having an internal chamber, a steam-supplier, means for controlling the pressure of steam from the supplier, a passage extending from the supplier to said chamber, a moisture outlet in said head and a valve governing said outlet, substantially as and for the purpose set forth.

11. In a laundry-ironer, the combination of an ironing-head having an internal chamber, a steam-generator, a safety-valve on the generator with means for regulating the same to raise and lower the generated steam-pressure, a passage extending from the supplier to said chamber, a moisture-outlet in said head, and a valve governing said outlet, substantially as and for the purpose set forth.

602,608. DOOR-MAT. JAMES W. SHEDEKER, Adrian, Mich., assignor to the Page Woven Wire Fence Company, same place. Filed Apr. 30, 1897. Serial No. 634,554. (No model.)

Claim.—1. A door-mat comprising a continuous coil folded upon itself to produce parallel coil lengths having intermeshing coils, and woof-wires binding the coil lengths together, substantially as described.

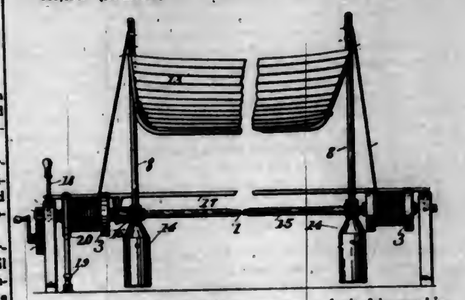
2. A door-mat comprising parallel wire coil lengths having intermeshing coils and bound together by woof-wires inserted longitudinally through the coils, and longitudinal stiffening-wires inserted through the coil lengths transversely thereof, substantially as described.

3. A door-mat comprising parallel wire coil lengths having intermeshing coils, woof-wires inserted longitudinally through the coil lengths to secure them together, and longitudinal stiffening-wires inserted through the coil lengths transversely thereof alternately above and below the woof-wires, substantially as described.

4. A door-mat comprising a continuous coil of wire bent upon itself to form parallel coil lengths, woof-wires binding said coil lengths together, stiffening-wires inserted through the coils crosswise thereof, and end guards inserted longitudinally through the end coil lengths, substantially as and for the purpose set forth.

602,609. BICYCLE. JOSEPH L. TATRO, New Bedford, Mass. Filed Jan. 20, 1897. Serial No. 619,917. (No model.)

Claim.—The combination in a bicycle, of a clutch mounted upon the pedal-shaft, said clutch comprising a wheel rigidly mounted on the said pedal-shaft and the sprocket having the clutches attached thereto, a chain passing around the said sprocket having one of its ends attached to a spring which is attached to the steering-head, the other end being secured to a cord or wire which is provided with a hook adapted to be fastened to suitable harness upon the rider's back.

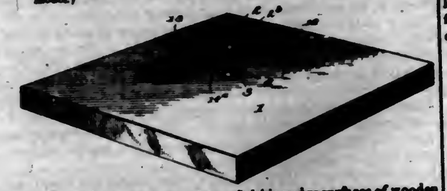


602,610. SINGLE-TRIGGER MECHANISM FOR GUNS. HENRY A. A. THORN, London, England. Filed Aug. 5, 1896. Serial No. 601,964. (No model.) Patented in England Mar. 15, 1895, No. 5,817.

Claim.—1. In a double-barreled firearm, the combination with the hammers each provided with a sear, of a single trigger, a switching trigger-blade pivotally connected with said trigger, a retaining device for holding said blade in operative relation with the sear of one hammer, having a part engaging the said hammer in its cocked position, a spring for forcing said blade into operative relation with the sear of the other hammer, when released by said retaining device, and a part located on the exterior of the lock and connected with said retaining device for withdrawing the same to allow the blade to shift, substantially as described.

2. In a double-barreled firearm the combination with the hammers, and a sear for each hammer, of a single trigger, a switching trigger-blade pivotally connected with said trigger and adapted to move transversely of the lock and said blade being provided with a slot, means for holding said blade normally in operative relation with the sear of one hammer, devices for moving said blade into operative relation with the sear of the other hammer, and the stationary time-stop located intermediate the two operative positions of said blade, and having a part in line with the slot in said blade, substantially as described.

602,611. BOAT HOISTING OR LOWERING APPARATUS. ROBERT H. AGNEW, New York, N. Y. Filed Dec. 10, 1896. Serial No. 615,126. (No model.)



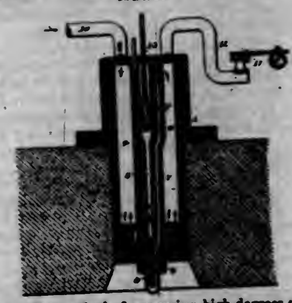
Claim.—1. In a boat-hoisting apparatus, a davit fulcrumed intermediate its ends and provided with a counterbalancing-weight, and means for operating said davit, substantially as described.

2. In a boat-hoisting apparatus, a davit fulcrumed on a horizontal axis intermediate its ends and provided, at one end, with means for suspending the boat and at its opposite end with a counterbalancing-weight, and means for operating said davit, substantially as described.

3. In a life-boat apparatus, the combination with a shaft having drums fast thereon and provided with operating means, of a hollow shaft surrounding the aforesaid shaft, a pair of davits fast on said hollow shaft and adapted to be operated in vertical planes, hoisting-cords running around said drums and passing through guides at the free ends of the davits, and connections between said davits and drums whereby the same means is employed for operating the davits, substantially as described.

4. In a boat-hoisting apparatus, a horizontal shaft, drums fast thereon, operating means for said shaft, a sleeve surrounding said shaft, spaced davits attached to said sleeve, means for causing said davits to swing simultaneously, hoisting-ropes wound on said drums and passing through guides at the free ends of the davits, a clutch cooperating with one of said davits for connecting the same to or disconnecting the same from said shaft, a shifting-rod connected to said clutch, and a lever for reciprocating said rod, substantially as described.

602,612. FINISHING-TOOL FOR WOOD-SHAPING MACHINES. ALEXANDER M. BAIRD, Opelika, Ala., assignor of one-half to W. A. Andrews, same place. Filed Aug. 7, 1897. Serial No. 647,494. (No model.)

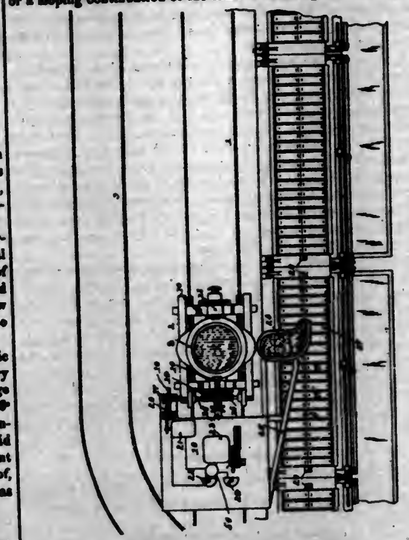


Claim.—1. A tool for dressing or finishing edge surfaces of wooden articles, comprising a cylindrical body provided with diagonal rows of teeth integral with the body and projecting outward therefrom, the teeth in each row being independent but arranged in close relation to each other, substantially as described.

2. A tool for dressing or finishing edge surfaces of wooden articles, having a cylindric body portion formed with a longitudinal opening, and having its outer face provided with diagonal rows of teeth, extending from one end and terminating short of the other end thereof so as to leave a smooth-surfaced face, the teeth in each row being independent, but arranged consecutively in close relation to each other, substantially as described.

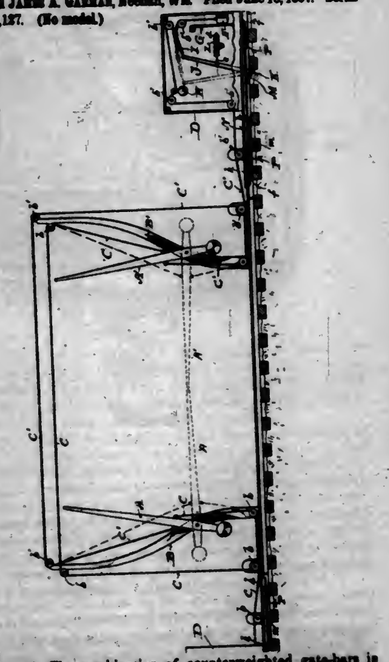
3. A tool for dressing or finishing wood, comprising a cylindric body portion formed with an opening and provided on its periphery with diagonal rows of teeth, each tooth having a broad cutting edge e^6 and an upwardly curved or convexed body portion e^8, the edge e^6 of the opening at the base of said tooth being beveled and the opening below the cutting edge gradually increasing in depth from said edge e^6, said diagonal rows of teeth extending from a point adjacent one end of the tool and terminating short of the other end thereof, so as to leave a smooth-surfaced or untoothed face, substantially as described.

602,613. PYROMETER. DAVID BAIRD, Sparrow's Point, Md. Filed Jan. 7, 1897. Serial No. 618,344. (No model.)



Claim.—The method of measuring high degrees of heat which consists in passing a current of saturated steam through a chamber exposed to the influence of the heat, thereby superheating said steam, maintaining said current at a uniform, unvarying pressure and temperature before it is superheated and determining the temperature of the superheated steam.

602,614. CASTING PLANT. DAVID BAIRD, Sparrow's Point, Md. Filed July 3, 1897. Serial No. 643,353. (No model.)

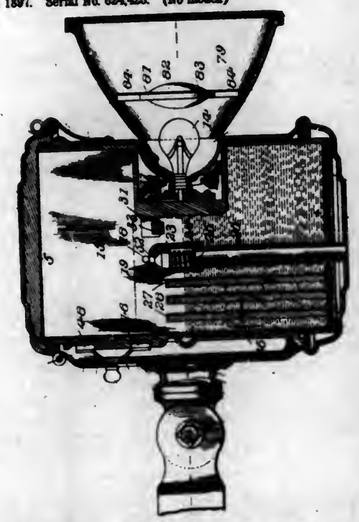


Claim.—1. In a casting plant the combination with a mold-bed, of a truck adapted to travel adjacent to the same, a ladle or receptacle for the molten metal mounted on said truck, a motor-car coupled to the truck and adapted to propel the same, and a pouring-spout sustained by the motor-car in position to receive the metal from the ladle and deliver the same to the molds.

2. In a casting plant the combination with a mold-bed of a truck adapted to travel adjacent to the same, a tilting ladle mounted on said truck, a motor-car coupled to the truck, mechanism located on the car for propelling the same, a second mechanism located on the motor-car independent of the propelling mechanism and suitable connections between the second mechanism and the tilting ladle whereby a single operator is enabled by the two mechanisms to move the ladle to any point of the mold-bed and to operate the tilting ladle independently to fill any desired mold.

3. In a casting plant the combination with a mold-bed and means for operating the same to discharge the casting, of means for filling the molds with molten metal, a downwardly-sloping platform in position to receive the castings from the mold-bed, a leaf hinged to the lower edge of the platform and mechanism for adjusting said leaf to form a trough in connection with the platform to retain the castings; or a sloping continuation of the same to discharge the castings.

602,615. RAILWAY-GATE MECHANISM. FREDERICK A. CRANE and JAMES A. GARNAN, Neenah, Wis. Filed June 10, 1897. Serial No. 640,127. (No model.)



Claim.—1. The combination of counterweighted gate-bars in pivotal connection with posts at opposite sides of a railway-crossing, sheave-supported weight-controlled flexible runners that extend along

the railway-track in opposite directions from the crossing and have branches connecting opposite gate-bars, a slack-take-up operative in conjunction with each runner, a cranked rock-shaft arranged under the track-rails, a crank-shaft lever having spring connection with said runner, an air-cushion mechanism coöperative with the lever, and a spring-supported auxiliary rail of suitable length in spring-controlled laterally-adjustable connection with a track-rail over the rock-shaft crank, one end of the auxiliary rail being in the path of car-wheel flanges and the other end beveled upon its inner side to obtain clearance for said flanges.

2. The combination of counterweighted gate-bars in pivotal connection with posts at opposite sides of a railway-crossing, sheave-supported weight-controlled flexible runners that extend along the railway-track in opposite directions from the crossing and have branches connecting opposite gate-bars, a slack-take-up operative in conjunction with each runner, a cranked rock-shaft arranged under the track-rails, a crank-shaft lever having spring connection with said runner, and a spring-supported auxiliary rail of suitable length in spring-controlled laterally-adjustable connection with a track-rail over the rock-shaft crank, one end of the auxiliary rail being in the path of car-wheel flanges and the other end beveled upon its inner side to obtain clearance for said flanges.

3. The combination of counterweighted gate-bars in pivotal connection with posts at opposite sides of a railway-crossing, sheave-supported weight-controlled flexible runners that extend along the railway-track in opposite directions from the crossing and have branches in direct connection with opposite gate-bars, a lever mechanism and slack-take-up in connection with each flexible runner, and a spring-supported auxiliary rail of suitable length in spring-controlled laterally-adjustable connection with a track-rail and coöperative with the lever mechanism, one end of the auxiliary rail being in the path of car-wheel flanges and the other end beveled upon its inner side to obtain clearance for said flanges.

602,616. **INVERTIBLE FLUID-BATTERY.** PORTEUS R. CUNNINGHAM and CHARLES H. HOWLAND-SHERMAN, Washington, D. C. Filed Feb. 20, 1897. Serial No. 624,423. (No model.)

Claim.—1. In an invertible fluid-battery, the combination of a closed casing, electrodes, of less height than the interior of the casing, removably inserted therein and designed to be freed from the electrolyte, when the casing is inverted, and retaining means engaging with the tops of the said electrodes but insulated therefrom, and interlocking interiorly with the casing to secure said electrodes in a fixed position and against displacement when the casing is inverted.

2. In an invertible fluid-battery, the combination of a suitably-closed casing, provided with one or more cells, electrodes of less height than the interior of the casing, removably inserted therein and designed to be freed from the electrolyte, when the casing is inverted, and retaining means engaging with the tops of the said electrodes but insulated therefrom, and interlocking interiorly with the casing to secure said electrodes in a fixed position and against displacement when the casing is inverted

3. In an invertible fluid-battery, a suitable receptacle having an annular boss or bead on its rim, and a hermetic closure, comprising a top and a flexible lining secured therein and provided with a depending, annular portion or flange, adapted to tightly inclose the mouth of the receptacle and a circumferential enlargement upon the interior of the depending portion or flange, adapted to tightly flex into the circumferential groove below the bead on the receptacle, when the closure is pressed into place; in combination with electrodes, of less height than the interior of the casing, removably inserted therein and designed to be freed from the electrolyte when the casing is inverted, and non-conductive retaining means extending across the tops of the electrodes and fastening the same to the interior of the casing, whereby they are secured against displacement when the casing is inverted.

4. In an invertible fluid-battery, the combination of a closed casing, electrodes of less height than the interior of the casing, inserted therein and removably engaging with the interior walls of the casing, gates or openings for the free circulation of the electrolyte about the electrodes, and retaining means engaging with the tops of the said electrodes but insulated therefrom, and interlocking interiorly with the casing to secure said electrodes in a fixed position and against displacement when the casing is inverted to free the electrodes from the electrolyte.

5. In an invertible fluid-battery, the combination of a closed casing, electrodes, of less height than the interior of the casing, removably inserted therein and designed to be freed from the electrolyte when the casing is inverted, non-corrosive, conducting-plates removably secured to the said electrodes and electrically connected with a translating device on the outside of the casing, and retaining means engaging with the tops of the said electrodes but insulated therefrom, and interlocking interiorly with the casing to secure said electrodes in a fixed position and against displacement when the casing is inverted.

6. In an invertible fluid-battery, the combination of a closed casing, electrodes, of less height than the interior of the casing, inserted therein and removably engaging with the interior walls of the casing, gates or openings for the free circulation of the electrolyte about the electrodes, retaining means engaging with the tops of the said electrodes but insulated therefrom, and interlocking interiorly with the casing to secure said electrodes in a fixed position and against displacement when the casing is inverted to free the electrodes from the electrolyte, and electrical connections between said electrodes and a translating device on the outside of the casing.

7. In an invertible fluid-battery, the combination of a suitable closed casing, electrodes, of less height than the interior of the casing, removably inserted therein and designed to be freed from the electrolyte when the casing is inverted, and non-conductive clamps extending across the tops of the electrodes, and engaging removably with recessed lugs projecting from the interior surface of the casing, to secure said electrodes against displacement when the casing is inverted, substantially as described.

8. In an invertible fluid-battery, the combination of a closed casing, vertically-disposed spacing-ribs projecting from the interior thereof, electrodes, of less height than the interior of the casing, removably inserted therebetween, oppositely-disposed, recessed lugs projecting interiorly from the casing, and non-conductive retaining means engaging with the said lugs and with the said electrodes to secure them in position between the spacing-ribs and against displacement when the casing is inverted to free them from the electrolyte, substantially as described.

9. In an invertible fluid-battery, a suitable receptacle provided with one or more cells, and having an annular boss or bead on its rim, and a hermetic closure therefor, comprising a top and a flexible lining secured therein and provided with a depending, annular portion or flange, adapted to tightly inclose the mouth of the receptacle and a circumferential enlargement upon the interior of the depending portion or flange, adapted to tightly flex into the circumferential groove below the bead on the receptacle, when the closure is pressed into place; in combination with electrodes, of less height than the casing, removably inserted therein, and designed to be freed from the electrolyte when the casing is inverted and non-conductive retaining means extending across the tops of the electrodes and fastening the same to the interior of the cells, whereby the said electrodes are secured against displacement when the casing is inverted, substantially as described.

10. In an invertible fluid-battery, the combination of a closed casing, electrodes, of less height than the interior of the casing, removably inserted therein and designed to be freed from the electrolyte when the casing is inverted, non-conductive retaining means engaging with the tops of the electrodes and interlocking interiorly with the casing to secure the said electrodes against displacement, and an automatically-acting gas-vent, for the escape of accumulated gas.

11. In an invertible fluid-battery, the combination of a closed

casing, electrodes, of less height than the interior of the casing, removably inserted therein and designed to be freed from the electrolyte, when the casing is inverted, and non-conductive retaining means engaging with the tops of the said electrodes, and interlocking interiorly with the casing to secure said electrodes in a fixed position and against displacement when the casing is inverted and a lamp-bracket comprising pivoted clamping-arms, a locking device for said arms and a universal connection between the body of the closed casing to be supported and the said clamping-arms, substantially as described.

12. In an invertible fluid-battery, a suitable receptacle provided with one or more cells, and having an annular boss or bead on its rim, and a hermetic closure therefor, comprising a top and a flexible lining secured therein and provided with a depending, annular portion or flange, adapted to tightly inclose the mouth of the receptacle and a circumferential enlargement upon the interior of the depending portion or flange, adapted to tightly flex into the circumferential groove below the bead on the receptacle, when the closure is pressed into place; in combination with electrodes, of less height than the receptacle, removably inserted therein, and designed to be freed from the electrolyte when the receptacle is inverted, and non-conductive retaining means extending across the tops of the electrodes and fastening the same to the interior of the cells, whereby they are secured against displacement when the casing is inverted, substantially as described.

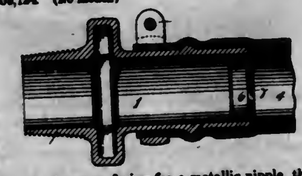
13. In an invertible fluid-battery, the combination of a receptacle, divided into cells, by means of one or more partitions, a hermetically-sealing, removable top therefor, electrodes, of less height than the receptacle, seated in the lower parts of the cells, and designed to be freed from the electrolyte, when the receptacle is inverted, and clamps extending across the tops of the electrode of each cell, and engaging removably with the retaining means, on the interior walls of the respective cells, to secure said electrodes against displacement when the receptacle is inverted, substantially as described.

14. In an invertible fluid-battery, a suitable receptacle provided with one or more cells, and having an annular boss or bead on its rim, and a hermetic closure therefor, comprising a top and a flexible lining secured therein and provided with a depending, annular portion or flange adapted to tightly inclose the mouth of the receptacle and a circumferential enlargement upon the interior of the depending portion or flange, adapted to tightly flex into the circumferential groove below the bead on the receptacle, when the closure is pressed into place; in combination with electrodes, of less height than the receptacle, removably inserted therein, and designed to be freed from the electrolyte when the receptacle is inverted, non-conductive retaining means extending across the tops of the electrodes and fastening the same to the interior of the cells, whereby they are secured against displacement when the casing is inverted, an opening between the cells for the circulation of gas and a gas-vent for the escape of the accumulated gas from the receptacle, substantially as described.

15. In an invertible fluid-battery, the combination of a receptacle having a boss or bead on its rim, and divided into cells, by means of one or more partitions, electrodes, of less height than the receptacle, secured in the lower parts of the cells and designed to be freed from the electrolyte, when the receptacle is inverted, a hinge-bracket, a swivel connection between it and the said receptacle, whereby it can be inverted, means for securing said hinge-bracket to a vehicle, and a hermetically-sealing, removable top therefor, comprising a flanged cover, and a lining secured therein and provided with an annular flange whose interior is epicycloidal in cross-section and designed to tightly adhere to the bead or boss of the receptacle when sprung over it, substantially as described.

16. A casing for an invertible fluid-battery consisting of a suitable receptacle, having a central partition and a boss or bead upon the outside of the rim, and a hermetically-sealing closure, comprising a hinged top and a permanent lining secured within said top and formed with a diametrically-disposed rib, parallel with the upper edge of the partition in the said receptacle, a depending annular flange, arc-shaped in cross-section to form a constriction, adapted when sprung over the bead or boss on the receptacle, to tightly adhere to the curvature of the same, substantially as described.

17. A casing for an invertible fluid-battery consisting of a suitable receptacle, having a central partition, and a boss or bead upon the outside of the rim, a hermetically-sealing closure, comprising a hinged top and a permanent lining, secured within said top and formed with a diametrically-disposed rib, parallel with the upper edge of the partition in the said receptacle, a depending annular flange, arc-shaped in cross-section to form a constriction adapted, when sprung over the bead or boss on the receptacle, to tightly adhere to the curvature of the same, and means for locking said cover to said receptacle, substantially as described.



18. The herein-described gas-vent, comprising a valve-chamber having an opening in one end, oppositely-disposed channels or grooves in the sides of said opening, a conical valve-seat, and a spring-actuated valve, correspondingly shaped to fit said seat, a base to said valve slidably fitting within the said valve-chamber and having oppositely-arranged channels or grooves in its periphery, a projection on said valve, slidably fitting the opening in the valve-chamber, and a perforated disk, closing the opposite end thereof.

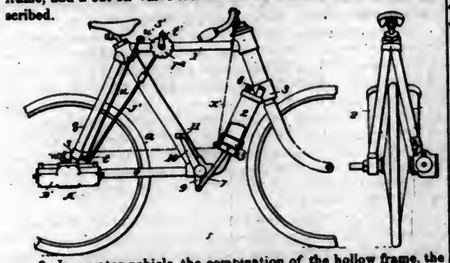
19. The herein-described gas-vent, comprising a valve-chamber having an opening in one end, oppositely-disposed channels or grooves in the sides of said opening, a conical valve-seat, and a spring-actuated valve correspondingly shaped to fit said seat, a base to said valve slidably fitting within the said valve chamber and having oppositely-arranged channels or grooves in its periphery, a projection on said valve, slidably fitting the opening in the valve-chamber, and a perforated disk at the opposite end of the valve-chamber, in combination with an inclosing receptacle and a pipe connection between the said valve-chamber and the exterior of the said receptacle, substantially as described.

20. In an invertible fluid-battery, the combination of a suitable receptacle provided with one or more cells, a hermetic closure therefor, vertically-disposed spacing-ribs projecting from the interior thereof, electrodes, of less height than the interior of the cells, removably inserted between said ribs, oppositely-disposed, recessed lugs projecting interiorly from the casing, non-conductive clamps extending across the tops of the electrodes and engaging removably with the said lugs and with the said electrodes to secure them in position between the spacing-ribs and against displacement when the receptacle is inverted, a passage between the cells for the circulation of gas, and a gas-vent for the escape of the same from the receptacle, comprising a valve-chamber having an opening in one end and projecting within said receptacle, oppositely-disposed channels or grooves in the sides of said opening, a conical valve-seat and a spring-actuated valve, correspondingly shaped to fit said seat, a base to said valve, slidably fitting within the valve-chamber and having oppositely-arranged channels or grooves in its periphery, a projection on said valve, fitting slidably into the opening in the valve-chamber, and a perforated disk located in the opposite end of the said chamber, substantially as described.

21. As a new article of manufacture, the herein-described battery-box, comprising an open, cylindrical vessel of non-conductive material, formed integrally with a central partition as 15, dividing the vessel into two compartments or cells, an inset chamber or recess as 11, opening exteriorly of the vessel, parallel and vertical spacing-ribs as 26, projecting interiorly from the walls of the partition and recess or chamber, electrodes fitting between said ribs, the diametrically opposite, undercut lugs, projecting from the walls of the partition and of the vessel, and clamps engaging with said lugs and with the tops of the electrodes to fasten them in place, substantially as and for the purposes specified.

602,617. **HOSE-NIPPLE.** CHARLES H. DALE, New York, N. Y., assignor to Jennie L. Dale, same place. Filed Nov. 12, 1897. Serial No. 658,124. (No model.)

Claim.—1. A cap or facing for a metallic nipple, the same consisting of a portion of soft yielding material extending over the end and exterior part of the nipple and a ring of hard inelastic material upon the interior of the nipple, whereby the soft yielding portion is secured and held in position, substantially as specified.



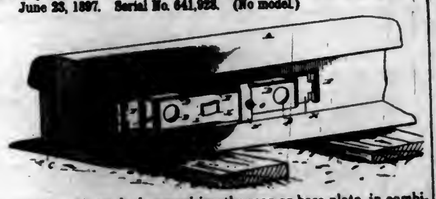
2. A cap or facing for a metallic nipple, the same consisting of a portion of soft rubber extending over the end and exterior part of the nipple, and a ring of hard inelastic material fitting the interior of the nipple, said soft-rubber portion being vulcanized to the ring of hard inelastic material, substantially as specified.

3. A cap or facing for a metallic nipple, the same consisting of a portion of soft rubber extending over the end and exterior part of the nipple, and a metallic ring coated with copper and located in the interior of the nipple, said soft-rubber portion being vulcanized to the metallic ring, substantially as specified.

602,618. **AIR-PROPELLED BICYCLE.** ELMER E. STUTZ, Indianapolis, Ind., assignor of one-half to Frank F. Rogers, same place. Filed June 10, 1897. Serial No. 640,295. (No model.)

Claim.—1. In a motor-vehicle, the combination of the combined motor and compressor having the positively-operated valves and the

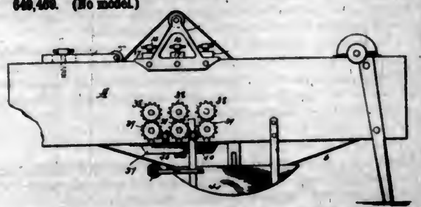
pistons, the hollow frame supplying air under pressure through said valves to actuate the pistons, a connection between the combined motor and compressor and frame through which air is forced into the frame, and a cut-off valve located on the frame, substantially as described.



3. In a motor-vehicle, the combination of the hollow frame, the motor having the pistons and constructed with the upper and lower passages, ports leading from the lower passage to the spaces behind the pistons and provided with controlling-valves, similar ports leading from the upper passage and having valves, a check-valve between the upper passage and the frame, and a cut-off valve and a relief-valve, substantially as described.

4. In a motor-vehicle, the combination of air-compressors, the hollow frame constituting a reservoir for the compressed air, a separate motor receiving air from the reservoir, means for shutting off the air, connections whereby the motion of the machine may be made to operate said motor to force air into the reservoir, and means for controlling the admission of the air from the motor to the reservoir and thus make the motor act as a brake, substantially as described.

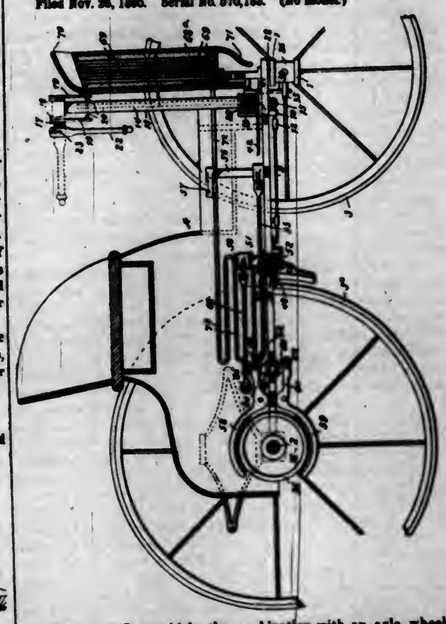
5. In a motor-vehicle, the combination with the compressors, of the pedal-cranks having a short arm connecting with the plunger-rods of said compressors, and an upper longer arm carrying the pedal, and means on each crank for independently restoring said cranks after depression, substantially as shown and described.



6. The combination with the pedal-cranks, and the crank-axle having the fluted end portions, of the sleeves fluted to fit said portions, and the springs having one end secured to the sleeves and their other ends secured to the cranks, substantially as shown and described.

602,619. NUT-LOCK. JAMES C. FERGUSON, Fayette, Mo. Filed June 23, 1897. Serial No. 641,928. (No model.)

Claim.—A nut-lock comprising the rear or base plate, in combination with the flaps or supplemental plates hinged to the ends thereof, an opening formed in one of said supplemental plates to receive the tongue projecting forwardly from the ends of the opposite supplemental plate, a sliding keeper adapted to be freely movable back and forth on said plates, and a fastening-pin adapted to be passed through said keeper and fastened on the rear sides of the supplemental plates to hold the same in a locked position against the sides of the nuts, substantially as described.



602,620. APPARATUS FOR EXPRESSING CIDER. ELI FLORY and TIMOTHY FLORY, Defiance, Ohio. Filed Aug. 25, 1897. Serial No. 649,469. (No model.)

Claim.—The combination with a frame, a set of rollers, journaled therein, vertically-movable journal-boxes, rollers journaled in these boxes and cooperating with the other set of rollers, and means for varying the spring-pressure upon the boxes, of belts passed around these sets of rollers, perforated blocks or bars interposed between the rollers of the lower set, and imperforate ones between the upper ones, said sets of boards having grooves and flanges at or near their ends whereby to prevent the passage of cider at that point.

2. In a motor-vehicle, the combination with the motor, its controlling-valves, the link pivoted to the motor midway between the valves, the screw carried by the link, and the adjustable connections extending in opposite directions from the screw to said valves, of an upright rod connected to turn the screw and having a small gear at its upper end, an enlarged gear-wheel engaging said small gear, a casing therefor having stops or notches, and a crank or handle carried by said large gear and provided with a catch for engaging said notches, substantially as described.

602,621. MOTOR-VEHICLE. WILLIAM W. GRANT, Brooklyn, N. Y. Filed Nov. 26, 1895. Serial No. 570,183. (No model.)

Claim.—1. In a vehicle, the combination with an axle, wheels, and means for clutching these wheels to the axle, of shaft having laterally projecting arms, pivoted levers having slots therein, pins projecting from the arms into the slots, bell-crank levers, and rods connecting the bell-crank levers with the slotted levers, substantially as set forth.

2. In a vehicle, the combination with a steering-wheel having an outwardly-projecting arm extending from its axle, of a pair of shafts extending at an angle to each other, one having a worm and the other a worm-gear intermeshed with each other, one shaft having a handle thereon by which it is turned and the other provided with an arm, and a rod extending from the latter to the arm on the wheel-axle.

3. In a vehicle, the combination with two steering-wheels, pivoted axles on which these wheels turn, and an arm projecting outwardly from each axle, of a pair of shafts disposed at an angle to each other, one provided with a worm and the other with a worm-gear, the two intermeshed, one of these shafts having a handle thereon whereby it is manipulated and the other provided with an outwardly-extending arm, and rod extending from this arm in both directions to the arms on the axles, whereby both steering-wheels are operated simultaneously by turning the handle in one direction or the other.

4. In a vehicle, the combination with a propulsion-axle drums thereon, and belts, ropes or chain extending from these drums to some propelling device, one of said belts crossed, of clutch mechanism for controlling these drums, and means for operating said mechanism from the operator's station on the vehicle, substantially as set forth.

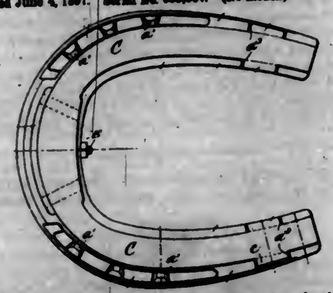
5. In a vehicle, the combination with a hollow shaft, and a slide therein, of a removable handle for rocking or swinging one shaft and sliding the other, pivotally secured to its support in such manner that the handle may be raised or lowered without effecting necessarily, operation of the hollow shaft, or of the slide-shaft.

6. In a vehicle, the combination with a rock-shaft having brake-shoes thereon, and a worm-wheel on said shaft, of a shaft extending at right angles thereto and having a worm thereon which engages directly with the worm-wheel on the rock-shaft, substantially as set forth.

7. The combination with a vehicle, of an air-passaged cooling-tank serving also as a dash and provided to effect collection and circulation of air through the tank.

8. In a vehicle, the combination with a rock-shaft located in proximity to the operator to be operated in controlling the movements of the vehicle, of a removable handle pivoted to this shaft, and a catch for locking the handle, substantially as set forth.

9. The combination with a vehicle, of an air-passage cooling-tank, serving also as a dash and of a hood located at one end thereof, and an apron at the other end to provide for collection and circulation of air.



10. In a vehicle, the combination with a drive-axle, wheels and drums thereon, and screws meshing with collar, of a brake, having a slotted shank engaging with collar carried by screw, for forcing brake in or out of braking engagement.

11. The combination with a drive-shaft, drive-wheels loose thereon, and a controller, of levers provided with slots, having straight and curved sides, the latter in the arc of a circle whose center is the controller, and means connecting said levers with the controller and drive-wheel mechanism, to facilitate bringing of drive-wheel in or out of driving engagement.

12. In a vehicle, the combination with a propelling-shaft, drive-wheels loose thereon, and clutch mechanism for each wheel, of a controller, arms connected therewith, wrists on these arms, levers having curved slots therein, extending in one direction and in the arc of a circle whose center the controller is, and rods extending from these levers to the clutches.

13. In a vehicle, the combination with an axle, wheels loose thereon, steering-wheels, and a controller, of mechanism for operating with the loosely-mounted wheels and the steering-wheels and having worm-gear mechanism intersecting or interposed thereupon whereby to prevent unfavorable movement of the parts connectively concerned with the worm-gear mechanism, and to lock, hold, or effect retention of the said parts, in such position, or release therefrom as occasion may require.

602,622. ELASTIC-CUSHIONED HORSESHOE. GEORGE GRIMWOOD, Chicago, Ill., assignor of one-half to Frank B. Place, Peoria, Ill. Filed June 4, 1897. Serial No. 639,267. (No model.)

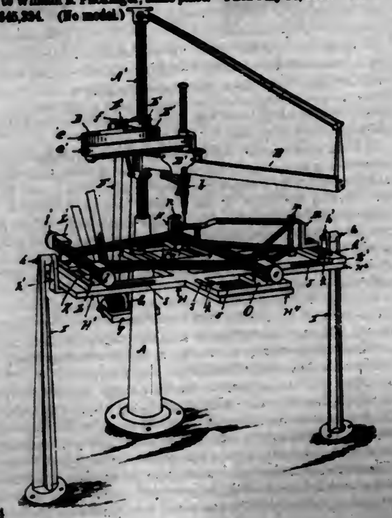
Claim.—1. The combination with a horseshoe, having downwardly-projecting flanges forming a continuous groove in the bottom of the shoe and open at the heels thereof, of a detachable elastic cushion seated in said groove and suitably secured therein, of means for engaging and protecting the forward end of the cushion consisting of a toe-clip extending around a portion of the cushion and suitably secured thereto, all substantially as and for the purpose described.

2. The combination with a horseshoe, having downwardly-projecting flanges extending around the inner and outer edges of the shoe from the toe to the heel or rear ends thereof, a groove formed by the flanges, of a detachable elastic cushion seated in said groove, means for retaining the same in the shoe by engagement at the toe and heels thereof, a toe-clip suitably secured to the toe of the cushion and extending a portion of the way around the same, all substantially as and for the purpose set forth.

3. A horseshoe having downwardly-extending flanges, forming a groove or recess in the bottom of the shoe, of a detachable elastic cushion held firmly therein, and a toe-clip secured to the toe or front end of the cushion, all substantially as and for the purpose described.

4. In a horseshoe consisting of a metal frame, provided with downwardly-projecting flanges extending around the inner and outer edges of the shoe from the toe to the heels thereof, and forming a continuous groove therein, of a detachable elastic cushion seated in said groove, a detachable bolt or clip for engaging the cushion at the forward end of the cushion, of laterally-extending lugs on the rear ends of the cushion, and suitable slots or recesses in the flanges adapted for receiving said lugs to hold the same against forward or backward movement in the shoe thereof, all substantially as and for the purpose described.

5. A horseshoe having downwardly-extending flanges, a groove formed in the bottom of the shoe, and a detachable elastic cushion seated therein, means for securing the same at the front or toe thereof, and means for engaging the same at the heels thereof, consisting of suitable lugs provided on the sides of the cushion adapted to be seated in slots or recesses in the flanges of the shoe, preventing forward or rearward motion of the cushion in the shoe, all substantially as and for the purpose described.



6. The combination with a metal shoe provided with apertures or nail-holes, and formed with downwardly-extended flanges around the outer and inner edges and provided with slots or recesses at the rear ends thereof, a groove or recess formed by the flanges around the shoe, of a detachable elastic cushion extending from one heel to the other and securely held in the groove by means of a detachable clip or bolt at the front or toe thereof, and against forward or backward motion at the rear ends by means of laterally-extending lugs adapted to be seated in the slots provided in the flanges of the shoe, all substantially as and for the purpose described.

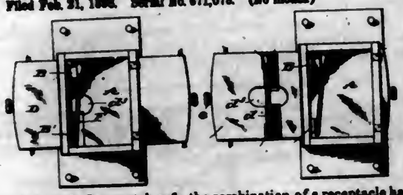
7. The combination with a horseshoe having downwardly-projecting flanges around the inner and outer edges of the shoe from the toe to the heels, and provided with an aperture at the forward end and slots or recesses at the rear ends thereof, a groove formed by the flanges, of a detachable elastic cushion seated in said groove and extending somewhat below the edge of the flanges, a detachable clip or bolt passing through the aperture at the toe for securing the same therein, and of suitable lugs at the rear end of the cushion adapted to fit in suitable slots or recesses for securing the same at the heels thereof, all substantially as and for the purpose described.

8. The combination with a horseshoe, having downwardly-projecting flanges extending around the inner and outer edges of the shoe and open at the rear ends thereof, of a groove formed by the flanges, an elastic cushion detachably secured in said groove and a portion of the same extending somewhat below the flanges, of a toe-clip secured to the toe or front of the cushion, the cushion firmly secured in the groove of the shoe through and by means of the bolt at the front and by the clips formed by the flanges at the heels or rear ends, all substantially as described and shown.

9. In a horseshoe provided with a detachable elastic cushion, the combination with the elastic cushion, of a toe-clip made of suitable material, all substantially as and for the purpose described.

602,623. MACHINE FOR SETTING UP, DRILLING, AND FINISHING BICYCLE-FRAMES. HENRY KELLER, Erie, Pa., assignor of one-half to William B. Flickinger, same place. Filed July 21, 1897. Serial No. 645,294. (No model.)

Claim.—1. In a machine for setting up, drilling and pinning bicycle-frames, the combination of a radial drill mechanism, and a drill-table mounted upon trunnions secured to arms extending above the top of the table, plates adjustably mounted on the sides of said table, and clamping mechanism adjustably mounted on said plates, substantially as and for the purpose set forth.



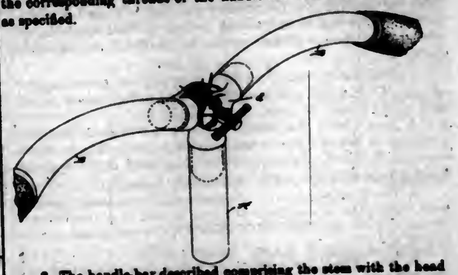
2. In a machine for setting up, drilling and pinning bicycle-frames, the combination of a drilling mechanism, comprising, substantially, a radially-moving arm, a drill-head mounted upon said arm and adapted to move in and out thereon, and driving mechanism for operating a vertical drill-stock in said drill-head, and a table under said arm, vertical arms secured to said table and extending above the top thereof, trunnions secured to said arms for supporting said table, plates adjustably mounted on the sides of said table, and clamping mechanism adjustably mounted on said plates, substantially as and for the purpose set forth.

3. In a machine for setting up, drilling and pinning bicycle-frames, a table, vertical arms secured thereto and extending above the top of the table, trunnions on the ends of said arms, upon which the table is supported and adapted to be reversed, adjustable plates on said table, clamping mechanism adjustable on said plates and adapted to engage and clamp a bicycle-frame between them, substantially as and for the purpose set forth.

4. In a machine for setting up, drilling and pinning bicycle-frames, a cross-shaped skeleton table, a plate adjustably mounted on each side or arm of said table, clamp mechanism adjustably mounted on each of said plates adapted to clamp a bicycle-frame between them, and trunnions on two opposite sides or arms of said table, whereby it is supported and upon which it can be rotated, substantially as and for the purpose set forth.

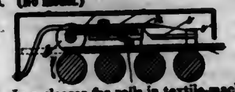
5. In a machine for setting up, drilling and pinning bicycle-frames, a drill-press mechanism comprising substantially a drill-press standard and column A A', a radially-moving arm B mounted on the column A', a drill-head B' carrying a vertically-operating drill-stock *b* mounted upon and adapted to be moved in and out on the arm B, belt mechanism F *e* and *d* for driving said drill-stock B, a cross-shaped table H under said radially-movable arm and mounted on trunnions *h h* so as to be reversible, slots J J in the arms of said table, longitudinally slotted plates K K' K^2 and K^3 adjustably secured to the arms of said table by bolts passing through the slots J J thereon, and clamping mechanism secured and adjustable in the longitudinal slots in said plates, substantially as and for the purpose set forth.

602,624. MATCH-SAFE. DALLAS KNOWLTON, Washington, D. C. Filed Feb. 21, 1898. Serial No. 671,072. (No model.)



Claim.—1. In a match-safe, the combination of a receptacle having a transverse slide passing through slots in the walls of said receptacle and provided with a match-retaining groove rubber strips secured to the rear edge of said match-retaining groove and two rubber blocks secured to the inner wall of the receptacle and extending over the edge of the front slot.

2. In a match-safe the combination of a receptacle having a transverse slide passing through slots in the walls of said receptacle and provided with a match-retaining groove having enlarged ends for receiving the heads of the matches and provided with rubber strips secured to the rear edge of said match-retaining groove and two rubber blocks of different thicknesses secured to the inner wall of the receptacle and extending over the edge of the front slot thereby preventing the matches from becoming locked between the receptacle and the edge of the slot.



602,625. ADJUSTABLE HANDLE-BAR. JOSEPH H. LA FAVE, Toledo, Ohio, assignor of one-half to Ray Conklin, same place. Filed Dec. 31, 1897. Serial No. 664,356. (No model.)

Claim.—1. An adjustable handle-bar for bicycles comprising handle-bar sections provided with portions having clutch-faces and also having transverse apertures one with right-hand threads and the other with left-hand threads, a stem adapted to be connected with the steering-head of a bicycle and provided with a head interposed or sandwiched between the portions of the handle-bar sections and having clutch-faces meeting those of said portions and a transverse aperture coincident with the threaded apertures of the portions, and a connecting-bolt extending through the apertures of the stem and handle-bar sections and having right and left hand threads engaging the corresponding threads of the handle-bar sections, substantially as specified.

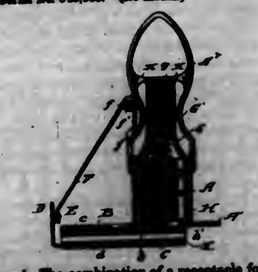
2. The handle-bar described comprising the stem with the head at its upper end having clutch-teeth on its opposite sides and also having a transverse aperture, the handle-bar sections terminating at their inner ends in portions disposed at opposite sides of the head on the stem and having clutch-teeth on their inner sides engaging those of the head and also having transverse apertures one with right-hand threads and the other with left-hand threads, the connecting-bolt extending through the apertures of the head and handle-bar sections and having right and left hand threads engaging the corresponding threads of the handle-bar sections and also having a circumferential groove at its middle, and a pin arranged in the head of the stem and extending into said groove, substantially as specified.

602,626. TEXTILE-ROLLER CLEARER. REUBEN S. MATTESON, Providence, R. I., assignor of two-thirds to Charles H. Field, same place, and Josiah A. King, Seekonk, Mass. Filed Feb. 6, 1897. Serial No. 622,304. (No model.)

Claim.—1. In a clearer for rolls in textile-machines, the combination with the rolls to be cleared of a plate bearing on the rolls, means for giving said plate a reciprocating motion in a direction at right angles or nearly so to the axis of the rolls, flanges on a stationary part, and studs on the plate to engage the flanges to guide the plate in the desired direction, substantially as described.

2. The combination in a clearer for rolls for the purpose specified, of a clearer-plate, a motor-frame, a shaft held in bearings attached to said motor-frame, wheels on said shaft receiving motion from the rolls, a worm-wheel fast on said shaft, a worm gear-wheel held on a stud fast in said motor-plate, and engaging with the worm-wheel, a stud in the worm-gear and arranged to push the clearer-plate in one direction by a ridge or projection fast on said plate, substantially as described.

602,627. COLLAPSIBLE EGG-CRATE. HILLARD F. PITCHFORK, Staunton, Va. Filed June 2, 1897. Serial No. 639,146. (No model.)



Claim.—1. A collapsible box comprising the bottom, sides and end pieces, one of the side pieces being hinged at its lower edge to the bottom and adapted to swing outwardly, the opposite side piece hinged to the opposite edge of the bottom and adapted to swing inwardly, the end pieces hinged to the bottom at its respective ends and adapted to swing inwardly, a lid hinged to the upper edge of the inwardly-swinging side and adapted to swing outwardly to rest upon the outer surface of said side, and securing means for uniting the ends and sides, substantially as set forth.

2. A collapsible box comprising the bottom, sides and end pieces, one of said sides being hinged to the bottom and adapted to swing outwardly, the opposite side piece hinged to the opposite edge of the bottom and adapted to swing inwardly, the lid hinged to the upper edge of the last-mentioned side piece and adapted to swing outwardly and rest upon the outer surface thereof, the end pieces hinged to the bottom and adapted to swing inwardly, a partition hinged to the inwardly-swinging side and adapted to fold against the inner surface of said side, and securing means for uniting the ends and sides, substantially as set forth.

3. A collapsible box comprising the bottom, sides and end pieces, one of the side pieces being hinged to the bottom and adapted to swing outwardly and rest against the outer side of the bottom when folded, the opposite side being hinged to the upper surface of the bottom and adapted to swing inwardly, a lid hinged to the upper edge of the last-mentioned side and adapted to swing outwardly and rest against the outer surface of said side, the end pieces being hinged to the upper surface of the bottom and adapted to swing inwardly and rest thereon, securing means adapted to unite the ends of the side pieces when the box is unfolded, said lid, side pieces and bottom having openings which are adapted to register when the crate is folded, and a bolt adapted to pass through said opening and receive a thumb-nut for securing the parts together, substantially as set forth.

4. A collapsible box comprising the bottom A, the ends D hinged thereto and adapted to fold inwardly thereupon, the side B hinged to the upper surface of the bottom and adapted to fold inwardly upon the end pieces, the hinges for said side pieces being so formed that when said side piece is folded inward it will rest flatly upon the ends D, side C hinged to the bottom and adapted to swing outwardly, lid E hinged to the upper edge of side B and adapted to swing outwardly against the outer face of said side, and fastening means adapted to unite the sides and ends when the box is unfolded, substantially as described.

602,628. GRATER. DAVID C. POWELL, Michigan City, Ind., assignor of one-half to Edward J. Powell, same place. Filed July 31, 1897. Serial No. 646,023. (No model.)

Claim.—1. The combination of a receptacle for the substance to be reduced, a grating-plate mounted to slide opposite one end thereof, a cap or cover closing the opposite end of the receptacle and adapted to move endwise therein, a handle secured to the receptacle and having a stop with which the cap or cover is adapted to engage, a plate adapted to bear upon the substance to be reduced, and a spring interposed between the plate and the cap or cover tending to force the plate toward the grating-plate, and the cap or cover against the stop in the handle.

2. The combination of a receptacle for the substance to be reduced, a grating-plate mounted to reciprocate opposite one end thereof, a recessed cap or cover closing the opposite end of the receptacle and adapted to move endwise therein, an open-sided handle secured to the receptacle and having inwardly-projecting legs or stops adapted to enter the recesses in the top of the cap or cover, a plate adapted to bear against the article to be reduced, a rod secured thereto and extending through the cap or cover, and a spring surrounding the rod and interposed between the cap and the plate and tending to move the cap in one direction against the stops and the plate in the opposite direction against the article to be reduced.

3. The combination with the frame having a hollow part constituting a receiving-chamber, a way or guide A', arranged at the front opening of the receiving-chamber, the bent plate, C, whose edges engage the way or guide and travel thereon, the grating-plate carried by the plate, C, and arranged to close the receiving-chamber, the thumb-piece for propelling the grating-plate across the open end of the receiving-chamber, the lug thereon and the spring secured upon the side of the handle and loosely engaging the lug on the thumb-plate, substantially as and for the purpose set forth.

602,629. ANGLE-GEARING. JAMES H. SAGER, Rochester, N. Y. Filed Dec. 30, 1897. Serial No. 664,602. (No model.)

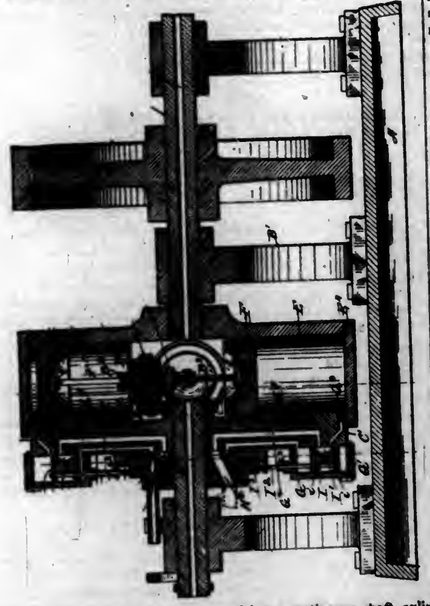
Claim.—1. In angle-gearing, a pin-gear having pins with parallel axes, in combination with a gear-wheel having an axis at an angle to that of the pin-gear and provided with interdental spaces and with teeth whose working faces have warped limiting-surfaces whose positions and curvatures are those generated by the surface lines of the moving pins when the pin-gear and gear-wheel revolve together, whereby the contact between the pins and the teeth of the gear-wheel is line-contact.

2. In angle-gearing a pin-gear having a series of cylindrical pins having parallel axes arranged in a circle about the axis of rotation of said pin-gear and parallel thereto, in combination with a gear-wheel having an axis at an angle to that of the pin-gear and provided with interdental spaces and with teeth whose working faces have warped limiting-surfaces whose positions and curvatures are those generated by the surface lines of the moving pins when the pin-gear and gear-wheel revolve together, whereby the contact between the pins and the teeth of the gear-wheel is line-contact.

3. In angle-gearing a face pin-gear having pins with parallel axes, in combination with a gear-wheel having an axis at an angle to that of the pin-gear and provided with interdental spaces and with peripheral teeth whose working faces are warped surfaces generated by the surface lines of the moving pins when the pin-gear and gear-wheel revolve together and the pins of said pin-gear cross the periphery of the gear-wheel, whereby the contact between the pins and the teeth of the gear is line-contact.

4. In angle-gearing, a face-gear having a series of parallel cylindrical pins, in combination with a gear-wheel having an axis set at an angle to that of the pin-gear and provided with wedge-like teeth set transverse to the plane of rotation of the gear-wheel and whose working faces are warped surfaces which are curved in planes perpendicular to the axes of the pins when in contact therewith and which are straight lines in planes parallel to the axes of the pins when in contact therewith.

5. In angle-gearing, a face-gear, having a series of parallel cylindrical pins, in combination with a gear-wheel having an axis set at an angle to that of the pin-gear and provided with peripheral wedge-like teeth, set transverse to the plane of rotation of the gear-wheel and whose working faces are warped surfaces which are curved in planes perpendicular to the axes of the pins when in contact therewith, and which are straight lines in planes parallel to the axes of the pins when in contact therewith, and antifriction-rollers on said pins.



6. In angle-gearing, a face-gear, having a series of parallel cylindrical pins, in combination with a gear-wheel having an axis set at an angle to that of the pin-gear and provided with peripheral wedge-like teeth set transverse to the plane of rotation of the gear-wheel and whose working faces have warped limiting-surfaces whose positions and curvatures are those generated by the surface lines of the moving pins when the pin-gear and gear-wheel revolve together, whereby the contact between the pins and the teeth of the gear-wheel is line-contact.

602,630. ROTARY ENGINE. WILLIAM SMITH, Marietta, Ohio, assignor, by direct and mesne assignments, to Longfellow Rice and Robert Stephens, Marietta, Ohio. Filed Apr. 22, 1897. Serial No. 633,262. (No model.)

Claim.—1. A rotary engine comprising a stationary shaft, a cylinder, a piston in said cylinder provided with a piston-rod which is attached at its inner end to said shaft by means permitting revolution of the cylinder about the shaft, said cylinder being provided with an inlet-port and a slide-valve, an eccentric rigid with said shaft, a valve-stem connected at one end with said valve and engaging at its opposite end the periphery of said eccentric, said valve and stem being constructed and arranged to act as a centrifugal governor to cut off the supply of motive agent to said port when the cylinder revolves about the shaft at a greater than a predetermined speed.

2. A rotary steam-engine comprising a stationary shaft, cylinders located about said shaft, pistons in said cylinders provided with piston-rods which are attached at their inner ends to said shaft by means permitting revolution of the cylinders about the shaft, steam-chests on said cylinders provided with ports connecting the same with the cylinders, slide-valves in said steam-chests adapted to control the passage of steam through said ports, an eccentric rigid with said shaft, radially-extending valve-stems attached at their outer ends to said valves and independently engaging at their inner ends the periphery of said eccentric, said valves and valve-stems being arranged

so that each may be independently moved out of contact with the eccentric to cut off steam from the cylinder controlled thereby.

3. A rotary steam-engine comprising a stationary shaft, cylinders located about said shaft, pistons in said cylinders provided with piston-rods which are attached at their inner ends to said shaft by means permitting revolution of the cylinders about the shaft, steam-chests on said cylinders provided with ports connecting the same with the cylinders, slide-valves in said steam-chests, an eccentric rigid with said shaft, valve-stems attached at their outer ends to said valves and independently engaging at their inner ends the periphery of said eccentric, springs applied to said stems and means for regulating said springs to vary the tension thereof upon the stems.

4. A rotary steam-engine comprising a stationary shaft, cylinders located about said shaft, pistons in said cylinders provided with rods which are attached at their inner ends to said shaft by means permitting revolution of said cylinders about the shaft, steam-chests on said cylinders provided with ports connecting the same with the cylinders, slide-valves in said steam-chests, an eccentric rigid with said shaft, radially-extending stems attached at their outer ends to said valves and independently engaging at their inner ends the periphery of said eccentric, spiral springs on said stems engaging at their outer ends the inner ends of the steam-chests and each acting to independently control the valve to which it is attached, and means on said stems engaging the inner ends of the springs to regulate the tension thereof.

5. A rotary steam-engine comprising a stationary shaft, cylinders located about said shaft, pistons in said cylinders provided with piston-rods which are attached at their inner ends to said shaft by means permitting revolution of the cylinders about the shaft, steam-chests on said cylinders provided with ports connecting the same with the cylinders, slide-valves in said steam-chests, an eccentric rigid with said shaft, valve-stems attached at their outer ends to said valves, springs applied to said stems, means for regulating said springs to vary the tension thereof upon said stems, and antifriction-rollers interposed between the inner ends of the stems and the periphery of said eccentric.

6. A rotary steam-engine comprising a stationary shaft, cylinders located about said shaft, pistons in said cylinders provided with piston-rods which are attached at their inner ends to said shaft by means permitting revolution of the cylinders about the shaft, said cylinders being provided with steam-ports and with slide-valves for controlling said ports, an eccentric rigid with said shaft, valve-stems attached at their outer ends to said valves and independently engaging at their inner ends the periphery of said eccentric, springs applied to said stems, means for regulating said springs to vary the tension thereof upon the stems, and governor-weights removably secured upon said stems.

7. A rotary steam-engine comprising a non-rotative shaft, cylinders located about said shaft, pistons in said cylinders provided with piston-rods which are connected at their inner ends with said shaft by means permitting revolution of said cylinders about the shaft, steam-chests on said cylinders provided with ports connecting the same with the cylinders, steam supply and exhaust passages opening at their outer ends into said steam-chests, a steam-disk non-rotatively mounted upon the shaft and provided on its inner face with concentric annular grooves adapted to register with the inner ends of said steam supply and exhaust passages, supply and exhaust pipes opening through said disk and connected with said grooves, and valves in the steam-chest for controlling the supply of steam to and exhaust from the cylinders.

8. A rotary steam-engine comprising a non-rotative shaft, a casing having a solid end wall rotatively mounted on said shaft and provided with a circular recess concentric with said shaft, cylinders mounted on said end wall, pistons in said cylinders provided with piston-rods which are connected at their outer ends with said shaft by means permitting revolution of said cylinders about the shaft, steam-chests on said wall adjacent to said cylinders and connected therewith by means of ports through said wall, steam supply and exhaust ports in said end wall connected at their outer ends with the steam-chests and opening at their inner ends in said annular recess, a steam-disk fitted into said annular recess and provided on its inner face with concentric annular grooves adapted to register with said supply and exhaust ports opening into the recess, supply and exhaust pipes opening through said disk and connected with said annular grooves, and means for controlling the passage of steam from the steam chest to the cylinders.

9. A rotary steam-engine comprising a stationary shaft, a circular casing provided with a solid end wall rotatively mounted on said shaft, said wall being provided with a central annular recess in its outer face concentric with said shaft, cylinders in said casing, pistons in said cylinders provided with piston-rods which are connected at their inner ends with said shaft by means permitting revolution of the cylinders about the shaft, steam-chests mounted on said wall adjacent to said cylinders and connected therewith by means of passages through said wall, steam supply and exhaust passages in said end wall connected at their outer ends with the steam-chests and opening at their inner ends in said recess of the wall, a steam-disk non-rotatively mounted on the shaft and fitting in said recess of the wall, said disk being provided on its inner face with concentric annular grooves adapted to register with said supply and exhaust passages, steam supply and exhaust pipes opening through said disk and connected with said annular grooves, said exhaust-passages opening into the steam-chests adjacent to the passages leading from the cylinders and a valve for intermittingly connecting said exhaust and cylinder passages and opening said last-mentioned passage for the admission of steam to the cylinder.

10. In a rotary engine, the combination of a stationary shaft and a plate rotatively mounted thereon carrying a cylinder and having ports which lead to the cylinder, a disk removably and non-rotatively mounted on the shaft and provided on its inner face with annular concentric grooves registering with the ports in the plate, supply and exhaust pipes opening through said disk and connected with said grooves and a valve mechanism for controlling the supply of steam to the cylinder, said valve mechanism being engaged with and actuated by said disk.

11. In a rotary steam-engine, the combination of a stationary shaft, a casing rotatively mounted thereon provided with a solid end wall, a cylinder in said casing, a piston in the cylinder connected with said shaft, steam inlet and exhaust ports connected at one end with the cylinder and opening at their opposite ends adjacent to the shaft, a disk non-rotatively mounted on the shaft provided on its inner face with concentric annular grooves adapted to register with said supply and exhaust ports, steam supply and exhaust pipes opening through said disk and connected with said grooves, a valve for controlling the admission of steam to the cylinder provided with an inwardly-extending valve-stem, said disk being formed in its part remote from the annular grooves therein eccentric to the shaft and adapted to engage the inner end of said valve-stem to actuate said valve.

12. In a rotary steam-engine, the combination of a stationary shaft, a casing non-rotatively mounted thereon having an end wall provided with an annular recess or depression concentric with said shaft, a cylinder in said casing, a piston in the cylinder connected with said shaft, steam inlet and exhaust ports connected at one end with said cylinder and at their opposite ends with said recess or depression, a valve for controlling the admission of steam to the cylinder, a disk mounted on the stationary shaft and provided with an inwardly-extending annular flange engaging said recess or depression and on its inner face with concentric annular grooves adapted to register with said steam inlet and exhaust ports, supply and exhaust ports opening through said disk and connected with said annular grooves, the periphery of the part of said disk remote from said grooves being arranged concentrically to the shaft, and a radially-arranged valve-stem connected at its outer end with said valve and adapted to engage at its inner end the periphery of said eccentric.

13. In combination with a rotary steam-engine, embracing a cylinder, a steam-chest thereon, a port connecting the same with the cylinder and an eccentric non-rotatively mounted on the shaft of the engine, of a slide-valve in said steam-chest provided with a radially-extending stem which has engagement at its inner end with the periphery of said eccentric, a shoulder on the stem and a spring applied to said stem to hold the same yieldingly against the eccentric, said valve mechanism being constructed to move outwardly under centrifugal action of the engine to cut off the supply of steam to the said cylinder.

14. In combination with a rotary engine embracing a cylinder, a steam-chest mounted thereon provided with a port connecting the same with the cylinder and an eccentric non-rotatively mounted on the shaft of the engine, of a slide-valve in said steam-chest provided with a radially-extending stem which has engagement at its inner end with the periphery of said eccentric, said valve being adapted to move outwardly under the centrifugal action of the engine to cut off the supply of steam to the cylinder, a spiral spring surrounding said stem and engaging at its outer end the steam-chest, an adjustable collar on the stem engaging the opposite end of the spring whereby the tension of said spring may be varied as desired.

15. In combination with a rotary engine having a rotative but normally stationary shaft, said shaft being provided with a crank portion, cylinders located around said shaft, pistons in said cylinders provided with piston-rods which are operatively connected with said crank portion of the shaft, of means for turning the shaft so that the pistons will be shifted within the cylinders whereby upon the admission of steam to the cylinders the movement of the engine will be reversed.

16. In combination with a rotary engine having a rotative movement, a normally stationary shaft, said shaft being provided with a crank portion, cylinders located about said shaft and pistons in said cylinders provided with piston-rods which are operatively connected with said crank portion of the shaft, of means for turning the shaft so that the pistons will be shifted within the cylinders, whereby upon the admission of steam to said cylinders the movement of the engine will be reversed, comprising a lever rigidly attached to the shaft, and means for locking said lever to a stationary part of the engine.

602,681. TYPE-CASE. Hulbert Dyer, Youngstown, Ohio. Filed July 7, 1896. Serial No. 598,206. (No model.)

Claim.—1. In a type-case, a frame, a number of rows of boxes secured together, the rows being pivoted at the ends to the frame, a shaft journaled between the sides of the frame and suitable flexible connections between the shaft and the boxes, as and for the purpose described.

2. In a type-case, a row of boxes pivoted at its ends to the sides of the frame, a shaft journaled between the sides of the frame, straps wound on the shaft and secured to the backs of the boxes, a crank on the end of the shaft, a pin adapted to a number of holes in the side of the frame, as and for the purpose described.

3. In a type-case, the combination of the type boxes or compartments arranged in rows in the case, each row of the upper-case boxes overlapping each other, the second and third rows of the lower case being adjusted by means of a shaft in the casing, said shaft being retained at the desired position by a pin in the side of the frame, all boxes or compartments having scoop or inclined fronts, excepting those in the front row of lower case, all boxes or compartments in the upper or capital case and second and third rows of lower case being tapered toward the front, thereby making the side walls of said boxes lower in front than the rear, and the front wall lower than the rear wall, the boxes being inclined forwardly substantially as shown and described.

602,682. METHOD OF OBTAINING FREE AMORPHOUS SILICON. Guillaume de Chalmot, Holcomb Rock, Va. Filed Sept. 24, 1897. Serial No. 652,912. (No specimens.)

Claim.—1. In the process of reducing silica or silicates in the presence of copper, the method herein specified of reclaiming the silicon in a free condition, consisting in finely pulverizing the silicon-copper alloy and mixing the same with sulfur, heating the same in a closed vessel to a temperature preferably between 250° and 300° centigrade, in which the copper unites with the sulfur and the silicon of the silicid is set free as an amorphous powder, substantially as set forth.

2. In the process of reducing silica or silicates in the presence of copper, the method herein specified of reclaiming the silicon in a free condition consisting in finely pulverizing the silicon-copper alloy and mixing the same with sulfur, heating the same in a closed vessel to a temperature preferably between 250° and 300° centigrade, in which the copper unites with the sulfur and the silicon of the silicid is set free as an amorphous powder, the amount of sulfur being regulated so as to obtain the compound Cu_2S or the compound CuS, substantially as set forth.

3. In the process of reducing silica or silicates in the presence of copper, the method herein specified of reclaiming the silicon in a free condition, consisting in finely pulverizing the silicon-copper alloy and mixing the same with sulfur, heating the same in a closed vessel to a temperature preferably between 250° and 300° centigrade, in which the copper unites with the sulfur and the silicon of the silicid is set free as an amorphous powder, treating the mixture of sulfids and free silicon with acids to dissolve the copper and liberate the sulfur, decomposing the sulfids, washing out the copper salts, drying the residue and extracting the sulfur by carbon disulfid and treating the remainder with hydrofluoric acid to remove the silica, substantially as set forth.

602,688. CONNECTION FOR CYCLE-CHAINS. Frederic Boarbert, Brooklyn, N. Y. Original application filed Apr. 5, 1897, Serial No. 630,622. Divided and this application filed Dec. 10, 1897. Serial No. 661,341. (No model.)

Claim.—1. The combination with the chain-links, of a screw for connecting the links and forming a pivot and a spring-arm connected to and turning with the screw and a latch or projection for holding the spring and preventing the spring-arm and screw turning backward, substantially as set forth.

2. The combination with the chain-links, of a screw for connecting the end links and forming a pivot and a spring-arm connected to and turning with the head of the screw and having clips at opposite sides for forming latches that engage the edges of the link and prevent the screw turning until the arm is sprung back to disengage the latches, substantially as set forth.

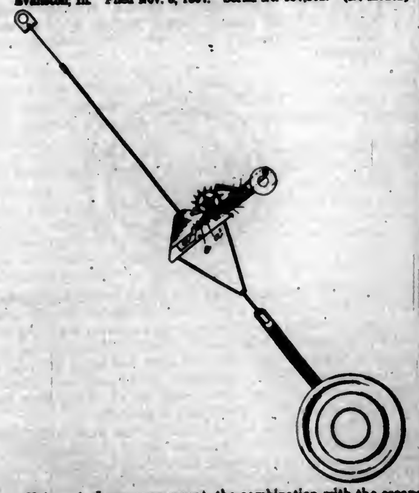
602,634. BACK-PEDALING BRAKE. Frederic Boarbert, Brooklyn, N. Y., and Harold Serrell, Plainfield, N. J.; said Serrell assignor to said Boarbert. Filed June 1, 1896. Serial No. 593,730. (No model.)

Claim.—1. The combination in a vehicle driving mechanism, of a revoluble shaft or axle, a wheel and its support, friction devices constantly connecting the wheel and shaft, whereby the wheel is under constant friction while revolving with reference to the shaft, means for positively connecting the shaft and wheel to cause the wheel and shaft to revolve together in one direction, and means for releasing said positive connection when the wheel and shaft move relatively to each other, substantially as set forth.

2. The combination with the shaft and the wheel, of an adjustable frictional connection between the two, which connection is constant and continuously operative, and a clutch mechanism operative in one direction and automatically separable by lessening the movement of one part in relation to the other, so as to permit the frictional connection to operate as a brake, substantially as set forth.

3. In a bicycle, the combination with the devices for applying power and for driving the machine, of two rings in the same plane the one within the other, the inner ring having notches and inclines and devices therein adapted to act against the inner edge of the outer ring as a clutch to cause an engagement of the rings when the rotation is in one direction only, and means connected with the inner ring for applying a constant pressure and friction against the respective opposite faces of the outer ring for frictionally retarding the movement of the outer ring and stopping the same when the clutch is released, substantially as set forth.

4. In a bicycle, the combination with the devices for applying power and for driving the machine, of an exterior ring *c* having peripheral sprocket-teeth, and an internal ring *d* in the same plane, friction-rollers 3 in notches having inclines in the edge of the internal ring, disks upon the respective surfaces of the internal ring and connected thereto, and extending to receive between them the external ring, rings of leather or similar material between the side surfaces of the external ring and the inner surfaces of the disks for producing a friction to retard and stop the rotation of the external ring, substantially as and for the purposes set forth.



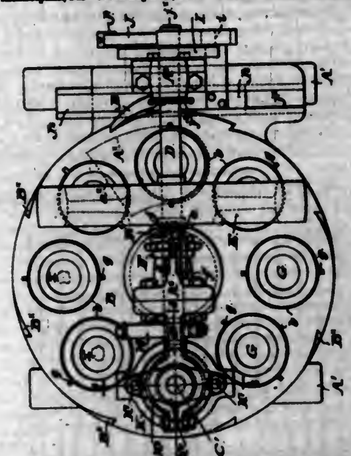
5. In a bicycle, the combination with the devices for applying power and for driving the machine, of an exterior ring *c*, having peripheral sprocket-teeth *c'*, a plain inner surface and recesses in its opposite faces, an internal ring *d* in the same plane with the ring *c*, and having equidistant notches and inclines in the outer edge, friction-rollers 3 in said notches and acting between the inclines and the inner surface of the ring *c* to connect said rings, disks upon the opposite sides of said rings connected to the inner ring, rings of leather or similar material in the recessed faces of the external ring and against which the said disks bear frictionally to retard and stop the rotation of the external disk when freed from the engagement of the rollers 3, substantially as and for the purposes set forth.

6. The combination with the ring, of a central shaft and clutch mechanism within the ring for operatively connecting the parts in one direction only, a plate or disk at each side of the ring connected with the shaft and intervening friction-rings of suitable material, and means for pressing the plates continuously toward each other and against the ring for applying a constant friction to the ring, substantially as specified.

7. The combination with the pedals and shaft in a cycle, of a wheel upon the shaft, a ring surrounding the wheel, friction-plates at opposite sides of the wheel and leather or similar material intervening, and screws for applying pressure and regulating the friction between the parts, substantially as set forth.

8. The combination in a vehicle with the driving-shaft and driven wheel, of a ring and a support for the same, plates at opposite sides of the ring and mechanism for tightening the plates upon the sides of the ring to produce a continuous uniform pressure and friction between the parts to operate as a brake to the vehicle when the movement of the driving shaft is arrested, substantially as set forth.

602,635. **PENDULUM-ESCAPEMENT.** LAURENCE ERICSON, Evanston, Ill. Filed Nov. 6, 1897. Serial No. 657,562. (No model.)



Claim.—1. In an escapement, the combination with the escapement-wheel, a pallet, a tappet, means connecting the pallet and tappet, of a pendulum having a cam-surface adapted to give impetus to and receive impetus from said tappet, and means for holding the escapement-wheel at rest while the cam-surface and tappet aforesaid are out of engagement with each other, substantially as set forth.

2. In an escapement, the combination with an escapement-wheel, a pallet, a tappet, and means connecting the pallet and tappet, of a pendulum having a cam-surface adapted to give impetus to and receive impetus from said tappet, and a rest carried by the pallet and adapted to engage said tappet for holding the pallet in engagement with the escapement-wheel, substantially as set forth.

3. In an escapement, the combination with an escapement-wheel, of a pallet having the lug *c* provided with a single surface adapted to engage the teeth of the escapement-wheel for holding it at rest, the lug *c'* having a single surface adapted to be engaged by the teeth of the escapement-wheel said surface being in the nature of a cam so disposed that the pressure of the escapement wheel thereon will oscillate the pallet, a pendulum, and means for transmitting movement from the pallet to the pendulum and from the pendulum to the pallet, substantially as set forth.

4. In an escapement, the combination with an escapement-wheel, a pallet, a tappet, means connecting the pallet and tappet, and means for counterbalancing them, of a pendulum having a cam-surface adapted to receive impetus from and impart impetus to said tappet, and means for holding the escapement-wheel at rest when the cam-surface and tappet aforesaid are out of engagement, substantially as set forth.

602,636. **GLASS-PRESSING MACHINE.** WILSON PEPPER, Philadelphia, Pa. Filed Sept. 20, 1897. Serial No. 652,248. (No model.)

Claim.—1. In a glass-press the combination with a fixed bed-plate, of a mold carrier mounted to rotate upon said bed-plate, mechanism to intermittently rotate said carrier, a series of sockets in said carrier, a series of molds pivoted in said sockets, and resting upon said bed-plate, a discharge-opening in said bed-plate, means to tilt said pivoted molds when over said discharge-opening, means to return said molds to normal position, a positively-actuated plunger, a second plunger in telescopic relation with said first plunger, an elastic medium between said two plungers, and a mold upon said second plunger adapted to successively register with said pivoted molds, substantially as set forth.

2. In a glass-press the combination with a fixed bed-plate, of a mold-carrier mounted to rotate upon said bed-plate, mechanism to intermittently rotate said carrier, a series of sockets in said carrier, a series of molds pivoted in said sockets, and resting upon said bed-plate, a discharge-opening in said bed-plate, means to tilt said pivoted molds, when over said discharge-opening, means to return said molds to normal position, a positively-actuated plunger, a mold comprising two concentrically-related relatively-movable members, adapted to successively register with said pivoted molds, and separate elastic mediums connective of said two mold members and said positively-actuated plunger, substantially as set forth.

3. In a glass-press, the combination with a fixed bed-plate, of a mold-carrier mounted for movement upon said bed-plate, a mold entered in said carrier adapted to rest upon said fixed bed-plate, means to shift said mold-carrier, and a second mold adapted to cooperate with the mold in said carrier, substantially as set forth.

4. In a glass-press, the combination with a fixed bed-plate, of a mold-carrier mounted for movement upon said bed-plate, a mold pivoted in said carrier, and adapted to rest upon said bed-plate, means to shift said mold-carrier, an opening in said bed-plate, means to tilt said pivoted mold when in registry with said bed-plate opening, and a second mold adapted to cooperate with said pivoted mold, substantially as set forth.

5. In a glass-press, the combination with a fixed bed-plate, of a mold-carrier mounted for rotation upon said bed-plate, a mold pivoted in said carrier, adapted to rest upon said fixed bed-plate, means to rotate said mold-carrier, an opening in said bed-plate, means to tilt said pivoted mold when in registry with said bed-plate opening, means to return said tilted mold to normal position by the rotation of said carrier, and a second mold adapted to cooperate with said pivoted mold, substantially as set forth.

6. In a glass-press, the combination with a fixed bed-plate, of a mold-carrier mounted for movement upon said bed-plate, a mold pivoted in said carrier, means to shift said mold-carrier, an opening in said bed-plate, means to tilt said pivoted mold when in registry with said bed-plate opening, to discharge the molded article through the latter, a table A^5, beneath said opening, and a second mold adapted to cooperate with said pivoted mold, substantially as set forth.

7. In a glass-press, the combination with a fixed bed-plate, of a mold-carrier mounted for movement upon said bed-plate, a mold pivoted in said carrier and adapted to rest upon said bed-plate, means to shift said mold-carrier, an opening in said bed-plate, means to tilt said pivoted mold when in registry with said bed-plate opening, to discharge the molded article through the latter, means to return said mold to normal position by the movement of said mold-carrier, a table A^5, beneath said opening, and a second mold adapted to cooperate with said pivoted mold, substantially as set forth.

8. In a glass-press, the combination with a fixed bed-plate, of a mold-carrier mounted for rotation upon said bed-plate, a mold pivoted in said carrier and adapted to rest upon said fixed bed-plate, peripheral notches in said carrier, a reciprocatory pawl to engage said notches and shift said carrier, an opening in said bed-plate, means to tilt said pivoted mold when in registry with said bed-plate opening, to discharge the molded article through the latter, means to return said mold to normal position by the movement of said mold-carrier, and a second mold adapted to cooperate with said pivoted mold, substantially as set forth.

9. In a glass-press, the combination with a positively-actuated plunger C, of a plunger L', mounted for relative movement upon the first-named plunger, a spring L^3, intermediate of said two plungers, and toggle-levers L^2 connective of said two plungers, substantially as set forth.

10. In a glass-press, a hollow plunger C, mounted for reciprocation, a second plunger L', mounted for reciprocation within said plunger C, a spring L^3, mounted within the plunger C, to bear upon the plunger L', and a pin *c*, entered through said plungers to limit their relative movement, substantially as set forth.

11. In a glass-press, a hollow plunger C, mounted for reciprocation, a second plunger L', mounted for reciprocation within said plunger C, a spring L^3, mounted within the plunger C, to bear upon the plunger L', a pin *c*, entered through said plungers to limit their relative movement, and a screw-threaded sleeve O^2, to adjust the pressure of said spring, substantially as set forth.

12. In a glass-press, a hollow plunger C, mounted for reciprocation, a second plunger L', mounted for reciprocation within said plunger C, a spring L^3, intermediate of said two plungers, a pin *c*, to limit the relative movement of said plungers, a threaded extension C', upon the upper extremity of said plunger C, a yoke K^3, mounted upon said extension C' and provided with an adjustable spring K^4, and rods K', connecting said yoke K^3 with the mold K, at the lower extremity of said plunger L', substantially as set forth.

13. In a glass-press, a hollow plunger C, mounted for reciprocation, a second plunger L', mounted for reciprocation within said plunger C, a spring L^3, intermediate of said two plungers, a pin *c*, to limit the relative movement of said plungers, a threaded sleeve O^2, to adjust the pressure of said spring L^3, a threaded extension C', upon the upper extremity of said plunger C, a yoke K^3, mounted upon said extension C', and provided with an adjustable spring K^4, and rods K', connecting said yoke K^3, with the mold K, at the lower extremity of said plunger L', substantially as set forth.

14. In a glass-press, a hollow plunger C, mounted for reciprocation, a second plunger L', mounted for reciprocation within said plunger C, a spring L^3, intermediate of said two plungers, a pin *c*, to limit the relative movement of said plungers, a sleeve O^2, in threaded engagement with the plunger C, the collar-wrench O^3, in engagement with said sleeve, a threaded extension C', upon the upper extremity of said plunger C, in threaded engagement with the sleeve O^2, a yoke K^3, mounted upon said extension C', and provided with an adjustable spring K^4, and rods K', connecting said yoke K^3, with the mold K, at the lower extremity of said plunger L', substantially as set forth.

602,687. **BASIC RED DISAZO DYE.** ERNST KÖNIG, Höchst-on-the-Main, Germany, assignor to the Farbwerks, vormals Meister, Lucius & Brüning, same place. Filed May 6, 1897. Serial No. 636,366. (Specimens.)

Claim.—As a new product, the scarlet-red dyestuff, obtained from diazotized meta-trimethyl ammonium phenyl-azo-meta-toluidin and beta-naphthol, being a brown-red powder, soluble in water with a blue-red color, soluble in alcohol, insoluble in benzene, ether or petroleum ether, and dyeing tanned and untanned cotton as well as half-wool scarlet red in an acid-bath, substantially as set forth.

602,688. **BASIC YELLOW DISAZO DYE.** ERNST KÖNIG, Höchst-on-the-Main, Germany, assignor to the Farbwerks, vormals Meister, Lucius & Brüning, same place. Filed May 6, 1897. Serial No. 636,367. (Specimens.)

Claim.—As a new product, the yellow dyestuff obtained from diazotized meta-trimethyl ammonium phenyl-azo-meta-toluidin and 1 phenyl 3 methyl 5 pyrazolon, being an orange-yellow powder, soluble in water, alcohol, ether and benzene; insoluble in petroleum ether, dyeing tanned and untanned cotton as well as half-wool yellow in an acid-bath, substantially as set forth.

602,689. **COPPERY-BROWN DYE.** ERNST KÖNIG, Höchst-on-the-Main, Germany, assignor to the Farbwerks, vormals Meister, Lucius & Brüning, same place. Filed May 6, 1897. Serial No. 636,368. (Specimens.)

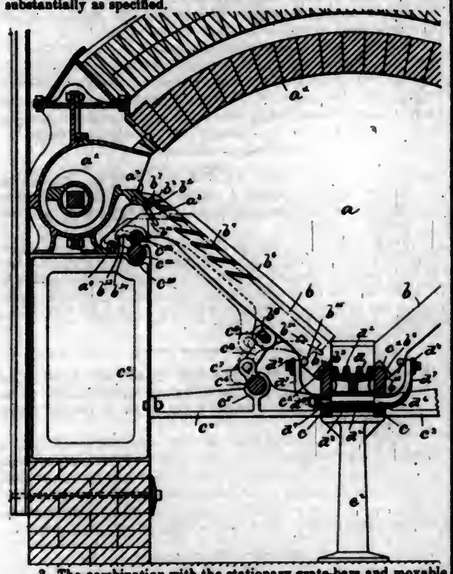
Claim.—As a new product, the brown dyestuff obtained from diazotized meta-trimethyl ammonium phenyl-azo-meta-toluidin and chrysoïdin, being a black-green powder, easily soluble in water with a reddish-yellowish-brown color, soluble in alcohol, insoluble in ether, benzene and petroleum ether, and dyeing tanned and untanned cotton as well as half-wool a coppery brown, substantially as set forth.

602,640. **RED-VIOLET BASIC DISAZO DYE.** ERNST KÖNIG, Höchst-on-the-Main, Germany, assignor to the Farbwerks, vormals Meister, Lucius & Brüning, same place. Filed May 6, 1897. Serial No. 636,369. (Specimens.)

Claim.—As a new product, the reddish-violet dyestuff obtained from diazotized meta-trimethyl ammonium phenyl-azo-meta-amido-para-cresol-ethyl ether and beta-naphthol, being a brown powder, soluble in water with a cherry-red color, soluble in alcohol, ether, benzene and petroleum ether, and dyeing tanned and untanned cotton, as well as half-wool a reddish violet in an acid-bath, substantially as set forth.

602,641. **BROWN DISAZO DYE.** ERNST KÖNIG, Höchst-on-the-Main, Germany, assignor to the Farbwerks, vormals Meister, Lucius & Brüning, same place. Filed May 6, 1897. Serial No. 636,403. (Specimens.)

Claim.—1. The process of producing brown disazo and polyazo dyestuffs, which consists in diazotizing the amidoazo dyestuffs from diazotized aromatic amido-ammonium bases and primary alphylamins, and then combining them with phenols, alphylamins, oxy or amido azo dyestuffs, substantially as set forth.



2. As a new product, the brown dyestuff obtained from diazotized meta-trimethyl ammonium phenyl-azo-alpha-naphthylamin and chrysoïdin, being a blackish-brown powder, easily soluble in water with a brown color, which solution is not changed either by alkalies or acids, dissolved by concentrated sulfuric acid with an olive-green color; insoluble in ether and benzene or petroleum ether, but soluble in alcohol, and dyeing tanned and untanned cotton, as well as half-wool, brown in an acid-bath, substantially as set forth.

602,642. **GRATE-BAR AND FURNACE.** GEORGE L. K. MORROW, Detroit, Mich. Filed Apr. 30, 1897. Serial No. 634,515. (No model.)

Claim.—1. In a furnace, a series of inclined grate-bars arranged on opposite sides of the furnace, each of said grate-bars being supported at its lower end on a bar-support having an angular projection fitted in a corresponding groove in said bar, an inclined supporting-plate at the upper ends of said grate-bars approximately in line with the plane of said bars, said plate having engaging lugs or projections adapted to engage in hook-shaped lugs on said bars to hold said bars against vertical displacement but permit a longitudinal and lateral adjustment of the same, substantially as specified.

2. The combination with the angularly-arranged grate-bars having the laterally-projecting shelves on the sides thereof, of the movable bars arranged between the ends of said shelves, said movable bars being supported at each end on operating parts adapted to move the same back and forth through the space between said grate-bars and shelves, the operating parts being so arranged that the movable bars when in any position of their movement shall tend to return by

gravity to their normal positions below the front of said grate-bars, substantially as specified.

3. The combination with the stationary grate-bars and movable bars arranged between the same, means for elevating and depressing the movable bars between the stationary grate-bars, a stationary longitudinal support arranged below said stationary bars, and a bearing-support on each of said movable bars adapted to engage said stationary support and thus hold said movable bars in alinement when in a position of rest, substantially as specified.

4. The combination with a side feeding device and central grate-bar supports, supporting-stands for said feeding device and brace connections from said supporting-stands to said grate-bar supports, inclined grate-bars extending from said fuel-feeding device to said supports, a rock-shaft journaled in bearings in said brace connections, and an oscillating beam or bar journaled in bearings in said supporting-stand, and movable bars fitted between said grate-bars and connected to said oscillating beam and rock-shaft at the respective ends thereof, substantially as specified.

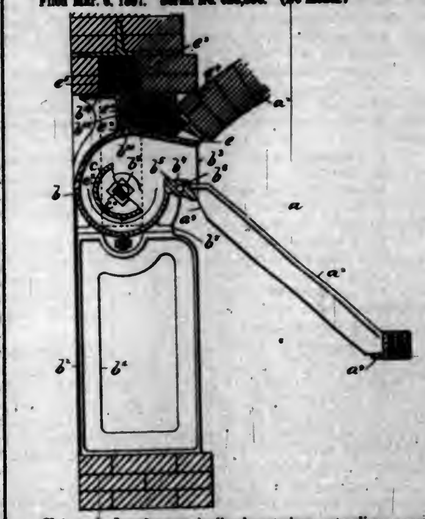
5. The combination with the inclined grate-bars and the central supports therefor, of the clinker-crushers journaled between said supports, said clinker-crushers each consisting of toothed crushers arranged in pairs, the respective crushers of each pair having oppositely-projecting cranks, and vibrating bars connecting all the cranks on the respective sides of said supports, and an oscillating beam connected to said vibrating bars, and means for communicating power to said beam, substantially as and for the purpose specified.

6. The combination with the feeding device, inclined grate-bars extending therefrom inwardly and downwardly to the center of the furnace and supported on longitudinal supports, movable bars having oscillating devices connected thereto, said movable bars being arranged between said grate-bars, rotary crushers journaled between said supports, crank-shafts on said crushers extending in opposite directions, and vibrating bars connected to said crank-shafts, an oscillating beam connected to said vibrating bars, and connecting devices by which said feeding devices, said oscillating bars and said crushers are operated in unison, substantially as and for the purpose specified.

7. The combination with the inclined grates, of the central grate-supports, the rotary crushers arranged between said supports, crank-shafts extending in opposite directions from said crushers, said crank-shafts being of gradually-decreasing length from front to rear, vibrating bars connected to said crank-shafts, and means for alternately reciprocating said bars, substantially as and for the purpose specified.

8. The combination with the grate-bar supports, the crushers located between the same, the movable toothed plates arranged at the front and rear of said grate-bar supports and adapted to act in conjunction with said crushers, substantially as specified.

9. The combination with the rotary crushers, the vibrating bars connected to oppositely-arranged crank shafts on said crushers, and an oscillating beam connected to said bars, of a removable lever-arm connected to said oscillating beam, said lever-arm having a reduced area in cross-section adapted to break under undue strain, substantially as specified.



10. The combination with the inclined grates, the longitudinal grate-supports, the spacing and supporting block at one end of said supports, a stud in said supporting-block, an oscillating plate journaled on said stud, vibrating bars extending from said oscillating beam to oppositely-arranged crank-shafts extending in opposite directions from said crank-supports, clinker-crushers on said crank-shafts, and a hearth-plate arranged above said spacing and supporting block and said oscillating beam, substantially as specified.

11. The combination with the inclined grate-bars, an inclined supporting-plate for the upper ends thereof, said plate being provided with a series of projecting lugs alternating with a series of spaces, hook-shaped projections on said grate-bars adapted to be inserted in the spaces between said lugs and when moved laterally to engage said lugs and hold said grate-bars against vertical displacement while permitting longitudinal expansion and contraction thereof, substantially as specified.

12. The combination with the upper grate-bar supports and the supporting-stands, the longitudinally-extending ribs arranged on said grate-bar supports and below the same, the oscillating beam supported in bearings in said stands and having the circular rib connected thereto and arranged adjacent to said longitudinal stationary rib, in combination with the movable bars which are journaled on the rib of said movable beam and provided with bearings adapted to engage with said stationary rib, substantially as and for the purpose specified.

13. The combination with the stationary grate-bars and the movable bars between the same, oscillating devices connected at each end to said movable bars to cause the same to reciprocate between the stationary bars, and stationary projections or supports below the respective ends of said movable bars, said stationary supports and movable bars having intereugaging projections adapted to receive and support said bars in line in assembling said movable bars and their connecting parts, substantially as specified.

602,648. FURNACE. Gustave L. K. Meerow, Detroit, Mich. Filed Mar. 6, 1897. Serial No. 626,596. (No model.)

Claim.—1. In a furnace, inclined grate-bars extending upwardly and outwardly toward the sides of said furnace, a feeding device arranged on each side of said furnace on the outside of and adjacent to the upper ends of said inclined grate-bars, said feeding device consisting of a screw conveyer arranged in a conveyer-box extending longitudinally along said furnace, said conveyer being gradually increased in diameter to reduce the carrying capacity, while the conveyer-box is increased in diameter to form a substantially uniform clearance, and a coking shelf or chamber between said conveyer and grate-bars, substantially as specified.

2. The combination with the inclined grate-bars, of a feeding-conveyer having a central hub or sleeve of a gradually-increasing diameter and the conveyer flights or flanges of a uniform diameter, and a conveyer-box of gradually-increasing diameter, of a coking shelf or chamber arranged between said conveyer and said inclined grates, substantially as specified.

3. The combination with the inclined grates, and a screw conveyer, a conveyer-box in which said conveyer is located, a coking shelf or arch between said conveyer and the grates, a stationary rib or ledge on said shelf, and an opening adjacent to the end of said shelf or arch, substantially as and for the purpose specified.

4. In a furnace, the combination with a conveyer-box extending into or adjacent to said furnace, a hopper located on the outside of said furnace, a contracted neck or throat between said hopper and conveyer-box, said conveyer being formed with flights of a uniform carrying capacity at a point opposite the contracted throat, at which point the carrying capacity is reduced by reducing the diameter of said flights, the carrying capacity of said conveyer being further reduced by gradually increasing the diameter of the central hub or shaft of said central conveyer while the diameters of the flights remain uniform, substantially as specified.

5. The combination with a conveyer-box, a conveyer mounted therein, said conveyer having flights of a uniform diameter in said box, the central hub or shaft of said conveyer being gradually increased in diameter to reduce the carrying capacity, the conveyer-box being increased in diameter to form a substantially uniform clearance between the bottom of said conveyer-hub and the bottom of said conveyer-box, substantially as specified.

6. The combination with the conveyer and the conveyer-box, of a hopper as described, gear arranged on the end of said hopper for driving said conveyer, and a lid or door hinged to said hopper above said gear and adapted to turn down and form a cover for said gear, substantially as specified.

7. The combination with the conveyer and a conveyer-box, of an air-trunk, one wall of which constitutes a portion of said conveyer-box and the other wall a support for a fire-arch, the engaging surfaces of said air-trunk and conveyer-box being formed with intermeshing devices as described, and twyer-openings in said air-trunk arranged slightly above and in front of the discharge from said conveyer-box, substantially as specified.

8. The combination with the inclined grates, a conveyer-box arranged adjacent to the upper end of said inclined grates, a conveyer having a gradually-reduced carrying capacity in said conveyer-box, a coking shelf or chamber between said conveyer and said grates, a rib or ledge between said conveyer and shelf and opening adjacent to the end of said shelf, an air-trunk, one side of which forms a portion of said conveyer box or chamber and twyer-openings from said air-trunk immediately above and in front of said coking-chamber, substantially as specified.

9. In a furnace having inclined grates and a fire-arch as described, a feeding device arranged between said grates and arch, an air-trunk having twyer-openings adjacent to said arch, said air-trunk being adapted to support said arch and having the walls thereof cut away to form a heating connection between said arch and air-trunk, substantially as specified.

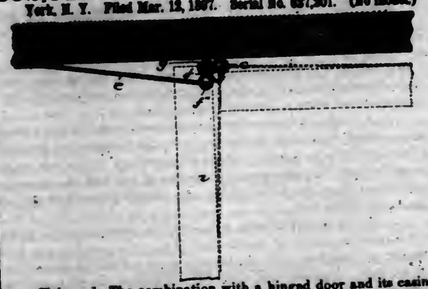
10. The combination with the feeding-conveyer and the conveyer-box, a shaft extending through said conveyer-box, a gear journaled on said shaft, a clutch-collar secured to said shaft adjacent to said gear and having ratchet-teeth as described, and a pawl adapted to engage and disengage said ratchet-teeth, substantially as and for the purpose specified.

11. The combination with the feeding-conveyer and its supports, a worm-gear journaled loosely on the conveyer-shaft, and a worm to engage said gear, a ratchet-wheel secured to said shaft, and a pawl to engage said ratchet, substantially as and for the purpose specified.

12. The combination with the feeding-conveyer and the coking-chamber adjacent thereto, an air-trunk having twyer-openings arranged adjacent to said coking-chamber, air-flues extending from the furnace-front and through the furnace-walls so as to communicate with the opposite ends of said air-trunk, and means at the furnace-front for regulating the openings to said flues, substantially as specified.

13. The combination in a furnace with the conveyer and the conveyer-box, an air-trunk arranged adjacent thereto having twyer-openings as described, an air-flue extending from the furnace-front through the furnace-walls and adjacent to said conveyer to an air-chamber formed at the rear of said conveyer-box, and an opening from said air-chamber into the air-trunk, substantially as specified.

14. The combination with a conveyer-box and a hopper as described, a conveyer extending through said box and into said hopper and having a shaft journaled at the respective ends in said conveyer-box and hopper, a gear mounted adjacent to said hopper and turning loosely on said shaft, a clutch-collar secured to said shaft adjacent to said gear and having ratchet-teeth as described, said clutch-collar being formed with polygonal sides to receive a wrench, a pawl on said gear to engage said ratchet-teeth, and means for rotating said gear, substantially as specified.



15. The combination with the conveyer and a conveyer-shaft, a worm-gear arranged loosely on said shaft, a ratchet-wheel secured rigidly to said shaft, and a pawl on said gear to engage said ratchet-wheel, a driving-shaft having a worm to engage said worm-gear, said worm being mounted loosely on said shaft, and a clutch splined to said shaft and adapted to be moved into or out of engagement with said worm, substantially as specified.

602,644. HANDLE FOR STOVE-DAMPERS. John J. Otaar, Eau Claire, Wis. Filed Mar. 13, 1897. Serial No. 627,351. (No model.)

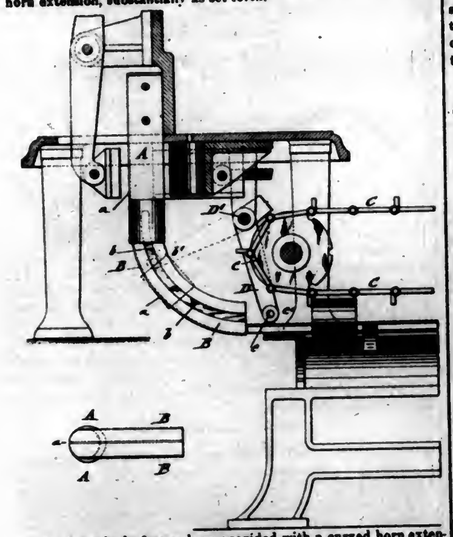
Claim.—A device of the class described designed to be applied to a stove-damper after the handle thereof has been destroyed and comprising a body portion having a semisocket with a longitudinal frangible portion 10, and a removable section having a semisocket provided with a longitudinal frangible portion 11 arranged contiguous to the frangible portion 10, said body portion and removable section being recessed at 14 adjacent to the inner ends of the frangible portions 10 and 11 to reduce the device and enable the same to clear a stove when the frangible portions are removed, substantially as and for the purpose described.

602,645. DOOR SPRING AND CHECK. Henry Porter, New York, N. Y. Filed Mar. 12, 1897. Serial No. 627,301. (No model.)

Claim.—1. The combination with a hinged door and its casing, of a plate-spring fixedly secured to and having its free end projecting away from the door, and a link secured to the free end of the spring and to a relatively-immovable object, such as the door-frame, the arrangement being such that the free end of the spring passes over and behind the axial line of the hinges of the door, whereby the door is closed and is held open, substantially as described.

2. The combination with a hinged door and its casing, of a plate-spring fixedly secured to and having its free end projecting away from and above the top of the door, and a link secured to the free end of the spring and to a relatively-immovable object, as the door-frame, the arrangement being such that the free end of the spring passes over and behind the axial line of the hinges of the door, whereby the door is closed and is held open, substantially as described.

3. The combination with a hinged door and its frame, of a plate-spring having one end fixed on and movable with the door, and its free end projecting away from and beyond the edge of the door, a fastening device on the door-frame, a link having hooked ends connecting the free end of the spring with a fastening device, the parts being so relatively located that the free end of the spring passes behind the axial line of the hinges of the door, substantially as described.



602,646. PROCESS OF MAKING ALKALINE ACETOSULFANILATE. Carl F. H. Schaeberle and Paul Schwabe, Basle, Switzerland, assignors to F. Hoffmann-La Roche & Co., same place. Filed Apr. 13, 1897. Serial No. 632,997. (Specimens.)

Claim.—The herein-described process for the preparation of a pure alkaline acetosulfanilate for use in medicine, which consists in first acetylizing an alkaline salt of sulfanilic acid by means of glacial acetic acid, and then freeing the product of reaction from free sulfanilic acid and alkaline acetate by means of water and alcohol.

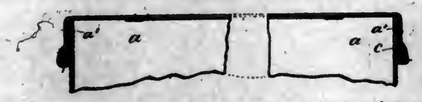
602,647. BORN EXTENSION FOR CAN-BODY-FORMING MACHINES. Richard Strohmeier, New York, N. Y. Filed Mar. 31, 1897. Serial No. 630,110. (No model.)

Claim.—1. A can-body former-horn, provided with a curved horn extension of smaller size than the former-horn, so as to permit the

dropping of the can-body by gravity from the former-horn to the horn extension, substantially as set forth.

2. A can-body former-horn provided with a curved horn extension of somewhat smaller size than the former-horn and provided with flattened sides, substantially as set forth.

3. A can-body former-horn, provided with a curved horn extension of smaller size than the former-horn so as to permit the dropping of the can-body by gravity from the former-horn to the horn extension, the latter having a groove extending in line with the groove of the former-horn, along the outside edge of said horn extension, substantially as set forth.

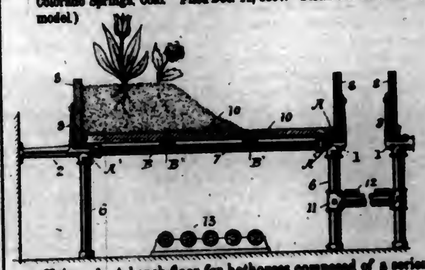


4. The combination with a can-body former-horn, of a curved horn extension made of smaller size than the former-horn so as to permit the dropping of the can-body by gravity from the former-horn to the horn extension, and a carrier mechanism for taking up the can-body from the lower end of the horn extension, substantially as set forth.

5. The combination, with a can-body former-horn, of a curved horn extension made of smaller size than the former-horn, and a transporting mechanism by which the can-body is moved over the lower part of said horn extension after it has moved over the upper part by gravity, substantially as set forth.

6. The combination, with a can-body former-horn, of a curved horn extension made of somewhat smaller size than the former-horn, a transmitting mechanism by which the can-body is moved over the lower portion of the curved extension after it has passed by gravity over the upper portion of the same, and a carrier mechanism by which the can-body is conveyed forward after being delivered by the transporting mechanism, substantially as set forth.

7. The combination, with a horizontal can body former-horn, of clearing-fingers for moving the can-body over said horn, a curved horn extension extending from said former-horn, an oscillating transmitting mechanism for conducting the can-body over the lower portion of the horn extension, and a carrier mechanism for conveying the can-body from the lower end of the horn extension to the side-seam-soldering machine, substantially as set forth.

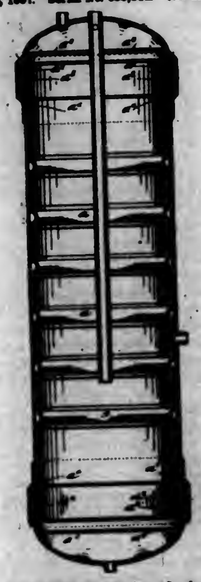


602,648. SHEET-METAL CAN. ARTHUR R. WALLER, Belleville, N. J., assignor to the Burger Manufacturing Company, Hoboken, N. J. Filed June 30, 1897. Serial No. 642,368. (No model.)

Claim.—1. The can-body having an upper edge turned over and flanged in combination with the cover having a rim and flange to set over the double upper edge and flange of the body, a wire in the space between the parts and the parts united by the flanges rolled together into a bead, substantially as set forth.

2. The can-body having an upper edge turned over and flanged in combination with the cover having a rim and flange to set over the double upper edge and flange of the body, and extend beyond said flange, a wire in the space between the parts with its end protruding, and said parts being rigidly connected by bending the edge of the cover-flange over the edge of the body-flange and then rolling the flanges together into a bead, substantially as set forth.

602,649. TILE BENCH FOR HOTHOUSES. WILLIAM P. WIGHT, Colorado Springs, Colo. Filed Dec. 11, 1897. Serial No. 661,490. (No model.)



Claim.—1. A bench-floor for hothouses composed of a series of porous tile-sections made with a convex upper surface and with longitudinal corrugations on the under side, in combination with a suitable supporting structure.

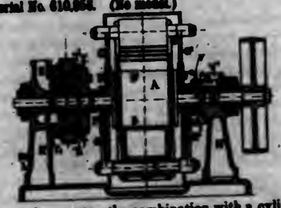
2. In combination with the tile-bed, consisting in the rabbeted bars A', B', of the supporting-framework consisting in the detachable cross-bars 7 and standards 6, connecting corner-pieces 1, having integral braces 2, 3, and side pieces 8, substantially as described.

3. In combination with adjacent benches for hothouses, the interposed walk connected with the respective supporting standards or legs, and vertically adjustable thereon, substantially as and for the purpose set forth.

602,650. RANGE-BOILER. VALENTIN WILHELMI, Paterson, N. J. Filed Oct. 20, 1897. Serial No. 655,811. (No model.)

Claim.—A range-boiler, consisting of a body having a flattened ring portion offset therefrom and of greater diameter than the diameter of said body, the said ring portion being provided with an offset and terminating in a cylindrical rim of substantially the diameter of the body of the boiler and inclined and curved to conform to the shape of the head, a head having an offset rim forming a shouldered flange of greater diameter than the body thereof, the shouldered flange of the head overlapping said flattened ring portion, and an exterior band extending over the said ring portion and the overlapping portion of the head, the upper and lower edges of said band fitting over the shoulders on said ring portion and flange so as to form a three-ply joint, substantially as set forth.

602,651. SCREW-PROPELLER. JAMES M. ADAM, Glasgow, Scotland. Filed Sept. 15, 1896. Serial No. 605,909. (Model.)



Claim.—1. A vane or propeller-blade having its body curved to conform to the surface of a conic figure attached to the hub about its perigee edge, said blade extending outward from the hub nearly parallel to the apogee edge of the figure according to pitch ratios determined substantially as set forth.

2. In combination the hub and blades carried thereby, said blades being each shaped to conform laterally to a conic surface which is inclined to the axis of its gyration and superficially to the outlines defined by the required pitch ratios determined substantially as described.

3. In combination the hub and the blade carried thereby, said blade being shaped to conform to the surface of a cone whose axis is inclined to the axis of rotation, and whose apex coincides with or touches the axis of said hub, substantially as described.

602,652. MOTOR. PAUL AUBRY, Paris, France. Filed Oct. 26, 1896. Serial No. 610,254. (No model.)

Claim.—1. In a motor, the combination with a cylinder, of a rotatable part actuated by said cylinder, a valve-disk located adjacent to said rotatable part and carrying a gear meshing with a gear located on the rotatable part, a stationary gear with which the gear on the valve-disk meshes, and valve-ports in said disk and rotatable part having communication with said cylinder, substantially as described.

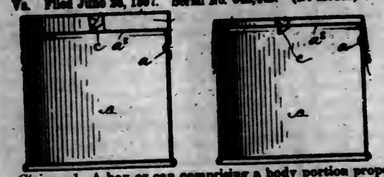
2. In a motor, the combination with a cylinder, of a rotatable part actuated thereby and having communication with said cylinder, a bevel-gear carried by said rotatable part, a rotating valve-disk provided with inlet and exhaust ports and carrying upon its periphery a gear meshing with said bevel-gear, a stationary support abutting against said rotating disk and provided with inlet and exhaust ports, and a bevel-gear carried by said support and meshing with the gear on the valve-disk, substantially as described.

3. In a motor, the combination of a rotatable cylinder mounted upon a shaft adapted to rotate therewith, a reciprocating piston in said cylinder, a rotating valve mechanism provided with inlet and exhaust ports, a hollow extension from said cylinder to establish communication with said valve mechanism, an eccentric located upon a fixed support between said valve mechanism and cylinder, and means connecting said piston and eccentric, substantially as described.

602,653. BOX OR CAN. ALEXANDER CAMERON, Jr., Richmond, Va. Filed June 15, 1897. Serial No. 640,242. (No model.)

Claim.—1. A box or can comprising a body portion having studs or projections near its upper edge and a permanent tagger-tin cover, a removable outer cover provided with a knife or cutter and vertical slots having lateral extensions and a peripheral groove, substantially as described.

2. A box or can comprising a body portion provided with engaging means and a tagger cover, a removable outer cover provided with a knife or cutter having a shoulder or shoulders to engage the under side of the tagger tin, and means on the cover for engaging the engaging means on the body of the can, substantially as described.



3. A box or can comprising in its construction a body portion having projections or studs near its upper edge and having a tagger top and a removable outer cover having a knife or cutter and provided with means engaging the studs for preventing the cover and the cutter carried thereby from coming in contact with the tagger cover during transportation, said means when engaging the said studs also locking the cover against being moved up and down longitudinally of the body of the can, substantially as described.

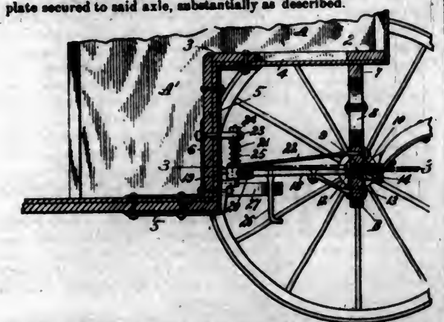
4. A box or can comprising in its construction a body portion proper provided with studs or projections on its outer surface near its upper edge having a permanent tagger top, and a removable outer cover having a cutter and provided on its flange with a peripheral groove and vertical slots having lateral extensions adapted to receive the said studs, substantially as described.

5. A box or can comprising a body portion having studs or projections on its outer surface near its upper edge and a permanent tagger cover or top, and a removable outer cover having a vertical flange and provided with a stationary knife or cutter, and on its vertical flange with means for engaging the studs on the body of the can and holding the cutter, during transportation, out of engagement with the tagger top, the construction and arrangement being such that, when desired, the cutter can be brought into contact with the tagger top and the cover revolved to cut out the tagger top, substantially as described.

6. A box or can comprising a body portion having studs or projections on its outer surface near its upper edge and a permanent tagger cover or top, and a removal outer cover having a vertical flange and provided with a stationary knife or cutter and on its vertical flange with a peripheral groove, and means for engaging the studs on the body of the can and holding the cutter, during transportation, out of engagement with the tagger top, the construction and arrangement being such, that, when desired, the cutter can be brought into contact with the tagger top and the studs caused to enter the peripheral groove, and by revolving the cover the tagger top will be cut out, the peripheral groove also serving with the studs, as a means of locking the removable cover on, after the tagger top has been cut out, substantially as described.

602,654. BOX OR CAN. ALEXANDER CAMERON, Jr., Richmond, Va. Filed June 26, 1897. Serial No. 642,443. (No model.)

Claim.—1. A box or can comprising a body portion proper and an outer cover, the body portion proper being provided with a permanent thin top and the outer cover being provided with spring-tongues, and one of the parts constituting the box or can being provided with a stud-engaging member and another part of the can with a receiving-recess member, one set of the engaging members being formed on the spring-tongues on the cover at suitable points, and the other set of engaging members being provided on the body proper of the can, the cover also being provided on its inside with a cutter or cutters, substantially as described.

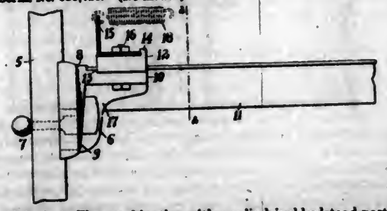


2. A box or can provided on its outer surface near its upper edge with sockets having a permanent thin top and a removable cover having a flange of greater depth than usual provided with spring-studs, and a cutter or cutters on the under side of the cover, said cutter or cutters being provided with a shoulder or shoulders, substantially as described.

602,655. VEHICLE RUNNING-GEAR. JAMES J. CASEY, Holyoke, Mass. Filed Dec. 20, 1897. Serial No. 664,022. (No model.)

Claim.—1. Running-gear for the front axle of vehicles having drop-down bodies, comprising an axle, a segment-shaped plate secured to said axle, a reach located at right angles to said axle and extending therefrom toward said wagon-body, a vertical king-bolt supported on said body with which bolt said reach engages and on which it has vertical movements coinciding with the vertical movement of said axle, in combination with a spring located between said

proximity to the said upturned edge and the said rail, and means for

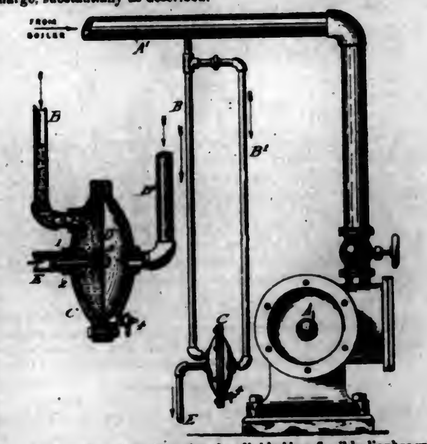


axle and the forward end of said wagon-body, a plate, a head-block to which said plate is secured in position to bear on said segmental plate secured to said axle, substantially as described.

2. In a vehicle having a drop-down body, running-gear for the front end thereof consisting of a spring, one side of which is secured to said body, a head-block to which the opposite side of said spring is secured, a plate on the under side of said head-block, a king-bolt supported in proximity to the end of the drop-down portion of said body, a brace extending from said head-block to said king-bolt, and having a sliding movement thereon, a spring between the upper end of said king-bolt and the top of said brace, combined with an axle, a segment-shaped plate secured thereto, a reach secured by one end to said axle and by its opposite end to said king-bolt on which it has a vertical sliding movement, and a hook on the plate secured to said head-block, for engaging the edge of said segment-shaped plate, substantially as described.

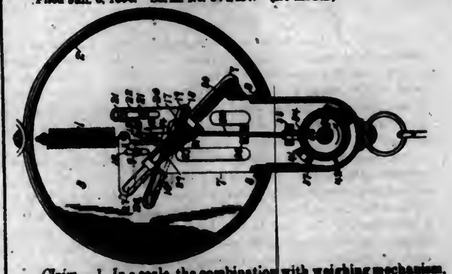
3. In a vehicle having a drop-down body, running-gear for the forward end thereof consisting of a king-bolt located on the end of said drop-down portion of said body, an axle, a segment-shaped plate secured to said axle, a reach extending between said axle and said king-bolt and engaging the latter, a head-block, a spring for supporting the forward end of said wagon-body, and interposed between said head-block and said body, a brace secured to and extending from said head-lock to said king-bolt and sliding freely thereon, a plate on said head-block for bearing on said segmental-shaped plate and suitable braces from the ends of said segment-shaped plate to said axle, substantially as described.

602,656. BEDSTEAD-BRACE. ADOLF G. DUWE, Brooklyn, N. Y., assignor to Oscar R. A. Wiesener, same place. Filed Nov. 26, 1897. Serial No. 659,729. (No model.)



Claim.—1. The combination with a cylindrical bedstead-post, of a hook 6, projecting therefrom, a brace vertically grooved to fit said post and provided with a slot to receive the head of said hook and tapered downwardly at the point of engagement with the hook to create a wedging action thereon said slot being below the horizontal ledge 10, of said brace and said ledge being connected to the vertical portion by a web which serves to conceal the head of said hook, the angle-bar side rail 11, resting upon said ledge, the flanged corner-block 12, resting on the side rail, the end rail 15, resting on said block, and a bolt for securing the rails and corner-block rigidly to said brace, substantially as and for the purpose set forth.

2. The combination with the brace provided with the ledge 10, of the angle-bar side rail fitted thereto, the corner-block resting on said rail and having a flange bearing against the edge thereof and having an upwardly-projecting flange at right angles to the other flange, the angular cross-rail resting upon said block and against the upper flange, and a bolt passing through all of said parts, substantially as and for the purpose set forth.



602,657. STEAM-TRAP. CHARLES E. FRANKLIN, San Francisco, Cal. Filed June 18, 1897. Serial No. 641,333. (No model.)

Claim.—1. In a steam-trap, the combination with a chamber having a flexible diaphragm which divides it into two parts, of a steam-inlet to one part of said chamber, and a steam and water inlet to the other part, a discharge-opening from said chamber, and a valve or stud carried by the diaphragm for opening and closing the said discharge, substantially as described.

2. In combination with a chamber divided by a flexible diaphragm, a steam-inlet to one side of said chamber, a steam and water inlet to the other side, a discharge-opening from said chamber having a hollow nipple projecting into said chamber, and a stud upon the diaphragm adapted to close and open the end of said nipple, substantially as described.

602,658. PRICE-SCALE. FREDERICK I. FULLER, Trenton, N. J. Filed Jan. 6, 1896. Serial No. 574,457. (No model.)

Claim.—1. In a scale, the combination with weighing mechanism, of a computing mechanism including a lever fulcrumed in the scale-frame, an actuator engaging said lever carried by and moving with the weighing mechanism, and means also carried by and moving with the weighing mechanism for adjusting said actuator, substantially as described.

2. In a scale, the combination with weighing mechanism, of a computing mechanism including a lever fulcrumed on the scale-frame, an actuator engaging said lever carried by and moving with the weighing mechanism, and means also carried by and moving with the weighing mechanism for adjusting said actuator along the lever to and from its fulcrum, substantially as described.

3. In a scale, the combination with weighing mechanism, of a computing mechanism including a lever fulcrumed in the scale-frame, said lever being upwardly inclined in the normal position of the weighing mechanism, an actuator engaging said lever carried by and moving with the weighing mechanism, and means also carried by and moving with the weighing mechanism for adjusting said actuator along the lever to and from its fulcrum, substantially as described.

4. In a scale, the combination with weighing mechanism including a rectilinearly-movable member, of a computing mechanism including a lever fulcrumed in the scale-frame, and an adjustable actuator therefor bodily mounted upon and movable with the rectilinearly-movable member, substantially as described.

5. In a scale, the combination with weighing mechanism including a rectilinearly-movable member, of a computing mechanism including a lever fulcrumed in the scale-frame, an adjustable actuator therefor bodily mounted upon and movable with the rectilinearly-movable member, and means for adjusting said actuator along the lever to and from its fulcrum, substantially as described.

6. In a scale, the combination with weighing mechanism, of a computing mechanism including a lever fulcrumed in the scale-frame, an actuating-pin engaging said lever carried by and moving with the weighing mechanism, and means also carried by and moving with the weighing mechanism for adjusting said actuating-pin along the lever to and from its fulcrum, substantially as described.

7. In a scale, the combination with weighing mechanism, of a computing mechanism including a lever fulcrumed on the scale-frame, said lever being upwardly inclined in the normal position of the weighing mechanism, an actuating-pin engaging said lever carried by and moving with the weighing mechanism, and means also carried by and moving with the weighing mechanism for adjusting said actuating-pin along the lever to and from its fulcrum, substantially as described.

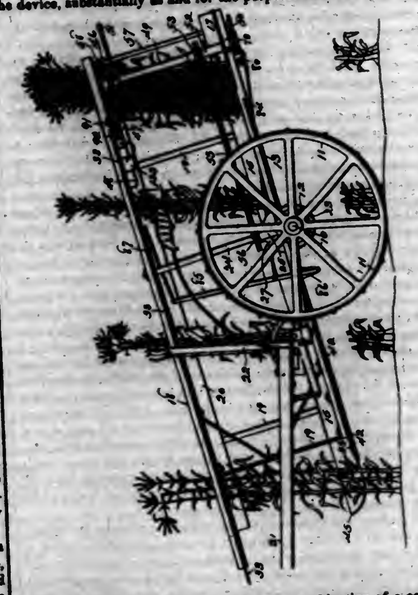
8. In a scale, the combination with weighing mechanism, of a computing mechanism, an actuating-pin therefor carried by and moving with the weighing mechanism, and means also carried by and moving with the weighing mechanism for adjusting said actuating-pin, substantially as described.

9. In a scale, the combination with weighing mechanism, of a computing mechanism, an actuating-pin therefor carried by and moving with the weighing mechanism and means also carried by and moving with the weighing mechanism for adjusting said actuating-pin transversely to the line of movement of the weighing mechanism, substantially as described.

10. In a scale, the combination with weighing mechanism, of a computing mechanism including a lever fulcrumed in the scale-frame, a rack-bar carried by and moving with the weighing mechanism, said rack-bar being parallel with said lever in the normal position of the weighing mechanism, an actuating-pin carried by the rack-bar engaging said lever, and gearing for moving said rack-bar longitudinally to adjust the actuating-pin, substantially as described.

11. In a scale, the combination with weighing mechanism, of a computing mechanism including a lever fulcrumed in the scale-frame, a rack-bar carried by and moving with the weighing mechanism, said rack-bar being parallel with said lever in the normal position of the weighing mechanism, an actuating-pin carried by the rack-bar engaging said lever, and gearing also carried by and moving with the weighing mechanism for moving said rack-bar longitudinally to adjust the actuating-pin, substantially as described.

12. In a scale, the combination with weighing mechanism, of a price-indicator, a rack for rotating the same, a lever fulcrumed in the scale-frame and engaging said rack, an actuator carried by and moving with the weighing mechanism engaging said lever, and means also carried by and moving with the weighing mechanism for adjusting said actuator, substantially as described.



13. In a scale, the combination with weighing mechanism, of a price-indicator, a rack for rotating the same, a lever fulcrumed in the scale-frame engaging said rack, an actuator carried by and moving with the weighing mechanism engaging said lever, and means also carried by and moving with the weighing mechanism for adjusting said actuator along the lever to and from its fulcrum, substantially as described.

14. The combination with a computing mechanism, of rod 7, rack-bar 28 sliding on and carried by said rod, actuator 27 carried by said rack-bar and engaging the computing mechanism, and gearing carried by rod 7 for rotating the worm, substantially as described.

602,659. CORN HARVESTER AND BINDER. WILLIAM H. GRAY, Eddyville, Iowa. Filed Mar. 22, 1897. Serial No. 628,268. (No model.)

Claim.—1. In a corn-harvester, the combination with means for severing cornstalks, of a continuous hollow track, a flange projecting laterally from one side of the track, an upturned edge on the flange, a second like track above the first in a parallel plane, a guide-rail supported on the machine-frame directly above the upturned edge of the lower flange, and an endless conveyer in each of said tracks, laterally-projecting arms on the conveyer to extend through the tracks and in proximity to said flange and rail, and means for driving the conveyer by means of power derived from the traction-wheels of the machine.

2. In a corn-harvester, the combination with means for severing cornstalks, of a lower hollow track having a laterally-widened portion therein near its rear end, a flange projecting laterally from one side of the hollow track, an upturned edge on the flange, a second hollow track above the first, also having a widened portion therein near its rear end, a guide-rail supported adjacent to the upper track and directly above the upturned edge of the lower track, a conveyer-chain in each track of a length greater than the distance around the track, so that they must kink or fold at one point, laterally-projecting arms on the chain to project outwardly through the track into proximity to the said upturned edge and the said rail, and means for driving both chains by power derived from the traction-wheels of the device, substantially as and for the purposes stated.

3. In a corn-harvester or the like, the combination of a continuous hollow track, an inwardly-inclined portion 34 near the rear end of the track, a curved portion 35 at one end of the inclined portion 34, an endless conveyer within the track of a length greater than the distance around the track, and composed of a series of links, rollers at the ends of the links to approximately fill the narrow portion of the track, and a laterally-projecting arm on each alternate link to project outwardly through the outer edge of the narrow portion of the track, substantially as and for the purposes stated.

4. In a corn-harvester or the like, the combination of a continuous hollow track, an inwardly-inclined portion 34 near the rear end of the track, a curved portion 35 at one end of the inclined portion 34, an endless conveyer within the track of a length greater than the distance around the track, and composed of a series of links, rollers at the ends of the links to approximately fill the narrow portion of the track, and a laterally-projecting arm on each alternate link to project outwardly through the outer edge of the narrow portion of the track, and a stop 37ª fixed to the base of the interior of the track at a point adjacent to the incline 34.

5. In a corn-harvester, the combination with means for severing cornstalks, of a conveyer designed to carry the stalks to the rear of the machine in an upright position, and composed of two hollow tracks one above the other, each having a widened portion near its rear end, stationary guides supported in the machine-frame in substantially the same planes as the tracks, a platform adjacent to the lower track to receive stalks from the cutting mechanism, a conveyer-chain in each track of a length greater than the distance around the track, and composed of a series of links, rollers in the ends of the links to approximately fill the narrow portions of the tracks, a laterally-projecting arm on each alternate link of the conveyers, a shaft rotatably mounted to extend through the spaces within the hollow tracks, a wheel on its lower end bowed upwardly in its central portion and having its lower edge admitted into one side of the lower track and provided with pockets designed to engage the rollers of the conveyer a bevel gear-wheel fixed to the lower end of the said shaft within the said wheel, a second bevel gear-wheel meshed therewith and fixed to the axle of the traction-wheels, and a wheel fixed to the upper end of the said shaft and provided with pockets on its edge designed to engage the rollers on the upper conveyer, all arranged and combined substantially in the manner set forth and for the purposes stated.

6. In a corn-harvester, the combination with a hollow continuous track, and an endless conveyer-chain arranged for constant rotation therein during the advance of the machine, of a wheel rotatably mounted within the forward tarn of the track, a series of pockets formed on the top surface of the said wheel to engage the endless

conveyer and to be rotated thereby, a series of curved knife-blades fixed to the under surface of the said wheel to project beyond the track, and a stationary knife-blade fixed to the track to coact with the rotatable blades, substantially in the manner set forth and for the purposes stated.

7. In a corn harvester and binder or the like, a device for imparting motion to a binding-needle and a discharge-arm when a shock of corn has been gathered on the machine-platform, comprising an upright shaft rotatably mounted, a binding-needle fixed to its upper end, an arm fixed to its lower end, a sleeve rotatably mounted on the shaft, a discharge arm fixed to the upper end of the sleeve, a disk fixed to the lower end of the sleeve and having a cam-groove therein, a second sleeve rotatably mounted upon the first, means for rotating this second sleeve during the advance of the machine, a ratchet-wheel fixed to the lower end of the said sleeve, a spring-actuated pawl fixed to the upper surface of the said disk to be normally held by its spring in engagement with the said ratchet-wheel, a lever pivoted to a stationary support, a roller pivoted to the lever and inserted in the said cam-groove, a second lever pivoted to the first and arranged for engagement with the end of the said spring-actuated pawl, a spring connecting the said levers and arranged to hold the pawl-engaging lever in engagement with its pawl, sprocket-teeth on the periphery of the said disk, two idlers located adjacent to the said sprocket-teeth, a sprocket-wheel mounted on the said idlers to engage the said sprocket-teeth, and a link pivoted to the said sprocket-chain and also to the arm on the binding-needle shaft, a yielding pressure device fixed to a stationary support to engage the arm of the binding-needle when at rest, to thereby hold the said disk in such a manner as to overcome the force of the spring belonging to the said spring-actuating pawl, and thereby hold the spring-actuated pawl out of engagement with its ratchet, a supporting-shaft rotatably mounted, a stalk-supporting arm fixed to its upper end, an arm fixed to its lower end, and a spring fixed to the said arm and also to the pawl-engaging lever, all arranged and combined substantially in the manner set forth and for the purposes stated.

8. In a corn harvester and binder or the like, a device for imparting motion to a binding-needle and a discharge-arm when a shock of corn has been gathered on the machine-platform, comprising an upright shaft rotatably mounted, a binding-needle fixed to its upper end, an arm fixed to its lower end, a sleeve rotatably mounted on the shaft, a discharge-arm fixed to the upper end of the sleeve, a disk fixed to the lower end of the sleeve and having a cam-groove therein, a second sleeve rotatably mounted upon the first, means for rotating this second sleeve during the advance of the machine, a ratchet-wheel fixed to the lower end of the said sleeve, a spring-actuated pawl fixed to the upper surface of the said disk to be normally held by its spring in engagement with the said ratchet-wheel, a lever pivoted to a stationary support, a roller pivoted to the lever and inserted in the said cam-groove, a second lever pivoted to the first and arranged for engagement with the end of the said spring-actuated pawl, a spring connecting the said levers and arranged to hold the pawl-engaging lever in engagement with its pawl, sprocket-teeth on the periphery of the said disk, two idlers located adjacent to the said sprocket-teeth, a sprocket-wheel mounted on the said idlers to engage the said sprocket-teeth, and a link pivoted to the said sprocket-chain and also to the arm on the binding-needle shaft, a lever fulcrumed to a stationary support and curved first in the direction of the shaft of the binding-needle and then concentric with the binding-needle, a groove in the top surface of the said lever, a roller on the end of the arm of the binding-needle shaft to enter said groove, and a rod pivoted to the outer end of the lever arranged to actuate a slide, a yielding pressure device fixed to a stationary support to engage the arm of the binding-needle when at rest, to thereby hold the said disk in such a manner as to overcome the force of the spring belonging to the said spring-actuating pawl, and to thereby hold the spring-actuated pawl out of engagement with its ratchet, a supporting-shaft rotatably mounted, a stalk-supporting arm fixed to its upper end, an arm fixed to its lower end, and a spring fixed to the said arm and also to the pawl-engaging lever, all arranged and combined substantially in the manner set forth and for the purpose stated.

9. In a corn harvester or binder or the like, a device for imparting motion to a binding-needle and a discharge-arm when a shock of corn has been gathered on the machine-platform, comprising an upright shaft rotatably mounted, a binding-needle fixed to its upper end, an arm fixed to its lower end, a sleeve rotatably mounted on the shaft, a discharge-arm fixed to the upper end of the sleeve, a disk fixed to the lower end of the sleeve and having a cam-groove therein, a second sleeve rotatably mounted upon the first, means for rotating this second sleeve during the advance of the machine, a ratchet-wheel fixed to the lower end of the said sleeve, a spring-actuated pawl fixed to the upper surface of the said disk to be normally held by its spring in engagement with the said ratchet-wheel, a lever pivoted to a stationary support, a roller pivoted to the lever and inserted in the said cam-groove, a second lever pivoted to the first and arranged for engagement with the end of the said spring-actuated pawl, a spring connecting the said levers and arranged to hold the pawl-engaging lever in engagement with its pawl, sprocket-teeth on the periphery of the said disk, two idlers located adjacent to the said sprocket-teeth, a sprocket-wheel mounted on the said idlers to engage the said sprocket-teeth, and a link pivoted to the said sprocket-chain and also to the arm on the binding-needle shaft, a lever fulcrumed to a stationary support and curved first in the direction of the shaft of the binding-needle and then concentric with the binding-needle, a groove in the top surface of the said lever, a roller on the end of the arm of the binding-needle shaft to enter said groove, and a rod pivoted to the outer end of the lever arranged to actuate a slide, a yielding pressure device fixed to a stationary support to engage the arm of the binding-needle when at rest, to thereby hold the said disk in such a manner as to overcome the force of the spring belonging to the said spring-actuating pawl, and to thereby hold the spring-actuated pawl out of engagement with its ratchet, a supporting-shaft rotatably mounted, a stalk-supporting arm fixed to its upper end, an arm fixed to its lower end, and a spring fixed to the said arm and also to the pawl-engaging lever, all arranged and combined substantially in the manner set forth and for the purpose stated.

10. In a grain-binder, the combination of a shaft rotatably mounted, a binding-needle fixed to its upper end, an arm fixed to its lower end, a sprocket-wheel loosely mounted on its lower end, means arranged to be set in motion by the pressure of a shock of corn upon the binding-needle whereby the said sprocket-wheel will be clutched to a constantly-rotating part, two idlers mounted adjacent to the sprocket-wheel, a sprocket-chain passed around the idlers to engage a segment of the said sprocket-wheel, and a link pivoted to a part of the said sprocket-chain and also to the arm on the lower end of the needle-shaft, substantially in the manner set forth and for the purpose stated.

11. In a grain-binder, the combination of a shaft rotatably mounted, a binding-needle fixed to its upper end, an arm fixed to its lower end, a sprocket-wheel loosely mounted on its lower end, means arranged to be set in motion by the pressure of a shock of corn on the binding-needle whereby the said sprocket-wheel may be clutched to a constantly-rotating part, and means for rotating the said sprocket-wheel one revolution, and two idlers mounted adjacent to the sprocket-wheel, a sprocket-chain passed around the idlers to engage a segment of the said sprocket-wheel, and a link pivoted to a part of the said sprocket-chain and also to the arm on the lower end of the needle-shaft, a lever pivoted to a stationary support and extended first in the direction of the shaft of the binding-needle, and then in a direction concentric with the shaft, a groove in its top surface, a roller on the outer end of the arm on the binding-needle shaft to enter said groove, and a rod pivoted to the outer end of the said lever for actuating a slide, substantially as and for the purposes stated.

12. In a corn-binder, the combination of a binder-needle, means for moving it across the binding-platform and then returning it, a shaft rotatably mounted within the needle, a disk on the shaft within the needle, a fixed finger on the disk to project beyond the side of the needle, a movable finger pivoted to the fixed finger, a pinion on the shaft, a rack slidingly mounted within the needle and in mesh with the pinion, a pitman connected with the rack, a lever pivoted to the pitman, and means whereby said lever is moved relative to the needle to thereby rotate the shaft on which the knotter-fingers are fixed.

13. In a corn-binder, the combination of a binder-needle, means for moving it across the binding-platform and then returning it, a shaft within the needle, a knotter on the shaft to project through the side of the needle, a pinion connected with the said knotter, a rack slidingly mounted with the needle and in mesh with the pinion, a pitman connected with the rack, a lever pivoted to the arm of the binder-needle and extended through a slot in the needle proper, and having its free end connected with the said pitman, a roller on said lever a stop fixed to a stationary support arranged to engage the said lever when the binder-needle approaches the outer limit of its movement, to thereby force the lever rearwardly within the needle, and a cam-guide fixed to a stationary support, substantially segmental in shape, and having on its cam-surface a part concentric with the said shaft, an outwardly-inclined shoulder, a second concentric part flush with the said shoulder, a second like shoulder, and a third concentrically-arranged segment beyond it, said cam being designed to be engaged by the said roller to control the movement of the lever relative to the needle, substantially as and for the purposes stated.

14. In a corn-binder, the combination of a binder-needle, means for moving it across the binding-platform and then returning it, a shaft rotatably mounted within the needle, a disk on the shaft within the needle, a fixed finger on the disk to project beyond the side of the needle, a movable finger pivoted to the fixed finger, a pinion on the shaft, a rack slidingly mounted within the needle and in mesh with the pinion, having two notches in its upper surfaces separated by the distance of its length of movement, a leaf-spring fixed to the inner surface of the needle, and having a lug thereon to engage said notches to aid in limiting the movement of the rack, a pitman connected with the rack, a lever pivoted to the pitman, and means whereby said lever is moved relative to the needle to thereby rotate the shaft on which the knotter-fingers are fixed.

15. In a binding device the combination with a needle arranged to carry the twine and to be moved in the segment of a circle, of a knotting device carried by the needle to project from one side thereof, a plate fixed to the machine-frame, and having an opening therein through which the needle must pass, and also having a slot connected with the opening through which the twine may pass, an automatic twine-holder located adjacent to the needle when the needle is at the outward limit of its stroke to hold the twine, an arm pivoted to a stationary support, and having a hook on its end, a lug on the said arm arranged in the path of the end of the needle and so positioned that the needle will move the said arm laterally as it nears the end of its outer movement, and a spring for normally returning the arm, substantially as and for the purposes stated.

16. In a binding device, the combination with a binding-needle arranged to move in the segment of a circle, and also arranged to carry the binding-twine, of a rim fixed to a stationary support in position where the end of the binding-needle will pass through it when at the outer limit of its movement, two teeth on the axial surface of the said rim, a second rim rotatably mounted within the first, and having teeth on its axial surface, the said teeth on the rims being so arranged and disposed that the twine carried by the needle will enter the interdental spaces of the rims, and a device carried by the needle for moving the rotatable rim one tooth's space, to thereby clamp the twine between the teeth on the two rims, for the purposes stated.

17. In a binding device, the combination with a binding-needle arranged to move in the segment of a circle, and also arranged to carry the binding-twine, of a rim fixed to a stationary support in position where the end of the binding-needle will pass through it when at the outer limit of its movement, two teeth on the axial surface of the said rim, a second rim rotatably mounted within the first, and having teeth on its axial surface, the said teeth on the rims being so arranged and disposed that the twine carried by the needle will enter the interdental spaces of the rims, and a device carried by the needle for moving the rotatable rim one tooth's space, to thereby clamp the twine between the teeth on the two rims, an arm fixed to the stationary rim, a lever pivoted to the said arm to engage the rotatable rim, a yielding pressure device for holding the lever in engagement with the rotatable rim, and a knife fixed to the lower end of the said lever, substantially as and for the purposes stated.

18. In a binding device, the combination with a needle arranged for carrying the twine and for movement in the segment of a circle, of a stationary rim through which the end of the needle must pass, two or more teeth on the axial surface of the rim, a second rim rotatably mounted on the first, a series of teeth on the axial surface of the second rim having beveled edges, a yielding pressure device for holding the rotatable rim against the movable rim, a knife on the said yielding pressure device, and a bar having a pointed end pivoted to the under surface of the needle, a stop fixed to the under surface of the needle to limit the movement of the said bar, and a spring also fixed to the needle to engage the opposite end of the bar, all arranged and combined to operate in the manner set forth and for the purposes stated.

19 In a binding device, the combination of a binding-needle, twine carried by the needle and passed through an opening in the end thereof, a knotter carried by the needle, a rim having fixed teeth on its axial surface and in position to receive the twine carried by the needle when the needle is at the outward limit of its stroke, a second rim rotatably mounted with the first, teeth on its axial surface, a device carried by the needle for rotating the movable rim upon the passage of the needle through the rims, to thereby grasp the twine between the teeth on the rims, for the purposes stated.

20. A binding device, comprising a binding-needle arranged for movement in the segment of a circle, twine passed through the needle and through an opening in the outer end thereof, a knotter carried by the needle to project beyond one of its sides, a plate having an opening therein through which the needle must pass, and a slot connected with the opening through which the twine must pass, an arm pivotally mounted, and having a hook on its outer end designed to engage and support the twine in position so that the knotting device of the needle may engage the twine as the needle passes through the opening in the said plate, a lug on the said pivoted arm whereby the arm is pressed laterally so that the knotting device will not contact therewith when the needle has continued its movement and is at the outward limit of its stroke, a device for actuating the twine-engaging device carried by the needle, a twine-holder fixed to a stationary support and a twine-cutter located on the twine-holder, substantially as and for the purposes stated.

21. In a corn-harvester, the combination of an endless conveyer track 13, having vertical side pieces, and a slot in the outer one of the said side pieces, and also having at its rear end a widened portion, an inclined portion 34, and rounded portion 35 on the inner side piece of the track, and a series of links 31, having rollers 32, and the arms 33 on each alternate link, all arranged and combined substantially in the manner set forth and for the purposes stated.

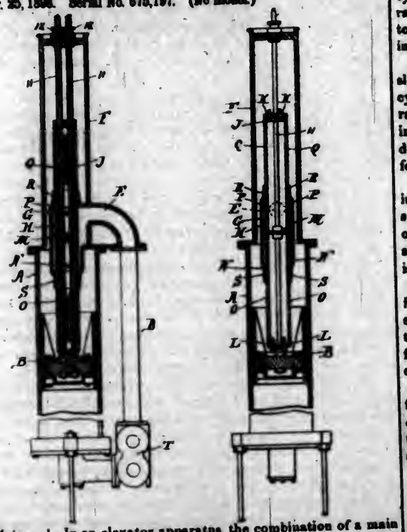
22. In a corn harvester and binder, the combination of a binder-platform to extend rearwardly and upwardly and designed to support the butts of the stalks when the shock is being bound, two conveyer-tracks arranged one above the other above said platform, endless conveyers in said tracks, laterally projecting fingers on said conveyers, means for operating the conveyers, means for withdrawing the conveyer-fingers into the tracks at points in the same vertical plane, and means for confining the cornstalks laterally at the side opposite from the tracks.

23. In a corn harvester and binder, the combination of a binder-platform to extend rearwardly and upwardly and designed to support the butts of the stalks when the shock is being bound, two conveyer-tracks arranged one above the other and above said platform, endless conveyers in said tracks, laterally-projecting fingers on said conveyers, means for operating the conveyers, means for withdrawing the conveyer-fingers into the tracks at points in the same vertical plane, means for confining the cornstalks laterally at the side opposite from the tracks and means for causing the conveyer-fingers in the upper track to be withdrawn at certain intervals at a point in advance of their usual withdrawal position.

24. In a corn harvester and binder, the combination of a binder-platform to extend rearwardly and upwardly and designed to support the butts of the stalks when the shock is being bound, two conveyer-tracks arranged one above the other and above the said platform, endless conveyers in said tracks, laterally-projecting fingers on said conveyers, means for operating the conveyers, means for withdrawing the conveyer-fingers into the tracks at points in the same vertical plane, means for confining the cornstalks laterally at the side opposite from the tracks, and means for causing the conveyer-fingers in the upper track to be withdrawn at certain intervals at a point in advance of their usual withdrawal position, and a binding-needle arranged for movement in the same plane as the tracks, and means for causing the said fingers in the upper track to be withdrawn at their forward point of withdrawal during that period of time when the binding-needle is moving across the passage, and to withdraw at their rearward limit, that is, directly above the withdrawal point of the fingers on the lower track, at all other times.

25. In a corn harvester and binder, the combination of a binder-platform inclined from its forward end upwardly and designed to support the butts of the stalks when the shock is being bound, means for severing cornstalks and for placing their butt-ends thereon, means for conveying the cornstalks in a vertical position to the rear end of the platform, a binder-needle arranged for movement in the same plane as the platform, and mechanism for holding the tops only of the incoming stalks from passing to their rearward limit during that period of time when the binding-needle is being moved across the platform, and for again moving the tops of the said stalks rearwardly to a vertical position after the binder-needle has withdrawn, for the purposes stated.

26. In a corn-harvester, the combination of a hollow conveyer-track having no bottom at its forward turn, an endless conveyor therein means for driving the conveyer by power derived from the traction-wheels of the machine, a wheel loosely mounted in the forward turn of said track, a circular flange on the lower edge of the wheel, and a series of pockets on its top, said flange and pockets being designed to support the conveyer-chain, stationary cutters fixed to the track, and rotary cutters fixed to the said flange, substantially in the manner set forth and for the purposes stated.



27. In a corn-harvester, a stalk-cutter, comprising in combination a sharp-edged knife fixed to the machine frame with its cutting edge diverging at an acute angle from a fore-and-aft line through the machine and in position to engage and cut cornstalks during the advance of the machine, and a rotary knife with its cutting edge inclined forwardly with relation to its direction of rotation, and forming with the fixed knife, and during its effective stroke, a narrow V-shaped opening with its apex forward and the angle of which constantly decreases, for the purposes stated.

28. A stalk-cutter for harvesters, &c., comprising a sharp-edged knife fixed to the machine-frame at an acute angle relative to the line of advance with its cutting edge forward and in position to engage and sever stalks with a drawing cut during the advance of the machine, in combination with a rotary knife mounted adjacent to the fixed one and inclined forwardly with relation to its line of rotation said incline being of such a degree that the cutting edge of the knife will during its rotation engage a standing stalk and slide relative thereto from its point toward its base, and said rotary knife being so positioned with relation to the fixed one as to form between the cutting edges thereof a narrow V-shaped opening with its apex forward, for the purposes stated.

29. A stalk-cutter for harvesters, &c., comprising a sharp-edged knife 43, fixed to the machine-frame at an acute angle relative to the line of advance with its cutting edge forward and in position to engage and sever stalks with a drawing cut during the advance of the machine and an auxiliary fixed blade 44 leading from the rear end of the blade 43 forwardly and away from the fixed blade 43 with its cutting edge on the side toward the blade 43, in combination with

a rotary knife inclined forwardly in relation to its line of rotation said incline being of such a degree that the cutting edge of the knife will during its rotation engage a standing stalk and slide relatively thereto from its point toward its base, and said rotary knife being of such a length that its point will overlap the rear end portion of the auxiliary fixed knife 44, said rotary knife also being so positioned with relation to the fixed one as to form between the cutting edges of the rotary knife and the knife 43 a narrow V-shaped opening with its apex forward, for the purposes stated.

602,660. AUTOMATIC STOP MECHANISM FOR ELEVATORS. THADDEUS W. HERRMANN, Chicago, Ill. Filed Nov. 4, 1895. Renewed Mar. 25, 1898. Serial No. 675,197. (No model.)

Claim.—1. In an elevator apparatus, the combination of a main cylinder and piston, and a plunger independent of said piston arranged to operate in said cylinder, and provided with port-openings arranged to control the admission to and from said main cylinder; as and for the purpose set forth.

2. In an elevator apparatus, a main cylinder and piston, in combination with a movable plunger independent of said piston arranged to operate in said cylinder, and provided with port-openings and means adapted to be actuated by said piston for displacing said plunger to control the admission to and exhaust from said main cylinder; as and for the purpose set forth.

3. In an elevator apparatus, a main cylinder and piston, in combination with a hollow plunger having closed ends and provided with port-openings through the shell thereof, arranged and adapted to control the admission to and exhaust from said main cylinder; as and for the purpose set forth.

4. In an elevator apparatus, a main cylinder and piston, a movable plunger independent of said piston and provided with port-openings of varying area, said plunger arranged to control admission to and exhaust from said main cylinder; as and for the purpose set forth.

5. In an elevator apparatus, a main cylinder provided with the usual port-opening, a main piston, a plunger independent of said piston arranged between said port-opening and said cylinder and provided with ports adapted to control the admission to and exhaust from said main cylinder, said plunger adapted to be actuated by said main piston; as and for the purpose set forth.

6. In an elevator apparatus, a main cylinder, provided with the usual port-opening, a main piston, a plunger independent of said piston arranged between said port-opening and said cylinder and provided with ports of varying area, and means actuated by said main piston for moving said plunger, whereby said ports are brought into communication with said port-opening thereby controlling the admission to and exhaust from said main cylinder; as and for the purpose set forth.

7. In an elevator apparatus, a main cylinder, a plunger provided with ports, means for normally maintaining said plunger in position for the ports therein to open communication between said cylinder and the exhaust and supply, and means for displacing said plunger, whereby the exhaust or supply may be cut off; as and for the purpose set forth.

8. In an elevator apparatus, a main cylinder, a plunger provided with ports of varying area, means for normally maintaining said plunger in position for the ports therein to open communication between said cylinder and its exhaust and supply, and means for displacing said plunger, whereby the exhaust or supply is gradually cut off; as and for the purpose set forth.

9. In an elevator apparatus, a main cylinder, an open-ended casing arranged in said cylinder in communication with the cylinder supply and exhaust, a plunger provided with ports arranged to travel through said casing and adapted to control communication between the casing and the cylinder; as and for the purpose set forth.

10. In an elevator apparatus, a main cylinder, an open-ended sleeve or casing arranged therein, and in communication with the cylinder supply and exhaust, a plunger provided with ports and arranged to travel back and forth in said sleeve or casing, and adapted to control communication between said casing or sleeve and the cylinder; as and for the purpose set forth.

11. In an elevator apparatus, a main cylinder, an open-ended sleeve or casing arranged therein and in communication with the cylinder supply and exhaust, a plunger provided with ports and arranged to move through said sleeve or casing, and means for displacing said plunger relative to said sleeve or casing, whereby the cylinder supply and exhaust are controlled; as and for the purpose set forth.

12. In an elevator apparatus, a main cylinder, an open-ended casing or sleeve formed therein and in communication with the cylinder supply and exhaust, a plunger arranged to move through said sleeve or casing, and provided with graduated ports, and means for moving said plunger relative to said sleeve, whereby the supply or exhaust is gradually cut off; as and for the purpose set forth.

13. In an elevator apparatus, a main cylinder, a casing or sleeve formed therein and in communication with the cylinder supply and exhaust, a plunger provided with closed ends and having ports formed through the shell thereof arranged in said sleeve or casing, and means for moving said plunger relative to said casing, thereby controlling the cylinder supply and exhaust; as and for the purpose set forth.

14. In an elevator apparatus, a main cylinder, a casing or sleeve formed therein and in communication with the cylinder supply and exhaust, a plunger provided with closed ends, and having ports formed through the shell thereof, means for moving said plunger through said sleeve or casing, whereby said ports are covered or uncovered and valves arranged in said plunger; as and for the purpose set forth.

15. In an elevator apparatus, a main cylinder, a casing or sleeve formed therein and in communication with the cylinder supply and exhaust, a plunger provided with closed ends and having ports formed through the shell thereof, means for moving said plunger through said sleeve or casing, whereby said ports are covered or uncovered, valves mounted in each end of said plunger, the valves at one end being arranged to open inwardly, and those at the other end arranged to open outwardly; as and for the purpose set forth.

16. In an elevator apparatus, a main cylinder, a plunger having closed ends arranged therein, and having a partition formed therein midway the length thereof, port-openings formed in each end of said cylinder, and means for covering and uncovering said port-openings; as and for the purpose set forth.

17. In an elevator apparatus, a main cylinder, a plunger arranged therein and having a partition formed therein midway the length thereof, port-openings formed in each end of said plunger, and relief-valves mounted in each end of said plunger; as and for the purpose set forth.

18. In an elevator apparatus, a main cylinder, a plunger provided with port-openings adapted to control the supply to and exhaust from said main cylinder, a piston and piston-rods, and means actuated by the movement of said rods for displacing said plunger; as set forth.

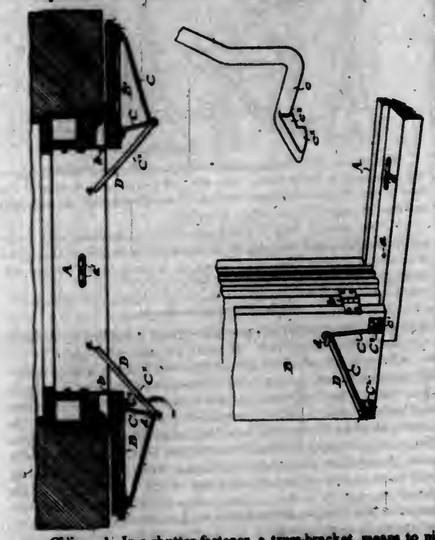
19. In an elevator apparatus, a main cylinder, piston and piston-rods, a plunger having port-openings, adapted to control the admission to and exhaust from said main cylinder, said plunger arranged to operate within said main cylinder, and means actuated by the movement of the main piston for displacing said plunger.

20. In an elevator apparatus, a main cylinder, piston and piston-rod, a plunger having port-openings, adapted to control the admission to and exhaust from said main cylinder, valves mounted in said plunger, and means actuated by the movement of said piston for displacing said plunger; as and for the purpose set forth.

21. In an elevator apparatus, a main cylinder, piston and piston-rod, a plunger arranged within said main cylinder, and having port-openings adapted to control the admission to and exhaust from said main cylinder, means for normally holding said plunger in position to open communication between said main cylinder and its supply and exhaust, and means arranged to be actuated at the limits of travel of said piston for shifting said plunger; as and for the purpose set forth.

22. In an elevator apparatus, a main cylinder and piston, a plunger arranged within said main cylinder and provided with port-openings, springs arranged to hold said plunger in position to open said main cylinder to its supply or exhaust, and means for displacing said plunger against the action of said springs at each limit of stroke of said piston; as and for the purpose set forth.

23. In an elevator apparatus, a main cylinder, piston and piston-rod, a plunger having port-openings adapted to control the admission to and exhaust from said main cylinder, rods mounted on said main cylinder, a follower-plate arranged to slide on said rods, rigid connections between said plate and said plunger, and a cross-head mounted on said piston-rods adapted to engage said follower-plate and move said plunger; as and for the purpose set forth.



24. In an elevator apparatus, a main cylinder, piston and piston-rods, a plunger having port-openings adapted to control the supply to and exhaust from said main cylinder, stationary rods, a follower-plate mounted to slide thereon, rigid connections between said follower-plate and said rods, a cross-head carried by said piston-rods, adapted to engage said follower-plate and displace said plunger, and springs arranged to return said plunger-cylinder to its normal position; as and for the purpose set forth.

25. In an elevator apparatus a main cylinder, piston and piston-rods, a plunger having port-openings, adapted to control the supply to and exhaust from said main cylinder, shouldered stationary rods, a follower-plate mounted to slide thereon and rigidly connected to said plunger, rods loosely passing through said follower-plate, and rigidly secured to plates, other plates mounted upon said stationary rods and adapted to abut against the shoulders thereon, springs interposed between said last-mentioned plates, said follower-plate adapted to be moved at the limits of travel of the main piston; as and for the purpose set forth.

26. In an elevator apparatus, a cylinder constructed in sections, one of said sections forming the main operating-cylinder, and the other of said sections having a sleeve formed therein adapted to receive a plunger, said plunger provided with port-openings adapted to control the supply to and exhaust from said main cylinder; as and for the purpose set forth.

27. In an elevator apparatus, a plunger, having port-openings and inwardly-opening valves at one end thereof and port-openings and outwardly-opening valves at the other end thereof in combination with a cylinder and piston; as and for the purpose set forth.

602,661. SHUTTER-FASTENER. SAMUEL M. W. KOHL, Philadelphia, Pa. Filed Jan. 5, 1898. Serial No. 665,696. (No model.)

Claim.—1. In a shutter-fastener, a trun-bracket, means to pivotally secure said bracket upon a shutter, a strut-eye in said bracket, a strut, means to pivotally support one extremity of said strut in the eye of said bracket, and means upon the opposite extremity of said strut to engage a fixed support, substantially as set forth.

2. In a shutter-fastener, a trun-bracket, provided with end trunnions, bearing-plates for said trunnions, means to secure said plates upon a shutter, a stop member adapted to maintain said bracket in horizontal position, and a strut pivotally mounted in said bracket, to engage a fixed support, substantially as set forth.

3. In a shutter-fastener, a trun-bracket provided with end trunnions, bearing-plates for said trunnions, means to secure said plates upon a shutter, a stop member upon said bracket adapted to maintain the latter in horizontal position, a strut pivotally mounted in said bracket to engage a fixed support, and a latch-lug upon said stop member adapted to engage a fixed support, substantially as set forth.

4. In a shutter-fastener, a trun-bracket, means to singedly secure said bracket upon a shutter, a strut-eye in said bracket, a strut pivotally secured at one extremity in said eye, and adapted at its opposite extremity to engage a fixed support, and a latch member upon said bracket, adapted to engage a fixed support, substantially as set forth.

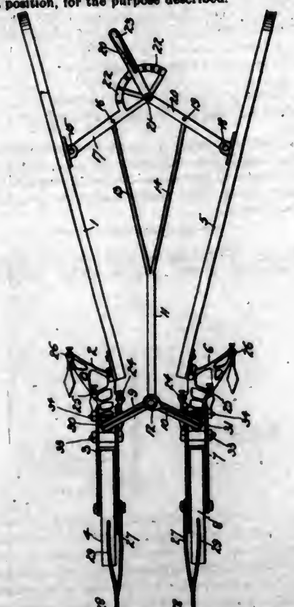
5. In a shutter-fastener, a trun-bracket provided with horizontal trunnions, bearings for said trunnions, means to secure said bearings upon a shutter in such relation therewith that said trun-bracket is retained in upright inoperative position, by its gravitation, substantially as set forth.

602,662. UMBRELLA SUPPORT. RICHARD MILLER, Appleton, Wis. Filed Nov. 13, 1897. Serial No. 658,951. (No model.)

Claim.—1. A rod or staff support comprising a plurality of clamping-blocks, a pair of plates having apertures to receive the same, one of said plates having formed therein a recess and the other a downwardly-projecting lug for engagement with the plate beneath and a bolt and nut for drawing the end of the upper plate toward the lower one so that the clamping-blocks will be forced together and upon the staff or rod which is passed therethrough, substantially as shown.

2. A holder or support for rods or staffs comprising a clamping-block made up of quadrant sections each provided centrally with a recess and a projecting portion which registers with the recess of the adjacent section, a base-plate having therethrough an aperture for the reception of the clamping-block, a plate similarly apertured and provided at one end with a depending lug for engagement with the under side of the base-plate the opposite end being engaged by a set-screw mounted on a bolt which passes through the base-plate, substantially as shown and for the purpose set forth.

602,663. CULTIVATOR. DAVID M. MOTHERWELL, Chicago, Ill., assignor to the Whitman & Barnes Manufacturing Company, Akron, Ohio. Filed Oct. 14, 1897. Serial No. 655,201. (No model.)



Claim.—1. A cultivator composed of two sections each consisting of a handle, a tool-frame and its wheel, an adjustable connection between said sections and means for adjusting said connection, adapted to be operated by the operator while standing in his usual working position between the handles, whereby the distance between said sections may be varied while maintaining parallelism, substantially as described.

2. In a cultivator the combination of two tool-carrying sections separable throughout their length, a spreading yoke adapted to extend over the row and to vary the distance between said sections and means adapted to be operated by the operator, while standing in his usual working position between the handles, for conjointly spreading said yoke and the handles of each section whereby said sections are adapted to be spread while maintaining their parallelism to the path of travel, for the purpose described.

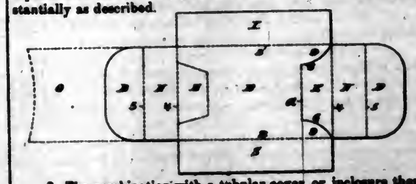
3. A cultivator having two sections, each consisting of a handle, a tool-frame, means for fastening working-tools to said frame, a wheel and a guard attached to said wheel adapted to lift plants out of the way of said wheel, and an adjustable connection between said sections whereby the distance between them may be varied equally throughout their length and the guards and other working parts be brought to greater or less proximity at the will of the operator, while standing in his usual working position between the handles, substantially as described.

4. In a cultivator, two sections, each consisting of a handle and a tool-frame, a lever pivoted to each frame, said levers being pivoted together midway between said frames, a lever pivoted to each han-

dle, said second levers being pivoted together midway between said handles, means for pivotally connecting the central pivot of said first levers with said second levers whereby when the position of said levers is changed the distance between the sections may be varied and each part will at all times occupy a position substantially parallel with its first position, for the purpose described.

5. The combination in a cultivator of two sections, each having a handle and a tool-frame, levers pivoted to each frame and pivoted together midway between said frames, levers pivoted to each handle and pivoted together midway between said handles, means for connecting the central pivot of said first-mentioned levers with said last-mentioned levers, whereby when the position of said levers is changed the distance between the parts of the cultivator may be varied and each part will at all times occupy a position substantially parallel with its first position, and means for rocking said second levers about their central pivot and securing them in any desired position, substantially as described.

6. In a cultivator, in combination with the wheel thereof, a guide projecting in front of said wheel and adapted to lift a vine from the ground allowing the cultivator to work thereunder, substantially as described.

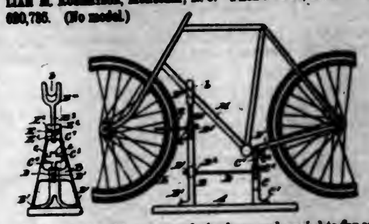


7. In a cultivator, in combination with the wheels thereof, a pair of guides projecting in front of said wheels and adapted to lift a vine from the ground allowing the cultivator to work thereunder, and means whereby the distance between said guards may be varied, substantially as described.

8. In a cultivator, the combination of the handles 1 and 5, tool-frames 2 and 6, the levers 9 and 10 pivotally connected together to rod 11, said lever 9 being pivoted to frame 2 and lever 10 being pivoted to frame 6, levers 17 and 20 pivotally connected together, said lever 17 being pivotally connected to handle 1 and to arm 13 of rod 11, and lever 20 being pivotally connected to handle 5 and to arm 14 of rod 11 and means for securing said levers 17 and 20 in any desired position when they are rocked about their common pivot whereby the distance between the tool-frames is adjusted, substantially as described.

602,664. PAPER BOX. HARVEY S. MUDGE, New Haven, Conn. Filed Mar. 23, 1897. Serial No. 628,064. (No model.)

Claim.—1. An end closure for paper boxes consisting of a tubular body from one ply of which projects a flap capacitated to cover the entire end of the body and overlap upon the opposite side of the box, said flap being partially disconnected from said ply by inward cuts 6, 6, that provide the opposite side walls with braces 9, 9, formed from said ply and uniting the side walls and said ply at the ends of said sides while admitting the turning back of said flap and a portion of said ply to expose the contents of the box, substantially as described.



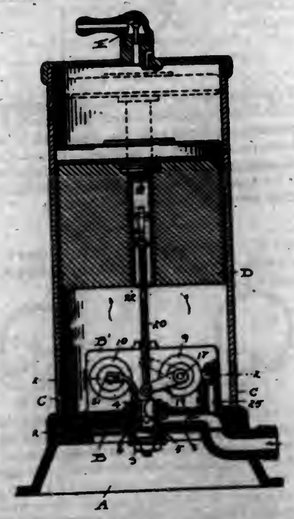
2. A container for slide-boxes, consisting of a flat blank creased on the fold-lines 2, 3 to provide the sides of a tray-like structure and upon the lines 4, 4 and 5, 5, to provide it with end flaps formed on the bottom ply and capacitated to cover the entire end of the body and overlap upon the opposite side of the box, and having its bottom ply divided on the lines 6, 6, at one or both ends to provide its opposite sides with braces 9, 9, uniting them to the bottom ply at the outer ends of said sides while permitting the turning back of the flap and a portion of the bottom ply to expose the contents of the box, substantially as described.

3. The combination with a tubular cover or inclosure therefor, of a container capable of sliding therein and consisting of a bottom ply to which sides and ends are united by folding-lines and to which ends tacking-flaps are connected by folding-lines, and which bottom is divided by cuts that provide braces 9, 9 connecting the bottom and opposite sides at the outer ends of the latter and render free a considerable portion of the end portion of the bottom, whereby it is capable of being turned back with the ends and tacking-flaps, substantially as described.

4. A box consisting of the tubular cover C and a container having the bottom B, sides I, S, closing means for one end, and at the opposite end having end N free from the sides and carrying flap D, and portion E of the bottom connected to the end N and partially separated from the rest of the bottom by cuts 6, 6 forming braces 9, 9 for the ends of the sides I, S and permitting the bottom portion E with end N and flap D to be turned back to expose the contents of the box, substantially as described.

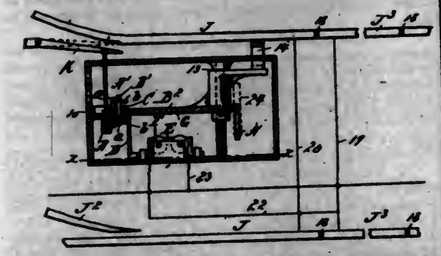
602,665. BICYCLE-STAND. WALTER C. MCBURNEY and WILLIAM M. ROBERTSON, Montclair, N. J. Filed Jan. 26, 1897. Serial No. 620,726. (No model.)

Claim.—1. In a bicycle-stand, the base and uprights for supporting a bicycle, in combination with the yoke E turning in eyes on the face of one of said uprights, the loop E' and bends E², all arranged to serve substantially as herein specified.



2. The yoke E, loop E' and bends E², in combination with a supporting-surface, and the eyes E³ set therein and receiving said yoke with liberty to turn therein, all arranged to serve with a bicycle substantially as herein specified.

602,666. HYDRAULIC PUMP. HENRY F. SCHROEDER, Cleveland, Ohio. Filed Dec. 17, 1896. Serial No. 615,969. (No model.)



Claim.—1. In a pump having a removable casing, a main valve 4 having ports 5 and 6, a piston 10 to operate said main valve, an auxiliary valve 9 having a partition 18 dividing the same into two parts, and having ports 13 and 16 on one side and ports 14 and 15 on the other side of said partition, inlet and outlet ducts 7 and 8, respectively, in said casing, inlet-ducts 23, 25, and 26, communicating with ports 13 and 15 of valve 9 and outlet-ducts 24 and 27 communicating with ports 14 and 16 of valve 9, ducts 29 and 30 leading from the piston-chamber 10 to the auxiliary-valve chamber, and means connected to the plunger of the pump to operate the auxiliary valve, substantially as described.

2. In a hydraulic air-compressing pump, the outside casing, the removable valve-casing B set into said outside casing and having inlet and outlet water-passages through the same, a main valve with openings set into said base to control the direction of the flow of water, a piston set into said base and operatively connected with main valve, inlet and outlet water-passages in said base to opposite sides of said piston and an auxiliary valve to control the flow of water to said piston, substantially as described.

3. The pump having a removable casing in its bottom provided with two separate valve-chambers at right angles to each other and a piston-chamber and water-passages, in combination with a main valve 4 in one of said chambers and an auxiliary valve 9 in the other of said chambers, a piston and rod in said piston-chamber and an arm on said main valve engaged by said piston-rod, and a plunger in the pump connected with an arm of the auxiliary valve, substantially as described.

602,667. RAILWAY-SWITCH-OPERATING MECHANISM. CHARLES W. SOUDER, Springfield, Mass. Filed Nov. 8, 1897. Serial No. 657,723. (No model.)

Claim.—1. The combination with a switch-moving device, and an engagement member or actuator which has a bodily thrust movement and also reversing movements whereby to assume different positions relative to the switch-moving device for engaging, and on the thrust of the actuator, throwing the switch-moving device in opposite directions, of a shifter cooperating with the actuator to successively shift or reverse the position of the latter, and a shiftable part comprised in the mechanism relative to which the shifter has an approaching and withdrawing motion, whereby, in the approach and engagement, the shifter is successively reversed to assume different shifting relations to the actuator, and means for imparting said bodily movement of approach and withdrawal relatively between said shifter and the shiftable part which it engages, and by which it is shifted, for the purpose set forth.

2. The combination with a switch-moving device and an engagement member or actuator which has a bodily thrust movement, and also reversing movements whereby to assume different positions relative to the switch-moving device for engaging, and on the thrust of the actuator, throwing, the switch-moving device in opposite directions, and having separated abutments or projections *b b*, and the abutment *b'*, means for imparting a thrust movement to the actuator, a shifter cooperating with said abutments *b b* of the actuator and also arranged to engage said abutment *b'*, and means for imparting a bodily movement to the shifter, substantially as described.

3. The combination with the switch and a movable switch-moving device, and a housed-in reversible actuator or engagement member coacting therewith, of a shifter arranged to cooperate automatically in conjunction with said reversible actuator whereby the said actuator is successively reversed from its one position to the other relative to the switch-moving device, said actuator being adapted for a thrust movement, means for insuring the shifting action of the shifter, and a movable indicator device operating in conjunction with the shiftable mechanism for showing by its position, any existing relations of the actuator relative to the switch-thrower.

4. The combination with a switch-moving device and an engagement member or actuator adapted for a bodily thrust movement and also reversing movements relative to the switch-moving device, provided with the abutments *b b*, an electromagnet and an armature-lever carrying shiftably thereon, a shifter adapted to engage according to its position one or the other of said abutments *b*, current connections for said electromagnet and a shiftable abutment member relative to which the shifter in its bodily movement with the armature-lever successively engages, whereby it is each time reversed, substantially as described.

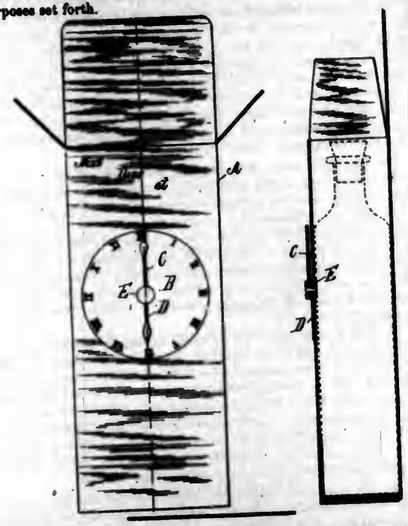
5. The combination with a switch-moving device, a car-wheel-operated lever, and an engagement member or actuator pivotally mounted on the lever, adapted for a bodily thrust movement with the lever and also reversing movements relative to the switch-moving device, provided with the opposite abutments *b b* and the abutment *b'*, an electromagnet and an armature-lever carrying shiftably thereon, a shifter adapted to engage according to its position one or the other of said abutments *b* and current connections for said electromagnet, each time reversed, substantially as described.

6. The combination with the switch-point and the switch-operating lever A pivotally mounted, connected with the switch-point, and having the two arms oppositely extending and provided with the contact-studs *a a*, a car-wheel-operated lever having a portion thereof adjacent the switch-operating lever and having pivotally mounted thereon, the engagement member or actuator provided with the two arms B B with the contact-studs *b b* and provided with the opposite hook members B' B' and having the median stud or abutment *b'*, of an electromagnet and current connections therefor, the armature-lever having the shifter C pivotally and shiftably mounted thereon comprising the opposing members *c c* arranged for operation, substantially as and for the purpose described.

7. The combination with the railway-track having the switch and the insulated track-section J³, the return-wire and a switch-operating device, of a reversible actuator or engagement member coacting therewith, an electromagnet and an armature-lever, a current-conductor in connection with said insulated track-section, and with a magnet, a current connection running from the magnet to connection with the return-wire, and the shifter movably mounted on the armature-lever, and bodily movable therewith, cooperating with the actuator to successively reverse it, and an abutment which the shifter engages each time it is reciprocated bodily by the armature-lever, whereby its own position is successively reversed, substantially as described.

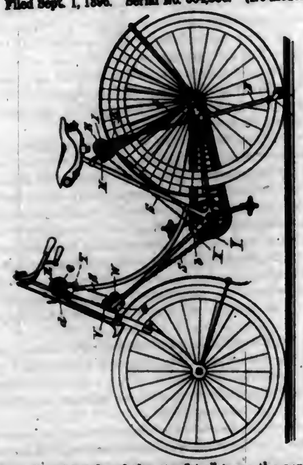
8. In a switch-operating mechanism of the character described, the combination with the switch-operating device and a reversible actuator and means for reversing it, of the rock-shaft having an arm engaged with said actuator and having an indicator-arm visible at the road-bed, for the purpose set forth.

9. The combination with a switch-operating device, of a car-wheel-operating lever having a shiftable medium of engagement co-operating with said switch-operating device, said lever consisting of two articulated members, one being adapted to yield relative to the other and a spring interposed between these members for insuring normally their movements in unison, for the purpose set forth.



10. The combination with a switch-operating device, of a car-wheel-operated lever consisting of the two members 26 and 27 pivotally united, one thereof having the horn 28, a spring interposed between said horn and the other member, and means for varying the tension of the spring.

11. The combination with a switch-operating device, of a car-wheel-operating lever consisting of the two members 26 and 27 pivotally united, one thereof having the horn 28, a spring interposed between said horn and the other member, the bolt 25 pivoted to the one part adjacent the spring, and extended loosely through the other part, and having the nut 30, substantially as described.



602,668. MEDICINE-CARTON. CHARLES R. SMITH, Chicago, Ill. Filed Nov. 26, 1896. Serial No. 613,228. (No model.)

Claim.—As a new article of manufacture, a carton formed to inclose a medicine-bottle and to hold the same in an upright position, having on one of its sides a time-dial and one or more movable hands on the outer face only of the carton pivotally secured at the center

of the dial and arranged to be moved over the same as and for the purposes set forth.

602,669. BICYCLE-SUPPORT. EDWARD A. TRAPP, New York, N. Y. Filed Sept. 1, 1896. Serial No. 604,538. (No model.)

Claim.—In a bicycle of the "safety" type, the supporting-rods extending downward and rearward on opposite sides of the rear wheel and from a point in rear of the saddle-post and adjacent to the top of the forward portion of the said rear wheel, and the sleeves swiveled to or pivotally mounted upon the rear portion of the bicycle-frame and at opposite sides of the latter, said sleeves receiving and guiding said rods and turning with the same during the oscillating movements of said rods created therein during their vertical movements, combined with the crank-shaft journaled to said frame adjacent to the upper ends of said rods and over said rear wheel and below the saddle, the cranks rigid with said shaft and pivoted to the upper ends of said rods for operating the latter from said shaft, means under the control of the rider for actuating said shaft to raise said rods, and means for positively locking said rods in their respective upper and lower positions; substantially as and for the purposes set forth.

602,670. BICYCLE-SUPPORT. EDWARD A. TRAPP, New York, N. Y. Filed Feb. 4, 1897. Serial No. 621,969. (No model.)

Claim.—1. In combination with a bicycle, the supporting-rods extending downward one on each side thereof, the crank-shaft carrying cranks pivotally connected with said rods, the sprocket-wheel on said shaft, the additional or locking sprocket-wheel, the chain connecting said sprocket-wheels, the foot-treadle connected with said chain for effecting the elevation of said rods and the latch for engaging the locking sprocket-wheel to prevent movement in said chain and wheels; substantially as set forth.

2. In combination with the bicycle, the supporting-rods extending downward one on each side thereof, the crank-shaft carrying the cranks pivotally connected with the upper ends of said rods, the sprocket-wheel on said shaft, the additional sprocket-wheel, the chain connecting said sprocket-wheels and the foot-treadle suspended by a link at its front end and at its rear end connected with said chain for actuating the same; substantially as set forth.

602,671. PNEUMATIC-TIRED WHEEL. JOHN T. TREDWAY, Kanmare, Ireland. Filed Dec. 20, 1897. Serial No. 662,610. (No model.) Patented in England Nov. 13, 1896, No. 25,563.

Claim.—1. In a pneumatic-tired wheel, the combination with a tubeless tire consisting of an outer or wearing part A having circumferential beads or enlargements *a a* at its edges and of an inner or lining part A' having internal circumferentially-arranged radial lips *a' a'*; of a wheel-rim B having inturned edges *b b* and a groove having a flat or approximately flat bottom and one or more circumferentially-arranged ridges *b'*, as and for the purpose set forth.

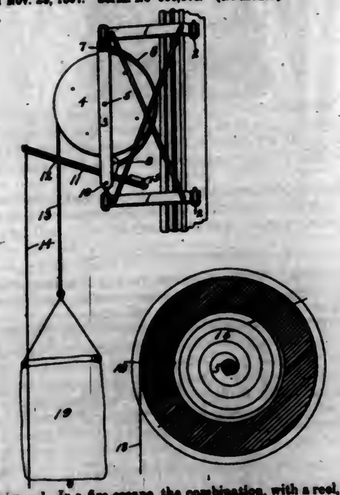
2. In a pneumatic-tired wheel, the combination with a tubeless tire consisting of an outer or wearing part A having circumferential beads or enlargements *a a* at its edges and of an inner or lining part A' having internal circumferentially-arranged radial lips *a' a'*; of a wheel-rim B having inturned edges *b b* and a groove with a convex-shaped bottom forming a central ridge *b'*, as and for the purpose set forth.

3. In a pneumatic-tired wheel, the combination of a tubeless tire consisting of an outer or wearing part A having circumferential beads or enlargements *a a* at its edges and of an inner or lining part A' having internal circumferentially-arranged radial lips *a' a'*, the two parts A and A' being vulcanized separately and subsequently made integral by cementation, and of a wheel-rim B having inturned edges *b b* and a groove having a flat or approximately flat bottom and one or more circumferentially-arranged ridges *b'*, as and for the purpose set forth.

4. In a pneumatic-tired wheel, the combination of a tubeless tire consisting of an outer or wearing part A having circumferential beads or enlargements *a a* at its edges and of an inner or lining part A' having internal circumferentially-arranged radial lips *a' a'* the two parts A and A' being vulcanized separately and subsequently made integral by cementation, and of a wheel-rim B having inturned edges *b b* and a groove with a convex-shaped bottom forming a central ridge *b'*, as and for the purpose set forth.

5. In a pneumatic-tired wheel, the combination with a tubeless tire consisting of an outer or wearing part A having circumferential beads or enlargements *a a* at its edges and of an inner or lining part A' having internal circumferentially-arranged radial lips *a' a'*, of a wheel-rim B having inturned edges *b*, and of a band B having a centrally-arranged circumferential ridge *b'* or its equivalents and so mounted in the wheel-rim as to give to its groove a flat or approximately flat bottom, as and for the purpose set forth.

602,672. DICE-BOX. ANDREW J. WELANDER, Omaha, Nebr. Filed Sept. 28, 1897. Serial No. 653,262. (No model.)

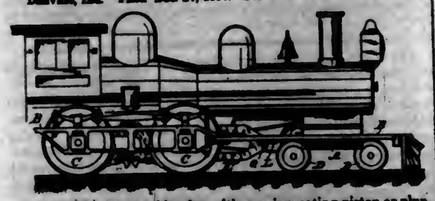


Claim.—1. A box or receptacle having one end closed the side wall being made up of a continuous thong of leather which is rectangular in cross-section, the same being spirally wound and cemented together.

2. A dice-box made up from a single piece of leather to present a bottom and cylindrical side, the side being made from a strip or thong of leather which is rectangular in cross-section and spirally disposed for the purpose set forth.

3. As an improved article of manufacture, a dice-box made of leather having a flat bottom from which springs a rectangular string or thong, said string or thong being cemented to the bottom and to each convolution of the thong, for the purpose set forth.

4. A dice-box made up of a single piece of leather, having a circular bottom and cylindrical convoluted side held together by cement and presenting smooth interior and exterior surfaces, substantially as set forth.



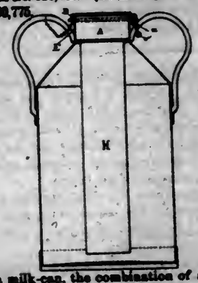
602,673. FIRE-ESCAPE. JOB R. WETHERS, Wellsborough, Pa. Filed Nov. 29, 1897. Serial No. 660,071. (No model.)

Claim.—1. In a fire-escape, the combination, with a reel, a flexible tape wound thereon and a receptacle for a person or baggage at the free end of the tape, of a brake adapted to control the unwinding of the tape, said brake consisting of a friction-band pivoted at its upper end to the reel-frame, and loosely following the circumference of the reel proper; a pair of links whose lower ends are pivoted to the reel-frame and to whose upper ends said band is pivoted; a brake-lever fixed between the links midway of their length, and a trip-rope fastened to the free end of the brake-lever.

2. A fire-escape consisting of a reel, adapted to be swung to a window-frame or other support; a band pivoted at its upper end to the reel-frame above the reel, loosely following the circumference of the reel; a pair of links whose lower ends are pivoted to the reel-frame below the reel and to whose upper ends said band is pivoted; a counterbalanced brake-lever fixed to the pair of links; a flexible tape wound on the reel; a receptacle for a person or baggage, and a coiled spring located within the reel, adapted to wind up as the reel unwinds.

602,674. POWER-TRANSMITTING DEVICE. GEORGE I. WHITE, Danville, Ind. Filed Dec. 27, 1897. Serial No. 663,895. (No model.)

Claim.—1. The combination with a reciprocating piston or plunger and a revolvable shaft, of a rack-bar provided with an oblong opening having two parallel internal straight engagement-faces connected at each end by a web having a semicircular engagement-face, and a continuous series of gear-teeth in said engagement-faces forming a continuous toothed rack, one end of said rack-bar being connected operatively to said piston; a circular toothed wheel secured rigidly to said shaft and of less diameter than the transverse distance between said parallel faces, said toothed wheel being in engagement with said toothed rack; guide-pins secured rigidly to said rack-bar and projecting from the side thereof at right angles to said side; and a guide suitably supported and having guide-channels in its face in which said guide-pins move, whereby said rack-bar and said toothed wheel are caused to maintain a constant contact while said rack-bar has a reciprocating motion and said toothed wheel has a revolving motion in one direction, substantially as shown and described.



2. In a power-transmitting device, the combination of the reciprocating rod, the revolvable shaft, the toothed wheel secured to the shaft, the toothed rack-bar having an oblong opening of greater width than the diameter of said toothed wheel and adapted to pass over said wheel in engagement at all parts of its inner contact portion, means by which said reciprocating rod and said rack-bar may be operatively connected, guide-pins on said rack-bar, and a suitably-supported guide having guide-channels in its front adapted to receive said guide-pins, whereby said rack-bar is caused to maintain constant contact with said toothed wheel and its motion reversed at each end of said oblong opening, substantially as shown and described.

3. The combination of a revolvable shaft, a reciprocating piston or plunger, a rack-bar provided with an oblong opening having two straight parallel opposing sides and two semicircular connecting ends and said sides and said ends having a continuous series of gear-teeth forming a continuous internal toothed rack; a circular toothed wheel rigidly secured to said shaft and engaging said rack-bar; a guide having its working face adjacent to said rack-bar; suitable guide-channels in the said face, guide-pins rigidly secured to said rack-bar and engaging said guide-channels, whereby said rack-bar is caused to maintain constant contact with said toothed wheel and its reciprocating motion controlled; and means whereby said rack-bar and said piston may be connected, substantially as shown and described.

4. In combination with the locomotive-engines having the steam cylinder and valve and main axles, of toothed wheels secured to said axles by which power may be transmitted, rack-bars provided with continuous internal gear-teeth arranged in an oblong opening in said bar and adapted to provide a continuous engagement with said toothed wheels, guides by which said rack-bars are supported and maintained in contact with said toothed wheels and the contact changed from one side to the other of said opening at either end thereof, means by which said rack-bar may be connected operatively to the cross-head, with a cross-head and guides therefor, and means by which the main steam-valve may be operated in unison with the said rack-bars and the piston in the cylinder, substantially as shown and described.

5. The combination of the rack-bars suitably operated, the toothed wheel connecting said rack-bar, the axle attached to said wheel, said toothed wheel and said rack-bar being adapted to effect a rotative travel of said axle in excess of half a revolution during the travel of said rack-bar through one horizontal stroke, the cylinder and piston with means by which said piston and said rack-bar may be connected, the steam-valve for said cylinder, the auxiliary shaft suitably mounted with means by which said auxiliary shaft may operate said valve, and means by which said axle shall impart a uniform motion to said auxiliary shaft equal to half of a revolution during a stroke of said rack-bar in one horizontal direction, substantially as shown and described.

602,675. MILK-CAN. HENRY WIARD, Paris, France. Filed Mar. 20, 1897. Serial No. 628,782. (No model.) Patented in France Oct. 27, 1896, No. 262,775.

Claim.—In a milk-can, the combination of a cooler H provided with a wider upper part A, acting as a cover for the can, a cover B for the cooler, provided with a cross piece C and kept in place by a key D, said key when in place being sealed to a projection arranged at the neck of the can, substantially as described.

602,676. RAILWAY-SIGNAL. FILLMORE WILLIAMS, Columbus, Ohio, assignor to O. W. Aldrich and C. W. Critchfield. Filed Feb. 2, 1898. Serial No. 668,972. (No model.)

Claim.—1. In a railway-signal, the combination of a depressible lever adapted to be operated by the wheel of a car composed of two parts 1 and 1^a, one of said parts having a comparatively narrow slot 1^b and the other a similar slot with an enlarged recess or countersink 1^c, shaft 2, crank-arm 3 on said shaft, and pin 3^a on the crank-arm having a T-head adapted to pass through the aforesaid narrow slots and to stand transversely in the countersink, all constructed and arranged, substantially as shown and described.

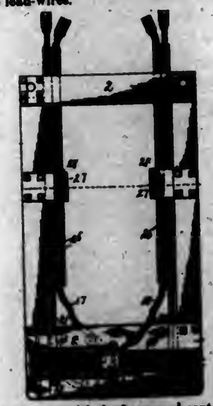
2. In a railway-signal, the combination of a depressible lever adapted to be operated by the wheel of a car composed of two parts 1 and 1^a, one of said parts having a comparatively narrow slot 1^b and the other a similar slot with an enlarged recess or countersink 1^c, shaft 2, crank-arm 3 on said shaft, pin 3^a on the crank-arm having a T-head adapted to pass through the aforesaid narrow slots and to stand transversely in the countersink, a spring 5^a for holding the parts 1 and 1^a laterally in position, crank-arm 6 on shaft 2, and a spring 7 acting against arm 6 to hold the parts 1 and 1^a in elevated position, all constructed and arranged, substantially as shown and described.

602,677. APPARATUS FOR ANNEALING GLASSWARE. WILLIAM BUTTLER, Redkey, Ind. Filed Apr. 16, 1897. Serial No. 633,477. (No model.)

Claim.—1. In a glass plant, a finishing-station, an annealing-leer, an intermediate glass-heating furnace independent of any glass-finishing furnace and located adjacent to the finishing-station, and a series of pans or carriers arranged to be successively placed in the heating-furnace, and to be placed in an annealing-leer after receiving the finished glass articles in the heating-furnace.

2. In a glass plant, the combination with a finishing-station and an annealing-leer, of an intermediate glass-heating furnace independent of the glass-finishing furnace and adjacent to the finishing-station, said furnace containing a tray, a door at one side and a receiving-opening at the opposite side, the tray being arranged to receive the finished article and be deposited in the annealing-leer.

3. In a glass plant, a finishing-station, an intermediate glass-heating furnace adjacent thereto, an annealing-leer, and a series of pans or trays arranged to be successively placed in the heating-furnace and then placed in the annealing-leer after being filled with finished glass articles in said heating-furnace.

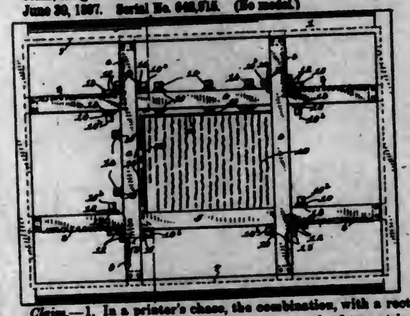


602,678. TRAVELING CONTACT FOR UNDERGROUND ELECTRIC RAILWAYS. GRIFFIN B. COLEMAN and JOSEPH W. DUGGAN, Washington, D. C. Filed Nov. 2, 1897. Serial No. 657,165. (No model.)

Claim.—1. The combination with a traveling contact or current-collector for underground electric-railway systems, of two pairs of lead-wires provided with independent couplings and independently connected to the contact-shoes of the device.

2. The combination with a traveling contact or current-collector of contact-shoes, recesses for the passage of the lead-wires, two pairs of lead-wires having independent connections with the shoes, and adapted to be used interchangeably.

3. The combination with the frame of the traveling contact, of double sets of lead-wires, insulating-tubes, clamped to the sides of the frame, said sets of wires being independently connected with the shoes and provided with means whereby the sets of lead-wires may be connected to the car-motor interchangeably.



4. The combination with the frame and double sets of lead-wires, of the shoes recessed centrally and slotted longitudinally for the attachment of the lead-wires.

5. The combination with the frame and contact-shoes, of the fiber plates, and two pairs of lead-wires, one pair arranged outside of the fiber-plates, and the other pair extending down between the plates and extending through openings in said plates for attachment to the shoes.

6. The combination with the frame, of the clamps secured thereto, and lead-wires provided with insulating-tubes which latter are thickened and flattened within said clamps.

602,679. PRINTER'S CHASE. DANIEL J. DUNBAR, Bridgeport, Conn., assignor of one-half to Charles B. Sanford, same place. Filed June 30, 1897. Serial No. 643,515. (No model.)

Claim.—1. In a printer's chase, the combination, with a rectangular frame, of adjustable parallel bars composed of two strips of metal fastened together at their respective ends, so as to leave a free, unobstructed space between such ends, said bars yoked together, as shown, adjustable spring-locks carrying spring-actuated dogs to engage ratchet-teeth on said bars, clamping-bolts adjustably mounted on one or more of said bars, for the purpose set forth.

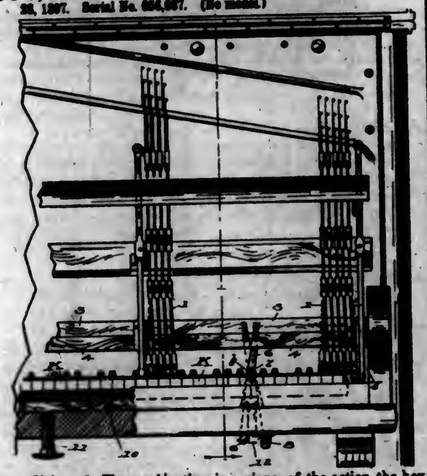
2. In a printer's chase, the combination, with a rectangular frame and adjustable parallel bars having ratchet-teeth, of spring-locks adjustably mounted on said bars, and carrying dogs to engage the teeth of said bars, for the purpose set forth.

3. In a printer's chase, the combination, with a rectangular frame and adjustable parallel bars having ratchet-teeth, of spring-locks adjustably mounted on said bars, and carrying dogs to engage the teeth of said bars, combined with clamping-bolts adjustably mounted on one or more of said bars, whereby the form is securely locked up after the parallel bars are locked, for the purpose set forth.

4. In a printer's chase, the combination, with a rectangular frame and adjustable parallel bars mounted thereon, each of said bars composed of two strips of metal parallel with each other and fastened together at their respective ends, in the manner substantially as shown, said bars adapted to be yoked together—as shown—locks carrying spring-actuated dogs to engage the teeth on said bars, said locks having a reduced central portion adapted to enter the space between the metal strips of said bars, and projections adapted to rest on both of said strips and on both edges thereof, combined with adjustable clamping-bolts mounted on said bars, for the purpose set forth.

5. In a printer's chase, the combination, with a rectangular frame and adjustable parallel bars mounted thereon and having ratchet-teeth formed on the edges thereof—as shown—of locks carrying spring-actuated dogs to engage with such ratchet-teeth, said teeth graduated—as shown—for the purpose set forth.

602,680. PIANO-TUNING-PIN HOLDER. JOHN DUNBORST, Indianapolis, Ind. Filed Oct. 4, 1897. Serial No. 654,294. (No model.)



Claim.—1. The combination, in a piano, with the pin-block, the strings and the tuning-pins, of pin-holders consisting of disks E each formed with a V-shaped notch in the side thereof the sides of which notches are of an angle to frictionally hold the pins when drawn thereinto by the tension of the strings, said pins being in contact with the two angle-faces of said notches only, substantially as set forth.

2. The combination, in a piano, of a pin-block having tapered pin-holes, pin-holders E secured at the upper side of the pin-block and having suitable notches in their sides to receive and hold the pins, said tuning-pins, and the piano-strings connected thereto, all substantially as shown and described.

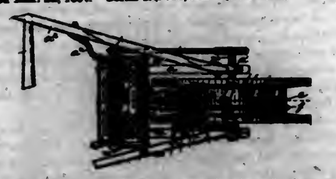
3. The combination, in a piano, of the strings, the tuning-pins, a pin-block having tapered pin-holes, and pin-holders consisting of disks having suitable notches in the sides thereof to receive the pins and secured at the upper side of the pin-block, whereby said pins are supported at and near their points and at a point where the strings are attached thereto, substantially as and for the purposes set forth.

602,681. PIANO. JOHN DUNBORST, Indianapolis, Ind. Filed Oct. 28, 1897. Serial No. 656,667. (No model.)

Claim.—1. The combination, in a piano, of the action, the keyboard, each lower member 1 of the action being connected at its upper end to the next member to swing laterally and near its lower end to a shifting bar, said lower member 1 being also somewhat inclined from a perpendicular when in operative position, and means for operating said shifting bar, substantially as set forth.

2. In a piano, the combination, of the action, the keyboard, the shifting bar 4 mounted to reciprocate in suitable supports on the frame of the piano, the levers 7 and 8 connected with said bar for operating the same, the lower members of the action being each connected to said shifting bar by a link and connected to the next member of the action by a joint which permits a sidewise swing of said lower member, said lower member being normally somewhat inclined from a perpendicular position, substantially as described and for the purposes specified.

3. The combination, in a piano, of the action, the keyboard, a shifting apparatus for the lower members of the action, a leveling-bar carrying a stop or lock and a push-pin for elevating said leveling-bar and throwing said stop or lock out of the path of the lever, while at the same time insuring the correct position of the keys for the shifting, so that the shifting operation shall not be interfered with thereby.



602,682. PROCESS OF PRODUCING ORTHOTOLUENE SULFONIC ACID. WILHELM DIETERLE, Feuerbach, Germany, assignor to The Firm of J. Hauff, same place. Filed May 7, 1897. Serial No. 636,557. (No specimens.)

Claim.—1. The process herein described of producing orthobenzene sulfonic acid, which consists in subjecting orthothiocresol continuously to the action of oxidizing substances, substantially as set forth.

2. In the art or process of producing orthobenzene sulfonic acid, the process of producing orthotoluene sulfonic acid by subjecting orthothiocresol to the action of oxidizing substances, substantially as set forth.

3. The process herein described of producing orthobenzene sulfonic acid, which consists in subjecting orthothiocresol to the continuous action of oxidizing substances in sufficient quantitative proportions so as to produce first the oxidation of the osthothiocresol into orthotoluene sulfonic acid, and then the oxidation of the latter into orthobenzene sulfonic acid, substantially as set forth.

602,683. SEED-SOWER. JOSEPH A. GLENDEN, Fair Haven, Pa. Filed Mar. 23, 1897. Serial No. 628,631. (No model.)

Claim.—1. In seed-sowers, the combination of a frame, a revolving cylinder within the frame having openings therein, spring-actuated pockets covering said openings and journaled on the exterior of said cylinder, a lug or finger on said frame for engaging with said pockets upon the revolution of the cylinder, whereby said pockets are raised, and projections on said cylinder for raising said lug or finger out of engagement with the pockets, substantially as and for the purposes set forth.

2. In seed-sowers, the combination of a frame, a revolving cylinder within the frame having openings therein, spring-actuated pockets covering said openings and journaled on the exterior of said cylinder, a slotted segmental lever on said frame, a slotted bar secured thereto, a lug or finger on said slotted arm for engaging with the pockets upon the revolution of the cylinder, whereby said pockets are raised, and a series of radial projections or lugs on said cylinder adapted to engage with a finger or lug on the slotted bar for raising said first-mentioned lug or finger out of engagement with the pockets, substantially as and for the purposes set forth.

3. In seed-sowers, the combination of a frame, a revolving cylinder having openings therein and provided with trunnions thereon journaled in the frame, spring-actuated pockets covering said openings and journaled on the exterior of the cylinder, a slotted segmental lever hinged to said frame, a slotted bar secured to said segmental lever and loosely mounted around one of the trunnions of the cylinder, a lug or finger on the slotted bar for engaging with the pockets upon the revolution of the cylinder, whereby said pockets are raised, and a series of radial projections or lugs on the side of the cylinder adapted to engage with a movable finger or leg on the slotted bar for raising said first-mentioned lug or finger out of engagement with the pockets, substantially as and for the purposes set forth.

4. In seed-sowers, the combination of a frame, driving-wheels journaled in the forward end of said frame, a revolving cylinder between said driving-wheels having openings therein, spring-actuated

pockets covering said openings and journaled on the exterior of said cylinder, mechanism for engaging with said pockets upon the revolution of said cylinder, whereby said pockets are raised, and mechanism for engaging with any one of said pockets to raise the same upon the revolution of the cylinder, substantially as and for the purposes set forth.

5. In seed-sowers, the combination of a frame, a revolving cylinder within the frame having openings therein, spring-actuated pockets covering said openings and journaled on the exterior of said cylinder, mechanism for engaging said pockets upon the revolution of the cylinder, whereby said pockets are raised, and a reversible chute secured on said frame provided with a roughened surface at one end and a smooth surface at the opposite end, substantially as and for the purposes set forth.

6. In seed-sowers, the combination of a frame, driving-wheels journaled in the forward end of said frame, lugs or flanges on the inner faces of the driving-wheels, a movable band curved in cross-section having openings therein resting on said lugs or flanges and adapted to form the face of a cylinder between the driving-wheels, spring-actuated pockets covering said openings and journaled on the exterior of the cylinder, and mechanism for engaging with said pockets upon the revolution of the cylinder whereby said pockets are raised, substantially as and for the purposes set forth.

7. In seed-sowers, the combination of a frame, driving-wheels journaled in the forward end of said frame, lugs or flanges on the inner faces of the driving-wheels, a movable band curved in cross-section having openings therein resting on said lugs or flanges and adapted to form the face of a cylinder between the driving-wheels, spring-actuated pockets covering said openings and journaled on the exterior of said cylinder, mechanism for engaging said pockets upon the revolution of the cylinder, whereby said pockets are raised, and a lug or bearing on said driving-wheels having a set-screw therein for engaging with the adjustable face of the cylinder to vary the size of the openings therein, substantially as and for the purposes set forth.

8. In seed-sowers, the combination of a frame, driving-wheels journaled in the forward end of said frame, lugs or flanges on the inner faces of the body portions of the driving-wheels, a movable band curved in cross-section having openings therein resting on said lugs or flanges and adapted to form the faces of the cylinder between the driving-wheels, spring-actuated pockets covering said openings and journaled on the exterior of the cylinder, mechanism for engaging said pockets upon the revolution of the cylinder, whereby said pockets are raised and posts on one of the body portions of the driving-wheels adapted to engage with pockets on the body portions of the opposite driving-wheels within the cylinder, substantially as and for the purposes set forth.

9. In seed-sowers, the combination of a frame, a revolving cylinder within the frame having openings therein, spring-actuated pockets covering said openings and journaled on the exterior of said cylinder, a slotted segmental lever on said frame, a slotted bar secured thereto and having a lug or finger thereon for engaging with the pockets upon the revolution of the cylinder, whereby said pockets are raised, and a lever having a rod connected thereto engaging with the segmental lever and the frame to raise the segmental lever and the lug or finger on the slotted bar out of contact with pockets, substantially as and for the purposes set forth.

10. In seed-sowers, the combination of a frame, a revolving cylinder within the frame, an opening in the side of said cylinder having a door therein for the introduction of seed or grain into the cylinder, flanges extending out on both sides of the inner face of said door, and a rod on the lower end of said door adapted to engage with the edges of the opening to hold the door when opened, substantially as and for the purposes set forth.

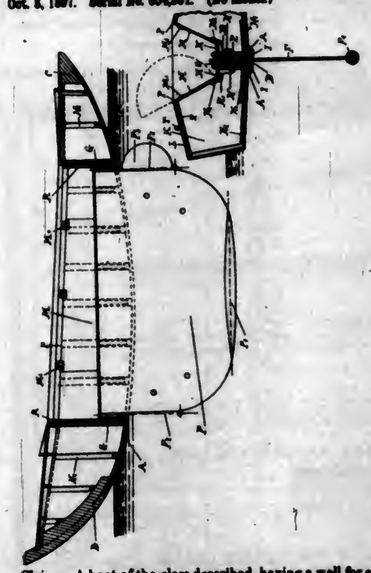
11. In seed-sowers, the combination of a frame, a revolving cylinder within the frame, an opening in the side of the cylinder having a door therein for the introduction of seed or grain into the cylinder, flanges extending out on both sides of the inner face of said door, and a slot in said door having a thumb-nut therein provided with a lug thereon for engaging with the edge of the opening, substantially as and for the purposes set forth.

12. In seed-sowers, the combination of a frame, a revolving cylinder within the frame having openings therein, pockets covering said openings and journaled on the exterior of said cylinder, mechanism for engaging said pockets upon the revolution of the cylinder whereby the pockets are raised, and a circular spiral spring fitting around the cylinder and engaging with the pockets to return them to their normal position when raised, substantially as and for the purposes set forth.

13. In seed-sowers, the combination with a frame having a revolving cylinder therein, of a box or hopper on said frame, a roll journaled in the box or hopper, and connections from said revolving cylinder to the roll to operate the same, substantially as and for the purposes set forth.

14. In seed-sowers, the combination with a frame having a revolving cylinder therein, of a box or hopper on said frame, a roll journaled in the box or hopper, connections from said revolving cylinder to the roll to operate the same, and spiral grooves around and within the face of said roll, substantially as and for the purposes set forth.

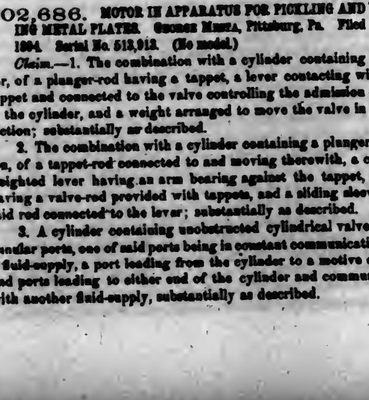
15. In seed-sowers, the combination with a frame having a revolving cylinder therein, of a box or hopper on said frame, a roll journaled in the box or hopper and provided with spiral grooves around and within its face, connections from the revolving cylinder to the roll to operate the same, and spring operated-shutters within said box or hopper, substantially as and for the purposes set forth.



16. In seed-sowers, the combination with a frame having a revolving cylinder therein, of a box or hopper on said frame, a roll journaled in the box or hopper, connections from said revolving cylinder to the roll to operate the same, spring-operated shutters within the box or hopper, and a flexible apron secured to the box or hopper in front of the shutters, and adapted to bear against the roll, substantially as and for the purposes set forth.

17. In seed-sowers, the combination with a frame having a revolving cylinder therein, of a box or hopper on said frame, a roll journaled in the box or hopper, connections from the revolving cylinder to the roll to operate the same, spring-operated shutters within the box or hopper, and an eccentric or cam adapted to engage with the spring-operated shutters to regulate the opening of the same, substantially as and for the purposes set forth.

18. In seed-sowers, the combination with a frame having a revolving cylinder therein, of a box or hopper on said frame, a roll journaled in the box or hopper, connections from the revolving cylinder to the roll to operate the same, spring-operated shutters within the box or hopper, and a flexible strip in the front of the box or hopper adapted to engage with roll, substantially as and for the purposes set forth.



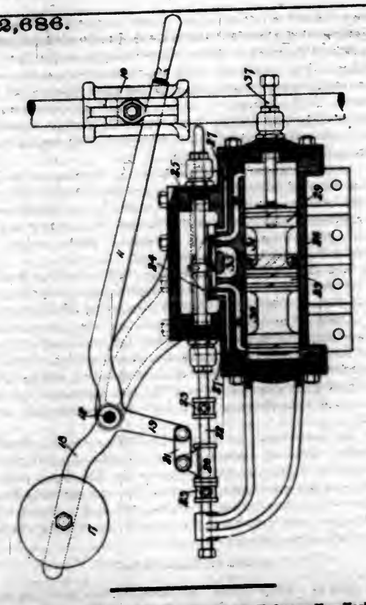
19. In seed-sowers, the combination with a frame having a revolving cylinder therein, of a box or hopper on said frame, a roll journaled in said box or hopper, connections from the revolving cylinder to the roll to operate the same, spring-operated shutters within the roll or hopper, an eccentric mounted on a shaft and adapted to engage with the spring-operated shutters to regulate the opening of the same, and mechanism connected to said shaft for regulating the amount of fertilizer dropped from the box or hopper around the roll substantially as and for the purposes set forth.

602,684. LIFE-BOAT. ALBERT HENRY, Rochefort, France. Filed Oct. 8, 1897. Serial No. 654,991. (No model.)

Claim.—A boat of the class described, having a well for a centerboard in communication with an open space inclosed by water-tight compartments on each side of the well, adapted to allow the water falling into the open space to run out through the well, in combination with a centerboard having at the bottom a weight formed by a metallic body in the shape of a cigar and having a rudder suitably hinged at its end, said rudder adapted to close against the side of the centerboard and to allow of the withdrawal of the latter substantially as described.

602,685. WATER SEAL AND VALVE-TRAP. ZACHARIAH LATSHAW, New York, N. Y., assignor to Charles R. Higgins, same place. Filed Nov. 19, 1897. Serial No. 658,093. (No model.)

Claim.—1. In a water seal and valve-trap, the combination, with the trap-elbow, of an inclined valve-seat upon the outlet branch, a joint-flange surrounding such seat, a cover secured permanently upon such joint and provided with the threaded socket K and cap L, as set forth, a bridge secured within the socket by the cap, and a valve fitted to the seat and jointed to the bridge by link F, as and for the purpose set forth.



2. In a water seal and valve-trap, the combination, with the trap-elbow, of an inclined valve-seat upon the outlet branch, a cover secured over the valve-seat and containing the vent-pipe socket and a socket for a removable cap over the valve-seat, and a valve fitted to the seat with link having support held in place by such cap.

3. In a water seal and valve-trap, the combination, with the trap-elbow, of an inclined valve-seat upon the outlet branch, a joint-flange surrounding such seat, a cover secured upon such joint and containing the vent-pipe socket and a socket for a removable cap over the valve-seat, and a valve fitted to the seat with link to support it movably, substantially as herein set forth.

4. In a water seal and valve-trap, the combination, with the trap-elbow, of an inclined seat upon the outlet branch with the same diameter as the trap-passage, a chamber of greater diameter outside of said seat, with a valve fitted to said seat and movable within the chamber, and a cover secured over the valve-seat and containing the vent-pipe socket and a socket for a removable cap above the seat, such cap-socket being adapted to insert and remove the valve, substantially as herein set forth.

5. In a water seal and valve-trap, the combination, with the trap-elbow, of an outlet branch provided with an inclined valve-seat, a cover secured over the valve-seat and containing a socket with a removable cap above the valve-seat, the ring G secured within such socket and provided with the bridge or cross-bar *g* having suitable lugs, and a valve fitted to the seat with link pivoted to such lugs, substantially as herein set forth.

602,686.

602,687. DOOR-CHECK. FREDERICK H. OSDEN, New York, N. Y., assignor to Henry Ill and Charles Winckhofer, Newark, N. J. Filed June 19, 1897. Serial No. 641,434. (No model.)

Claim.—1. In a door-check, the combination, with a vertically-arranged working chamber, a piston arranged to move up and down therein, and operating devices therefor, of a liquid-reservoir separate from the working chamber but communicating therewith below the piston, valves arranged to permit free passage of liquid from said reservoir into the working chamber but to restrict the flow of liquid therefrom, a check-valve, opening downward in said piston, for automatically returning into action liquid which escapes to the upper side of the piston, and an air-passage connecting the upper portion of the working chamber with said reservoir, substantially as described.

2. In a door-check, the combination, with a casing containing a spring-chamber and a working chamber below the spring-chamber and adapted to contain a moving piston and mechanism for operating the same, suitable passages and valves, and a piston within the working chamber, of a plate separating the spring and working chambers, a horizontal shaft within said working chamber and suspended from said plate, mechanism operated by the revolution of said shaft for operating the piston, a vertical shaft projecting through said plate into the working chamber and connected by gearing to said horizontal shaft, means for connecting said vertical shaft and the door whereby as the door opens and closes said shaft rotates, and a spring for closing the door, substantially as described.

3. In a door-check, the combination, with a casing containing a spring-chamber and a working chamber below the spring-chamber and adapted to contain a moving piston and mechanism for operating

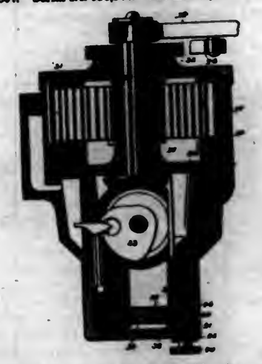
---

602,686. MOTOR IN APPARATUS FOR PICKLING AND WASHING METAL PLATES. GEORGE MESTA, Pittsburg, Pa. Filed June 8, 1894. Serial No. 513,913. (No model.)

Claim.—1. The combination with a cylinder containing a plunger, of a plunger-rod having a tappet, a lever contacting with said tappet and connected to the valve controlling the admission of fluid to the cylinder, and a weight arranged to move the valve in one direction; substantially as described.

2. The combination with a cylinder containing a plunger or piston, of a tappet-rod connected to and moving therewith, a counterweighted lever having an arm bearing against the tappet, a valve having a valve-rod provided with tappets, and a sliding sleeve upon said rod connected to the lever; substantially as described.

3. A cylinder containing unobstructed cylindrical valve having annular ports, one of said ports being in constant communication with a fluid-supply, a port leading from the cylinder to a motive cylinder and ports leading to either end of the cylinder and communicating with another fluid-supply, substantially as described.



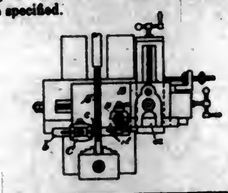
the same, suitable passages and valves, and a piston within the working chamber, of a plate separating the spring and working chambers, a cam-shaft within said working chamber and suspended from said plate, a cam upon said shaft acting upon the piston and adapted to reciprocate the same, an operating-shaft projecting through said plate into the working chamber and connected by gearing to said cam-shaft, means for connecting said operating-shaft and the door whereby as the door opens and closes said shaft rotates, and a spring for closing the door, substantially as described.

4. In a door check, the combination, with a casing containing a working chamber, and a piston therein, of a plate closing said chamber, a shaft within said chamber and suspended from said plate, mechanism operated by the revolution of said shaft for operating said piston, and a vertical operating-shaft connected by gearing to said first-mentioned shaft, substantially as described.

5. In a door-check, the combination, with a working chamber, and a piston therein having a piston-rod carrying a projecting cam-piece or stud, of a revolubly-mounted cam having shoulders, one of which is adapted to engage the stud and move the piston outward, and the other of which is arranged to bear against the end of the piston-rod for pressing the piston inward, said cam and cam-piece being so shaped that they disengage when the cam is in a position corresponding to a partly-open position of the door, and means for rotating said cam when the door opens and closes, substantially as described.

6. In a door-check, the combination, with a working chamber, of a piston within said chamber having a piston-rod working along and guided by a guide-rib projecting from the side of said working chamber and having a plane guide-face, the corresponding face of the piston-rod where it comes in contact with said guide-rib being also plane, whereby rotation of the piston in the working chamber is prevented, substantially as described.

602,688. DOOR-CHECK. FREDERICK H. OSBER, New York, N. Y., assignor to Henry Ill and Charles Winckhofer, Newark, N. J. Filed Sept. 4, 1897. Serial No. 650,577. (No model.)



Claim.—1. In a door-check, the combination, with a working chamber, a piston therein, and means for reciprocating the same, of a check-valve adapted to permit free passage of a liquid or other fluid from one side of the piston to the other, a valve-plug in said piston adapted to restrict a passage therein through which reverse flow of the fluid may take place, an operating-rod projecting through the wall of the working chamber, and gearing connecting said valve-plug and operating-rod, by which said valve-plug may be adjusted, substantially as described.

2. In a door-check, the combination, with a working chamber, a piston therein, and means for reciprocating the same, of a check-valve adapted to permit free passage of a liquid or other fluid from one side of the piston to the other, a screw in said piston adapted to restrict a passage therein through which reverse flow of the fluid may take place, a gear-wheel upon the end of said screw, and an operating-rod projecting through the wall of the working chamber, and provided with teeth adapted to mesh with the teeth of said gear-wheel, by which said screw may be adjusted, substantially as described.

602,689. SCREW-CUTTING MACHINE. JAMES REYNOUD and ADOLPHE POCHERON, St. Imier, Switzerland. Filed July 6, 1897. Serial No. 643,565. (No model.)

Claim.—In a screw-cutting machine, a support or plate provided with two tool-holders, one integral therewith and the other movable thereon, said first tool-holder adapted to be adjusted parallel to the axis of the work-piece according to the pitch of the screw-thread required, and said second tool-holder capable of adjustment at right angles to the axis of the work-piece according to the diameter thereof, whereby the cutters are adapted to act separately upon the work-piece during the forward and return movement of the carriage, substantially as specified.

602,690. ACETYL DERIVATIVE OF PHENETIDIN. CARL F. M. SCHAEFFER and PAUL SEIWARD, Basle, Switzerland, assignors to F. Hoffmann-La Roche & Co., same place. Filed Oct. 19, 1897. Serial No. 655,741. (Specimens.) Patented in England June 14, 1897, No. 14,307.

Claim.—1. The process of preparing pharmaceutical products consisting in the preparation of phenetidin-sulfonic acid by treating phenetidin with concentrated sulfuric acid, as described.

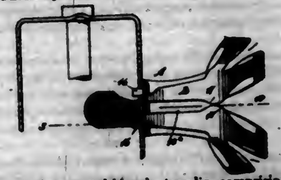
2. The process of preparing pharmaceutical products consisting in the preparation of an acetyl derivative of a salt of phenetidin-sulfonic acid, by treating phenetidin with concentrated sulfuric acid, converting the phenetidin-sulfonic acid thus obtained into a salt and acetylizing this salt (phenetidin sulfonate) by means of glacial acetic acid and acetic anhydrid, as described.

3. As a new article of manufacture, the herein-described acetyl derivative of an alkaline phenetidin sulfonate, which consists of a reddish-white microcrystalline, hygroscopic body, which is easily soluble in water, less easily soluble in alcohol and insoluble in ether and has antipyretic properties.

602,691. TILING FOR FLOORS, WALLS, CEILINGS, FIRE-PLACES, &c. CHARLES C. ALEXANDER, Bayonne, N. J. Filed June 11, 1897. Serial No. 640,203. (No model.)

Claim.—1. A tiling composed of disks arranged in series of rows with the disks of each row in peripheral contact with the adjacent disks of such row and with the disks of each row in line with the spaces between the disks of the next row and in peripheral contact with two disks of such next row whereby to properly aline the disks in each row and to form triangular spaces between the contacting disks and a binding material filling the triangular spaces between the adjacent disks, the inner or base ends of said disks being flat, substantially as described.

2. A tiling composed of circular disks of uniform size and made in the form of a frustum of a cone with the large ends or bases of said cones inward and in peripheral contact with the adjacent disks, and the binding material filling the spaces between said disks and the interstitial openings between their contacting portions, substantially as shown and described.



3. A tiling composed of circular disks of uniform size and made in the form of truncated cones with their large ends innermost, such disks being set with portions in peripheral contact with the similar adjacent disks leaving triangular spaces and interstitial openings between the adjacent disks and the cement-like binding below and between the disks and extended through the interstitial openings between the large ends of the disks tying the material below the disks to that between the same and keying the disks in place, substantially as shown and described.

4. A tiling composed of contrasting disks made alike in shape, and having their peripheral edges in contact with each other to form triangular spaces between adjacent disks, the top surfaces of the disks extending in the same plane, and a binding material in which the said disks are embedded, and which material fills the triangular spaces to bind the tile-disks at their edges, the top surface of the material being flush with the top surface of the disks and in contrast thereto to set off the contrasting disks, substantially as shown and described.

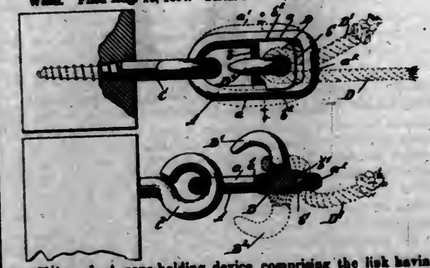
5. A tiling composed of the blocks made circular in cross-section and frusto-conical with their large inner ends flat, and the binding material in which said blocks are set with their inner flat ends in peripheral contact with the corresponding ends of the adjacent blocks, the interstitial spaces between the blocks being filled with the binding material and the flat inner ends of the blocks forming broad bases by which to prevent any tilting of the tile-blocks, substantially as shown and described.

6. A tiling substantially as described, comprising circular tile-disks having their peripheral surfaces in contact with each other to form intermediate spaces between the adjacent disks and binding material in which said disks are embedded and in the spaces between the disks and the edges thereof, the circular form of the disks permitting the shifting thereof in securing a regulation of the pattern in setting the tiles, substantially as set forth.

602,692. TOE-CLIP FOR BICYCLES. DAVID BAGH, New York, N. Y. Filed May 17, 1897. Serial No. 636,903. (No model.)

Claim.—A sheet-metal bicycle toe-clip, comprising the bottom, front, and top sections, divided into two parts by a longitudinal opening extending from the front of the bottom section, through the front section, and rearwardly to near the end of the top section, the walls of such opening where the front section merges into the top section being made to closely approach each other, forming lips which are capable of being bent vertically, as set forth.

602,693. ROCK OR LIKE DRILL. ERNEST P. BLACKMORE, Johannesburg, South African Republic, assignor of two-thirds to Richard Oliver Gardner Drummond and Edward John Way, same place. Filed Sept. 2, 1897. Serial No. 650,317. (No model.)



Claim.—1. In a rock-drill the combination with the frame, of the reciprocating drill-shaft mounted therein, the shell O mounted on said shaft and surrounding the same and formed with a spiral cam-surface, the stator Q mounted in the frame and also surrounding the drill-shaft, the rotor P mounted within the stator and surrounding the shaft, the shell C' fixed to the rotor and surrounding the drill-shaft beyond the shell O and formed with a spiral cam-surface abutting against the cam-surface on the shell O.

2. In combination, the drill-shaft A, the boss a formed thereon and forming the shoulders a' a^2, the cylindrical cam C, screwed onto the shaft A up to the shoulder a', the corresponding cylindrical cam C' screwed within the rotor P, the bush O screwed within the cam C' and forming the bearing for the rotating part of the motor, the rotor P and stator Q, comprising the electric motor mounted concentrically on the drill-shaft A, the spiral spring D inserted within the cylindrical casing B and bearing against the shoulder a^2 formed on the drill-shaft, the cylindrical casing B and its cover b' against which the spring D bears the cavity E formed in the inner extremity of the drill-shaft A, the rifle-nut F screwed therein, the rifle-bar G passing through the rifle-nut and projecting into the cavity E, the ratchet or leaf wheel H attached to the end of the rifle-bar G, the pawl J, the cup-shaped piece K attached to the cover b' of the cylindrical casing B for regulating the tension of spring D, the adjusting-screw M fitted with a locking device, operating-handle N, and the several parts L L' L^2, annular piece S and cap R of the exterior casing substantially as described and shown.

3. In a drill the combination with the frame, of the drill-shaft A, the concentric cylindrical cam C attached thereto near its rear end, the stator Q surrounding the drill-shaft near its forward end, the rotor P mounted within the stator, the rotor-shaft surrounding the drill-shaft and provided with a rearward extension T, the cylindrical cam C' fixed to said extension in rear of stator Q and abutting against the cam C, and the packing-ring V surrounding the cam C'.

4. In combination, the drill-shaft A, the boss a formed thereon and forming the shoulders a' a^2, the cylindrical cam C, screwed onto the shaft A up to the shoulder a', the corresponding cylindrical cam C' gearing therewith attached to the extension-piece or continuation T of the rotor-shaft U of the motor, the rotor P and stator Q mounted concentrically on the drill-shaft A the rotor-shaft U and the extension T thereof, the packing-ring V, the spiral spring D inserted within the cylindrical casing B and bearing against the shoulder a^2 formed on the drill-shaft, the cylindrical casing B and its cover b' against which the spring D bears the cavity E formed in the inner extremity of the drill-shaft A, the rifle-nut F screwed therein, the rifle-bar G passing through the rifle-nut and projecting into the cavity E, the ratchet or leaf wheel H attached to the end of the rifle-bar G, the pawl J, the cup-shaped piece K attached to the cover b' of the cylindrical casing B for regulating the tension of spring D, the adjusting-screw M fitted with a locking device, operating-handle N, and the several parts L L' L^2, of the casing of the drill, substantially as described.

602,694. ROPE-CLAMPING HOOK. ABNER R. BRADSHAW, Seattle, Wash. Filed Aug. 10, 1897. Serial No. 647,726. (No model.)

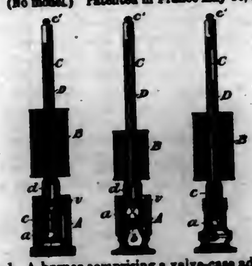
Claim.—1. A rope-holding device, comprising the link having its rear end arranged for attachment to a support, and a block fitted to slide between the side bars of said link and having a hook projecting therefrom, said hook being bent toward the rear end of said link and lying within the margin of said link, as and for the purpose set forth.

2. A rope-holding device, comprising the link formed with a rear end arranged for attachment to a support and two parallel side members connected at their forward ends by a lateral section, a block having its side edges concaved and by which it is held to slide between the sides of the link and its front edge concaved to fit the lateral section of said link, and a hook projecting from a face of said block and curved backward away from the lateral section of the link, whereby strain on a rope inserted between the concaved edge of the block and a lateral section of the link and around the hook will securely clamp the same, as and for the purpose set forth.

602,695. MUSICAL INSTRUMENT. PETER CASELLE, New York, N. Y. Filed Dec. 2, 1897. Serial No. 660,803. (No model.)

Claim.—1. A musical instrument, having a separable body and neck, the body having a recess with sloping or converging sides opening to one side of the body and adapted to receive the similarly-shaped end of the neck, a plate located at the bottom of said recess and having slots extending to the open edge of said recess, a plate on

the end of the neck, and bars attached to said plate by webs and adapted to fit in the slots in the plate at the bottom of the recess, substantially as described.



2. A musical instrument, having a separable body and neck, the body having a recess with sloping or converging sides opening to one side of the body and adapted to receive the similarly-shaped end of the neck, a plate located at the bottom of said recess and having slots extending to the open edge of said recess, a plate on the end of the neck, bars attached thereto by webs and adapted to fit in the slot in the plate at the bottom of the recess, one of said bars having a threaded hole in its ends, and a bolt mounted in the body and entering said threaded bar, substantially as described.

3. A musical instrument, having a neck and body, said neck being separable from the body, and a plate pivoted to the neck at its end and extending over the body when in use, or folded down against the end of the neck, as the parts are connected or separated, said plate carrying a portion of the frets, substantially as described.

4. A fastening for the strings of musical instruments, comprising a plate having a series of holes therethrough and a narrow slot extending from each hole and adapted to receive the strings, and a plate mounted to slide upon the first plate and adapted to cover or free said holes, and means for clamping the two plates together, substantially as described.

602,696. VALVE-CONTROLLING DEVICE FOR GAS-BURNERS.

JOSEPH D. C. CHATEAU, Paris, France. Filed Dec. 31, 1896. Serial No. 617,623. (No model.) Patented in France May 30, 1896, No. 256,734.

Claim.—1. A burner comprising a valve-case adapted to be connected to the gas-service piping; and having a gas-exit passage, a valve formed of magnetic material, arranged loosely on its seat, and adapted to control said exit-passage, a piece of soft iron arranged above said valve and adapted to lift the same when sufficiently excited, a permanent-magnet facing arranged so as normally to magnetize said piece of soft iron but not to a sufficient extent to lift said valve; and an electromagnet comprising a steel rod surrounded by a solenoid through which electric currents can be passed, said electromagnet serving when suitably excited to modify the magnetism of the armature produced by the first magnet and vary the effect thereof so as to depress or raise the same according as the magnetism of the electromagnet assists or is in opposition to the magnetism of the permanent magnet, substantially as hereinbefore described.

2. A gas-burner comprising a valve-case having a passage for exit of gas and a burner-stem C with burner proper, a valve *a* controlling said gas-exit passage, a soft-iron plunger *c*, a V-shaped part *d* of magnetic material, a magnet A surrounding said armature and V-shaped part, a solenoid B surrounding said burner-stem, and a steel rod D located within said stem, the whole constructed, arranged and operating substantially as described and shown for the purpose specified.

3. A burner comprising a valve-case having a gas-exit passage and a hollow stem with burner proper, a loose valve of magnetic material controlling said exit-passage, a magnetic part adapted when sufficiently magnetized to raise said valve, a solenoid surrounding said stem, and a rod of magnetic material arranged as a core to said solenoid and adapted to magnetize said magnetic part and raise said valve when the solenoid is traversed by a continuous current and to demagnetize said movable part and permit said valve to fall into its closed position when said solenoid is traversed by an alternating current of decreasing strength, substantially as herein described.

4. The combination of the valve-casing, the magnetic valve controlling a port in said casing, a steel rod aligning longitudinally with said valve, a solenoid or coil arranged to influence said steel rod magnetically, the valve being located without the coil, and a hollow permanent magnet surrounding the valve, substantially as described.

5. The combination of the valve-casing, the magnetic valve controlling a port in said casing, a tubular permanent magnet surrounding the valve and extending above the same, and a solenoid or coil located above said magnet and arranged to influence the same, substantially as described.

6. A gas-burner consisting of a valve-case *d'* with exit-passage *b'* and stem C carrying the burner proper *d'*, a valve *a* of magnetic material controlling said gas-exit passage, a soft-iron plunger located above said valve, a steel rod D located above said plunger and within the stem, and a solenoid surrounding said stem and rod, substantially as described.

7. The combination of a valve-casing, a valve capable of actuation by magnetism and operating within the valve-casing, an electromagnet, and a stationary magnetic member interposed between the valve and the core of the electromagnet and coacting with the magnet to operate the valve, substantially as described.

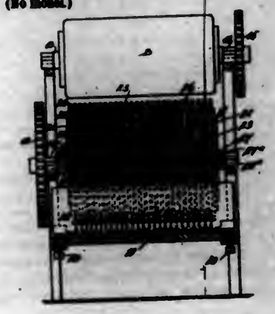
8. The combination of a valve-casing, a valve capable of actuation by magnetism and located within the valve-casing, an electromagnet, a magnetic member interposed between the valve and electromagnet and transmitting magnetism from the electromagnet to the valve, and a permanent magnet adjacent to the valve and influencing the same in conjunction with the electromagnet, substantially as described.

9. The combination of a casing, a valve capable of actuation by magnetism and located within the valve-casing, a magnetic member normally rested on the valve, a second magnetic member located above the first magnetic member, and an electromagnet with whose core the said second magnetic member is engaged, substantially as described.

10. The combination of a casing, a valve capable of actuation by magnetism and located within the valve-casing, a magnetic member normally rested on the valve, a second magnetic member located above the first magnetic member, a permanent magnet embracing the valve-casing and influencing but not entirely operating the magnetic parts therein, and an electromagnet coacting with the permanent magnet and operating the valve through the medium of the magnetic members within the valve-casing, substantially as described.

602,697. FORMALDEHYDE STARCH AND METHOD OF MAKING SAME.

ALEXANDER CLASSEN, Aix-la-Chapelle, Germany. Filed Aug. 20, 1896. Serial No. 603,207. (No specimens.)



Claim.—1. The herein-described process for the manufacture of compounds of starch and starch-like substances with formaldehyde, which consists in causing said substances to react with formaldehyde and heating the products of the reaction for about twenty-four hours to a temperature of about 120° centigrade, the compounds obtained by such heating being again treated with formaldehyde and then freed by means of a solvent of formaldehyde, such as water, from the excess of formaldehyde, and dried.

2. The herein-described process for the manufacture of chemical compounds of starch and starch-like substances with formaldehyde, which consists in placing said substances in the presence of each other under pressure and heating them to a temperature above 100° centigrade, thereby causing a chemical reaction between the starch and the formaldehyde, whereupon the compound produced is dried and then freed from the excess of formaldehyde.

3. The herein-described compounds containing starch or starch-like substances in chemical combination with formaldehyde, said compounds presenting the following characteristics: when boiled with water, they do not give off any formaldehyde, nor does the starch or starch-like substance contained in them assume a pasty consistence; they may be heated up to 180° centigrade without giving off formaldehyde; when heated with dilute acids or alkalies, they are decomposed under liberation of formaldehyde; they are decomposed in a like manner by the action of organic tissues and secretions.

602,698. RAISIN-SEEDER.

CARY S. COX, Fresno, Cal., assignor to Lee L. Gray, same place, and the Phœnix Raisin Seeding and Packing Company, Fresno County, Cal. Filed Dec. 31, 1896. Serial No. 617,632. (No model.)

Claim.—1. In a raisin-seeding machine, a rubber-covered roller the covering of which is slitted circumferentially, substantially as described.

2. In a machine for seeding raisins, a carrying-drum for the raisins provided with pin-like projections from its periphery, and a composite drum comprising non-yielding body-disks and yielding material between the body-disks, the yielding material projecting beyond the disks, forming pockets for the reception of seed, the pin projections upon the carrying-drum being arranged to enter the spaces between the projecting portions of yielding material.

3. In a machine for seeding raisins, a drum for the reception of seed, comprising non-yielding body-disks and rings or gaskets of a yielding material held between the body-disks, extending beyond said disks, forming a series of pockets for the reception of seed, the said pockets having closed yielding walls.

4. In a machine for seeding raisins, a drum for the reception of seed, comprising non-yielding body-disks having openings therein, rings or gaskets of a yielding character held between the disks and extending beyond them, and means for drawing the disks together and forcing the yielding material into the openings of the said disks.

5. In a machine for seeding raisins, a carrying-drum for the raisins provided with pins on its periphery, a composite drum consisting of a non-yielding body and spaced yielding projections from the periphery of the body, between which the pins on the carrying-drum pass, and a division-plate located between the two drums at a point below their centers, as and for the purpose specified.

6. In a machine for seeding raisins, a carrying-drum having its periphery provided with rows of pins, a composite drum consisting of a body and annular projections from the body, made of a yielding material and between which the rows of pins on the carrying-drum pass, and combs located one beneath each of the drums and arranged to remove the material therefrom, substantially as described.

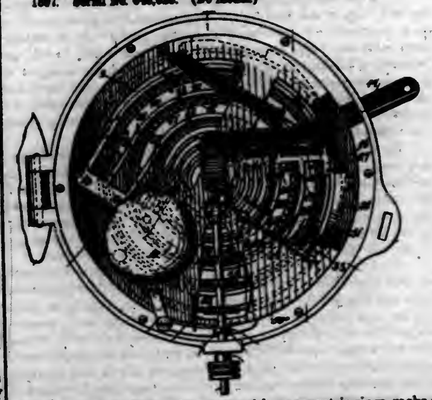
7. In a machine for seeding raisins, a carrying-drum having its periphery provided with rows of pins, a composite drum consisting of a body and annular projections from the body, made of a yielding material and between which the rows of pins on the carrying-drum pass, combs located one beneath each of the drums and arranged to remove the material therefrom, and a division-plate located between the combs and between the drums, extending upward to a point near where the drums come in contact, as and for the purpose set forth.

8. In a raisin-seeder, feed-rollers one of which is provided with a yielding surface, a raisin-carrying roller located beneath one of the feed-rollers and having pins located upon its peripheral surface, a composite drum consisting of a shaft and series of disks of a non-yielding material secured on the shaft, and gaskets or rings secured between the said disks and extending beyond their peripheral faces, the teeth of the carrying-drum being arranged to pass through the spaces between the gaskets or rings, and combs having their teeth arranged to enter in the spaces between the rings or gaskets of the composite roller and between the rows of teeth on the carrying-roller, as and for the purpose set forth.

9. In a raisin-seeder, feed-rollers one of which is provided with a yielding surface, a raisin-carrying roller located beneath one of the feed-rollers and having pins located upon its peripheral surface, a composite drum consisting of a shaft and series of disks of a non-yielding material secured on the shaft, and gaskets or rings secured between the said disks and extending beyond their peripheral faces, the teeth of the carrying-drum being arranged to pass through the spaces between the gaskets or rings, combs having their teeth arranged to enter in the spaces between the rings or gaskets of the composite roller and between the rows of teeth on the carrying-roller, and a division-plate located between the combs and between the carrying and the composite drums, the upper portion of the division-plate extending to a point near where the two said drums engage, substantially as shown and described.

602,699. HAIR-TIE BUTTON.

CHRISTOPHER C. DAVIS, Hopatcong, N. Y. Filed Jan. 24, 1898. Serial No. 667,737. (No model.)



Claim.—1. A hair-tie button, comprising two opposing heads, a shank connecting the heads, the said shank being provided with a transverse opening and with a chamber communicating with the opening, and a tape, cord or rubber passing through said opening and having an enlargement larger than the opening and contained within the chamber of the shank, as set forth.

2. In a hair-tie button, the combination, with opposing heads having concaved opposing surfaces, and a shank connecting the concaved surfaces of the heads, the said shank being provided with a recess in its end close to the inner face of one of its heads, the shank being also provided with an interior chamber communicating with the recess, of a tape, cord or ribbon provided with an enlargement at its center, the tape, cord or ribbon being passed through said recess in the shank, the enlargement being contained within the chamber of the shank, whereby the tape, cord or ribbon cannot be withdrawn from the shank when the button is being applied, enabling the operator to readily manipulate the cord, tape or ribbon around the button and around the braid above and below the button, as set forth.

602,700. FARE-REGISTER.

EDWARD FIRMS, New York, N. Y., assignor to the New York Stencil Works, same place. Filed July 31, 1897. Serial No. 646,622. (No model.)

Claim.—1. A fare-register, comprising concentric rings, racks on the rings, a pivoted lever, dogs on said lever engaging the racks to move the rings, and means for raising the dogs wholly out of engagement with the rings on the return movement of the lever, substantially as specified.

2. A fare-register, comprising concentric rings, a pivoted lever, dogs carried by said lever for engaging with racks on the rings and imparting a step-by-step motion to said rings, a plate attached to a fixed support, and a finger attached to the dogs and adapted to ride upon the upper surface of said plate, to raise the dogs out of engagement with the rings on the return movement of the lever, substantially as specified.

3. A fare-register, comprising concentric rings, a pivoted lever, dogs mounted to swing on said lever, racks on the rings with which said dogs are designed to engage, a spring yielding plate mounted on a fixed support and having its free end curved downward, and a finger extended from the dogs and adapted to engage upon the upper side of said plate to raise the dogs out of engagement with the rings upon the return movement of the lever, substantially as specified.

4. A fare-register, comprising a series of concentric rings, a lever, dogs mounted to swing on said lever, the said dogs being of different lengths, notched racks on the rings, a notch in one rack being deeper than a notch in the other rack, means for moving the dogs out of engagement with the racks, on the return movement of the lever, stop-pins on certain of the rings, swinging dogs adapted to engage the stop-pins, and means carried by the lever for moving said stop-dogs out of the line of movement of the pins, substantially as specified.

5. A car-fare register, comprising concentric rings, a rack extended around each ring, means for moving said rings forward to disclose consecutive numbers, a swinging shaft, gear-wheels mounted on the swinging shaft to be engaged with the racks when the shaft is swung in one direction, a tubular locking-head on the outer end of said shaft, and a pin extended from said head into a groove formed longitudinally in the shaft, substantially as specified.

6. A car-fare register, comprising concentric rings, a rack extended around each ring, means for moving said rings forward to disclose consecutive numbers, a swinging shaft, gear-wheels mounted on the swinging shaft to be engaged with the racks when the shaft is swung in one direction, a tubular locking-head on the outer end of said shaft, a pin extended from said head into a groove formed longitudinally in the shaft, a nut engaging with the outer end of the shaft and movable within the head, and a spring in said nut and the shaft, substantially as specified.

7. A fare-register, comprising concentric rings, means for moving said rings forward to disclose numbers consecutively, racks extended partially around said rings, gear-wheels adapted for engagement with said racks, a swinging shaft on which said wheels are mounted, means for holding the shaft in either of its adjusted positions, a bell-hammer lever, and means carried by the swinging shaft for moving said bell-hammer lever out of operative position, substantially as specified.

8. A fare-register, comprising concentric rings, means for rotating said rings in one direction for disclosing numbers consecutively, a rack extended partially around each ring, gear-wheels for engagement with said racks, a swinging shaft on which said wheels are mounted, whereby the wheels may be moved into and out of engagement with the racks, means for holding the shaft in either of its adjusted positions, a bell-hammer lever designed to be swung by the outer one of said rings and means for moving said lever out of its operative connection with the ring when the swinging shaft is moved to engage the gear-wheels with the racks, substantially as specified.

9. A fare-register, comprising concentric rings, means for rotating said rings in one direction to disclose numbers consecutively, a rack extended partially around each ring, gear-wheels for engagement with said racks, a swinging shaft on which said wheels are mounted, a bell-hammer operating-lever adapted to be swung on its pivot by the outer one of the rings, a projection on said shaft, and an inclined lug on the bell-hammer operating-lever with which said projection is designed to engage, to move the lever out of its operative connection with the ring, substantially as specified.

10. A fare-register, comprising concentric rings, a pivoted lever, dogs mounted to swing on said lever, racks on the rings with which said dogs are designed to engage, stop-pins extended from certain of said rings, stop-dogs for engaging with said pins, a spring-pressed rod on which said stop-dogs are mounted, and an inclined lug carried by the lever and engaging with said rod to move the stop-dogs out of the line of movement of the pins, substantially as specified.

11. A fare-register, comprising a series of rings, a notched rack on each of said rings, a pivoted lever, dogs mounted to swing on said lever and adapted for engagement with the racks, a spring for holding the dogs yieldingly in engagement with the racks, a spring-plate mounted on a fixed support and curved toward the ring at its free end, and a finger carried by one of the dogs and adapted to move against the inner surface of said spring-plate when a ring is turned in one direction by the dog, and adapted to ride upon the outer surface of the plate as the dog is moved in the opposite direction, substantially as specified.

12. A fare-register, comprising a series of concentric rings for registering the number of trip-fares collected, a series of concentric rings within the first series, for indicating the total amount of fares collected, means for moving all of said rings forward, means for resetting the first-named series of rings and consisting of a shaft and gear-wheels mounted on said shaft for engaging with racks on the rings, means for resetting the inner series of rings, comprising a finger-piece having engagement with the innermost ring, and spring-pressed dogs carried by certain of the rings, for imparting motion to other rings, substantially as specified.

13. A fare-register, comprising a series of concentric rings for registering the number of trip-fares collected, another series of concentric rings within the first series, racks on said inner series of rings, a pivoted lever, dogs mounted to swing on said lever for engaging the racks of said inner series of rings, other dogs mounted to swing on said lever for operating the outer series of rings, and means comprising a fixed plate, and a finger having connection with the dogs for simultaneously moving all of the dogs out of operative position upon a return movement of the lever, substantially as specified.

14. A fare-register, comprising a series of concentric rings, a swinging lever for moving said rings in one direction, stop-pins on certain of the rings, swinging dogs adapted to engage with the stop-pins, and means carried by the lever for moving said swinging dogs out of the line of movement of the pins, substantially as specified.

15. A fare-register, comprising a series of concentric rings, a swinging lever for moving said rings in one direction, stop-pins on certain of said rings, spring-pressed swinging dogs adapted to engage the stop-pins, a rocking shaft on which said dogs are mounted, the said shaft having its inner end cranked, and an inclined lug on the inner end of the lever with which the cranked end of said shaft engages, substantially as specified.

602,701. BALL-BEARING. FRANK GUSTAVSON, Wabasha, Minn. Filed Sept. 24, 1897. Serial No. 652,814. (No model.)

Claim.—1. A cup for a ball-bearing, having a cupped flange extending inwardly from the ball-race and forming an oil receiving and retaining cup which is separate from the ball-race, substantially as described.

2. A cup for a ball-bearing, having a flange extending inwardly from the raceway, and cupped or decreased in diameter at its inner end, whereby an oil-receiving cup is formed, and a filtering-washer between said oil-cup and the ball-race, substantially as described.

3. A bicycle-bearing, comprising a hub having cups therein each provided with a flange or collar extending inwardly from the raceway and cupped or decreased in diameter at its inner end, whereby an oil-receiving cup is formed, an axle having cones thereon cooperating with the cups to form ball-raceways, balls between said cones and the raceways of the cups, and a tube surrounding the axle, with its ends entering the oil-receiving cups and constituting an oil-reservoir, substantially as described.

602,702. KNIT FABRIC FOR UNDERWEAR, &c. DAVID P. HALSTED, Brooklyn, N. Y. Filed Mar. 11, 1897. Serial No. 627,016. (No model.)

Claim.—A knit fabric for hosiery, blankets underwear and other knit goods, comprising a cotton fabric formed of a face-thread and a binding-thread in the rear of the face-thread and following the lines of the said face-thread, the successive courses of said face-thread and binding-thread being interlooped with each other, and a silk thread for each course of such face-thread and binding-thread, interlocked at intervals with the said binding-thread by the said silk thread passing through the bottom portions of some of the loops of the said binding-thread in each course, such loops being locked by the upper ends of the succeeding loops of both face and binding threads, substantially as shown and described.

602,703. ROTARY ENGINE. REUBEN P. JARVIS, South Centre, Kans. Filed May 6, 1897. Serial No. 635,925. (No model.)

Claim.—1. In a rotary engine, the combination with a cylinder, of a fixed shaft having a crank-arm in the cylinder, a piston mounted eccentrically in the cylinder and to turn loosely on the said shaft, said piston having its rim slotted, rocking bearings carried by the piston, a packing on the inner face of the bearing, said packing comprising a casing secured to the bearing and adjustable packing-plates in the casing, piston-heads sliding in the bearings and packings and having their inner ends pivotally connected with the crank-arm of the said shaft, and means for operating the piston, substantially as described.

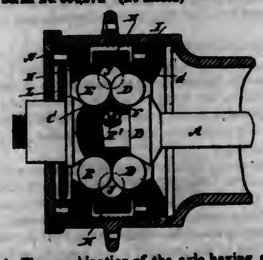
2. In a rotary engine, the combination with a cylinder, provided with the ports *a*, *b*, *c*, *d*, *g*, *h*, *j* and *k* and a rotary piston having sliding heads, of the valves J, K, L, mounted to turn and having ports *e*, *f*, *i*, respectively, extending through them, the valve L being connected with the steam-inlet, and means for operating the said valves in unison, substantially as described.

3. In a rotary engine, the combination with a cylinder provided with the ports *a*, *b*, *c d*, *g*, *h*, *j k* and *l*, the port *l* connecting the ports *c d*, and a rotary piston having sliding piston-heads, of the valves J K L mounted to turn and having the ports *e f i* respectively extending through them, the valve L being connected with the steam-inlet N, and gearing between the said valves for turning them in unison, substantially as described.

4. In a rotary engine, the combination of a cylinder having in its upper part the ports *a b c d g h j k* and *l*, and the ports *n o* in its lower portion, a rotary piston having sliding piston-heads, the valves J K L mounted to turn and having the ports *e f i* respectively, the valve L being connected with the steam-inlet, the valves P Q having ports *p q* adapted to register with the ports *n o* respectively, and means for operating all of the said valves in unison, substantially as described.

5. A rotary engine, provided with a piston-head, a trunnion in which the piston-head is fitted to slide, and a packing for the said piston-head and comprising a casing secured to the said trunnion, packing-plates engaging the faces of the piston-head, bars engaging the said packing-plates, and a set-screw held in the casing and engaging the said bars to adjust the latter and the packing-plates, substantially as shown and described.

602,704. ROLLER-SKATE. SAMUEL L. KIMBERWEIN, Berlin, Germany. Filed Apr. 17, 1897. Serial No. 632,871. (No model.)

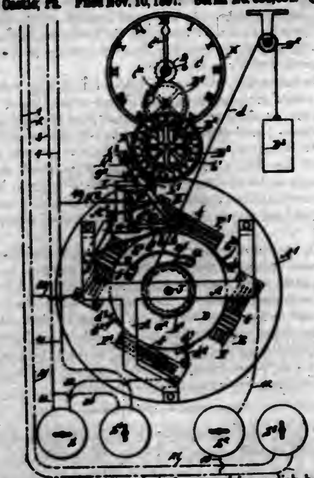


Claim.—1. The combination of the frame and the supporting-rollers, with the foot-support hinged to the frame, the crank-shaft journaled in the frame and operatively connected to one of the rollers, and a connecting-rod pivoted to the foot-support and to the crank of said shaft, substantially as described.

2. A roller-skate having a frame carrying rollers, a foot-support movable vertically in relation to said frame, a crank-shaft journaled in the frame, a connecting-rod pivotally attached to the foot-support and to the crank of the said shaft, said connecting rod having a longitudinal slot where it engages the crank-pin, and a driving connection between the crank-shaft and one of the rollers, substantially as described.

3. A roller-skate, comprising a frame provided with supporting-rollers, a foot-support movable up and down relatively to the frame, and a permanent positive connection between said foot-support and one of the rollers, so that the said support will remain in driving or controlling connection with the supporting-roller during the upward movement of the foot-support as well asduring the downward movement thereof.

602,705. BALL-BEARING. OLE LOUDE, Elgin, Ill. Filed Dec. 20, 1897. Serial No. 664,574. (No model.)



Claim.—1. The combination of the axle having spaced collars inclined toward each other, a ring slidable upon the axle between the collars yet held to rotate with the axle, the peripheral surface of said ring being inclined at each end toward the adjacent collar, balls engaging the collars and ring, and a hub engaging the outer surfaces of the balls.

2. The combination of the axle having spaced collars inclined toward each other, a ring slidable upon the axle between the collars, and having its peripheral surface inclined at each end toward the adjacent collar, balls engaging the collars and ring, and a hub engaging the outer surfaces of the balls.

3. The combination of the axle having a stationary collar and another collar adjustable longitudinally of the axle, the peripheral surfaces of said collars being inclined toward each other, a ring located between the collars and freely slidable upon the axle longitudinally, the peripheral surface of the ring being inclined at each end toward the adjacent collar, balls engaging the collars and ring, and a hub engaging the outer surfaces of the balls.

602,706. CLOCK-CONTROLLED SWITCH. FRANKLIN L. MAGINNIS, New Castle, Pa. Filed Nov. 10, 1897. Serial No. 658,091. (No model.)

Claim.—1. An automatic switch, comprising a disk having locking-stops spaced thereon and carrying switch-points, means acting on the said disk to rotate it, a pawl engaging the stops to hold the disk, fixed switch-points attachable to the circuit, and means operated by a clock to momentarily lift the locking-pawl, substantially as described.

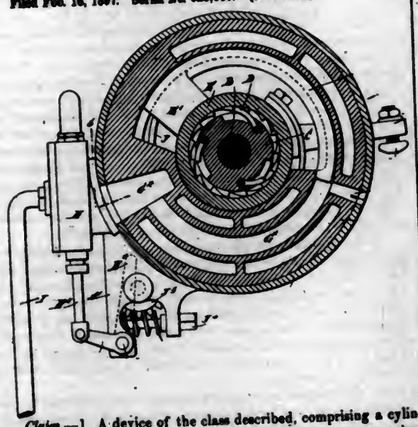
2. An automatic switch, comprising a disk having locking-stops spaced thereon and carrying switch-points, means acting on said disk to rotate it, a pawl engaging said stops to hold the disk, fixed switch-points attachable to the circuit, a toothed bar or hook engaging said pawl to lift it, a link pivoted to said bar and forming a swinging pivot therefor, a spring attached to the bar to hold the hook thereof beneath the locking-pawl, and means operated by a clock to momentarily lift the locking-pawl, substantially as described.

3. An automatic switch, comprising a disk having locking-stops spaced thereon and provided with switch-points, means acting on said disk to rotate it, a pawl engaging said stops to hold the disk, fixed switch-points engageable with the moving switch-points, a bar connected to the pawl to lift it, an arm pivoted thereto and projecting from one side as a hook, pins limiting the side swing of said arm, a wheel having pins and mounted to revolve so as to engage said arm to lift the pawl, and a clock mechanism for rotating said disk, substantially as described.

4. An automatic switch, comprising a rotating disk having locking-stops thereon and carrying switch-points, means for rotating said disk, a pawl engaging said stops to hold the disk, fixed switch-points engageable by the moving switch-points, a bar connected to the pawl to lift it a clock-operated mechanism adapted to engage said bar to lift it and free the disk, and a pin upon the disk adapted to engage the bar to free the pawl as the disk revolves, substantially as described.

5. An automatic switch, comprising a rotatable disk having locking-stops and switch-points thereon, means acting on said disk to rotate it, a pawl engaging said stops to hold the disk, fixed switch-points adapted to be engaged by the moving switch-points, a bar having a tooth engaging the pawl to lift it, a link pivoted to said bar to form a swinging pivot therefor, a spring acting on said bar to draw it toward the disk and to swing it on its pivot, an arm pivoted to the end thereof opposite the tooth and projecting to the opposite side therefrom, pins upon the bar at opposite sides of the arm limiting its swing, a spring holding said arm normally toward the center, a disk having pins adapted when revolved to engage the swinging end of said arm to raise it and the bar, and a clock mechanism for revolving said disk, substantially as described.

6. An automatic switch, comprising a disk having switch-points thereon, means for rotating the disk, fixed switch-points consisting of spring-bars supported from one end and extending tangentially to the disk, said disk having lugs projecting therefrom, a pawl engaging the lugs to prevent forward rotation of the disk, a spring-pawl engaging the lugs to prevent backward rotation of the disk, and means operated by the clock mechanism to momentarily lift the first pawl, substantially as described.



7. An automatic switch comprising a disk having switch-points thereon, means for rotating the same, fixed switch-points consisting of spring-bars supported from one end and extending tangentially to

the disk, said disk having lugs projecting therefrom, a pawl engaging the lugs to prevent forward rotation of the disk, a spring-pawl engaging the lugs to prevent backward rotation of the disk, means operated by a clock mechanism to lift the first pawl, and a pin upon the disk engaging the pawl-lifting means to free the pawl as the disk revolves, substantially as described.

8. An automatic switch, comprising a disk having switch-points thereon, means for rotating the same, fixed switch-points consisting of spring-bars supported from one end, said disk having lugs projecting therefrom, a pawl engaging the lugs to prevent forward rotation of the disk, a spring-pawl engaging the lugs to prevent backward rotation of the disk, a disk or wheel rotated by clock mechanism and having a series of holes therein, pins insertible in the holes, and a bar connected to the holding-pawl and engageable by said pins to free the pawl and permit rotation of the switch-disk, substantially as described.

9. An automatic switch, comprising a switch-disk having a rotating means connected thereto, switch-points attached to the disk, a locking-pawl, stops spaced upon said disk and adapted to be engaged by said pawl, a wheel or disk connected with a clock to rotate once for each cycle of time, and having a series of holes therein subdividing the same, pins insertible in said holes, a bar having a projection in the path of said pins and engaging the locking-pawl to lift it, and a pin on the switch-disk adapted to engage said bar to free it from the locking-pawl, substantially as described.

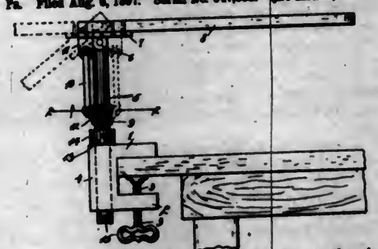
602,707. **EXPLOSIVE-ENGINE.** GEORGE A. NEWMAN, Cliff, Nebr. Filed Feb. 16, 1897. Serial No. 623,689. (No model.)

Claim.—1. A device of the class described, comprising a cylinder, a driving-shaft mounted in the cylinder, one or more spiral springs, a connection between the springs and driving-shaft for operating the latter from the former, and a piston in the cylinder and adapted to receive an impulse thereon to wind up the springs, substantially as described.

2. A device of the class described, comprising a pawl-and-ratchet mechanism connected with the main driving-shaft, one or more spiral springs attached by their inner ends to the ratchet-wheel of the said pawl-and-ratchet mechanism, and a piston moving in a cylinder and adapted to receive an impulse thereon, the said piston being secured to and carried by the said ratchet-wheel, substantially as shown and described.

3. A device of the class described, comprising a pawl-and-ratchet mechanism connected with the main driving-shaft, one or more spiral springs attached by their inner ends to the ratchet wheel of the said pawl-and-ratchet mechanism, a piston moving in a cylinder and adapted to receive an impulse thereon, the said piston being secured to and carried by the said ratchet-wheel, and a valve mechanism controlled by the said ratchet-wheel, as set forth.

4. A device of the class described, comprising a pawl-and-ratchet mechanism connected with the main driving-shaft, one or more spiral springs attached by their inner ends to the ratchet-wheel of the said pawl-and-ratchet mechanism, a piston moving in a cylinder and adapted to receive an impulse thereon, the said piston being connected with the said ratchet-wheel, and means substantially as described, for increasing or diminishing the tension of the said springs, as set forth.



5. A device of the class described, comprising a cylinder, a driving-shaft mounted in the cylinder, one or more spiral springs, a pawl-and-ratchet mechanism between the springs and driving-shaft, and a piston in the cylinder and connected with the pawl-and-ratchet mechanism, said piston being adapted to receive an impulse thereon to move it in one direction to wind up the springs, substantially as described.

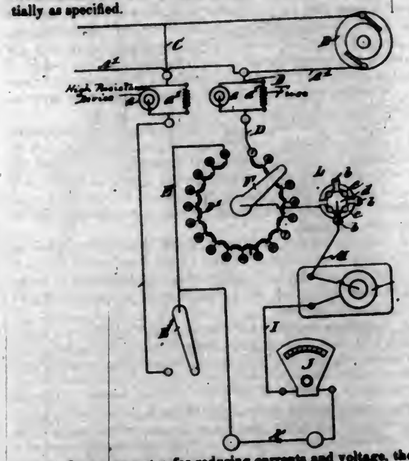
6. A device of the class described, comprising a cylinder, a driving-shaft mounted therein, a ratchet-wheel mounted loosely upon the shaft, pawls carried by the shaft and engaging the ratchet-wheels, spiral springs having one end secured to said ratchet-wheel, and a segmental piston secured to the ratchet-wheel and adapted to receive an impulse thereon to turn the said ratchet-wheel and wind the springs, substantially as described.

7. In a device of the class described, the combination of a cylinder having a segmental bore, a driving-shaft in the cylinder, a ratchet-wheel mounted loosely on the shaft, pawls carried by the shaft and engaging the ratchet-wheel, spiral springs having one end secured to the ratchet-wheel and their other ends to a movable support, means for adjusting said support, and a segmental piston in the cylinder and adapted to receive an impulse thereon to turn the ratchet-wheel and wind the springs, substantially as described.

8. In a device of the class described, the combination with a casing, a cylinder in the casing and having a segmental bore, an explosion-chamber and exhaust-port, and a driving-shaft mounted in said casing and cylinder, of a ratchet-wheel loosely mounted on the shaft, pawls carried by the shaft and engaging the ratchet-wheel, spiral springs having one end secured to the hubs of the ratchet-wheel and their other ends to the casing, a segmental piston secured to the ratchet-wheel and working in the bore of the cylinder, a valve mechanism for admitting the explosive mixture to the explosive-chamber of the cylinder, and means for operating the valve mechanism from the ratchet-wheel, substantially as described.

602,708. **PRESS-BOARD HOLDER.** LOUIS SCHUPPER, Easton, Pa. Filed Aug. 6, 1897. Serial No. 647,202. (No model.)

Claim.—1. The combination with a press-board, of a clamp, a post mounted to rotate and to move vertically in said clamp, the board being pivoted to the upper end of the post, a toothed clutch-section on the clamp and a toothed clutch-section on the post adapted for engagement with the first-named clutch-section, substantially as specified.



2. The combination with a press-board, of a clamp, a post mounted to rotate and to move vertically in said clamp, the board being pivotally attached to the upper end of the post so as to swing vertically, a clutch section on the clamp, a clutch-section on the post, a collar vertically adjustable on the post, means for holding the collar as adjusted, and a link connection between said collar and the board, substantially as specified.

3. A press-board holder, comprising a clamp, a post mounted to rotate and to move longitudinally in said clamp, a clutch-section on the clamp, a clutch-section on the post, adapted to engage with the first-named clutch-section, a collar movable vertically on the post, means for securing the collar as adjusted, a plate pivotally connected to the upper end of the post, and a link connection between the collar and plate, substantially as specified.

602,709. **APPARATUS FOR REDUCING ELECTRIC CURRENTS AND VOLTAGE.** ALEXANDER P. VETTER, Long Island City, N. Y., assignor, by mesne assignments, to the Maytowitz Manufacturing Company, Ridgefield, N. J. Filed Sept. 2, 1895. Renewed Nov. 12, 1897. Serial No. 658,436. (No model.)

Claim.—1. In apparatus for reducing currents and voltage, the combination with the supply-circuit, of resistance controlling the current strength, a second resistance placed in the supply-circuit, a shunt-circuit including translating devices, and means for transferring a portion of the second resistance of the supply-circuit to the shunt-circuit, substantially as specified.

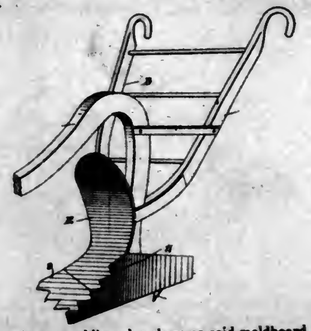
2. In apparatus for reducing currents and voltage, the combination with the supply-circuit, of a current-reducing resistance, a sectional resistance placed in the supply-circuit, a shunt, including translating devices, and means for transferring one or more of the sectional resistances in the supply-circuit to the shunt-circuit, substantially as specified.

3. In an apparatus for reducing currents and voltage, the combination with the supply-circuit, of a current-reducing resistance and a sectional resistance placed in the supply-circuit, a shunt including the translating devices, means for transferring one or more sections of the sectional resistance of the supply-circuit to the shunt-circuit, and a rheostat and measuring instrument placed in the shunt-circuit, substantially as specified.

4. In an apparatus for controlling the voltage and amperage of currents, the combination of a volt-controller comprising a series of resistances, and means for putting one or more of the said resistances into the circuit, a rheostat connected in series with the said volt-controller, means whereby various points or resistances of the said rheostat and volt-controller may be connected with the working circuit, and a supply-circuit connected to both ends of the volt-controller and to one end of the rheostat, substantially as described.

5. In an apparatus for controlling the voltage and amperage of currents, the combination of a supply-circuit, a volt-controller comprising a series of resistances, the ends of the volt-controller being connected to the supply-circuit, an ampere-controller likewise consisting of a series of resistances, means whereby one end of one of the said controllers may be connected with any point or resistance of the other controller, and a working circuit located in a shunt and arranged so as to be in series with the ampere-controller and in parallel with the volt-controller, substantially as described.

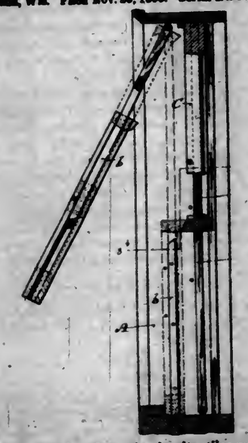
602,710. **THILL-COUPLING.** XADOC L. WHEELER, Cedar Falls, Iowa. Filed Aug. 27, 1897. Serial No. 649,709. (No model.)



Claim.—A thill-coupling having a clip with two transversely-alined eyes thereon, a pin passed through the eyes and having a head with two upbent ends, one end forming an eye and the other end forming a hook, and a retractile spring one end of which is permanently engaged with the eye on the head of the pin and the other end of which has a loop capable of removable engagement with the hook on the head of the pin.

602,711. **PLOWSHARE.** FREDERICK WOLF, Quincy, Ill. Filed July 7, 1897. Serial No. 643,694. (No model.)

Claim.—1. A plow, having a series of forwardly-extending teeth at the front end thereof, and a series of teeth or blades arranged on the plow at a point along and extending forward beyond the upper edge or landside edge of the moldboard, substantially as specified.

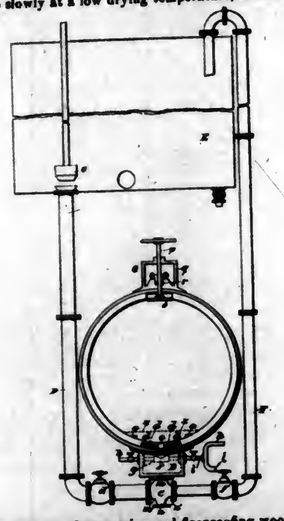


2. A plow, comprising a moldboard, and a series of teeth or blades arranged on the plow at a point along and extending forward beyond the upper or landside edge of the moldboard, substantially as specified.

3. In a plow, a moldboard, a share on said moldboard, the said share having forwardly-extending teeth, a bar at the rear of the moldboard, and teeth on said bar extending downwardly below the plane of the first-named teeth, substantially as specified.

4. In a plow, a moldboard, a share on the moldboard and provided with forwardly-projecting teeth, a landside having teeth or blades on its upper edge which extend forward of the moldboard, and a series of teeth rearward of and extended to cut the ground below the plane of the first-named teeth, substantially as specified.

602,712. **WINDOW.** JACOB APPELL, Milwaukee, Wis., assignor, by direct and mesne assignments, of one-half to Michael Lohnerer, Waukesha, Wis. Filed Nov. 20, 1895. Serial No. 570,442. (No model.)



Claim.—A window-frame having its stiles provided with outside stops *d*, sash-guides in the form of strips each comprising two sections of unequal length, the short section being rigid and the long section pivoted to the upper end of a frame-stile, and other sash-guides in the form of strips each comprising two sections of unequal length, the short section being rigid and the long section pivoted to the lower end of the frame-stile; the meeting ends of all said strip-sections being at such elevation as to require bringing of sash a greater distance than full length out of normal position before either pair of the movable sections can be swung on their pivots, it also requiring that run-up lower sash be swung out before run-down upper sash can be swung out for removal.

602,718. **PRESERVED WOOD AND PROCESS OF PREPARING SAME.** MAX RAMSEIER, New York, N. Y., and DAVID W. O'NEIL, Newark, N. J., assignors to the Electric Fireproofing Company, New York, N. Y. Filed Mar. 1, 1898. Serial No. 672,104. (No specimens.)

Claim.—1. The herein-described method of saturating wood with preservatives, which consists in inclosing the same within a receptacle, enveloping the wood in an atmosphere surcharged with aqueous vapor at the temperature substantially as specified, to soften and open the same; removing the vapor or water from the chamber and contents; and then impregnating the wood uniformly through-

out with wood-saturating material under pressure; and finally drying the same slowly at a low drying temperature, as set forth.

2. The process of preserving and fireproofing wood, which consists in saturating or opening its very fiber and cell throughout with aqueous vapor at low pressure and temperature as specified; then removing the vapor or water from the wood; then impregnating the open fiber uniformly-through and through with a fireproofing solution under pressure, and finally drying the wood slowly at a low drying temperature, substantially as set forth.

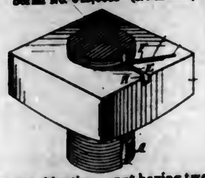
3. The process of preserving and fireproofing wood which consists in enveloping the same within a closed receptacle with an atmosphere saturated with aqueous vapor maintained at about 110° to 200° Fahrenheit to soften and open the wood; then producing a vacuum and removing the vapor and water from the wood; impregnating the wood uniformly throughout with fireproofing solution under pressure, and finally drying the wood at a temperature ranging from 85° to 125° Fahrenheit, substantially as set forth.

4. The hereinbefore-described product, being fireproofed wood impregnated uniformly throughout, and retaining its natural color, elasticity and tensile strength, substantially as set forth.

602,714. APPARATUS FOR MAKING CHILLED IRON CASTINGS. ALFRED K. BARKER, Beonton, N. J. Filed Aug. 21, 1896. Serial No. 603,562. (No model.)

Claim.—1. A machine for making chilled castings, consisting of a horizontal rotating table carrying chill-molds, a central water-supply with branches leading to said molds, and a subjacent annular trough receiving the discharge-water from all of the chill-molds substantially as and for the purpose described.

2. In a machine for making chilled castings, the combination of a horizontal rotating table, a series of chill-molds mounted thereon and made in sections and having water-jacketed mold-cavities, radiating water-pipes leading to the several boxes and having a central hub, a main supply-pipe swiveling within said hub, flexible discharge-pipes from the several boxes, and an annular trough or water-receptacle arranged beneath the table and extending around its center and beneath all the drainage ends of the discharge-pipes from the boxes substantially as and for the purpose described.



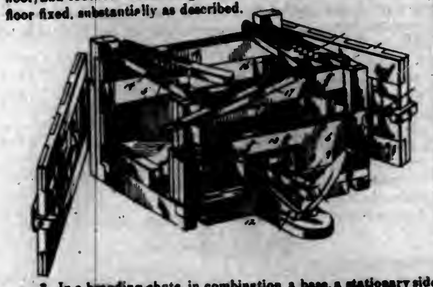
3. In a chill-mold, the combination of the lower half-box provided with a water-chamber having inlet and outlet openings, and having in its upper surface a mold-cavity with a gate as described, lugs on each side of said box having cams formed on the upper edges, upper box-sections having mold cavities in their under surfaces, said sections being formed in two halves and hinged to the sides of the lower box by lugs having elongated holes for receiving the pivot-pin of said hinges, and water-jacketed projections upon the adjacent edges of each upper box-section conical in form, one half in each box, and arranged when closed to form a water-cooled runner-opening, and a detachable water-protected shield to receive the first contact of the metal poured, said shield being fitted into the gate-cavity formed in the lower box and secured by screw-threads substantially as shown and described.

4. In a machine for making chilled castings, the combination with a horizontal rotary table, a series of mold-boxes fixed upon its periphery and having each its upper portion made in two hinged sections with lifting pins or handles projecting therefrom, and forked lifting-arms, and a lever operating the same to act upon the pins or handles of the mold-boxes and open the same substantially as and for the purpose described.

5. The combination with the horizontal rotating table, and its series of mold-boxes having a two-part hinged upper section provided with lifting pins or handles, the forked arms d^7 d^8 connected by spring c, the vertical slide-rod d^6, stand d and lever d^5, substantially as and for the purpose described

6. A machine for making chilled castings, comprising a circular frame D with track on its upper surface, a central pivot-standard C, a horizontal rotating table with central step-bearing, and subjacent rollers running on the track, water-cooled chill-boxes detachably fixed upon the outer periphery of the table, a central vertical water-supply pipe, a rotating hub moving with the table and swiveling about the lower end of the supply-pipe, radiating-pipes connecting said hub to the chill-boxes, and a subjacent annular water-trough to receive the waste water from the chill-boxes, substantially as and for the purpose described.

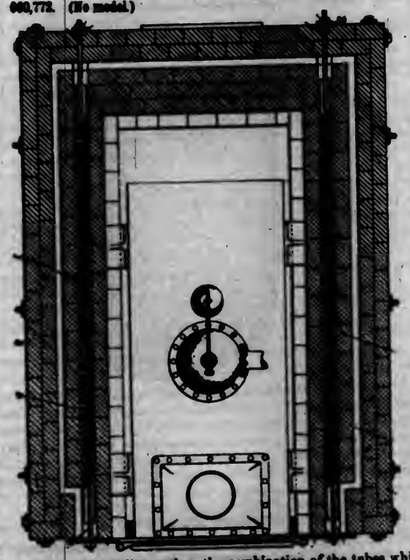
602,715. NUT-LOCK. NATHAN BARNES, Burlington, Mo. Filed July 17, 1897. Serial No. 645,008. (No model.)



Claim.—1. In combination, a nut having two slots formed in one face thereof, one of said slots running radially from the middle of one side, the other extending diagonally joining the first-named slot at its junction with the central opening, a V-shaped spring arranged in the slots, with one arm fitting in the diagonal slot a portion of the walls of which are swaged, the remainder of the slot being of greater width than the spring, the other arm fitting in the radial slot and curved at its end, and a bolt having a V-shaped longitudinal groove formed therein, one wall of said slot being in a plane which extends through the longitudinal axis of the bolt, as and for the purpose described.

2. In combination with a bolt having a longitudinal V-shaped groove therein, one wall of which is in a plane which runs through the longitudinal axis of the bolt, a V-shaped spring having the end of one of its arms hooked, and a nut having a radial slot formed in one face thereof extending from the middle of one side, and a diagonal slot joining the first-named slot at its junction with the central opening said slots being of greater width than the spring said spring being arranged in the slots with the V portion thereof projecting into the central opening of the nut into engagement with the bolt, the arm in the diagonal slot being secured at its outer end to the nut, said arm fitting against the wall of the slot on the outside and a space formed between the arm and the wall of the slot on the inside, and a space formed on either side of the arm in the radial groove, whereby when the nut is tightened the spring will have sufficient play to move out of engagement with the groove of the bolt, but a movement to loosen the nut will cause the spring to abut the walls of the slot and enter into firmer engagement with the groove, substantially as set forth.

602,716. BRANDING-CHUTE. JOE BENNETT, Coleman, Tex. Filed Nov. 16, 1897. Serial No. 658,726. (No model.)

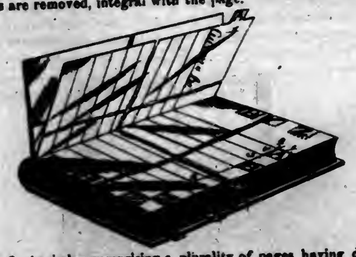


Claim.—1. In a branding-chute, in combination, a suitable base, a stationary side, a movable side, means for shifting the movable side toward and away from the stationary side, two slide-bars attached to the movable side, two bars pivotally connected to the stationary side and arranged to intermesh with the two side bars, and a spreading bar for holding the pivoted bars in engagement with the slide-bars, substantially as described.

2. In a branding-chute, in combination, a base, a stationary side connected thereto, a movable side, a movable floor connected to the movable side, an operating-lever for shifting the movable side and floor, and toothed interlocking bars for holding the movable side and floor fixed, substantially as described.

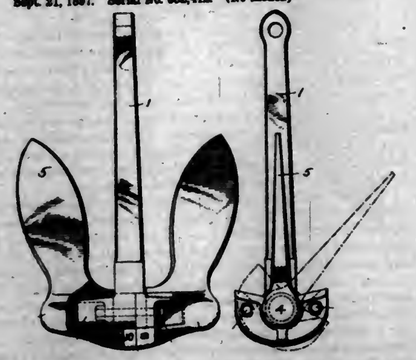
3. In a branding-chute, in combination, a base, a stationary side, a movable side, means for shifting the movable side, a pivoted catch or button on the movable side, an end gate hinged to the stationary side and a keeper-rod extending along the inner side of the gate and designed to remain in engagement with the catch during the shifting of the movable side, substantially as described.

602,717. BOILER-SETTING. LOUIS BERNHARD, Bridgeport, Conn., assignor to Charles Lee, same place. Filed Dec. 4, 1897. Serial No. 660,772. (No model.)



Claim.—In a boiler-setting, the combination of the tubes which extend within the brickwork of the setting, the stay-bolts having resilient coils throughout the greater portion of their lengths, said coils extending within said tubes while the extremities of the stay-bolts are straight and threaded, the vertical stays at the rear of the furnace through which said bolts pass, the nuts driven on the rear ends of said bolts against said stays, the iron face-plate at the front of the setting through which said bolts pass, and the nuts driven on said bolts against said plate, substantially as set forth.

602,718. INDEX. JOHN A. BEST, Augusta, Ga. Filed Aug. 14, 1897. Serial No. 648,308. (No model.)



Claim.—1. An index comprising a plurality of pages having detachable portions along the margins thereof, upon which are placed indexing characters, spaces being left between said detachable portions which form projections when the detachable portions are removed, integral with the page.

2. An index comprising a plurality of pages having detachable portions along the margins thereof, upon which are placed indexing characters, the same indexing characters being placed upon each page and the corresponding indexing characters on each page being arranged opposite those on the others, the said detachable portions being formed by weakening or perforating the page, leaving the remainder of the page imperforate and forming spaces between said detachable portions which form projections when the detachable portions are removed, integral with the page.

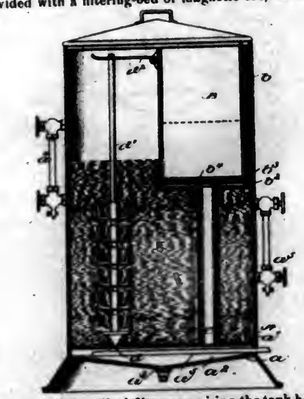
3. An index comprising a plurality of pages having divisional indexing-tabs projecting outwardly from the edges of the pages, each of said pages being provided with subdivisional indexing characters placed upon the detachable portions thereof which are separated by spaces which form projections integral with the page when the detachable portions are removed.

602,719. ANCHOR. LA MONT M. BOWERS, Cleveland, Ohio. Filed Sept. 21, 1897. Serial No. 652,412. (No model.)

Claim.—1. In an anchor, the combination with the shank and cross-arm thereon, of a separable fluke-head composed of two duplicate sections, and provided with interlocking lugs at their point of juncture, whereby the sections are locked against torsional strain in relation to each other, and are interchangeable, substantially as described.

2. In an anchor, a shank provided with trunnions, in combination with a jointed or separable fluke-head, the sections of which are secured against pulling apart longitudinally, by bolts, and against torsional or lateral strain in relation to each other, by interlocking lugs, substantially as described.

3. An anchor comprising the usual shank having frusto-conical trunnions on which the fluke portion rocks, in combination with a separable fluke portion, the sections of which are secured together longitudinally by bolts, and held against turning laterally in relation to each other by interlocking lugs, substantially as described.



602,720. FILTER. JOHN D. BOWER, New York, N. Y., assignor to James L. Robertson, same place. Filed Aug. 3, 1897. Serial No. 646,897. (No model.)

Claim.—1. An oil-filter having a passage-way for the filtered oil, and a series of vertically-arranged magnets in juxtaposition to said passage-way, as and for the purpose stated.

2. An oil-filter having a heated chamber, a passage-way for the oil leading from said chamber, and a series of vertically-arranged magnets located directly above and in juxtaposition to said passage-way, substantially as set forth.

3. An oil-filter comprising a tank having an elevated filtering vessel located therein, a lower heated chamber with which said vessel is in communication, a passage-way leading from said chamber, and a vertically-arranged series of magnets suspended above said passage-way and arranged in juxtaposition thereto, substantially as set forth.

4. A filter comprising a tank having a lower chamber, an outlet leading therefrom into said tank, a vertically-arranged series of magnets located above said outlet in juxtaposition thereto, a heating-medium within said chamber, and a filtering vessel located in said tank and communicating with said heating-chamber, said filtering vessel being provided with a filtering-bed of magnetic ore, substantially as set forth.

5. The herein-described filter comprising the tank having a false bottom formed with an opening, a heating medium beneath said false bottom, a series of magnets in said tank in line with said opening, and a filtering vessel in the upper part of said tank connecting with the space beneath said false bottom, substantially as set forth.

6. The combination with the tank having an upper chamber, and a false bottom forming a lower chamber, a pipe connecting said chambers, a filtering vessel located in said upper chamber, a heating-pipe in said lower chamber, and a series of magnets in said tank above an opening in said false bottom, substantially as set forth.

7. The combination with the tank having an upper chamber, and a false bottom forming a lower chamber, a pipe connecting said chambers, a filtering vessel located in said upper chamber, a heating medium in said lower chamber, a series of magnets, and a rod in said tank on which said magnets are located, substantially as set forth.

8. The filter for oil, herein described, comprising the tank having an upper chamber and a lower chamber in communication therewith, a vessel fitted in said upper chamber having a foraminous bottom and a filtering-bed thereon, a heating-pipe leading into said lower chamber, said latter chamber being also in communication with said tank, a magnet, or series thereof, suspended within said tank in juxtaposition to the opening from said lower chamber, and gage tubes and cocks on the exterior of said tank, substantially as set forth.

602,721. PUNCHING-MACHINE. MARTIN BOYER, Bigler ville, Pa. Filed Dec. 28, 1897. Serial No. 664,063. (No model.)

Claim.—1. In a machine of the character described, the combination of a plunger carrying a punch, pivoted links, and a shaft rotatable in said links and having an eccentric which is adapted to engage and reciprocate the plunger, substantially as set forth.

2. In a machine of the character described, the combination of a plunger carrying a punch and having a head formed with a circular passage therethrough, pivoted links, and a shaft rotatable therein and having a disk secured eccentrically thereto and movable in the passage of the head, substantially as set forth.

3. In a machine of the character described, the combination of a base, a plunger movable thereon and carrying a punch, links pivoted at their lower ends to the base, a shaft rotatable in the upper end of said links and having an eccentric which engages and reciprocates the plunger, a die carried by the base, and the detachable operating-lever for the shaft, substantially as set forth.

602,722. RANGE-BOILER. DAVID W. BOYES and JAMES R. DENISON, Grand Rapids, Mich.; said Denison assignor to said Boyes. Filed May 31, 1895. Serial No. 551,320. (No model.)

Claim.—1. In a range-boiler, an outer and an inner chamber, a screened communication between the two and detachable heads, in combination with a coiled flue passing through the outer chamber, substantially as and for the purpose set forth.

2. In a range-boiler, an outer chamber, an inner chamber, detachable heads in said inner chamber, and the chamber interchangeable to a water-chamber or an air-flue, a communication between the two chambers, and a slide for opening and closing said communication, substantially as and for the purpose set forth.

3. In a range-boiler, an outer and an inner cylinder forming an outer and an inner chamber, a means of communication between said chambers, a slide for opening and closing said means of communication, a smoke-flue through the outer chamber, and a supply and drain pipes, substantially as and for the purpose set forth.

602,723. MAIL-BAG. FRANK A. BROWN, West Pike, Pa. Filed Mar. 13, 1897. Serial No. 627,201. (No model.)

Claim.—A mail-bag having the top opening, the side flaps, the tongues secured to the inner sides thereof, the brace-rods riveted to the upper portions of the tongues, the casing I secured to the upper portion G, an opening J formed within said casing, the opening K through the central part thereof, and a hook M formed integral with the upper edge of the plate L secured to the upper portion H of the bag, as and for the purpose set forth.

602,724. BOLT-NUT. WINFIELD H. BUTLER, Landenburg, Pa. Filed Apr. 26, 1897. Serial No. 633,963. (No model.)

Claim.—1. A nut having a recess intersecting the central aperture therein, hooked projections thereon, a locking-dog fitting within said recess and having lateral projections adapted to fit beneath said hooked projections, whereby said dog may be readily applied and removed, and a spring for normally urging said dog inwardly.

2. A nut having a smooth central opening, and a recess in one side thereof intersecting said central opening, a pair of lugs having hooked ends, one on each side of said recess, a pin engaged by the hooked ends of said lugs, a locking-lever fulcrumed to said pin and fitting within said recess, and a spring for normally urging the free end of said locking-dog inwardly.

3. A nut having a smooth central opening, and a recess in one side thereof intersecting said central opening, a pair of lugs having hooked ends, one on each side of said recess, a pin engaged by the hooked ends of said lugs, a locking-lever fulcrumed to said pin and fitting within said recess, and a spring for normally urging the free end of said locking-dog inwardly, constructed of a single piece of wire having two coils formed therein through which said pin passes, and a two-part arm leading from said coils and engaging the outer edge of said dog, substantially as and for the purpose described.

4. The combination with a bolt having a smooth shank with an annular groove therein, of a nut having a central smooth opening, a recess in one side thereof intersecting said central opening, a pair of parallel lugs having hooked ends located one on each side of said recess, a removable pin engaged by said hooked end, a locking-lever fulcrumed to said pin fitting within said recess and adapted to engage the annular groove in said bolt, a spring for normally urging the free end of said locking-lever inwardly, the said spring being formed with two coils through which said pin passes, and a two-part arm leading outwardly from said coils and engaging the outer edge of said lever, and a coil-spring engaging the side edge of said nut for holding the head of said bolt in close contact with the material through which it passes and thereby preventing rattling, substantially as described.

602,725. PROCESS OF RECOVERING GLYCERIN FROM TANK-WATER. DANIEL CAMERON and DAVIS S. CARRAWAY, Omaha, Nebr., assignors to the Cudahy Packing Company, Chicago, Ill. Filed Feb. 28, 1898. Serial No. 671,962. (No specimens.)

Claim.—1. The method of recovering glycerin from tank-waters which consists in separating and removing from the tank-water substantially all the nitrogenous matter contained therein, and removing from the residuary liquid the excess of moisture, substantially as described.

2. The method of recovering glycerin from tank-waters which consists in coagulating and removing substantially all of the nitrogenous matter contained therein, and evaporating the residuary liquid, substantially as described.

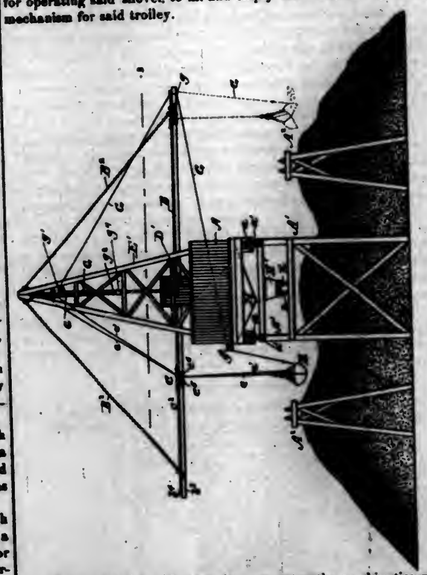
3. The method of recovering glycerin from tank-waters which consists in separating and removing from the tank-water substantially all the nitrogenous matter contained therein, and purifying and evaporating the residuary liquid, substantially as described.

4. The method of recovering glycerin from tank-waters which consists in boiling the tank-water with a suitable alkali, adding a suitable metallic salt, and neutralizing and separating the precipitated or coagulated matter from the supernatant liquid, substantially as described.

5. The method of recovering glycerin from tank-waters which consists in boiling the tank-water with a suitable alkali, adding a suitable metallic salt, neutralizing and separating the precipitated or coagulated matter from the supernatant liquid, treating the supernatant liquid with an alkali, separating the supernatant liquid from the precipitate, adding a suitable metallic salt, and neutralizing the solution, substantially as described.

6. The method of recovering glycerin from tank-waters which consists in boiling the tank-water with a suitable alkali, adding a suitable metallic salt, neutralizing and separating the precipitated or coagulated matter from the supernatant liquid, treating the supernatant liquid with an alkali, separating the supernatant liquid from the precipitate, adding a suitable metallic salt, neutralizing the solution, removing the last precipitate, and evaporating the supernatant liquid in vacuo to about 34° Baumé, substantially as described.

7. The method of treating tank-waters to render insoluble the nitrogenous matter therein contained, which consists in heating the tank-waters with a suitable alkali and adding a suitable metallic salt, substantially as described.



8. The method of treating tank-waters to render insoluble the nitrogenous matter therein contained, which consists in heating the tank-waters with a suitable alkali and then adding sulfate of iron or its equivalent, substantially as described.

9. The method of treating tank-waters to render insoluble the nitrogenous matter therein contained, which consists in boiling the tank-waters in the presence of lime and then adding sulfate of iron or its equivalent, substantially as described.

602,726. HOISTING AND CONVEYING APPARATUS. JEREMIAH CAMPBELL, Chelsea, Mass. Filed Dec. 4, 1897. Serial No. 660,853. (No model.)

Claim.—1. In a hoisting and conveying apparatus, the combination with the car or truck provided with a tower having an unobstructed opening through it from top to bottom, of a boom or tramway supported on said car or truck and extending outward horizontally on both sides of the latter, a trolley running on said boom or tramway, a shovel or bucket suspended from the upper part of said tower and controlled as to its horizontal position by said trolley, and means for operating said shovel and trolley; whereby the shovel or bucket supporting and controlling rope or ropes are adapted to swing through said tower as the shovel or bucket is moved from one side of said tower to the other by the trolley which travels on said boom or tramway.

2. In a hoisting and conveying apparatus, the combination with a car or truck provided with a tower having an unobstructed opening through it from top to bottom, of a boom or tramway extending outward on both sides of said car or truck, a trolley running on said boom or tramway, a shovel or bucket suspended from the upper part of said tower and controlled as to its position on said boom by said trolley, said boom being elevated above the bottom of said car or truck to leave an unobstructed space beneath for the passage of said shovel between said boom and the floor of the car-truck, and means for operating said shovel, to fill and empty the same, and operating mechanism for said trolley.

3. In a hoisting and conveying apparatus, the combination with a movable boom-support, of a boom extending across and on both sides of said support, a tower on said boom-support and having an unobstructed opening through it from top to bottom, a bucket or shovel suspended from the upper part of said tower, a trolley running on said boom and serving to control the horizontal position of said bucket or shovel, said trolley having two sets of sheaves with one of which the shovel rope or ropes are in contact when said shovel is on one side of said car or truck and with the other of which said ropes are in contact when the said shovel is on the other side of said car or truck, and means for operating said shovel and trolley.

4. The combination of the boom B extending across and from both sides of a support having an unobstructed space above and below the same, a trolley mounted upon said boom to be operated upon any part thereof and having the two sets of sheaves c^4, c^5 for alternate use with the said shovel, and its said operating-ropes.

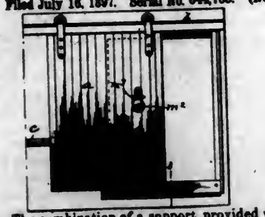
5. The combination, in a hoisting and conveying apparatus, of a boom centrally supported and having an unobstructed space above it and below it, the shovel-trolley mounted thereon, the shovel, its operating-ropes and an automatic guy-rope extending from one end of the boom only to the shovel and operative upon both sides of the center of the boom, as and for the purposes set forth.

6. The combination, in a hoisting and conveying apparatus, of a boom centrally supported and having an unobstructed space above it and below it, the shovel-trolley mounted thereon, the shovel, its operating-ropes, and an automatic guy-rope extending from one end of the boom only to the shovel and operating upon both sides of the center of the boom, and the guy-rope sheave or guide g^3, as and for the purposes set forth.

7. The combination, in a hoisting and conveying apparatus, of a boom centrally supported upon a car or other movable support, said car or movable support, a trolley movable upon said boom throughout its operative length and having two sets of shovel-rope receiving and transferring sheaves, the steam-shovel, its operating-ropes, receiving and transferring sheaves therefor, the automatic guy-rope operative upon each side of the center of the boom and shovel-operating engines mounted upon said car or movable support.

8. The combination, in a hoisting and conveying apparatus, of a car or support, a tower extending therefrom, a boom extending crosswise the car or support and from each side thereof and having an unobstructed space below and above the same throughout its length,

the boom-stays B' and suspending-chains B³, and the trolley and steam-shovel movable thereon, as specified.



9. The combination, in a hoisting and conveying apparatus, of the boom centrally supported and having an unobstructed space above and below the same throughout its length, a trolley movable thereon, the steam-shovel, its operating rope or ropes passing over the trolley and means for actuating them, and a trolley-rope, winding drum or spool, and means for positively turning said drum or spool in both directions.

10. The combination, of the boom centrally supported and having an unobstructed space above and below the same, the trolley mounted thereon having two sets of shovel-rope-transferring sheaves, the trolley-actuating rope, its sheaves b^4, b^5, one at each end of the boom, the sheaves b^6, b^7 at or near the center of the boom and the trolley-rope-winding drum or spool, and means for positively turning it in both directions, as and for the purposes set forth.

11. The combination, in a hoisting and conveying apparatus, of a movable car or support, a boom mounted upon said car or support extending horizontally from each side thereof and having an unobstructed space above and below the same, a trolley-actuating engine at one end of said car or support, and a shovel-actuating engine at the other end of said car or support, said engines being separated from each other by an open space extending across the car, a trolley mounted upon said boom to be movable thereon throughout its operative length and governing the horizontal position of a steam-shovel, said steam-shovel and the said trolley and steam-shovel engines being connected with said trolley and with the shovel as specified.

12. The combination of the car, a boom supported by the same and extending from both sides thereof, the trolley and steam-shovel operative upon the boom as specified, and a hopper in the bottom of the car.

602,727. SLIDING-DOOR FIXTURE. CHARLES R. CASE, Allen's Hill, N. Y. Filed July 16, 1897. Serial No. 644,735. (No model.)

Claim.—1. The combination of a support, provided with a door-opening, a sliding door, means for supporting the door on the support, and means for guiding the door, said means consisting essentially of a device connecting the free part of the door to the support, said device having a sliding connection to the support and to the door, the sliding connection to the door being at an angle to that of the support and being in a substantially vertical plane, whereby the door may sag vertically without binding.

2. The combination of a support, a sliding door, and means for supporting the door on the support, a rail on the support, and a device slidingly connecting the door to said rail, said device having a sliding connection to the door at an angle to the rail, the sliding connection to the door lying in a substantially vertical plane, whereby the door may sag without binding.

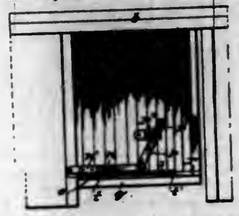
3. The combination of a support, a sliding door, means for attaching the door to the support, a rail attached to the support to one side of the opening, a plate attached to the door in a substantially vertical plane, and a device connecting the rail to said plate and having a movable connection with each.

4. The combination of a support, a sliding door thereon, means for slidingly connecting the door to the support, said means consisting of a rail attached to the support at one side of the door-opening, a plate attached to the door and arranged in a substantially vertical plane, and a device connecting said rail to the plate, said device consisting of a pair of clips slidingly engaging respectively the rail and the plate and having a substantially vertical movement on the latter, substantially as described.

5. The combination of a support provided with a door-opening, a sliding door adapted to slide across said opening, a clip connected to the lower front corner of said door and having a substantially vertical movement thereon, and a flanged plate extending across the door-sill and having a sliding connection with said clip, substantially as described.

6. The combination of a support provided with a door-opening, a sill-plate provided with an inward-turned flange extending across said door-opening, a clip having a substantially vertical sliding connection to the lower front corner of the door and provided with a hook-like extension engaging said flange, substantially as described.

602,728. SLIDING-DOOR LATCH. CHARLES R. CASE, Allen's Hill, N. Y. Filed Sept. 4, 1897. Serial No. 650,639. (No model.)



Claim.—1. The combination of a support and a sliding door, a latch-lever pivoted on said door and extending across the same, said lever being curved upward at one end and downward at its other end, the downward-turned end normally tending downward, and a pair of stops carried by the support and adapted to abut against the respective ends of said lever.

2. The combination of a support and a sliding door, a pivoted gravitating lever on said door, said lever curved upward at one end and downward at its other end, impinging stops between which said lever moves endwise, and a cam for disengaging said lever from said stops, substantially as described.

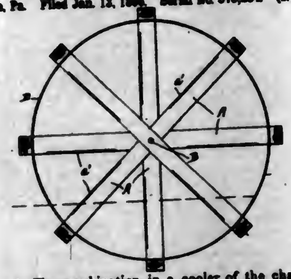
3. The combination of a support and a sliding door, a pivoted lever on said door, curved upward at one end and downward at its other end, stops between which said lever moves endwise, a rock-shaft journaled in the door and extending therethrough, a double cam on the inner end of the rock-shaft, for the purpose set forth, a swinging arm on the outer end of the rock-shaft, and means carried by the door for restricting the swing of the arm, substantially as set forth.

4. The combination of a support, a sliding door, a pivoted lever extending across said door, said lever being curved upward at one end and downward at its other end, stops between which the lever moves, said lever being constructed of endwise-adjustable sections, substantially as described.

602,729. SLIDING-DOOR FIXTURE. CHARLES R. CASE, Allen's Hill, N. Y. Filed Sept. 4, 1897. Serial No. 650,640. (No model.)

Claim.—1. The combination of a structure and a sliding door supported thereon and having a transverse flange on its free end, means for attaching the free end of the door to the structure, said means consisting of a stay or brace adapted to be projected into the door-opening when the door is closed, said stay being carried by the structure and having a sliding connection with the flange on the door, as and for the purposes set forth.

2. The combination with a structure and a sliding door thereon provided with a transverse flange, of a stay connecting the lower end of the door to the structure and means for folding or swinging said stay across the door-opening when the door is closed, the stay being carried by the structure and having a sliding connection with the flange at all times, for the purposes set forth.



3. The combination with a structure and a sliding door thereon, of a stay pivoted to the structure at one side of the door-opening, and means for letting down said stay across the door-opening when the door is closed, means connecting the free end of the stay to the door when the stay is let down, as and for the purposes set forth.

4. The combination of a support and a sliding door suspended thereon, with a folding stay pivoted to the door-post at one side of the door-opening, a pivoted link connecting the stay to the door and adapted to raise the stay against the post and lower it across the door-opening as the door is moved back and forth, and means carried by the stay for slidingly engaging the lower end of the door for holding it to the support, for the purpose set forth.

5. The combination with a support provided with a door-opening, and a sliding door therefor, and means for holding the door to the support at its lower end, said means consisting essentially of a movable stay adapted to be projected across said door-opening when the door is shut, said stay being provided with a flange slidingly engaging a flange carried by the door, for the purposes set forth.

6. The combination with a support provided with a door-opening and a sliding door, of a movable stay carried by the support and adapted to be projected across the door-opening when the door is shut, said stay being provided with an extension rod or stay adapted to be projected beyond the end of the said stay, and means carried by the lower end of the door for slidingly engaging said extension-stay, substantially as set forth.

602,730. PIE OR CAKE COOLER. MARGARET M. CORBETT, Roseville, Pa. Filed Jan. 13, 1898. Serial No. 666,884. (No model.)

Claim.—1. The combination, in a cooler of the character described, of transverse bars, and sections struck up on the sides of said bars to form ribs, for the purpose specified.

2. The combination, in a cooler of the character described, of transverse bars, sections struck up on the sides of said bars to form ribs, and a rim around said cooler, the rim being higher than the ribs, for the purpose specified.

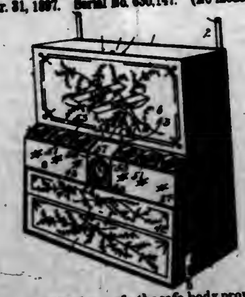
3. The combination, in a cooler of the character described, of transverse bars having the ends thereof turned down to form feet, a rim located adjacent to said feet, and sections struck up on the sides of said bars to form ribs between the point of intersection of said bars and the rim, substantially as and for the purpose specified.

602,731. SASH-FASTENER. WILLIAM A. COULSON, Moss Point, Miss. Filed May 26, 1897. Serial No. 638,198. (No model.)

Claim.—1. The combination of a window sash and frame, with a crescent-shaped cam-faced plate eccentrically pivoted to the sash and projecting therefrom in contact with the frame, the spring pressing the lower horn of the plate toward the sash, and a spring-bolt engaging an opening in the inner or upper horn and securing the eccentric in its locked position, substantially as set forth.

2. The combination of the window sash and frame with a lock-plate secured to the frame and provided with a suitable socket, a plate eccentrically pivoted to the sash and having a hook to engage in said socket and a spring-bolt adapted to engage in a socket in the eccentric to fasten it in its locked position, substantially as set forth.

602,732. BICYCLE-SADDLE. WARREN H. CRAIG, Lawrence, Mass. Filed Aug. 26, 1895. Serial No. 560,514. (No model.)



Claim.—1. A bicycle-saddle having a forward extension or steering portion and a seat portion at the rear of said steering portion, the surface of said seat portion being substantially above the surface of the steering portion to wholly support the weight of the rider and constitute the entire seat portion of the saddle, substantially as described.

2. A bicycle-saddle having a forward extension or steering portion and a seat portion at the rear of said steering portion, the surface of said seat portion being substantially above the surface of the steering portion to wholly support the weight of the rider and constitute the entire seat portion of the saddle, and a longitudinal space or opening along the middle of said seat portion extending rearward from the steering portion, substantially as described.

3. A bicycle-saddle comprising a rigid supporting-frame having a forward extension or horn to constitute a steering projection or guide, and a cushion-supporting portion of suitable shape to constitute a seat, and a cushion or pad supported thereon, and having its surface substantially above that of the horn, whereby the weight of the rider is wholly supported upon the surface of said cushion above said extension, substantially as described.

4. The combination of the main supporting-frame provided with an opening extending rearward into the body of the frame, and a web within said frame, and a horn extending forward therefrom, said frame projecting above said web at the front portion and being wholly below said web at the rear portion of the saddle, with a cushion supported on said web corresponding in shape with and bounded by said frame and provided with a flap overlapping and secured to the rear portion of the frame, substantially as described.

602,733. KITCHEN-SAFE. JESSE M. CURTICE, Kansas City, Mo. Filed Mar. 31, 1897. Serial No. 630,147. (No model.)

Claim.—1. In a kitchen-safe, the safe-body provided with a clock-receptacle, and a swinging clock-holder hinged at its upper edge to the safe-body and arranged to normally cover said receptacle, said clock-holder being provided with an opening snugly receiving therein a clock and adapted to be raised or swung upwardly on its hinge to expose the rear side of the clock for winding or setting, substantially as set forth.

2. In a kitchen-safe, the safe-body provided at the front with an offset portion having an inclined top panel and a centrally-located clock-receptacle, and a clock-holder detachably hinged at its upper edge to the front of the safe-body over said clock-receptacle and conforming to the shape of the front offset of the safe-body, said clock-holder being provided with an opening for receiving therein an ordinary clock, substantially as set forth.

602,734. CUTTING APPARATUS FOR MOWERS. SILAS S. DUNHAM and THOMAS F. THORN, Edina, Mo., assignors of one-half to Henry S. DUNHAM, same place. Filed July 10, 1897. Serial No. 644,060. (No model.)

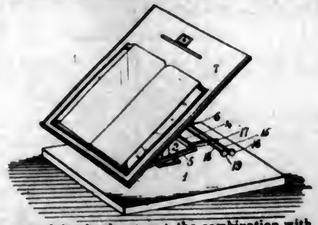
Claim.—In cutting apparatus for harvesters, mowers and the like, the combination of a plate, guard-fingers having tangs secured to the lower side of the plate and formed with forwardly-convergent side flanges, and having rearwardly-divergent horns with their outer edges alining vertically with corresponding edges of the said side flanges, tapering ledger-plates secured to the guard-fingers and having their edges projecting beyond the edges of the side flanges and

horns and coming flush with the top side of the aforesaid plate, and having the front ends of the edges merging into the sides of the guard-fingers to avoid projecting shoulders, oscillating cutters pivoted to the said plate and projecting beyond the rear edge thereof, and having their projecting ends longitudinally slotted, and having their front ends normally intermediate of adjacent guard-fingers, their edge portions coming beneath the aforesaid horns, which prevent any upward movement of the cutters, irons secured to the bottom side of the aforementioned plate and having their rear ends bent vertically, and an operating-bar confined between the rear edge of the plate, the bent ends of the irons, and the rear ends of the oscillating cutters, and having pivot projections entering the slots of the said cutters, substantially as and for the purpose set forth.

602,785. PUZZLE. FRED H. DONALDSON, Garvanza, Cal., assignor to Nellie A. Donaldson, Lydia R. Williams, and Sylvia Allott. Filed Nov. 15, 1897. Serial No. 658,502. (No model.)

Claim.—1. As an improved article of manufacture, the puzzle herein described and shown, consisting of a board constructed with inner and outer grooves concentric with one another and the inner groove having a portion of its wall provided with an opening or gateway by which it is placed in communication with the outer groove, a boss located at the center of the inner groove, partitions arranged, respectively, in said grooves at one side of the said opening or gateway, and disks or men constructed to shift back and forth in the grooves and to move from one groove to the other through the opening or gateway, the partitions being located at such distance from the said opening or gateway as to permit one disk or man only to lie in each groove between the partition thereof and the opening or gateway, substantially as and for the purposes described.

2. In a puzzle, the combination with a board provided with two concentric grooves or ways communicating with one another by a passage or gateway, a partition arranged transversely in each of said grooves or ways on one side of said passage or gateway, and disks or men adapted to be shifted back and forth in said grooves or way and from one groove or way to the other, the transverse partitions being located at such distance from the said passage or gateway as to permit one disk or man only to lie in each groove between the partition thereof and the passage or gateway, substantially as described.

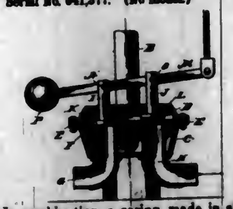


3. In a puzzle, the combination with a board provided with two concentric grooves or ways communicating with one another by a passage or gateway, a partition arranged transversely in each of said grooves or ways on one side of the passage or gateway, and a plurality of series of disks or men adapted to be shifted back and forth in said grooves or ways and from one groove or way to the other, the disks or men of one series being distinguished from the disks or men of another series, and the partitions being located at such distance from the said opening or gateway as to permit one disk or man only to lie in each groove between the partition thereof and the opening or gateway, substantially as described.

4. In a puzzle, the combination with a board provided with two concentric grooves or ways communicating with one another by a passage or gateway, a partition arranged transversely in each of said grooves or ways on one side of the passage or gateway, and two series of disks or men arranged in said grooves or ways and adapted to be shifted back and forth therein and from one groove or way to another, the size of the passage or gateway being such as to permit of the passage therethrough of but one disk or man at a time, and the said partitions being arranged at such points that one disk or man only may lie in each of the grooves between the partitions and said passage or gateway and leave the latter unobstructed for the passage therethrough of the remaining disks or men, substantially as described.

602,786. REVOLVING BOOK-REST. PERCY H. DE DUBOSAY, Tallulah, Ga. Filed May 5, 1897. Serial No. 635,294. (No model.)

Claim.—1. In a revolving book-support, the combination with a standard, of a frame revoluble thereon, a table or desk hinged to the frame, a depending rack-bar carried by said table, mechanism carried by the frame for actuating the rack-bar longitudinally to effect the tilting of the table, and mechanism independent of the actuating mechanism for locking the rack-bar in its adjusted positions, substantially as specified.

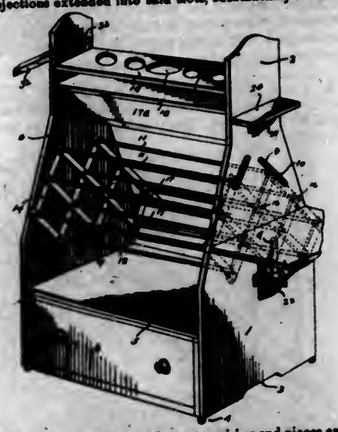


2. In a revolving book-support, the combination with a supporting-standard, of a frame revoluble thereon, a table or desk hinged to the frame and having a depending rod or arm with rack-teeth on one edge, a shaft carried by the revoluble frame and having a pinion in mesh with the arm of the table and a second shaft engaging a screw-threaded aperture and adapted to be moved into frictional contact with the arm or rack-bar, substantially as shown and for the purpose set forth.

3. In a revolving book-support, the combination with a hollow standard, of a frame having a spindle set within the hollow standard, a table or desk hinged to the frame and having a depending arm or rack-bar; together with a pinion supported by a shaft journaled in the revoluble frame, said pinion being in mesh with the rack-bar, and a second shaft also supported by the revoluble frame and threaded to engage a threaded aperture and bear against the rack-bar of the table or desk, and a screw in the standard to engage the spindle of the revoluble frame, substantially as shown and for the purpose set forth.

4. In a revolving book-support, the combination with a standard having a socket at its upper end, of a frame consisting of a cross-bar having forwardly-projecting members at its ends and centrally a rearwardly-projecting arm, said frame being mounted upon a standard and having a spindle which extends within the socket thereof, a table or desk hinged at its forward end to the outer ends of the side members of the revoluble frame, a rack-bar depending from the table, through an opening in the rearwardly-projecting arm of the frame; together with a shaft journaled in said arm and having a pinion in mesh with the rack-bar, a second shaft engaging a threaded opening in the arm to frictionally contact with the rack-bar, and a screw carried by the standard to engage the spindle of the revoluble frame, substantially as shown and for the purpose set forth.

602,787. ANTIFREEZING-VALVE. MICHAEL FARRELL, Buffalo, N. Y., assignor of one-half to J. L. C. Creaya, same place. Filed June 18, 1897. Serial No. 641,377. (No model.)



Claim.—In combination, a casing, made in an upper and lower section secured together by bolts passing through flanges surrounding the edges of the sections, a diaphragm secured between the flanges, plungers above the diaphragm having stems projecting through the top of the upper section, right-angled pipe-couplings of less diameter than the plungers threaded through the bottom of the lower section and projecting upward directly beneath the plungers, a supply-pipe connected to one of said couplings and a waste-pipe to the other, a valve-lever pivoted to the stems of the plungers above the casing, a weight secured on one end of the lever and a rod secured to the other end of the lever whereby one plunger will be depressed against the top of its coupling, the pivoting-point of the stem acting as a fulcrum for the valve-lever to elevate the other plunger from off of its coupling, as and for the purpose described.

602,788. CABINET. GONZAVO M. PISOTTI, Mission Hill, S. D. Filed May 13, 1897. Serial No. 636,219. (No model.)

Claim.—1. The herein-described cabinet comprising end pieces each having upper converging slots and a lower vertical slot, and a folding rack-bar having projecting portions extended into said slots, substantially as set forth.

2. The herein-described cabinet comprising end pieces each having upper inclined or converging slots and a lower vertical slot arranged in juxtaposition with said former slots, and a rack-bar having a series of pivotally-connected end bars, and provided with upper and lower projections extended into said slots, substantially as set forth.

3. The herein-described cabinet, comprising end pieces each having upper inclined or converging slots and a lower vertical slot arranged in juxtaposition with said former slots, and a rack-bar made up of a series of pivotally-connected parallel end bars, and yoke-bars connecting said end bars and having projecting ends extended into said slots, substantially as set forth.

4. The herein-described cabinet, comprising side pieces having upper converging slots and a lower vertical slot arranged in juxtaposition to said former slots, a folding rack-bar having projections extended into said slots, upper and lower shelves mounted between said side pieces, drawers located beneath said shelves, an arm or support pivotally mounted on one of said side pieces, and means for holding said arm in a horizontal position, substantially as set forth.

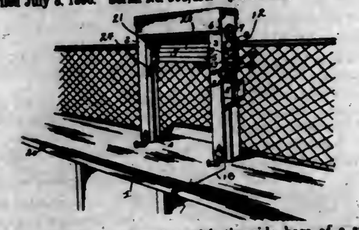
5. The combination with a cabinet, of a cleat secured to one side thereof, a shelf pivoted to said cleat, and a bracket pivotally secured to said side adjacent said cleat and formed of two pivoted members, said bracket having a cut-away portion adapted to receive said cleat, whereby said bracket may be folded flush against the side of said cabinet, substantially as set forth.

602,789. COMPOUND FOR DESTROYING VEGETATION. WILLIAM M. FLETCHER, Vicksburg, Miss. Filed Nov. 17, 1897. Serial No. 658,814. (No specimens.)

Claim.—1. A compound for exterminating vegetation, consisting of salt water, petroleum and carbolic acid.

2. A compound for exterminating vegetation, consisting of sea-water, petroleum and crude carbolic acid combined in substantially the proportions specified.

602,740. FENCE-POST. WILLIAM H. FRANK, Peabody, Mass. Filed July 28, 1897. Serial No. 645,997. (No model.)



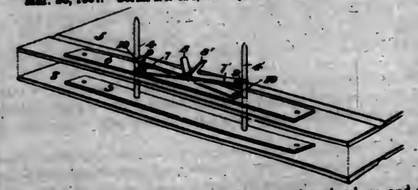
Claim.—1. A fence-post having cavities with grooves on a line therewith, in combination with retaining-plates having lugs which project into the cavities, said lugs engaging the fence-wires to press them within the cavity and form sharp bends, substantially as shown and described.

2. A fence-post having a cavity therein, in combination with a retaining-plate provided with a projecting lug which enters the cavity when the plate is secured in place, substantially as shown and described.

3. A fence-post having transverse recesses with central cavities and grooves extending from said cavities to the sides of the post, in combination with retaining-plates fitting within the recesses and having rearwardly-projecting lugs which enter the cavities, substantially as shown and described.

4. A fence-post having transverse recesses with a central cavity and grooves extending from said cavity to the sides of the post, in combination with retaining-plates provided with rearwardly-projecting lugs having notched ends, and means for securing the plates in the recesses of the post, substantially as shown and for the purposes set forth.

602,741. CASHIER-PROTECTOR. GEORGE B. FRY, Byron, Mont. Filed July 8, 1896. Serial No. 598,481. (No model.)

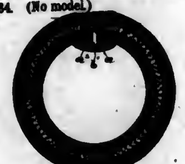


Claim.—1. The combination with the side bars of a suitable frame, of a shaft mounted to rotate therein, a screen secured to said shaft, a spring for normally urging said screen downward, a beveled wheel on said shaft, a slidingly-mounted shaft carrying a pinion upon its upper end in mesh with said gear-wheel, a spring for normally holding said pinion and gear-wheel in contact one with the other, and means for depressing said slidingly-mounted shaft, substantially as and for the purpose described.

2. The combination with the side bars of a suitable frame, of a shaft mounted to rotate therein, a screen secured to said shaft, a spring for normally urging said screen downward, a beveled gear-wheel upon the outer end of said shaft, a vertically-disposed, slidingly and rotatably mounted shaft carrying a pinion upon its upper end adapted to mesh with said gear-wheel, a spring for normally holding said vertical shaft in its raised position, and electromagnetic means for depressing said vertical shaft, substantially as and for the purpose described.

3. The combination with the side bars of a suitable frame, of a shaft mounted to rotate therein, a screen secured to said shaft, a spring for normally urging said screen downward, a beveled gear-wheel upon the outer end of said shaft, a vertically-disposed, slidingly and rotatably mounted shaft carrying a pinion upon its upper end adapted to mesh with said gear-wheel, a spring for normally holding said vertical shaft in its raised position, a lever fulcrumed in said frame and adapted to engage a stop on said vertical shaft, an electromagnet, and an armature mounted upon the free end of said lever, substantially as and for the purpose described.

4. The combination with the side bars of a suitable frame, of a shaft mounted to rotate therein, a screen secured to said shaft, a spring for normally urging said screen downward, a beveled gear-wheel upon the outer end of said shaft, a vertically-disposed, slidingly and rotatably mounted shaft carrying a pinion upon its upper end adapted to mesh with said gear-wheel, a spring for normally holding said vertical shaft in its raised position, a shoulder on said vertical shaft, a lever fulcrumed in the frame adapted to engage said shoulder, an electromagnet, an armature therefor attached to the free end of said lever, circuit-wires, and electric push-buttons located at different points therein, substantially as and for the purpose described.



602,742. BINDER. JAMES J. GILMORE, Allegheny, Pa. Filed Mar. 20, 1897. Serial No. 628,635. (No model.)

Claim.—In a temporary binder, having clamping-bars and upright rods, the combination therewith of oppositely-extending clamp-

ing-arms, bearing on the rods and adapted to hold the clamping-bar, and a headpiece on each of said arms at a point between said rods, the headpieces of said arms being adapted to be moved simultaneously on compression by the hand and to release the pressure on said rods.

602,743. DEVICE FOR CLOSING PUNCTURES IN PNEUMATIC TIRES. GEORGE F. GLIDDEN, Watertown, Mass. Filed Feb. 7, 1898. Serial No. 669,384. (No model.)

Claim.—1. A puncture-closer for tubing, comprising a shank, a head hinged thereon, and a cooperating retaining-cap, substantially as described.

2. A puncture-closer for tubing, comprising a threaded shank, a head hinged thereon and having a concave back, and a retaining-cap threaded to engage the shank, substantially as described.

3. A puncture-closer for tubing, comprising a shank, a head, and a spring-hinge connecting the shank and head, substantially as described.

4. A puncture-closer for tubing, comprising a shank, a head hinged thereon, and a cooperating retaining-cap constructed and arranged to be engaged and held by the material of the tube, substantially as described.

5. A puncture-closer for tubing, comprising a threaded shank to extend through the material of the tube, a thin, substantially concavo-convex head hinged to the inner end of the shank, and a retaining-cap adapted to be screwed onto the shank, to clamp the tube between the head and cap, substantially as described.

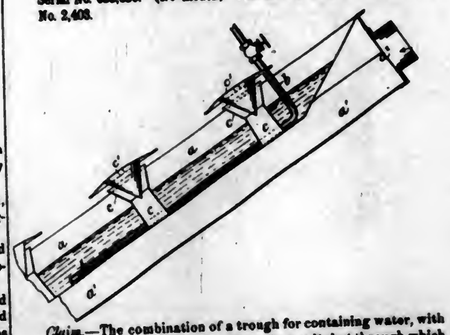
6. A puncture-closer for tubing, comprising a head having a concave back, a threaded shank hinged to said head, and a cooperating retaining-cap having a tapered hub on its inner face, interiorly threaded to engage the shank, the head adjusting itself on the inner surface of the tube relatively to the shank, the latter extending through the hole or puncture, substantially as described.

7. In a puncture-closer for tubing, a threaded shank having a forked inner end, a head hinged to said forked end, said head having a slightly-convexed face and rounded periphery, and a retaining cap to engage the shank and peripherally notched, as and for the purpose described.

8. In a puncture-closer for tubing, a shank, a spring-controlled head hinged thereto, and means to retain said shank and head in place in the tubing, substantially as described.

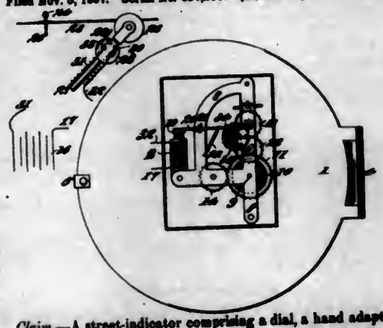
9. In a puncture-closer for tubing, a shank threaded interiorly and exteriorly, a head hinged to the inner end of the shank, and a retaining-cap having an internally-threaded hole to engage the shank, the interior thread of the shank being adapted to be engaged by a holder when inserting the head in the tube, substantially as described.

10. A puncture-closer for tubing, comprising a metallic head, a threaded metal shank with which it is pivotally connected, whereby the head can be turned up against the shank, and a cap adapted to be screwed onto the shank and bear against the exterior of the tube, substantially as described.



602,744. FENCE-POST. CHRISTIAN GROS and JOHN F. THOMAS, Delphi, Ind. Filed Feb. 28, 1898. Serial No. 671,997. (No model.)

Claim.—1. The combination of a base provided with a longitudinal opening, a fence-post extending into the opening of the base, a yoke forming a cap for the upper portion of the base and provided with a depending sleeve fitting in the opening of the base and receiving the fence-post and interposed between the same and the walls of the opening of the base, and a fastening device passing through the sides of the yoke, the base and the fence-post, substantially as described.

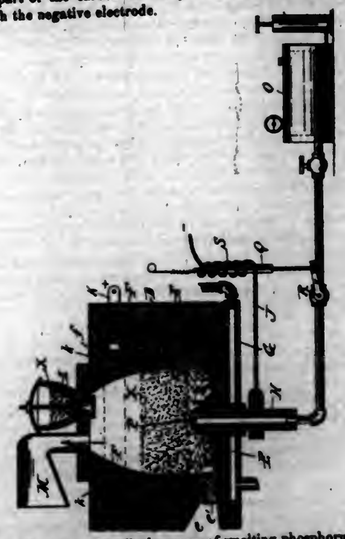


2. The combination of a base, provided with a longitudinal opening and having a transverse perforation, a fence-post arranged within the longitudinal opening and having a perforation registering with that of the base, a yoke comprising sides arranged on the exterior of the base and provided with perforations registering with the said perforations, the connecting top portion, and the depending sleeve fitting within the opening of the base and interposed between the latter and the fence-post and terminating above said perforations, and a fastening device passing through the said perforations and connecting the parts, substantially as and for the purpose described.

602,745. MEANS FOR HUMIDIFYING AIR. DANIEL HALL and JAMES H. KAY, Ashton-under-Lyne, England. Filed Feb. 16, 1897. Serial No. 623,650. (No model.) Patented in England Feb. 3, 1896, No. 2,403.

Claim.—The combination of a trough for containing water, with a suitable heater for the water, an air casing or jacket through which a current of air is passed, air-outlets therefrom, opening just above the water-level in the trough, and deflecting-plates above the air-outlet and above the sides of the trough, whereby the air is caused to spread and mix with the steam or vapor arising from the heated water in the trough and is discharged in all directions directly into the room.

602,746. STREET-INDICATOR. EDGAR J. HALL, St. Louis, Mo. Filed Nov. 3, 1897. Serial No. 657,230. (No model.)



Claim.—A street-indicator comprising a dial, a hand adapted to travel over the dial, a sprig-gearing, a battery, a magnet connected with one pole of the battery, a spring-arm carrying an armature over the magnet, a notched disk controlled by the arm and operated by the gearing, a trolley-wire provided with a spur, a trolley-rod, a plate mounted on the trolley-rod, a contact-plate and spring-pawl mounted on the rod-plate and connected with the other pole of the battery and with the magnet; substantially as described.

602,747. PROCESS OF SMELTING PHOSPHORUS. CHARLES K. HARDING, Chicago, Ill. Filed Apr. 5, 1897. Serial No. 630,288. (No specimens.)

Claim.—1. The herein-described process of smelting phosphorus, consisting in first making from a phosphatic base a phosphoric oxid substantially free from lime, roasting the phosphoric oxid in the presence of carbon until the combustible impurities have been consumed and substantially two parts of the oxygen have been smelted out, and then subjecting the phosphorous oxid remaining, intermixed with granular carbon, to the action of an electric arc developed within the mass of the material to be treated and between a negative electrode and the said material in an atmosphere of hydrogen.

2. The herein-described process of smelting phosphorus, consisting in first making from a phosphatic base a phosphoric oxid substantially free from lime, roasting the phosphoric oxid in the presence of carbon until the combustible impurities have been consumed and substantially two parts of the oxygen have been smelted out, and then subjecting the phosphorous oxid remaining, intermixed with granular carbon, to the action of an electric arc developed within the mass of the material to be treated and between a negative electrode and the said material in an atmosphere of hydrogen, and supplying a part of the carbon necessary to the reaction in fluid form through the negative electrode.

3. The herein-described process of smelting phosphorus consisting in subjecting oxid of phosphorus intermixed with granular carbon to the action of an electric arc developed within the mass to be smelted, in an atmosphere of hydrogen and supplying a part of the carbon necessary to the reaction in fluid form through the arc.

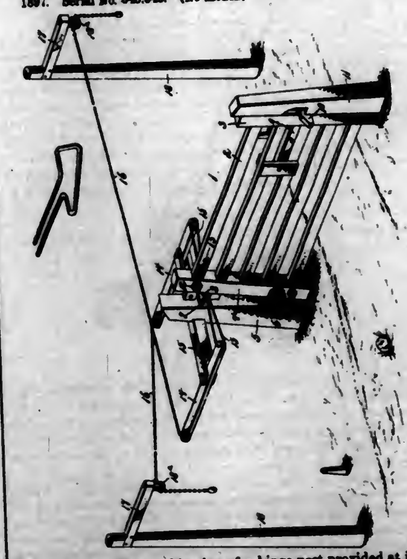
4. The herein-described continuous method of smelting phosphorus consisting in treating phosphatic material with sulfuric acid to eliminate substantially all of the lime, roasting the material with carbon to eliminate the major part of the sulfur, then continuously smelting the remaining material in an electric furnace in the presence of hydrogen.

5. The herein-described continuous method of smelting phosphorus consisting in treating phosphatic material with sulfuric acid to eliminate substantially all of the lime, roasting the material with carbon to eliminate the major part of the sulfur, and smelting out a part of the oxygen, then continuously smelting the remaining phosphorous-oxid mixture in an electric furnace in the presence of hydrogen.

6. The herein-described process of smelting phosphorus from a fused bath of phosphatic material by maintaining an electric arc below the surface of the material in an atmosphere of hydrogen and continuously supplying the reducing agent through the fused mass.

7. The herein-described process of smelting phosphorus, consisting in first making from a phosphatic base a phosphoric oxid substantially free from lime, roasting the phosphoric oxid in the presence of carbon until the combustible impurities have been consumed and substantially two parts of the oxygen have been smelted out, then adding to the phosphorous oxid which remains sufficient granular carbon to combine with the residue of the oxygen and subjecting such mixture to the direct heat of an electric arc.

8. The herein-described continuous process of making phosphorus consisting in preparing from a phosphatic base an oxid of phosphorus substantially free from lime and sulfur, mixing the oxid with carbon, maintaining a body of the mixture at a temperature below the point at which the oxid of phosphorus vaporizes and quickly bringing into the field of action of an intense heating means successive portions of the mixture in such quantities that each portion is raised in a substantially inappreciable time to a smelting temperature.



9. The herein-described continuous process of making phosphorus consisting in preparing from a phosphatic base a phosphoric oxid, roasting the oxid in the presence of carbon to eliminate the sulfur and a portion of the oxygen, and then mixing the resultant phosphorous oxid with granular carbon and raising the mixture in a substantially inappreciable period of time to a smelting temperature.

10. The improvement in the art of manufacturing phosphorus which consists in taking a phosphate of a base such as phosphate of lime, treating with an excess of sulfuric acid, eliminating all of said basic material, then roasting the phosphoric acid in an oxidizing atmosphere with carbon to eliminate all the sulfur, and continuously smelting in an electric furnace with carbon the material thus prepared.

11. The improvement in the art of smelting phosphorus which consists in first preparing a material for continuous smelting by taking a phosphate of a base, treating with sulfuric acid, removing all the basic material, roasting with carbon to eliminate all the sulfur, and then continuously smelting said material, thus freed from all deleterious and non phosphorus-yielding oxids by carbon, in a suitable electric furnace.

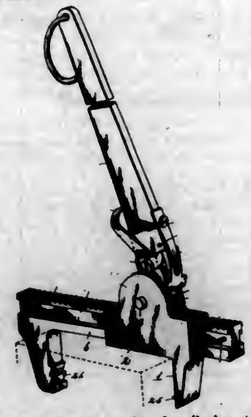
12. The method of making phosphorus consisting in taking a mixture of substantially pure oxid of phosphorus and carbon, maintaining the mixture at a temperature below the volatilizing temperature of the oxid, and bringing successive portions of such mixture quickly into the presence of an electric arc in such quantities that each portion is raised in a substantially inappreciable time to a smelting temperature.

602,748. GATE. WILLIAM I. HARP, Sparta, N. C. Filed July 24, 1897. Serial No. 645,843. (No model.)

Claim.—1. The combination of a hinge-post provided at its top with a horizontal triangular eye, a gate provided at its back with an adjustable end bar disposed at an inclination, pivoted at its lower end and adjustably secured at its top, whereby its degree of inclination may be varied, a hinge connecting the bottom of the gate with the hinge-post, an eye mounted on the upper portion of the gate and linked into the triangular eye, and operating mechanism connected with the back of the gate, substantially as described.

2. The combination of a hinge-post provided at its top with a triangular eye, a gate provided at its top with a series of perforations and having an inclined rear end bar pivoted at its bottom, a fastening device passing through the inclined end bar and through one of the said perforations, a hinge connecting the bottom of the gate with the hinge-post, an eye mounted on the gate near the top thereof and linked into the triangular eye, horizontal operating-levers located at opposite sides of the gate and connected at their front terminals with the same, and the crossed operating-ropes connected with the rear terminals of the levers and extending from opposite sides of the gate, substantially as described.

602,749. ROLLER-BEARING. REUBEN W. HAVILAND, Richmond, Ind. Filed Nov. 27, 1896. Serial No. 613,633. (No model.)



Claim.—1. An antifriction-bearing box comprising two sections one of which is provided with two oppositely-inclined upwardly-facing surfaces arranged slightly out of a horizontal plane, and the other with two downwardly-facing oppositely-inclined faces also arranged slightly out of a horizontal plane; the oppositely-inclined faces of the

respective sections being constructed and arranged to engage with one another and firmly lock the sections together against any longitudinal movement in either direction, substantially as described.

2. In an antifriction-bearing, the combination with a shaft, of a bearing-box surrounding the same and comprising two sections each having oppositely-inclined edges so constructed that when the two sections are applied together they will be firmly locked against any longitudinal movement, and antifriction-rollers mounted between said sections and the shaft, substantially as described.

602,750. HITCHING DEVICE. THOMAS M. HENDERSON and THOMAS R. FREEMAN, Portsmouth, Va. Filed Dec. 6, 1897. Serial No. 661,191. (No model.)

Claim.—1. In a device of the class described, a stationary jaw, a sliding jaw carried thereby, a lever pivotally connected to said stationary jaw, and suitably connected with the sliding jaw for actuating the latter, and means for engaging the operating-lever with the fixed jaw for locking said lever against reverse movement, substantially as described.

2. In a device of the class described, a stationary jaw, a sliding jaw carried thereby, an operating-lever pivotally connected to the stationary jaw, and suitably conneted to the sliding jaw for actuating the latter, means for locking the operating-lever against reverse movement, and means for actuating said locking means, substantially as described.

3. In a device of the class described, a stationary jaw, a sliding jaw carried thereby, a lever pivotally connected to said stationary jaw, and suitably connected with the sliding jaw for actuating the latter, and a locking-pawl carried by said operating lever and adapted to engage the stationary jaw for locking said operating-lever against reverse movement, substantially as described.

4. In a device of the class described, a stationary jaw, a sliding jaw carried thereby, an operating-lever for actuating said sliding jaw, a locking-pawl carried by said operating-lever and adapted to engage the stationary jaw to prevent reverse movement of said lever, and a lever carried by the operating-lever for actuating said locking-pawl for releasing the latter from engagement with the stationary jaw, substantially as described.

5. In a device of the class described, a stationary jaw, a sliding jaw carried thereby, an operating-lever for actuating said sliding jaw, a locking-pawl carried by said operating-lever and adapted to engage the stationary jaw to prevent reverse movement of said lever, and a lever carried by the operating-lever and provided with a cam-surface adapted to engage the locking-pawl to release the latter from engagement with the stationary jaw, substantially as described.

6. In a device of the class described, a stationary jaw having a series of parallel upwardly-extending ears provided with longitudinal ribs, a sliding jaw arranged between said ears and having each of its sides provided with a groove, said grooves being adapted to receive said ribs, whereby the sliding jaw is adapted to move on the ribs, an operating-lever pivoted between said ears for actuating the sliding jaw, and means thereon for engaging the fixed jaw for preventing reverse movement of the operating-lever, substantially as described.

7. In a device of the class described, a stationary jaw having a series of parallel upwardly-extending ears provided with longitudinal ribs, a sliding jaw arranged between said ears and having each of its sides provided with a groove, said grooves being adapted to receive said ribs, whereby the sliding jaw is adapted to move on the ribs, an operating-lever pivoted between said ears for actuating the sliding jaw, means for preventing reverse movement of the operating-lever, and means for releasing said locking means, substantially as described.

8. In a device of the class described, a stationary jaw provided with parallel upwardly-extending ears each of which is provided with a longitudinal rib, a sliding jaw disposed between said ears and having each of its sides provided with a groove, said grooves being adapted to receive said ribs, whereby the sliding jaw is adapted to move along the ribs, oppositely-disposed segments formed on said ears, and each provided with a series of peripheral teeth, an operating-lever pivoted between said ears and provided with a cam, peripheral teeth formed on said cam, a series of teeth formed on the sliding jaw adapted to be engaged by the teeth of said cam, whereby when said lever is operated the sliding jaw is adapted to move toward and away from the stationary jaw, a locking-pawl pivoted to the operating-lever and adapted to engage the teeth of the segments, whereby the operating-lever is locked against reverse movement, and a lever pivoted to said operating-lever and provided with a cam-surface adapted to engage the locking-pawl for releasing the latter from engagement with the stationary jaw, substantially as described.

602,751. VAGINAL SYRINGE. ABIJAH F. HENRY, Alamo, Ind. Filed Dec. 10, 1894. Serial No. 531,384. (No model.)

Claim.—A syringe-nozzle of the class described, consisting of a solid wooden body having a rounded front end adapted to be arranged at the mouth of the canal, and having a pair of divergent induction and eduction passages meeting at a point in rear of the rounded front end of the nozzle-body and combining at such point to form a common orifice 8 for both the inlet and outlet of fluid, said induction and eduction passages being of the same size or diameter, whereby a distention of the canal may be maintained when both passages are open to the circulation of fluid.

602,752. MORTISING-BIT. ROBERT HIRKI, Maple, Wis. Filed May 27, 1897. Serial No. 638,402. (No model.)

Claim.—1. In a mortising-machine, the combination of a bearing-block having a horizontal slot through the lower portion thereof communicating with a vertical slot at one side, a face-plate mounted over the said vertical slot, gear-wheels journaled in the said slots and meshing with each other, a bit or auger having the shank thereof secured to the horizontally-disposed gear-wheel, vertically-movable chisels surrounding the said bit or auger, a cylindrical guide surrounding the lower end of the bit or auger, supplemental guides for the said chisels, and means for operating the said chisels and bit or auger, substantially as described.

2. In a mortising-machine, the combination of a bearing-block, gearing mounted in said bearing-block, a bit or auger operated by said gearing, a crank-shaft to which said gearing is connected, rocking arms operated by said crank-shaft, and vertically-reciprocating chisels attached to said rocking arms and adapted to be operated thereby, alternately in pairs, substantially as and for the purposes specified.

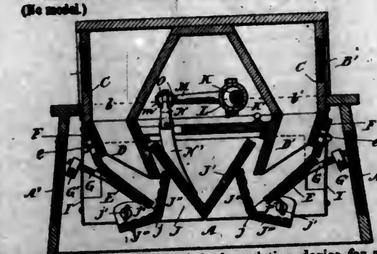
3. In a mortising-machine, the combination of a bearing-block, having a transverse journal-bearing therein, a shaft mounted in said journal-bearing and provided with cranks, a gear mounted on said shaft, a bit-shank having a gear thereon, meshing with the aforesaid gear and provided with a lower bit, rocking arms attached to the lower portion of the bearing-block, vertically-reciprocating chisels movably attached to said rocking arms, and means for operating the said rocking arms, substantially as and for the purposes specified.

4. In a mortising-machine, the combination of a bearing-block having a transverse journal-bearing extending therethrough, a shaft mounted in said journal-bearing, and having cranks on opposite ends thereof, a gear on the shaft, a bit-shank adapted to be operated by said gear, and carrying a bit at the lower end thereof, rocking arms attached to the lower portion of the bearing-block, vertically-reciprocating chisels movably attached to said rocking arms, pitmen connecting the rocking arms to the cranks on the shafts, and means for operating the said shaft, substantially as and for the purposes specified.

5. In a mortising machine, the combination of a bearing-block having a transverse journal-bearing therein, a shaft mounted in said journal-bearing and provided with cranks on the opposite ends thereof, a gear mounted on the said shaft, a bit-shank having a gear thereon engaging the aforesaid gear and carrying a bit at the lower portion thereof, a cylindrical guide forming a shield for the bit, supplemental guides depending from the lower portion of the bearing-block, rocking arms attached to opposite sides of the lower part of the bearing-block, vertically-reciprocating chisels movably attached to said rocking arms and held in position by the said supplemental guides, pitmen attached to the said rocking arms and to the cranks of the said shaft, and means for operating the said shaft, substantially as and for the purposes specified.

602,753. LID-HOLDER. JOSEPH HILT, Marne, Ill. Filed July 22, 1897. Serial No. 645,569. (No model.)

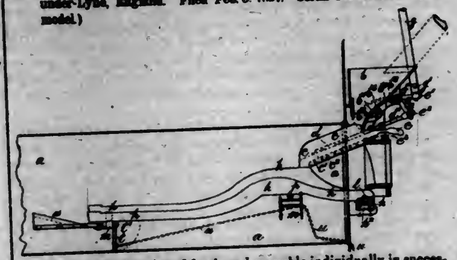
Claim.—1. A lid-holder for boxes, consisting of a pair of elastic arms normally held apart, and a stem, bent at right angles to the plane in which the arms lie, the arms being adapted to lie against the end of the box and the stem on the lid thereof, substantially as described.



2. A lid-holder, consisting of a piece of elastic wire bent at about its mid-length and twisted to form a stem for attachment to the top of the box-lid, and bent at right angles at the inner end of the twisted stem to form two arms to lie against the end of the box and by their elasticity engage a stop thereon, substantially as described.

3. A lid-holder, consisting of a piece of elastic wire bent at about its mid-length and twisted to form a stem for attachment to the top of the box-lid, and bent at right angles at the inner end of the twisted stem to form two arms to lie against the end of the box, one of said arms being bent into undulatory form to engage a stop on the end of the box, substantially as described.

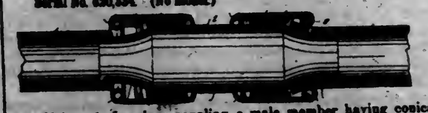
4. The combination with a box and a hinged lid thereon, the end of the box being provided with a staple, of a lid-holder attached to the top of the lid and formed into two elastic arms which lie against the end of the box and pass through said staple, said arms being normally pressed away from each other, thereby, by their contact with the staple, holding the lid open at any desired angle to the box, substantially as described.



5. The combination of a box, a hinged lid thereon, and a staple in one end of the box, of a lid-holder consisting of a stem, lying upon and attached to the top of the lid, and two elastic arms bent at right angles to the stem, to lie upon the end of the box and pass through the staple, one of said arms being bent to form undulations to engage one leg of the staple and held in engagement therewith by the normal, outward pressure of the arms, substantially as set forth.

602,754. FEED FOR TOP ROLLS OF GRIST-MILLS. JOHN F. HIMES, Bearing Spring, Pa. Filed Aug. 26, 1897. Serial No. 649,616. (No model.)

Claim.—In a feeding and feed-regulating device for mills, the combination with the feed-box having the feed-chutes or hoppers, one at each end portion thereof, the hinged or pivoted counter-weighted valves at the bottoms of the said chutes, and the adjustable pieces to which said valves are attached, of the spring-supported shaker having the feed-plates J''', J''' at each end portion thereof, the plates J'' being curved and the plates J''' adjustable, the central drive or actuating shaft having an eccentric, the strap fitted thereto, and an adjustable connection between said strap and the central portion of the said shaker, substantially as specified.



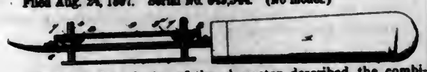
602,755. STEAM-BOILER FURNACE. THOMAS HIBBERT, Ashton-under-Lyne, England. Filed Feb. 3, 1897. Serial No. 621,861. (No model.)

Claim.—1. A series of fire-bars A movable individually in succession in the direction of their length, in combination with a multiple crank-shaft having its cranks arranged in different radial positions, in order that they may operate the said fire-bars one after the other, and a grate having its fixed bars arranged alternately with the said fire bars substantially as set forth.

2. A series of fire-bars A movable individually in succession in the direction of their length, in combination with a multiple crank-shaft having its cranks arranged in different radial positions, in order that they may operate the said fire-bars one after the other, a grate having its fixed bars arranged alternately with the said fire-bars, and an inclined coking-box and scraper substantially as set forth.

602,756. HOSE-COUPLING. MILO C. HOARD, Toledo, Ohio, assignor of one-half to S. E. Todd, Jr., same place. Filed Jan. 23, 1897. Serial No. 620,334. (No model.)

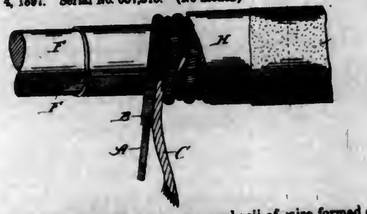
Claim.—1. In a hose-coupling, a male member having conical ends, marginal screw-threads, and sleeved sections upon the male member having concentric impinging portions with inner contracted ends.



2. In a hose-coupling, a male member having conical ends, marginal screw-threads, and sleeved sections upon the male member having concentric impinging portions with inner contracted ends formed by compressible diaphragms.

602,757. CAN-OPENER. GEORGE R. HOWELL, Southampton, N. Y. Filed May 8, 1897. Serial No. 635,708. (No model.)

Claim.—A pair of can-opening shears comprising two blades and handles pivotally secured together, said blades being projected downwardly, forward and again downwardly from the pivot to the point, and also curved laterally to conform to the curvature of the body of the can, substantially as described.



602,758. GAGE-KNIFE. GEORGE M. LANDERS, Brocton, Ill. Filed Aug. 24, 1897. Serial No. 649,344. (No model.)

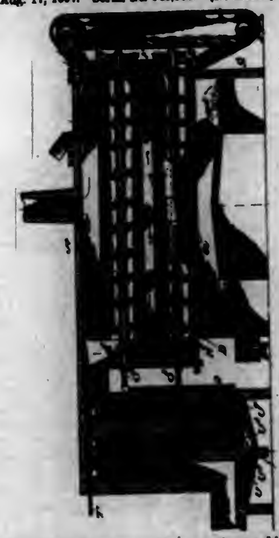
Claim.—1. In a device of the character described, the combination with a gage provided upon one extremity with a handle and upon its opposite extremity with a spoon end, of a knife located upon one side of the gage, a guide-plate located upon the opposite side of the gage, knife-adjusting screws secured to the knife adjacent to its opposite end and extending through the gage and guide-plate respectively, and knife-adjusting disks carried upon the screws and located intermediate of the gage and guide-plate, substantially as specified.

2. In a device of the character described, the combination with a gage provided upon one extremity with a handle and upon its opposite extremity with a spoon end, of a knife located upon one side of the gage, a guide-plate located upon the opposite side of the gage and provided with angular ends fixedly secured thereto, adjusting-screws adjacent to opposite ends of the knife and passing through the gage and guide-plate respectively, and adjusting-disks internally screw-threaded and engaging threads upon the adjusting-screws, said disks being located between the gage and guide-plate and having their edges projecting beyond the sides of the latter, substantially as specified.

602,759. VEHICLE-TIRE. FRANK LAYTNER, Huntley, Ill. Filed Nov. 4, 1897. Serial No. 657,315. (No model.)

Claim.—1. In a vehicle-tire, a compound coil of wire formed of two primary coils in telescopic or tubular engagement with each other and wound around in the tire so as to form a compound helix, substantially as described.

2. In a vehicle-tire, the combination of a compound helix formed of two primary coils of wire in telescopic or tubular engagement with each other, a cord wound around between the coils of the compound helix so as to keep such coils out of physical contact with each other, substantially as described.



3. In a vehicle-tire, the combination of a compound helix formed of at least two primary coils of wire in telescopic or tubular engagement with each other, a cord wound around in a helical manner between the coils of the compound helix to keep such coils out of physical contact, and a body of rubber in which such coils are embedded or vulcanized so as to produce the complete tire and hold the parts in position, substantially as described.

602,760. UMBRELLA AND HOLDER. WILLIAM S. LEES, Warren, Ind. Filed Oct. 30, 1896. Serial No. 610,617. (No model.)

Claim.—The combination of a support adapted to be attached to the bicycle, a ball-and-socket joint upon the upper end of the support, braces hinged to the ball of said joint, clamps carried by the opposite ends of the braces, and a shade slidable upon said braces and adapted to be secured in the desired position by means of the clamps, substantially as set forth.

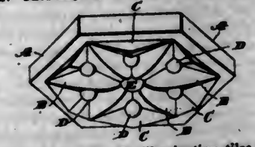
602,761. METALLURGICAL FURNACE. JAMES MAHR, Denver, Colo., assignor of one-fourth to Leonard Hanscom Flanders, same place. Filed Aug. 17, 1897. Serial No. 648,558. (No model.)

Claim.—1. In a metallurgical furnace, the combination of a heating-furnace, a pair of longitudinally-disposed parallel retorts extending through said furnace, a vertical passage at one side of the furnace into which both of said retorts open at one end and through which material passes from the upper to the lower retort, a feed-inlet in the opposite end of the upper retort and an outlet in the adjoining end of the lower retort, a closed casing communicating with the said inlet and outlet openings, and a conveyer in said casing adapted to elevate material discharged from the outlet of the lower retort back into the feed-inlet of the upper retort; a discharge door or slide in said passage, conveyers in said retorts for moving the ore therethrough in opposite directions, and means for injecting air or steam into the retorts, for the purpose and substantially as described.

2. In a metallurgical furnace, the combination of a heating-furnace, a pair of longitudinally-disposed parallel retorts extending through said furnace, a vertical passage at one side of and exterior to the furnace into which both of said retorts open at one end and through which material is directed from the upper to the lower retort, a feed-inlet in the opposite end of the upper retort and an outlet in the adjoining end of the lower retort, a closed casing communicating with the said inlet and outlet openings and a conveyer in said casing adapted to elevate the material discharged from the lower retort back into the upper retort, with a discharge-outlet in the lower end of said passage, a slide for closing said vertical passage, rotary conveyers in said retorts for moving the ore therethrough in opposite directions, and means for injecting air or steam into the retorts, through passages in the hollow conveyer shafts and blades, a fume-arrester communicating with the upper end of said passage having a perforated bottom and means for precipitating the fumes in said arrester, all substantially as and for the purpose described.

3. The combination of the furnace, the passage at one end thereof, the retorts in said furnace opening into said passage, the conveyers in said retorts, a feed-throat communicating with the feed end of the first retort, and a chute at the discharge end of the lowest retort, a conveyer-casing communicating with said throat and chute, and an endless conveyer for elevating material from the chute into said throat; with a fume-arrester connected to said passage, an outlet for calcined ores in said passage, and means for injecting air or steam into the retorts through passages in the hollow conveyer shafts and blades, all substantially as and for the purpose set forth.

602,762. COMPOSITION FOR DRESSING LEATHER. DAVID MADDEN, London, England. Filed Aug. 30, 1897. Serial No. 650,036. (Specimens.) Patented in England June 27, 1896, No. 14,267.



Claim.—1. A composition for dressing leather, or other flexible material, the said composition being made by mixing an elastic gum with the sap, or juice, of the *Rhus vernicifera*.

2. A composition for dressing leather, or other flexible material, the said composition being made by mixing india-rubber with the sap, or juice, of the *Rhus vernicifera*.

3. A composition for dressing leather or other flexible material, the said composition being made by mixing sulfur and elastic gum with the sap or juice of the *Rhus vernicifera*.

4. A composition for dressing leather or other flexible material, the said composition being made by mixing an elastic gum and silicate of magnesia with the sap or juice of the *Rhus vernicifera*.

602,763. LENS FOR ILLUMINATING TILES. JACOB MARX, New York, N. Y. Filed May 20, 1897. Serial No. 638,509. (No model.)

Claim.—1. A glass or lens for illuminating tiles having projections with adjacent inclined faces that converge to a common point, and a circular series of convex lenses that alternate with said projections, substantially as and for the purpose specified.

2. A glass or lens having a side formed of a series of convex lenses arranged in a circle and a series of projections with inclined sides also arranged in a circle, each convex lens being arranged in such relation to a projection, that a plane radial to the center of said circle, passes through the centers of lens and projection, substantially as and for the purpose specified.

3. A glass or lens for illuminating tiles having a series of projections radiating from a common point, with inclined or sloping sides, other projections with like sides disposed between adjacent ones of the first mentioned, and convex lenses placed at points where the sides of the other projections come together, substantially as specified.

602,764. MAIL-BAG LOCK. JOSEPH B. MAY, Lexington, Ky., assignor of one-fourth to George P. Ross, same place. Filed Sept. 25, 1897. Serial No. 653,041. (No model.)

Claim.—1. In a mail-bag lock, the combination of the sliding locking-bar carrying pivoted bolts or dogs having inclined lower portions, and keepers or housings arranged around the staple-receiving openings of the bag or pouch, and adapted to receive said lower portions of the bolts and to guide them into the staples, substantially as set forth.

2. In a mail-bag lock, the combination of the sliding locking-bar carrying pivoted bolts, having inclined lower portions and keepers or housings arranged around the staple-receiving openings of the bag or pouch and having upward inclined portions to engage the lower inclined portions of said bolts to elevate the forward ends of said bolts when said locking-bar is slid or moved rearward, substantially as set forth.

3. In a mail-bag lock, the combination of the sliding locking-bar carrying pivoted bolts having lower inclined portions, keepers or housings arranged around the staple-receiving openings of the bag or pouch, and adapted to receive said inclined portions of the bolts, and the clasp companing the edge of the bag or pouch and hinged at one edge to the base-plate and having a link connection with said sliding bar, substantially as set forth.

4. In a mail-bag lock, the combination of the sliding locking-bar carrying pivoted bolts having lower inclined portions, keepers or housings arranged around the staple-receiving openings of the bag or pouch and adapted to receive said inclined portions of the bolts, the clasp or hasp pivoted at one edge to the base-plate and having a link connection with one end of said locking-bar, said bar having at its opposite end a lateral arm provided with a pin, and a right-angled plate applied to the bag or pouch and having an aperture to receive said lateral pin, substantially as specified.

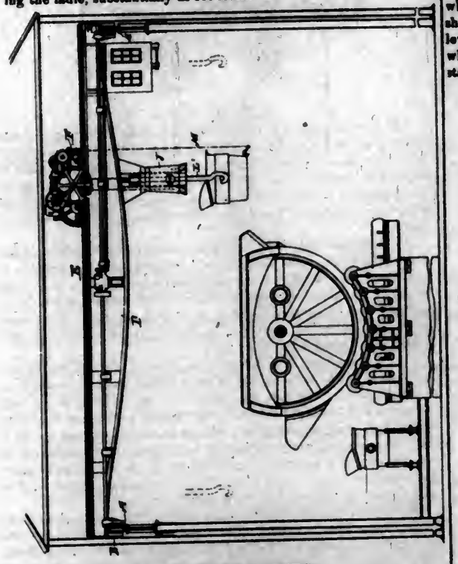
5. In a mail-bag lock, the combination of the sectional locking-bar carrying bolts, the housings or keepers arranged around the staple-receiving openings of the bag and adapted to receive said bolts, said housings or keepers also adapted to house the joints between the sections of said locking-bar when the latter is slid or moved rearward for the purpose set forth.

6. In a mail-bag lock, the combination of the locking-bar having pivoted bolts provided with lower inclined portions, the housings or keepers arranged around the staple-receiving openings of the bag and adapted to receive said inclined portions of the bolts, also having rabbeted forward edges to form a rest and guard for the free end of said locking-bar, substantially as set forth.

7. In a mail-bag lock, the combination of the locking-bar having at one end a hasp or clasp and at its other end a lateral arm provided with a pin, and the right-angled plate or bracket provided with an aperture to receive said pin, as the locking-bar is moved forward, substantially as specified.

602,765. OVERHEAD TRAVELING CRANE. WILLIAM H. MORGAN, Alliance, Ohio. Filed May 20, 1897. Serial No. 637,435. (No model.)

Claim.—1. In an overhead traveling crane, the combination with a bridge and a traveling trolley thereon, of a hoisting-chain carried by the trolley and carrying a ladle, a guide depending from the trolley between the bridge-girders, and a ladle bail or frame adapted to enter said guide and lock the bail against movement.



2. In an overhead traveling crane, the combination with a bridge and a traveling trolley thereon, the trolley having a flexible hoisting device, of guides depending from the trolley between the bridge-girders, a ladle having a bail or frame and devices carried by the bail and adapted to rest in the guides when the ladle is in its elevated position, substantially as set forth.

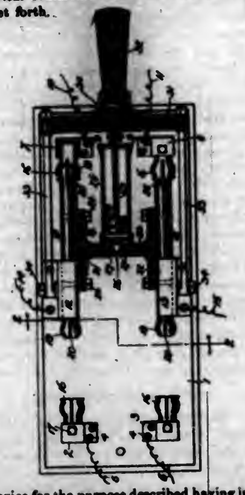
3. In an overhead traveling crane, the combination with a bridge and a trolley thereon, the trolley having a main hoisting-drum and an auxiliary hoisting-drum, and a chain on each drum, of guides depending from the trolley between the bridge-girders, a ladle bail or frame carried by the chain on the main hoisting-drum and antifriction-rollers mounted on the ladle bail or frame and adapted to engage the guides.

4. In an overhead traveling crane, the combination with a bridge and a traveling trolley thereon, of a main hoisting-chain and means for actuating same, an auxiliary or tilting chain and means for actuating same, guides depending from the trolley and resting adjacent to the inner faces of the bridge-girders and a bail or frame carried by the main hoisting-chain and adapted to be engaged by the guides when in an elevated position, substantially as set forth.

5. In an overhead traveling crane, the combination with a bridge, a traveling trolley thereon and guides depending from the trolley be-

tween the bridge-girders, of a main hoisting drum and chain, carried by the trolley, a ladle-bail comprising connected side arm, and cross-bars, suspended from said hoisting-chain, antifriction-rollers on said bail or frame, and independent chain carried by said trolley for tilting the ladle, substantially as set forth.

602,766. PNEUMATIC TIRE. PETER T. MCKAY, Toronto, Canada. Filed Feb. 1, 1898. Serial No. 668,702. (No model.)



Claim.—In a bicycle or other wheel, in combination the rim, the tire provided with edge loops, the air-tube located within same and the wire chains extending through each edge loop circumferentially around the rim and comprising arc-shaped links connected at right angles whereby the links are projected at the joints against the rim and the main body of each arc-shaped link is held flat by the pressure of the air-tube as and for the purpose specified.

602,767. ELECTRIC SWITCH. ARTHUR G. MCPHERSON, Highland Park, Ill. Filed May 1, 1897. Serial No. 634,713. (No model.)

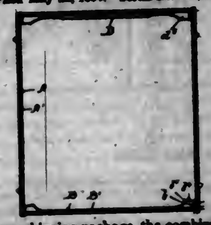
Claim.—1. A device for the purpose described having in combination two isolated contacts each adapted to be connected with one limb of an electric system, a longitudinally-shiftable contact-piece adapted to connect alternately with said contacts and being in electrical communication with another limb of said system, an oscillatory lever or handle pivoted at a point between said contacts, an elastic connection between said lever or handle and said shiftable piece, and means for retarding the movement of said shiftable piece while in electrical communication with either of said contacts, substantially as set forth.

2. A device for the purpose described having in combination two isolated contacts each adapted to be connected with one limb of an electric system, a longitudinally-shiftable contact-piece adapted to connect alternately with said contacts and being in electrical communication with another limb of said system, an oscillatory lever or handle pivoted at a point substantially midway between said contacts and having the axis of its pivot passing through said shiftable piece whereby said handle or lever may rest substantially parallel with said shiftable piece, an elastic connection between said shiftable piece and lever, and means for retarding the movement of said shiftable piece while in electrical communication with either of said contacts, substantially as set forth.

3. A device for the purpose described having in combination two pairs of isolated contacts each of which is adapted to be connected with one limb of an electrical system, a pair of longitudinally-shiftable contact-pieces adapted to be forced into electrical communication with said pairs of contacts alternately at opposite ends, means for holding said shiftable contacts each in electrical communication with one limb of said system, an insulated cross-head extending between said shiftable pieces, an oscillatory pivoted arm or lever having elastic connection with said cross-head, and means for retarding the movement of said shiftable pieces while in electrical communication with either of said contacts, substantially as set forth.

4. A device for the purpose described having in combination two pairs of isolated contacts each adapted to be connected with one limb of an electric system, a pair of shiftable contact-pieces adapted to be forced into connection with either pair of said contacts, a pair of blocks in which said shiftable pieces slide, each of said blocks being adapted to be electrically connected with another limb of said electric system, a two part cross-head extending between said shiftable pieces, means for forcing the parts of said cross-heads away from each other, an arm or lever pivoted between said pairs of contacts and having an elastic connection with said cross-head, and means for retarding the movement of said shiftable pieces while in electrical communication with either pair of said contacts, substantially as set forth.

5. A device for the purpose described having in combination two isolated contacts each adapted to be connected with one limb of an electric system; a longitudinally-shiftable contact-piece adapted to be reciprocated alternately into contact with said isolated contacts; a pivoted oscillatory lever and an elastic connection between said lever and shiftable contact-piece; the distance between the pivot of said lever and the point of connection of said lever with said elastic connection being greater than the distance between said point and the point of attachment of said elastic connection to the shiftable contact-piece when the elastic connection is in its retracted condition, substantially as set forth.



6. A device for the purpose described having in combination two isolated contacts each adapted to be connected with one limb of an electric system, a longitudinally-shiftable contact-piece adapted to connect alternately with said contacts and being in electrical communication with another limb of said system, an oscillatory lever or handle pivoted at a point between said contacts, an elastic connection between said lever and said shiftable piece, and means for retarding the movement of said shiftable piece while in electrical communication with either of said contacts; the point of connection between said elastic connection and said shiftable piece being normally at a point between the pivot of said lever and its free end, substantially as set forth.

7. A device for the purpose described having in combination two isolated contacts each adapted to connect with one limb of an electric system, a longitudinally-shiftable contact-piece adapted to connect alternately with said contacts and being in electrical communication with another limb of said system, an oscillatory lever or handle pivoted at a point between said contacts, and elastic connection between said lever or handle and said shiftable piece, and means for retarding the movement of said shiftable piece while in electrical communication with either of said contacts; the stretch of said elastic connection being less than the movement of said shiftable piece whereby the shiftable piece will be pulled away from the isolated contact with positive power, substantially as set forth.

8. A device for the purpose described having in combination two isolated contacts, a lever pivoted between said contacts, a longitudinally-shiftable piece arranged to connect with either of said contacts, the cross-bar 31 secured to said lever, an elastic connection secured to said shiftable piece and having the bolt 30 passing through said cross-bar 31, and the handle 32 composed of non-conducting material secured to said cross-bar and inclosing said bolt 30, substantially as set forth.

9. A device for the purpose described having in combination two isolated contacts each connected with one limb of an electric system, a longitudinally-reciprocating contact-piece 16 having electrical communication with another limb of said system, an oscillatory lever pivoted between said isolated contacts, a cylinder having pivotal connection at one end with said reciprocating piece, a piston in said cylinder having a piston-rod pivotally connected to said lever, the movement of said piston with relation to said cylinder being shorter than the movement of said reciprocating piece, substantially as set forth.

602,768. WOOD-VENEER-JACKETED SHIPPING-CAN. EDWIN HORTON, Maywood, Ill., assignor to himself, and OLIVER W. HORTON, Chicago, Ill. Filed May 22, 1897. Serial No. 637,676. (No model.)

Claim.—1. In a shipping-package, the combination with a combined sheet-metal and wood-veneer body of a combined sheet-metal and wood-veneer bottom, the sheet-metal bottom being provided with an interior flange or shoulder soldered to the sheet-metal body at the end thereof, and the rim of the sheet-metal bottom being folded or hemmed over the rim of the wood-veneer bottom, and the rim of the combined bottom projecting laterally under and abutting against the end of the combined body, substantially as specified.

2. In a shipping can or package, the combination with a combined sheet-metal and wood-veneer body, of a seamless ring having a depending flange soldered to the sheet-metal body at the end thereof, a horizontal flange extending across the end of the wood-veneer body and an upright flange, a sheet-metal cover having a shoulder or flange *b* fitting within said seamless ring and forming a tight frictional joint therewith, and a wood-veneer cover on top of said sheet-metal cover and having the upper edge of said upright flange of the seamless ring folded down upon the same, substantially as specified.

3. In a shipping-package, the combination with a sheet-metal body of a wood-veneer body a wood-veneer bottom, a sheet-metal bottom having an interior flange or shoulder fitting within the sheet-metal body, and having its rim folded over the wood-veneer bottom, the rim of wood-veneer bottom projecting laterally under the end of the wood-veneer body for it to abut against and a wire hoop surrounding the same, having integral bail-ears formed therein by twisted loops, the meeting ends of said wire hoop being twisted together substantially as specified.

4. In a shipping-package, the combination with a sheet-metal body of a wood-veneer body, a wood-veneer bottom, a sheet-metal bottom having an interior flange or shoulder fitting within the sheet-metal body, and having its rim folded over the wood-veneer bottom, the rim of wood-veneer bottom projecting laterally under the end of the wood-veneer body for it to abut against, and a wire hoop surrounding the same, and embedded in the wood veneer thereby holding it securely in place, the meeting ends of said wire hoop being twisted together substantially as specified.

5. In a shipping-package, the combination of a sheet-metal body and a wood-veneer body of a removable sheet-metal head having a depending flange or shoulder fitting in the mouth of the sheet-metal body and forming a tight frictional joint therewith, and a wood-veneer cover or head secured on top of said sheet-metal cover by an interned flange connected with the sheet-metal body, substantially as specified.

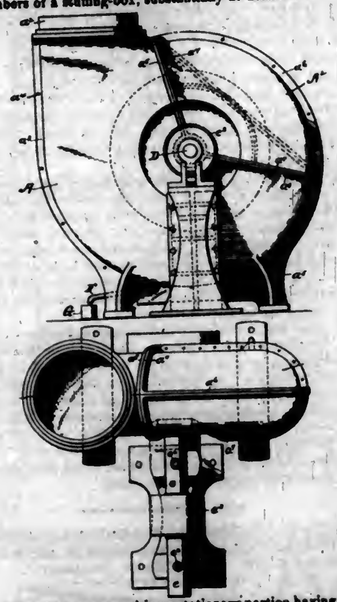
6. In a shipping-package, the combination of a sheet-metal body and a wood-veneer body of a removable sheet-metal head having a depending flange or shoulder fitting in the mouth of the sheet-metal body and forming a tight frictional joint therewith, and a wood-veneer cover or head secured on top of said sheet-metal cover by an interned flange connected with the sheet-metal body, said sheet-metal cover being smaller in size than said interned flange so that it may be removed after the wood-veneer cover has been split out, substantially as specified.

7. In a shipping-package, the combination of a sheet-metal body and a wood-veneer body of a removable sheet-metal head having a depending flange or shoulder fitting in the mouth of the sheet-metal body and forming a tight frictional joint therewith, and a wood-veneer cover or head secured on top of said sheet-metal cover by an interned flange connected with the sheet-metal body, said sheet-metal cover having an annular channel or depression to permit a pointed instrument to be inserted through the wood-veneer cover for removing the same, substantially as specified.

8. In a shipping-package, the combination of a sheet-metal body and a wood-veneer body of a removable sheet-metal head having a depending flange or shoulder fitting in the mouth of the sheet-metal body and forming a tight frictional joint therewith, and a wood-veneer cover or head secured on top of said sheet-metal cover by an interned flange connected with the sheet-metal body, said sheet-metal cover having an annular channel or depression to permit a pointed instrument to be inserted through the wood-veneer cover for removing the same, and a ring or handle attached to the sheet-metal cover in said depression, substantially as specified.

602,769. WAINSCOTING AND PARQUETRY FOR HARD-WOOD FLOORS, &c. CHARLES F. PARKER, Washington Court-House, Ohio. Filed Sept. 25, 1897. Serial No. 653,080. (No model.)

Claim.—1. The combination of a suitable backing or support, wooden blocks or strips provided with kerfs in their edges extending a short distance each side of the center of such edge between the corners, and suitable binding-plates adapted to enter said kerfs for holding the blocks together, substantially as set forth.



2. The combination of a suitable backing or support with wooden blocks provided with kerfs in their edges extending a short distance each side of the center of such edge and a cut-away portion or recess below said kerf, and suitable binding-plates adapted to enter said kerfs for holding the blocks together and a nail adapted to pass through said binding-plates thereby securing the whole to the backing or support, substantially as and for the purpose described.

602,770. EXHAUSTER. NATHANIEL P. PRATT, Atlanta, Ga. Filed Feb. 13, 1897. Serial No. 623,213. (No model.)

Claim.—1. An exhauster-casing comprising a stationary portion provided on one side with an entry-flue and at its periphery with an exit-flue, and a peripherally-removable portion extending to the axis of and impermeably secured to the stationary portion, the removable portion being of such size that, when removed, an opening is left, through which the blast-wheel and its shaft can be taken out without detaching either of the flues, substantially as described.

2. An exhauster-casing comprising a stationary portion provided on one side with an entry-flue and at its periphery with an exit-flue, and a peripherally-removable portion extending to the axis of and impermeably secured to the stationary portion, a blast-wheel mounted in the stationary portion opposite the entry-flue, and a stuffing-box arranged partly on the stationary portion and partly on the removable portion for preventing admission of air from without or escape of gas from within, the removable portion of the casing being of such size that, when removed, an opening is left, through which the blast-wheel and its shaft can be taken out without interference with either of the flues, substantially as described.

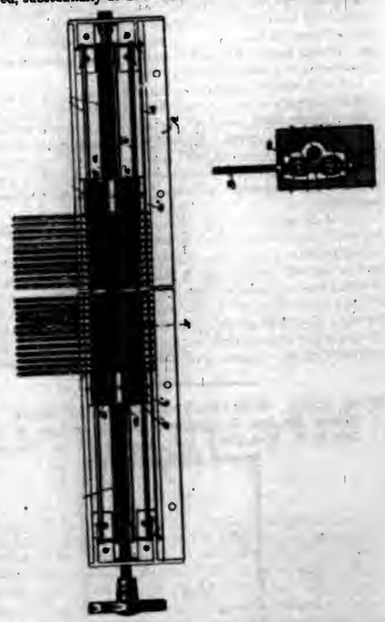
3. An exhauster comprising a stationary portion having an entry and an exit flue, and a removable portion, the sides of the two portions, opposite the entry-flue, being curved or bent inward to present two members of a stuffing-box, substantially as described.

4. An exhauster comprising a stationary portion having an entry and an exit flue, and a removable portion, the sides of the two portions, opposite the entry-flue, being curved or bent inward to present two members of a stuffing-box, a shaft running in the stuffing-box, and a blast-wheel supported on the shaft in juxtaposition to the stuffing-box, substantially as described.

5. An exhauster comprising a stationary portion having an entry and an exit flue impermeably secured thereto, and a removable portion, the removable portion being adapted to be separated from the stationary portion without interference with any of the parts of the latter, the sides of the two portions, opposite the entry-flue, being curved or bent inward to present two members of a stuffing-box, a blast-wheel mounted within the casing and having a shaft running in the stuffing-box; the end of the shaft, opposite the entry-flue, being unsupported, substantially as described.

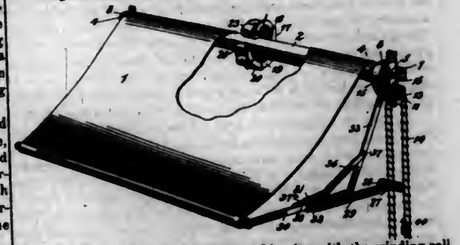
6. An exhauster-casing comprising a stationary portion provided on one side with an entry-flue and at its periphery with an exit-flue, and a peripherally-removable portion extending to the axis of and impermeably secured to the stationary portion, the removable portion being of such size that, when removed, an opening is left, through which the blast-wheel and its shaft can be taken out without interference with either of the flues, and a drip-pipe connected with the casing, substantially as described.

7. In an exhauster, a shaft, a blast-wheel secured thereto by solder or the like, nuts secured on one end of the shaft for holding the wheel in place, and a non-corrosive cap or casing inclosing the nuts and the end of the shaft, substantially as described.



8. In an exhauster, the combination with a shaft, of a blast-wheel, a right and left hand threaded bushing secured to the hub of the wheel and to the shaft, and keys inserted between the bushing and shaft, substantially as described.

602,771. WARPER-COMB. ALONZO R. REOADES, Hopedale, Mass., assignor to the Draper Company, same place and Portland, Me. Filed July 23, 1897. Serial No. 645,663. (No model.)



Claim.—1. In a warper-comb, a series of warp-guides having flattened shanks offset therefrom alternately in opposite directions, whereby the shanks are in alinement and the upper ends of the guides are staggered, substantially as described.

2. In a warper-comb, a series of warp-guides rounded in cross-sections at their upper ends, and having flattened shanks offset therefrom alternately in opposite directions, whereby the shanks are in alinement and the upper ends of the guides are staggered, substantially as described.

3. In a warper-comb, a supporting-stand having a longitudinal recess therein, a series of warp-guides having flattened shanks to enter said recess, and means to vary the distance between the guides, the flattened shanks of said guides being offset therefrom alternately in opposite directions, whereby while the shanks are in alinement in the longitudinal recess of the stand the upper ends of the guides are staggered, substantially as described.

602,772. AWNING. JOHN W. RICHARDS, Muscatine, Iowa. Filed Aug. 10, 1897. Serial No. 647,739. (No model.)

Claim.—1. In an awning, the combination with the winding-roll carrying the awning-sheet, of a main bracket supported intermediate the ends of the roll in a fixed position and having a pair of arms 19, with an open space therebetween, and arched under the roll and extending to a point in front thereof, a plurality of wooden rollers arranged parallel with the winding-roll and having their spindle extremities journaled in said arms 19, a separate bracket having a shank or base portion seated within the main bracket and also provided with a pair of forwardly-extending arms arched over the winding-roll, a single roller supported between said forwardly-extending arms of the upper bracket and disposed in substantial alinement with the vertical center of the winding-roll, and fastening means for detachably securing the two brackets together, substantially as set forth.

2. In an awning-frame, the combination of the front bar, an arm pivotally connected at one end to the building and carrying a slide at its other end, a second arm connected at one end to the end of the front bar and working through said slide, a lever pivotally connected at its upper end to the building and at its lower end to the inner end of the second arm, a second lever pivoted at one end to the first lever intermediate its ends and at its other end to the said slide, and a spring-actuated hook to engage the slide and lock the frame against folding, substantially as described.

3. In an awning-frame, the combination of the front bar, an arm 29 pivotally connected at one end to a building, a second arm 30 slidably connected with the arm 29, a lever 33 pivotally connected at its upper end to a building and at its lower end to the inner portion of the arm 30, and a bar or lever 36 pivoted at one end to an intermediate point of the lever 33 and at its other end to the slidable connection between the parts 29, 30, and means to lock the parts against folding, substantially as described.

602,773. CONVERTIBLE PIANO STOOL AND CHAIR. LEROY H. ROST and GILES C. ROST, Fostoria, Ohio. Filed Sept. 20, 1897. Serial No. 652,307. (No model.)

Claim.—1. In a convertible chair and stool, the combination of an extensible seat-frame, a back hinged to one member of the seat-frame, and means operatively connecting the hinged back to said extensible seat-frame, substantially as and for the purposes described.

2. In a convertible chair and stool, a sectional seat-frame consisting of a base member and an extensible member slidably fitted thereto, in combination with a back adjustably attached to the slidable member of the seat-frame, and operative connections between said adjustable back and sliding seat-frame member to sustain the back in its lowered position, substantially as and for the purposes described.

3. In a convertible chair and stool, the sectional seat-frame consisting of a base member and an extensible member slidably fitted thereto, in combination with a back hinged to the slidable member of the seat-frame, links operatively connected to the sliding seat-frame member and to the slidable back, and an attaching-spring attached to the respective members of the seat-frame, substantially as and for the purposes described.

4. In a convertible chair and stool, a sectional seat-frame consisting of a base member provided with inclines or cams and an extensible member slidingly fitted to the base member, in combination with an adjustable back hinged to the sliding member of the seat-frame, and links slidably attached to the adjustable back, connected with the sliding member of the seat-frame and provided with projections arranged to ride against the cams of the base member of the seat-frame in raising or lowering the back and extending or retracting the slidable member of the seat-frame, substantially as and for the purposes described

5. In a convertible chair and stool, a sectional seat-frame consisting of a base member and an extensible member slidably connected thereto, and locking devices for holding the slidable seat member in its retracted or projected positions, in combination with an adjustable back, and operative connections between said adjustable back and the seat-frame, substantially as and for the purposes described.

6. In a convertible chair and stool, the combination of a sectional extensible seat-frame, an adjustable back, means for sustaining said back in either its raised or lowered positions, and a vertically-adjustable seat carried by one member of said sectional seat-frame, substantially as and for the purposes described.

7. In a convertible chair and stool, the combination of a sectional seat-frame having one member thereof slidably connected to the other member, a vertically-adjustable seat carried by said slidable member of the seat-frame, means for locking said seat in its raised or lowered positions with relation to the seat-frame, an adjustable back, and means for sustaining said adjustable back in either its raised or lowered positions, substantially as and for the purposes set set forth.

8. The combination with a seat-frame and a vertically-movable seat, of the angularly-slotted plates carried by said seat and provided with offsets at right angles to vertical slots in said plates, rails attached to the seat-frame and provided with slotted keepers, a seat-lock having bars fitted in the slotted keepers and engaging with the angularly-slotted plates, lifting-springs for raising the seat, and a holding device for the seat-lock, substantially as and for the purposes described.

9. The combination with a seat-frame and a vertically-adjustable seat thereon, of fixed rails on the seat-frame, slotted keepers carried by said fixed rails, angularly-slotted plates rigidly attached to the vertically-adjustable seat, a seat lock having its cross-bars fitted in the keepers and the angularly-slotted plates and provided with a stem which protrudes beyond the seat-frame, and a spring to hold the seat-lock in engagement with the offsets of the angularly-slotted plates, substantially as and for the purposes described.

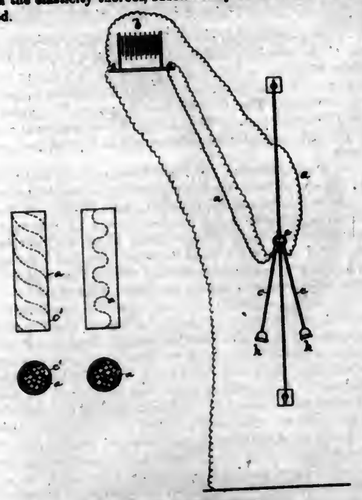
10. In a convertible chair and stool, the combination with a standard, of a two-part seat-frame having one member mounted on the standard and its other member slidably fitted to said first-named member, a seat-back mounted for adjustment to lie in substantially the horizontal plane of the seat-frame, means for locking the sliding seat-frame in fixed relation to the base member of the seat-frame, and means for sustaining the adjustable seat-back in its horizontal or upright positions, substantially as and for the purposes described.

11. In a convertible chair and stool, the combination of a standard, a two-part seat-frame, a hinged back, operative connections between the hinged back and one member of the seat-frame, and a vertically-adjustable seat mounted on the member of the seat-frame to which the hinged back is connected; substantially as described.

12. The combination with a base, of a seat-carrying standard provided with longitudinal channels, pivoted pawls within the channels, levers mounted on the standard within other channels thereof, a toothed adjuster connected loosely with said levers, and an adjusting-lever normally free from the toothed adjuster and adapted to engage therewith to turn the latter and move said levers to retract the pawls, substantially as and for the purposes described.

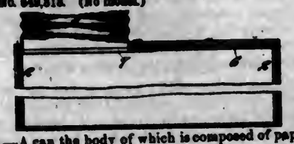
13. The combination with a base provided with holding-plates, of an angular non-rotatable standard fitted for vertical adjustment within said base, holding-pawls pivoted to the standard and arranged to engage with said holding-plates of the base, vertical levers fulcrumed to the standard and pivoted to said holding-pawls, a toothed adjuster loosely mounted on the standard and having pivotal connections with said levers, and a spring-controlled adjusting-lever arranged to be normally free from engagement with the toothed adjuster and having a prong which may be thrown into engagement with said adjuster, for the purposes described substantially as set forth.

14 The combination with a base having a lifting-spring and toothed holding-plates, of a seat-frame, a non-rotatable vertically-adjustable standard fitted in said base, a spindle passing through the standard and pivoted to the seat-frame, a casting having a clip attached to said standard and forming a bearing for the seat-frame, holding-pawls mounted on the standard to engage with the holding-plates of the base, an adjuster also mounted on the standard and on the spindle, levers operatively connected with said adjuster and with the holding-pawls, and an adjusting-lever carried by the seat-frame and arranged to engage with said pawl-adjuster, substantially as and for the purposes described.



15. The combination with a seat-frame, of a vertically-adjustable seat, the plates having the vertical slots thereof provided with offsets and carried by the seat-frame, a seat-lock independent of the seat proper and slidingly confined on the seat-frame to normally lie in the horizontal plane thereof and engaging with said angularly-slotted plates to sustain the seat in its raised or lowered positions, and a holding-spring fitted against the seat-lock and the seat-frame, substantially as and for the purposes described.

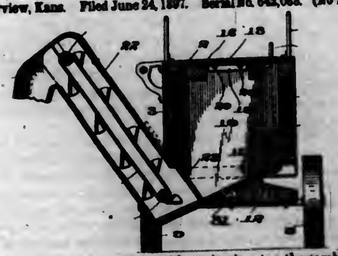
16. The combination with a chambered base, and a vertically-adjustable seat-carrying standard, of the ratchet-teeth disposed in the base on opposite sides of the standard, the oppositely-acting pawls fitted on the standard to engage with the ratchet-teeth, the levers arranged longitudinally of the standard, fulcrumed thereto, and connected at their lower ends to the pawls, a pawl-adjuster pivoted on the standard and connected to the pawl-adjusting levers, and means for actuating said pawl-adjuster, substantially as described.



602,774. ELECTRIC MUSCULAR EXERCISER. ROBIN SANDOW, London, England. Filed Jan. 24, 1896. Serial No. 667,796. (No model.)

Claim.—The combination with an elastic-cord exerciser, of handles attached to the cords of the exerciser, wires attached to the cords and extending the length of the cords, being so united with the handles and extending the length of the cords, being so united with the cords as to be capable of extending with them so as not to inter-

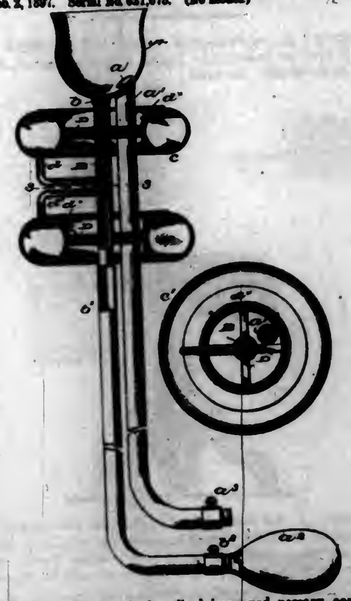
fere with the elasticity thereof, substantially as and for the purpose described.



602,775. CAN. FRANK J. SCHLEICHER, St. Louis, Mo., assignor to the St. Louis Paper Box Company, same place. Filed Aug. 28, 1897. Serial No. 649,818. (No model.)

Claim.—A can the body of which is composed of paper, a lining within said body, a top composed of two sheets joined together, a neck projecting from said can-top, said neck having a flange secured between the sheets forming said top and said flange having lips struck therefrom and bent upwardly and outwardly against the uppermost of said top sheets, for the purpose of securing said neck in position, substantially as described.

602,776. PORTABLE GRAIN-ELEVATOR. THOMAS F. SCHMITT, Fairview, Kans. Filed June 24, 1897. Serial No. 642,083. (No model.)



Claim.—1. In a wheeled portable grain-elevator, the combination with a body having a centrally-located hopper provided with inclined sides and a bottom inclining downwardly toward one side of the machine, of a tilting platform over the hopper and an elevator comprising a chute leading into the hopper at the bottom thereof, a gate for regulating the supply of grain to the chute, and an endless carrier operating in said chute, substantially as described.

2. In a portable wheeled grain-elevator, the combination with a body having a flat top provided with a central opening, of a tilting platform fitted in said opening, catch mechanism for holding the platform in horizontal position, a hopper located directly under said platform, an elevator leading from said hopper, fixed inclines leading up to the top of the hopper on opposite sides thereof, and supplemental hinged and folding extensions of said inclines, for the purpose and substantially as described.

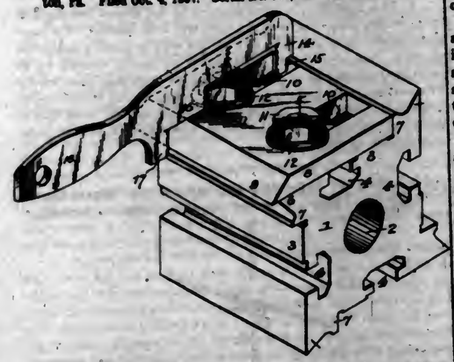
3. In a portable grain-elevator, in combination with a body mounted on wheels, a hopper located centrally intermediate the front and rear wheels, a dumping-platform over said hopper, an elevator connected with said hopper, fixed or main inclines on opposite sides of the dumping-platform, and supplemental inclines hinged to the lower ends of the main inclines and adapted to be extended to the ground or folded upon said main inclines, substantially as described.

602,777. PESSARY. JOSEPH W. SIMMONS, Rogers, Ark. Filed Feb. 2, 1897. Serial No. 621,673. (No model.)

Claim.—1. The herein-described improved pessary, comprising a cup adapted to embrace the cervix and having a lower hole or opening therein, a tube leading from said hole or opening, a compressible bulb removably secured to the end of said tube, and coincident rings adapted to prevent lateral movement of said cup, as and for the purpose set forth.

2. The herein-described pessary, comprising a cup adapted to embrace the cervix, a supporting-stem therefor, coincident inflatable rings secured to said stem and encircling the same, means connected to said stem for inflating the rings, and a pneumatic attachment communicating with said cup, as and for the purpose set forth.

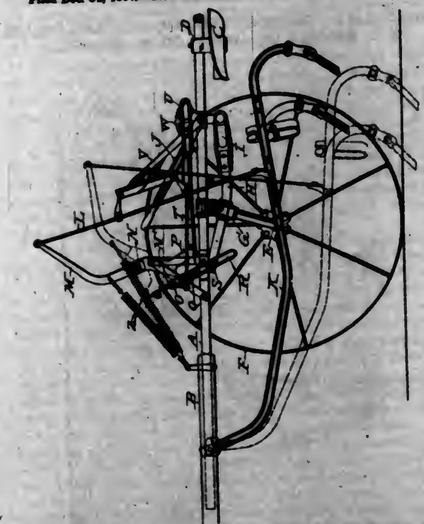
3. The herein-described improved pessary, comprising a cup adapted to embrace the cervix, a stem secured thereto, coincident inflatable rings adapted to support the same and of different degrees of elasticity, means for inflating said rings, and a pneumatic attachment communicating with said cup, as and for the purpose set forth.



4. The herein-described improved pessary, comprising a cup adapted to embrace the cervix, a hollow stem supporting the same, inflatable rings connected to said stem, tubes leading from said stem to said rings, means for inflating said rings connected to said stem, and a pneumatic device connected to said cup, as and for the purpose set forth.

5. The herein-described improved pessary, comprising a cup adapted to embrace the cervix, a stem supporting the same, arms secured to said stem having overhanging flanges, inflatable rings secured thereto, means for inflating said rings, and a pneumatic device connected to said cup, substantially as and for the purpose set forth.

6. The herein-described improved pessary, comprising a cup adapted to embrace the cervix, a hollow stem, inflatable rings connected to said stem and having communication therewith, a tube leading from said stem having a stop-cock near one end thereof, a compressible bulb secured to the free end of said tube, and a pneumatic device connected to said cup, substantially as and for the purpose set forth.



7. The herein-described improved pessary, comprising a cup adapted to embrace the cervix, and having a flexible tube leading therefrom, a hollow stem adapted to support said cup, inflatable rings carried by said stem and communicating therewith, a tube leading from said stem having a stop-cock near one end thereof, and a compressible bulb adapted to be secured to the end of either one of said flexible tubes, substantially as and for the purpose set forth.

602,778. GAGE FOR CUTTER-KNIVES. SAMUEL J. SHEARER, Milton, Pa. Filed Oct. 4, 1897. Serial No. 654,043. (No model.)

Claim.—As an improved article, a gage for the knives or cutters of rotary cutter-heads consisting in the plate cut away along one edge forming an arm with a notch in its end at the outer side, adapted to engage with a longitudinal shoulder on a cutter-head, and a shoulder opposite said arm adapted to engage with the upper side of a knife or cutter, and in rear of said shoulder formed with a lug or shoulder for determining the position of the cutting edge of the knife or cutter, substantially as described.

602,779. CULTIVATOR. BER G. SHARER, Madison, Wis., assignor to the Fuller & Johnson Manufacturing Company, same place. Filed Dec. 31, 1897. Serial No. 664,941. (No model.)

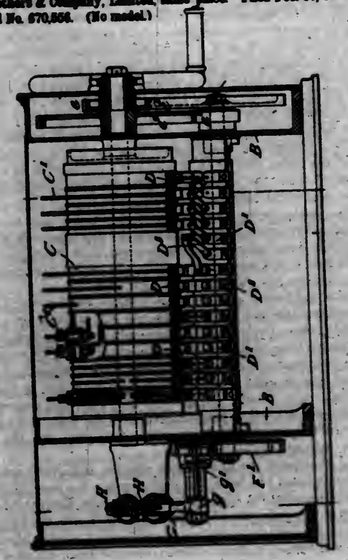
Claim.—1. In a cultivator or plow, the combination of a suitable frame; an arched axle journaled thereon; an arm secured to said axle; and a lever pivoted to the frame and connected to one end of said arm, substantially as described.

2. In a cultivator or plow, the combination of a suitable frame; an arched axle journaled thereon; an arm secured to said axle; a lever pivoted to the frame and connected to one end of said arm; a plow-beam pivoted to the frame; means for suspending said beam; and connections between said means and the opposite end of said arm for determining the position of the beams as the lever is raised or lowered.

3. In a cultivator or plow, the combination of a suitable frame; an arched axle journaled thereon; an arm secured to said axle extending forwardly and rearwardly thereof; a bell-crank lever pivoted to the frame and pivotally connected to one end of said arm; a plow-beam pivoted to the frame and extending beneath the axle; means for suspending the rear end of the beam pivotally supported upon the frame; and connections between said means and the forward end of the arm.

4. In a cultivator-plow, the combination of a suitable frame; an arched axle journaled thereon; an arm secured to said axle extending forwardly and rearwardly thereof and provided with an elongated slot or eye at its rear end; a lever J pivoted to the frame having its short arm in operative connection with said eye; a beam pivoted to the frame; and connections between said beam and the forward end of the arm.

5. In a cultivator or plow, the combination of a frame; an arched axle journaled thereon; an arm H secured to said axle and provided with an elongated eye I at its rear end; a lever J pivoted to the frame and provided at its short end with a stud or roller working in said eye; a plow-beam pivoted to the frame and extending rearwardly beneath said axle; a member N pivoted on the frame; lever M extending upwardly therefrom; rod L connecting said arm and the beam; link Q connected to said member N and provided with an elongated eye at its lower end; a connection between said eye and the forward end of arm H; and means for adjusting the member N.



602,780. APPARATUS FOR DETERMINING FAT IN MILK. ALFRED W. STOKES, London, England, assignor to the R. A. Lister & Company, Limited, Dursley, England. Filed Oct. 27, 1897. Serial No. 656,567. (No model.) Patented in England June 24, 1895, No. 12,194.

Claim.—1. Apparatus for determining volumetrically the proportion of fat in milk, consisting of an open-ended straight glass tube having in the order named a terminal chamber, a contracted graduated length, a second chamber, a contracted portion, a third chamber and a contracted portion, said second and third chambers each of greater capacity than the first, in combination with means for closing the open ends of the tube, substantially as set forth.

2. Apparatus for determining volumetrically the proportion of fat in milk, consisting of an open-ended straight glass tube having in the order named a terminal chamber, a contracted graduated length, a second chamber, a contracted graduated portion of greater diameter than the first graduated portion, and a third chamber terminating in a contracted graduated portion, said third chamber of greater capacity than the first or second and said second chamber of greater capacity than said first, in combination with means for closing the open ends of the tube, substantially as and for the purpose set forth.

602,781. APPARATUS FOR CONTROLLING ELECTRIC MOTORS. ARTHUR J. STOPHER, London, England, assignor to the Siemens Brothers & Company, Limited, same place. Filed Feb. 16, 1898. Serial No. 670,556. (No model.)

Claim.—1. In an apparatus for controlling electric motors, the combination of a rotatable cylinder provided with contact-segments arranged circumferentially thereon, spring-contacts mounted on a fixed support and arranged to be periodically engaged by the contact-segments on the rotatable cylinder, means for rotating the cylinder, and a switch comprising two independent series of oppositely-arranged fixed spring-contacts, a pivoted switch-arm and a cam geared to revolve with the cylinder and operating to oscillate said switch-arm to alternately contact with said series of spring-contacts, substantially as described.

2. In an apparatus for controlling electric motors, the combination of a rotatable cylinder provided with contact-segments arranged circumferentially thereon, spring-contacts arranged to be periodically engaged by the contact-segments on the rotatable cylinder, means for rotating the cylinder, and a switch comprising two series of contacts, a pivoted switch-arm, and a cam geared to revolve with the cylinder and operating to oscillate said switch to cause the latter to alternately contact with said series of contacts, the relative arrangement of the contact-segments and the oscillating switch being such that the circuit for each succeeding operation on the motors is prepared but not completed till the switch has made a corresponding stroke, substantially as described.

602,782. PROTECTED RAIL-JOINT. James M. Trahes, Palestine, Tex. Filed Oct. 1, 1897. Serial No. 653,743. (No model.)

Claim.—1. In a rail-joint, the combination with the meeting ends of the two rails, of a base-plate seated under the same, provided with upwardly-projecting flanges, the fish-plates and bolts having nuts thereon, a subrail having an elevated tread portion overlapping the joint and polygonal recesses on its inner face adapted to embrace the nuts on the ends of the bolts and prevent the same from turning, and a key driven between the outer face of the said subrail and the inner face of one of the flanges of the base-plate, substantially as described.

2. In a rail-joint, the combination with the meeting ends of two rails, of a base-plate seated under the same provided with upwardly-projecting flanges, the fish-plates and securing-bolts having nuts thereon, a subrail having an elevated tread portion overlapping the joint and polygonal recesses on its inner face adapted to embrace the nuts on the ends of the bolts and prevent the same from turning, and a wedge-shaped key having a split end forming a lip turned down against the edge of the base-plate and locking the key in position, substantially as described

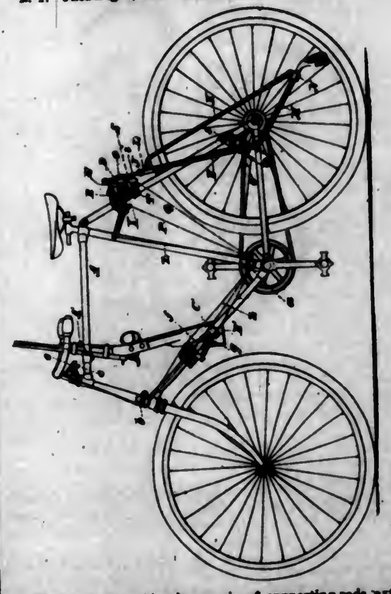
3. In a rail-joint, the combination with the meeting ends of two rails, the fish-plates and bolts and nuts securing the same together, of a base-plate having an upwardly-turned flange embracing the flange of one of the fish-plates on one side of the rail, and a flange extending upwardly from the other side of said base-plate provided with a beveled inner face, a nut-protector provided with recesses on its inner face shaped to fit the nuts and seated against the fish plate and a groove on its outer face, a locking key provided with a groove on its inner face corresponding with the groove on the outer face of the nut-protector when in position, and a soft-metal filling in said grooves for locking the key in place, substantially as described.

4. In a rail-joint, the combination with the ends of two meeting rails, the fish-plates and securing bolts and nuts therefor, of a base-plate seated under the joint having upwardly-projecting flanges on opposite sides of the rail, one of said flanges being provided with an extension resting between two adjacent bolt-heads and the other flange being beveled to form a wedge-shaped recess between its wall and the rails, a nut-protector having recesses in its inner face to fit the nuts, and a locking-key for holding the said nut-protector in place against the rail, substantially as described.

5. In a rail-joint, the combination with the ends of two meeting rails, the fish-plates and securing bolts and nuts therefor, of a base-plate seated under the joint having upwardly-projecting flanges, one of said flanges being provided with an extension resting between two adjacent bolt-heads, and the other flange being beveled to form a recess between its wall and the rails, a nut-protector having recesses in its inner face to fit the nuts and cylindrical holes or depressions in said recesses adapted to receive the ends of the bolts, and a locking-key driven between the flange of the base-plate and the nut-protector, substantially as described.

6. In a rail-joint, the combination with the ends of the meeting rails, the fish-plates and bolts and nuts securing the same in place, of a base-plate provided with upwardly-projecting flanges on opposite sides of the rails, one of said flanges embracing the flange of the rails, and a subrail having an elevated tread portion spanning the joint and locked in place between the rails and a flange of the base-plate, whereby the said subrail also serves as a nut-protector, substantially as described.

7. In a rail-joint, the combination with the ends of two meeting rails, the fish-plates and securing bolts and nuts therefor, of a base-plate seated under the joint having upwardly-projecting flanges on opposite sides of said rails, a nut-protector having recesses on its inner face adapted to fit the nuts, a flange projecting downwardly from said protector and resting on the base-plate, and a locking-key inserted between one of the base-plate flanges and the outer face of the nut-protector, whereby the latter is held against the fish-plate, substantially as described.



602,783. FASTENER FOR WIRE-STAYS. John G. Thomas, Lima, Ohio. Filed July 29, 1897. Serial No. 646,573. (No model.)

Claim.—1. As an improved article, a fastener for the stays of wire fences, comprising the plate formed with a central bend and the ends extended laterally outward and formed with apertures, and the opposite tongues in a line with the center of the plate, substantially as described.

2. The combination with the horizontal strands of a wire fence and the vertical stays, of the fastener consisting of the plate having a central bend in which said strands are seated, and formed with holes through which the stays pass, and the opposite integral tongues bent around the said strands, substantially as described.

602,784. BICYCLE-SUPPORT. Howard A. Trapp, New York, N. Y. Filed Aug. 6, 1897. Serial No. 647,204. (No model.)

Claim.—1. In a bicycle, a pair of supporting-rods extending downward and rearward one on each side of the rear wheel, and having the elongated spiral feathers I and the sleeves G, having the spiral grooves H and swiveled to the frame of the bicycle at opposite sides of the latter and receiving and controlling said rods both during their vertical movement and oscillatory motion along the sides of said rear wheel, combined with the crank-shaft operable by the rider and journaled below the bicycle-saddle and adjacent to the top of the forward portion of said rear wheel, crank connections intermediate said shaft and the upper ends of said rods for operating the latter from said shaft, and locking devices connected with said shaft and under the control of the rider for maintaining said rods in their upper and lower positions; substantially as set forth.

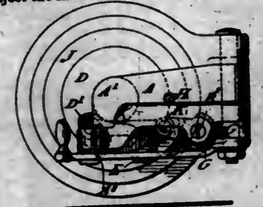
2. In combination with the bicycle, the supporting-rods extending downward one on each side of the bicycle, the crank-shaft to which said rods are connected for operating said rods, the lever operatively connected with said shaft for effecting the elevation of said rods, the recessed locking-wheel connected with said shaft, and the locking-dog engaging said wheel; substantially as set forth.

3. In combination with the bicycle, the supporting-rods extending downward one on each side of the bicycle, the crank-shaft to which said rods are connected for operating said rods, the lever operatively connected with said shaft for effecting the elevation of said rods, the recessed locking-wheel connected with said shaft and having the ratchet-teeth, and the locking-dog adapted to engage either the recesses or teeth of said wheel and lock said rods in their upper and lower positions; substantially as set forth.

4. In combination with the bicycle, the supporting-rods extending downward one on each side of the bicycle, the crank-shaft to which said rods are connected for operating said rods, the lever operatively connected with said shaft for effecting the elevation of said rods, the recessed locking-wheel connected with said shaft and having the stops adjacent to its recesses, and the locking dog adapted to engage the recesses of said wheel and to contact with said stops; substantially as set forth.

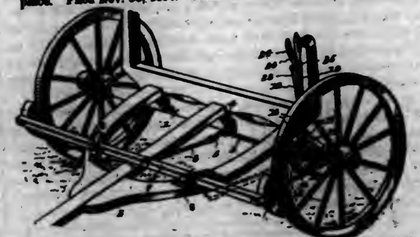
5. In a bicycle, the pair of supporting-rods, the crank-shaft to which the upper ends of said rods are connected, the recessed wheel on said shaft, and the locking-dog adapted to engage said wheel, combined with the bracket applied to the upper rear fork of the bicycle-frame and having the forwardly and rearwardly extending ears to form the bearings for said locking-dog and said crank-shaft; substantially as set forth.

6. In combination with the bicycle, the supporting-rods extending downward one on each side of the bicycle, and means for raising and lowering said rods and turning the same axially, said rods each having the tubular body portion, the upper threaded section freely entering said body portion, the sleeve revolubly on said upper section and engaging the sleeve upon the upper end of said body portion, and the nuts on said upper section at the upper and lower ends of said sleeve revolubly thereon; substantially as set forth.



7. In combination with the bicycle, the supporting-rods extending downward one on each side of the bicycle, the crank-shaft to which said rods are connected for operating said rods, the sleeves swiveled to the frame of the bicycle and receiving and controlling said rods both during their vertical movement and oscillatory motion along the sides of the bicycle, the wheel on said crank-shaft, the foot-treadle lever *f* pivotally secured to the lower front portion of the bicycle-frame and connected with said wheel on said crank-shaft for elevating said rods, and locking devices connected with said shaft for maintaining said rods in their upper and lower positions; substantially as and for the purposes set forth.

8. In a bicycle of the "safety" type, the supporting-rods having the bent lower ends and extending downward on opposite sides of the rear wheel from a point in rear of the saddle-post and adjacent to the top of the forward portion of said rear wheel, and the sleeves swiveled to the rear portion of the bicycle-frame, said sleeves receiving and guiding said rods during their vertical and axial movements and turning with said rods during their oscillating movement along the sides of said rear wheel, combined with the crank-shaft journaled adjacent to the upper ends of said rods and over said rear wheel and below the saddle, the cranks rigid with said shaft and pivotally connected with the upper ends of said rods for operating the latter from said shaft, swivels in said rods above said sleeves and below said cranks for permitting said rods to turn axially, the foot-treadle operatively connected with said shaft for turning the latter and thereby through said cranks elevating said rods when pressure is applied on said treadle, the spiral on said swiveled sleeves for turning said rods axially during their vertical movements, and an automatic latch mechanism for locking said rods in their upward position, the relation of the parts being such that upon the release of said latch said rods will automatically descend; substantially as set forth.



602,785. BREECH-LOADING ORDNANCE. Douglas Vickers and Sydney T. Buckham, Sheffield, England, assignors to Vickers Sons & Co., Limited, same place. Filed Oct. 4, 1897. Serial No. 654,004. (No model.) Patented in England Oct. 10, 1895, No. 19,026.

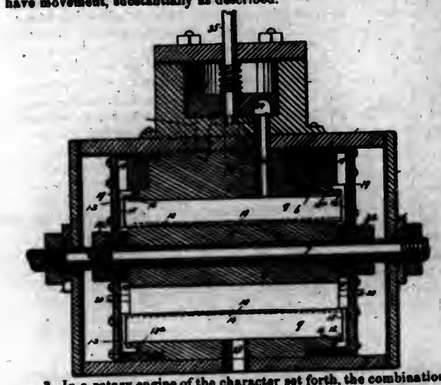
Claim.—1. In breech-loading ordnance, the combination with the breech-plug, and a pivoted carrier to which the breech-plug is pivotally attached, of a toggle-joint-lever mechanism working in a plane at right angles to the axis of the gun and composed of an arm pivoted on the plug-carrier and a link connecting said arm with the breech-plug, and gearing through which the said toggle-lever mechanism and plug-carrier are actuated, substantially as described.

2. In breech-loading ordnance, the combination with a pivoted breech-plug carrier, and a cam A^3 on the pivotal portion of said carrier, of a lever Q having an arm Q' to bear on the cartridge-rim, a wedge-piece T movable along the lever Q and its arm Q', a pivoted lever U engaged with said wedge-piece, and a spring-bolt Q^2 mounted on the lever Q and arranged to bear against the toe of the lever U, whereby on swinging the breech-plug outward the lever U is actuated by the cam A^3 so as to force the wedge-piece T along the lever-arm Q' thus starting the cartridge-shell from its seat so that in the last part of its movement the carrier A will strike the lever Q and cause it to eject the said shell, substantially as described.

602,786. WAGON-BRAKE. Isaac L. Wagner, Butler, Penn., assignor of one-half to D. J Farthing and William A. McGeean, same place. Filed Nov. 30, 1897. Serial No. 660,242. (No model.)

Claim.—1. The combination with a rod, and a wheel or disk, of a sectional lever having its parts united together by clips which are arranged in relation to the lever members to form a guideway, a slidable pawl fitted in said guideway, and a handpiece to which the pawl is connected, substantially as described.

2. The sectional lever comprising the handle-bar, the parallel plates, the clips which embrace said plates, and the bolts for uniting the parts together, combined with a rod to which the plates are loosely fitted, a wheel or disk fast with the rod and arranged between the plates, a pawl slidably fitted between the lever-plates and within the clips, and a handpiece to which the pawl is linked, substantially as described.

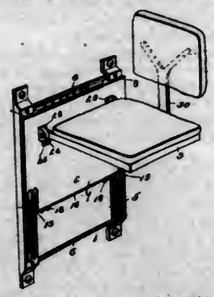


3. The combination with a rear axle, the running-gear, and a brake-beam carrying shoes, of the rod journaled on said axle and linked to the brake-beam, a wheel or disk fixed to said rod at a point outside of the running-gear, a lever fitted loosely on the rod which serves as the fulcrum for the lever and the latter adapted to turn independently of the rod and the disk so as to lie in rear of the axle when not in service, and locking devices for making the lever fast with the disk or wheel at any point within the range of adjustment of the lever, substantially as described.

602,787. ROTARY STEAM-ENGINE. Isaac Wertz, Bandon, Minn. Filed May 26, 1897. Serial No. 638,607. (No model.)

Claim.—1. In a rotary engine of the character set forth, the combination of an outer shell or casing supported upon a suitable base, an interior shell or casing having a circular piston-chamber formed therein, a shaft extending concentrically through said piston-chamber having a radially-slotted rotary piston thereon, valves or wings movably carried by the said piston and having lugs engaging the opposite ends of the piston-chamber, arms with outer angular ends fitted to the opposite ends of the said valves or wings, the latter being formed slightly concave at their back edges and provided with grooves adjacent to the opposite ends, and yielding rods seated in the back portions of the said valves or wings, and having the said arms connected to opposite ends thereof, substantially as described.

2. In a rotary engine of the character set forth, the combination of a body having a piston-chamber therein, a piston concentrically mounted in said piston-chamber, valves or wings movably carried by the said piston, and having grooves on their inner edges, arms embracing the opposite ends of the valves or wings having inwardly-extending ends standing over the outer portions of the said valves



or wings, guides for engaging the inwardly-extending outer ends of the said arms, and radially-slotted end plates in which the said arms have movement, substantially as described.

3. In a rotary engine of the character set forth, the combination of a body having a piston-chamber therein, a rotary piston mounted in said body, valves or wings movably carried by the said piston, arms embracing the opposite ends of the said valves or wings, slotted end plates in which said arms have movement, clamping-plates engaging the said end plates, guides for the said arms and means set forth for controlling the ingress and exhaust of steam, substantially as described.

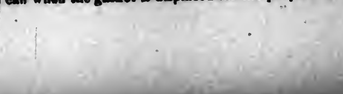
4. In a rotary engine of the character set forth, the combination of a rotary piston having a series of slots therein, valves or wings movably mounted in said piston, arms embracing the opposite ends of the said valves or wings, slotted end plates in which said arms have movement and clamping-plates engaging the said end plates, said clamping-plates and end plates being rotatable with the piston, substantially as described.

602,788. FOLDING SPRING-SEAT. FRANK G. WESTLAND, McCook, Nebr. Filed Mar. 31, 1897. Serial No. 630,047. (No model.)

Claim.—1. The combination with a supporting-frame, of a spring-pressed slide mounted on the same, a seat hinged on said slide so as to be turned up or down at will, and a back also pivotally mounted upon said slide and adapted to be turned out against the edge of the seat or flattened against the slide out of the path of the seat at will, substantially as described.

2. The combination with a suitable supporting-frame containing ball-runs, of a spring-pressed slide mounted on said frame and also formed with ball-runs, antifriction-balls applied in the ball-runs between the slide and frame a seat hinged on said slide so as to turn up or down at will, and a back also pivotally mounted on the slide so that it may be turned back flat against the slide out of the path of the seat, substantially as described.

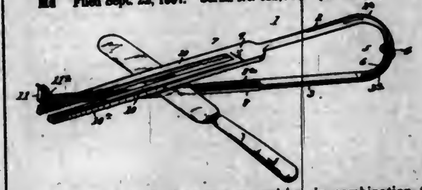
3. The combination with a suitable supporting-frame, of a slide mounted thereon, a flange mounted on said slide, bolts passed through said flange, thumb-nuts applied on said bolts so as to engage said flange, a cross-bar connecting said bolts, springs connecting said cross-bar and the frame, and a seat mounted on said slide, substantially as described.



4. The combination with a supporting-frame containing ball-runs, of a slide mounted thereon also formed with ball-runs, springs connecting said slide and said frame, antifriction-balls in said ball-runs between the frame and slide, a seat hinged upon said slide so as to be turned up or down at will, a back-rest pivoted on said slide so as to be turned out against the seat, or back against the slide at will, and a catch mounted on the seat for holding the back in its operative position, substantially as described.

5. The combination with a supporting-frame, of a spring-pressed slide mounted thereon and formed with lateral apertures and apertured lugs in proximity to said apertures, a seat provided with brackets having elongated slots and a pivoted rod passed through the apertured lugs and said elongated slots; the construction being such that the said brackets may be passed through the slots of the slide when so desired to permit the same to be lowered, substantially as described.

6. The combination with a supporting-frame, of a slide mounted thereon, springs connecting said slide and said frame, adjusting-bolts connected to said springs, thumb-screws for moving said bolts longitudinally to increase or decrease the tension of said springs, and a seat hinged to said slide so that it may be turned up or down at will, substantially as described.



7. The combination with a supporting-frame, of a slide mounted thereon, springs connecting said slide and said frame, a seat pivoted on said slide so that it may be turned up or down at will, a back-support pivoted on said slide, a spring connecting said back-support and slide so that the former is normally held against the latter, and a catch mounted on the seat for securing the back-support in position thereon, substantially as described.

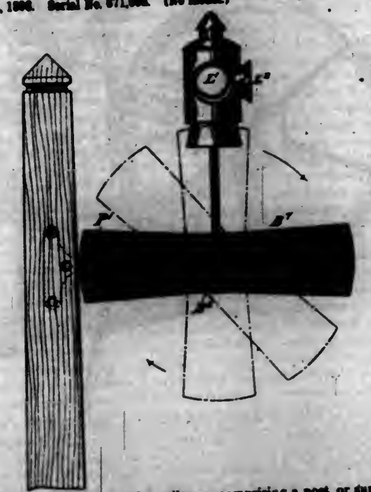
602,789. METALLIC RAILROAD-TIE. WILLIAM T. WILKINSON, Lafayette, Colo. Filed Dec. 4, 1896. Serial No. 614,508. (No model.)

Claim.—A railway-tie formed of two opposing, hollow one-piece sections overlapping at their edges to permit of vertical play, springs arranged between the sections, and vertical tie-bolts adjustably and detachably connecting said sections, substantially as described.

602,790. KNIFE-SHARPENER. JOHN R. WILLIAMS, Baltimore, Md. Filed Sept. 23, 1897. Serial No. 652,644. (No model.)

Claim.—1. A knife-sharpener comprising, in combination, two members, each consisting of a file-blade having a curved handle extension and one provided with a stop device against which the other is adapted to abut to hold it at an incline, said handle extensions being pivotally connected to form a bow-shaped handle, and a spring adapted to hold the abutting member against said stop device, substantially as described.

2. A knife-sharpener comprising, in combination, two members 2 3, each having a curved handle-section 2^a 3^a pivoted to form a bow-shaped depressible handle 5 and a file-blade 7 8, the former bifurcated to form the arms 10, and the latter provided with the lug 11 having the stop-pins 11^a under which said arms 10 are adapted to take, and a spring for normally holding said arms of the file-blade 7 against said stop-pins, substantially as described.



602,791. JAR OR OTHER RECEPTACLE FOR PRESERVES, &c. LUDWIG WURZBURG, London, England. Filed May 20, 1897. Serial No. 638,764. (No model.)

Claim.—1. In combination with a receptacle, a cap having an annular downward flange, fitting within the top of the same, and a compressible gasket interposed between the said parts, the said flange having a gate or way, *b'*, extending through the entire width of the flange and making communication with the interior of the can and the said space, in order that air may be admitted to the interior of the can when the gasket is displaced for the purpose set forth.

2. In combination with a receptacle, a cap having a flange that extends down into the latter, and a compressible gasket interposed between the under side of the said cap and the upper edge of the said receptacle, the said flange having a gate or way formed therein which makes communication with the interior of the can, in order that when the gasket is compressed air may be admitted to the interior of the can, substantially as, and for the purpose set forth.

602,792. RAILWAY SIGNALING SYSTEM AND APPARATUS. HENRY BAKER, New Rochelle, N. Y. Filed Dec. 8, 1896. Renewed Feb. 26, 1898. Serial No. 671,602. (No model.)

Claim.—1. A signal for railways comprising a post or support, an arm extending therefrom, a substantially straight semaphore-blade broader than the arm and fitted to rotate in a plane substantially vertical and substantially at right angles to the direction of traffic, and pivoted to the arm at such a distance from said post or support as to be substantially clear of the background of said post or support in all positions of a full revolution, and means for rotating said semaphore-blade and for stopping and holding at rest said semaphore-blade in one or more predetermined positions, substantially as set forth.

2. A block-signal for railways comprising a post or support, an arm extending therefrom, a substantially straight semaphore-blade broader than the arm and fitted to rotate in a plane substantially vertical and substantially at right angles to the direction of traffic, and pivoted to the arm at such a distance from said post or support as to be substantially clear of the background of said post or support in all positions of a full revolution, and means for rotating said semaphore-blade when changing from one position to another and for stopping and holding at rest said semaphore-blade in one position to indicate that a plurality of blocks in advance is clear and in a second position to indicate that the block in advance is clear and in a third position to indicate that the block in advance is occupied, substantially as set forth.

3. A signal for railways comprising a supporting-post, a semaphore fitted to rotate in a substantially vertical plane, and pivoted at such a distance from said post as to be substantially clear of the background of said post in all positions of a full revolution, a lantern fitted to rotate on a substantially vertical axis, said semaphore and lantern being connected so as to rotate together and give corresponding indications and said semaphore being located on the same side of said post as said lantern, and means for rotating said semaphore and lantern and for holding said semaphore and lantern at rest in one or more predetermined positions, substantially as set forth.

4. A signal for railways comprising a supporting-post, an arm extending therefrom, a semaphore-blade broader than the arm and fitted to rotate in a plane substantially vertical and substantially at right angles to the direction of traffic, and pivoted to the arm at such a distance from said post as to be substantially clear of the background of said post in all positions of a full revolution, and means for rotating said semaphore-blade and for stopping and holding at rest said semaphore-blade in one or more predetermined positions, and a lantern on the same side of the post as the semaphore-blade and arranged to give corresponding indications, substantially as set forth.

5. A signal for railways comprising a visual indicator giving signals by different positions thereof, a motor for the indicator, a locking device, a part at all times connected to and moving with the indicator, constructed to be engaged by the locking device in positions corresponding with the different positions of the indicator, and a commutator controlling the locking device so as to lock the indicator in predetermined positions to indicate the condition of the track, substantially as set forth.

6. A signal for railways comprising a visual indicator, an electromotor for said indicator, a locking device for the indicator having a locking-piece whereby the indicator is held at rest in one or more predetermined positions, and a circuit make and break combined motor starting and stopping device actuated by said locking-piece, the circuit of said motor having a single break therein controlled by said make-and-break device, substantially as set forth.

7. A signal for railways comprising a rotating visual indicator, a motor for rotating said indicator always in the same direction, a part moving with said indicator, a movable locking-piece engaging with said part to stop and lock the indicator in one or more predetermined positions of the indicator, a motor starting and stopping device controlled by the movement of said locking-piece so that the withdrawal of said locking-piece starts the motor and the engagement of said locking-piece stops the motor, and means for withdrawing the locking-piece and for putting the locking-piece in condition for engagement with said part moving with the indicator, substantially as set forth.

8. A signal for railways comprising a rotating visual indicator, a motor for rotating said indicator, a part moving with said indicator, a movable locking-piece engaging with said part to stop and lock the indicator in one or more predetermined positions of the indicator, an electromagnet for withdrawing said locking-piece, continuously-acting means tending to restore said locking-piece to engaging position, and a circuit make and break combined motor starting and stopping device actuated by said locking-piece and controlling the motor-actuating circuit, said motor actuating circuit having a single break therein, substantially as set forth.

9. A signal for railways comprising a visual indicator and a motor and locking device for the indicator, a motor starting and stopping device, and a commutator controlling the locking device and motor starting and stopping device so as to stop and lock the indicator in one or more predetermined positions to indicate the condition of the track, substantially as set forth.

10. A signal for railways comprising a visual indicator and a motor and locking device for the indicator, a motor starting and stopping device controlled by the movement of said locking device, and a commutator controlling the locking device so as to lock the indicator in one or more predetermined positions to indicate the condition of the track, substantially as set forth.

11. A block-signal for railways comprising a visual indicator adapted to assume three positions, indicating respectively "safety," "distant danger" and "home danger," said indicator being normally in the home danger position, a commutator connected at all times to the indicator, a circuit controlled at the track-section in rear of the indicator and adapted to be also controlled at the section guarded by the indicator for starting the movement of the indicator from the home danger position, and another circuit thrown into action by the movement of the indicator and commutator and adapted to be controlled a plurality of sections in advance, to carry said indicator past the distant danger position, and a circuit for continuing the motion of the indicator after it has been started from home danger to distant danger, independently of the first-named circuit, and for continuing the movement of the same from distant danger to safety after it has been carried beyond the distant danger position, independently of the last-named circuit, substantially as set forth.

12. In a block-signal for railways, in combination, an indicator and a commutator, means for actuating the indicator and commutator, and a locking device for the indicator controlled by a train to unlock the indicator, said actuating mechanism being relieved from the control of said train by the unlocking of the locking device and the initial movement of the indicator, and controlled by the commutator through circuits not under the control of said train to complete the movement of the indicator, substantially as set forth.

13. In a block-signal for railways, in combination, an indicator and a commutator connected to move together, a motor and locking device for the indicator and commutator, means under the control of a train for unlocking said locking device and starting the motor, and means under the control of the commutator independently of said train for controlling the motor and locking device to complete the movement of the indicator, substantially as set forth.

14. A signal for railways comprising an indicator and a commutator, means for moving and locking the indicator whereby said indicator may be moved into and locked in one or more predetermined positions, and a circuit make and break device controlling the moving and locking means to unlock and start the indicator, said circuit

make and break device being relieved from the control of the indicator by the unlocking and initial movement of the indicator, and said indicator being controlled by the commutator through circuits not under the control of said circuit make and break device to complete the movement of the indicator, substantially as set forth.

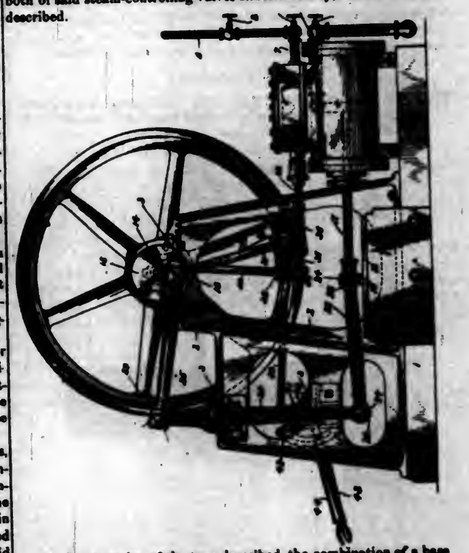
15. A signal for railways comprising a movable visual indicator free from tendency to movement while at rest, a circuit make and break device, an engaging device actuated by said circuit make and break device, whereby the signal is held in one or more predetermined positions, a motor for said indicator in a circuit controlled by said engaging device, whereby the movement of said engaging device actuates the motor to move the indicator, and a commutator connected to the indicator whereby the circuit of the engaging device is controlled while the indicator is passing its one or more indicating positions, the motor-actuating circuit being controlled by the engaging device while the signal is moving through all positions intermediate of its position or positions of indication, substantially as set forth.

16. A signal for railways comprising a visual indicator and means for moving the same, a single locking-piece for the indicator adapted to lock the indicator in different positions thereof to give different indications as to the condition of the track, and a commutator connected to and moving with the indicator and controlling the locking-piece, substantially as set forth.

17. A signal for railways comprising a movable visual indicator free from tendency to movement while at rest, a motor for the indicator, a movable locking device for the indicator, and a motor starting and stopping device controlled by the locking device to energize the motor after the indicator has been unlocked and to deenergize the motor when the indicator is locked, substantially as set forth.

18. In combination, an actuating electric circuit, two batteries, electromagnets in circuit with each battery, battery-contacts connected with each battery, and circuit-contacts for each battery, a contact for each battery being controlled by an electromagnet of the other battery, whereby either battery may be actively connected in the circuit until the current supplied falls below a predetermined point and will thereupon connect the other battery actively in said circuit, substantially as set forth.

19. In combination, an actuating electric circuit, two batteries, an electromagnet connected in a shunt-circuit with one of said batteries and another electromagnet connected in a shunt-circuit with the other of said batteries, and contacts controlled by said electromagnets, the contacts of each battery controlled by the electromagnet of the other battery, whereby either one of said batteries is maintained in the actuating-circuit until the current supplied by said battery falls below a predetermined point and then is cut out and the other battery connected in the actuating-circuit, substantially as set forth.



20. In combination, an actuating electric circuit, two batteries, an electromagnet connected in a shunt-circuit with one of said batteries and a make-and-break device in said shunt-circuit, an electromagnet connected in a shunt-circuit with the other of said batteries and a make-and-break device in the latter shunt-circuit, the make-and-break device in each shunt-circuit being controlled by the electromagnet in the other shunt-circuit, and other circuit make and break devices controlled by said electromagnets, whereby one of said batteries is maintained in the actuating-circuit until the current supplied by said battery falls below a predetermined point and then said battery is cut out and the other battery connected in the circuit, and the electromagnet in the circuit with the active battery breaks the shunt-circuit of the electromagnet of the cut-out battery, substantially as set forth.

602,793. PROCESS OF PRESERVING ALIMENTARY SUBSTANCES, &c. ALBERT L. LAWTON and ARTHUR W. LAWTON, New York, N. Y. Filed Dec. 31, 1897. Serial No. 665,180. (No specimens.)

Claim.—The process of preserving alimentary substances, which consists in subjecting them to the action of a gaseous mixture, composed of nitrogen carbonic oxid and oxygen in substantially the proportions specified.

602,794. ENGINE. JOSIAH PERRITT, San Francisco, Cal. Filed Dec. 31, 1896. Serial No. 617,613. (No model.)

Claim.—1. In an engine, the combination with a base and frame consisting of side plates or standards, of horizontally-disposed cylinders mounted on said base and arranged on opposite sides of the standards, pistons moving within said cylinders, valves directly over and controlling the supply of steam to said cylinders, piston-rods connected to the pistons, a vertical walking-beam mounted on a stub-shaft on the exterior side of each standard, side rods connecting the lower ends of the said beams with the piston-rods, a horizontal shaft mounted in bearings in the upper ends of the standards and located between the said cylinders and beams, a fly-wheel mounted on said shaft between the standards, connecting-rods attached to the upper ends of the walking-beams and to the said horizontal shaft and adapted to rotate said fly-wheel, and valve-operating mechanism connected to the opposite ends of the said horizontal shaft for operating both of said steam-controlling valves simultaneously, substantially as described.

2. In an engine of the type described, the combination of a base and frame consisting of two side plates or standards rising therefrom, horizontally-disposed cylinders mounted on said base at opposite sides of the standards, pistons reciprocating within said cylinders, rods attached to said pistons, a vertical walking-beam mounted on a stub-shaft on the exterior side of each standard and having arms of unequal length, side rods connected to the lower ends of the longer arms of the said walking-beams and to the piston-rods, a horizontal shaft located between the cylinders and beams and mounted in bearings in the upper ends of the standards and carrying intermediate of its length between said standards a fly-wheel, a crank-disk secured upon each end of the shaft and provided with crank-pins, and connecting-rods between the crank-disks and the upper ends of the short arms of the walking-beam, said crank-disks and connecting-rods being arranged exteriorly of each standard, substantially as described.

3. In an engine of the type described, the combination of a base and a frame comprising two side standards rising therefrom, a pair of horizontally-disposed cylinders mounted on said base at opposite sides of the standards, cross-heads carried by the piston-rods, horizontally-disposed cross-head guides in which the said cross-heads operate, a pair of vertical walking-beams arranged at opposite sides of the base and mounted on stub-shafts projecting from exterior sides of the frame-standards, valves controlling the steam-supply to said cylinders, side rods connecting said cross-heads and the lower ends of said walking-beams, a horizontal shaft mounted in the upper ends of said standards between the cylinders and beams, a fly-wheel on the said shaft between the standards, crank-disks on the opposite end of the said shaft, rods connecting the upper ends of the walking-beams with said crank-disks, eccentrics mounted on the horizontal shaft inside of the standards, a fly-wheel on the said shaft between the eccentrics, and means operatively connecting the said eccentrics and controlling-valves, substantially as described.

4. In an engine of the type described, the combination of a base and frame consisting of two side standards rising therefrom, a pair of horizontally-disposed cylinders mounted on said base at opposite sides of the standards, each cylinder being provided with a steam-chest, steam-supply pipes connecting the steam-supply chest with a common steam-supply, a piston in said cylinders provided with piston-rods, a valve operating within each steam-supply chest and adapted to control the supply of steam to the cylinders, said valves being provided with exteriorly-projecting stems or rods, cross-heads attached to the rods and moving in cross-head guides, a pair of vertically-disposed walking-beams having arms of unequal length and mounted on stub-shafts projecting from the opposite exterior sides of said standards, side rods connecting the longer lower arms of said beams and the cross-heads, a horizontal shaft rotatably mounted in bearings in the upper ends of said standards and located between the beams and cylinders, crank-disks attached to the ends of the shaft and arranged on the exterior sides of the standards, rods connecting said disks to the shorter upper arms of the walking-beams, a fly-wheel mounted on the horizontal shaft between said standards, a pair of eccentrics also mounted on said shaft between the frame and standards on opposite sides of the fly-wheel, a pair of depending eccentric-rods attached to each pair of eccentrics, links carried at the lower ends of said eccentric-rods, and connections between said links and valve stems or rods, substantially as described.

5. In an engine of the type described, the combination of a base, a frame consisting of two standards rising therefrom, a pair of horizontal cylinders mounted on said base at opposite sides of the frame, each cylinder being provided with a steam-chest, valves in said steam-chests provided with exteriorly-projecting valve-rods, a piston in each cylinder provided with a piston-rod carrying a cross-head movable in cross-head guides on the frame, a pair of vertical walking-beams having arms of unequal length and mounted on stub-shafts projecting from the exterior sides of the frame-standards, side rods connecting the lower or longer arms of said walking-beams with the cross-heads, a horizontal shaft mounted in bearings in the upper ends of the frame-standards and located between said cylinders and beams, crank-disks secured to the outer ends of said shaft, rods connecting said disks with the upper shorter arms of said walking-beams, a pair of eccentrics attached to said shaft between the frame-standards and provided with depending arms or rods arranged in pairs, a single link located on the exterior side of the frame-standards and connected to the lower ends of the arms or rods depending from the eccentrics, a link-block held to slide within each of said links, a rock-shaft mounted in the frame-standards and provided with bell-crank rocker-arms secured to the valve-stems, and means located between the said standards for shifting said links, substantially as described.

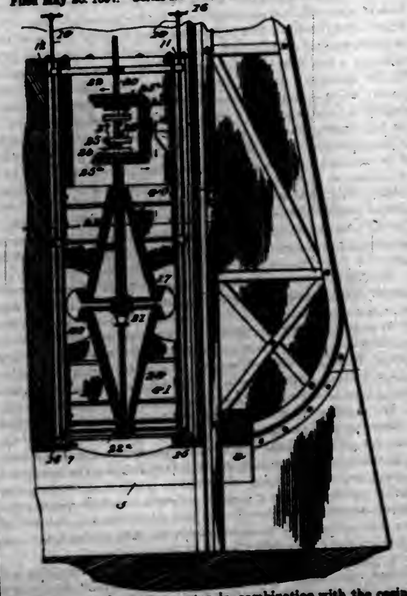
6. In an engine of the type described, the combination of a base, a frame consisting of two side standards rising therefrom, a pair of horizontally-disposed cylinders mounted on said base at opposite sides of said standards, said cylinders each being provided with a steam-chest and valves therein for controlling the supply of steam, a piston in each cylinder provided with a piston-rod, a cross-head secured to each piston-rod and operating in cross-head guides on the frame, a pair of vertical walking-beams at opposite sides of the engine and mounted on stub-shafts projecting from the exterior sides of each frame-standard, side rods connecting the lower arm of each walking-beam with the adjoining cross-head, a horizontal shaft rotatably mounted in bearings in the upper ends of said standards and located between the cylinders and said beams, cranks secured to the outer projecting ends of said shaft, rods connecting said crank-disks with the upper ends of said walking-beams, eccentrics mounted on the shaft between the said frame-standards and provided with depending eccentric arms or rods arranged in pairs on opposite sides, a single link located on the exterior side of each frame and connected to the lower ends of each pair of eccentric arms or rods, link-blocks sliding in said links, a rock-shaft arranged between the frame-standards and provided with rocker-arms rotatable thereon, radius-rods connecting the rocker-arms to said valves, a tumbling-shaft provided with a plurality of rocker-arms, saddles carried by said links, rods connecting said saddles to the rocker-arms upon the tumbling-shaft, a lever connected with said shaft between the frame-standards, and means to lock the lever for regulating the cut-off of the valves, substantially as described.

7. In an engine of the type described, the combination of a base, a frame consisting of side standards rising therefrom, a pair of horizontally-disposed cylinders mounted on said base at opposite sides of the standards, each cylinder being provided with a steam-chest and controlling-valve operating therein and also with a valve-stem, pistons operating in said cylinders and provided with rods connected to cross-heads movable in cross-head guides on the frame, a pair of vertical walking-beams having arms of unequal length, said beams being mounted on stub-shafts projecting from the exterior side of each frame-standard, side rods connecting the lower longer arms of the beams to said cross-heads, a horizontal shaft rotatably mounted in bearings in the upper ends of said frame-standards between the cylinders and said beams, crank-disks attached to the projecting ends of said shaft, rods connecting said crank-disks with the upper shorter arms of the walking-beams, a fly-wheel mounted on said horizontal shaft between the frame-standards, a pair of eccentrics also mounted on said shaft and on each side of the fly-wheel and between the same and the standards, crank-disks secured to the outer projecting ends of said walking-beams, eccentrics mounted on the shaft between the said frame standards and provided with depending pairs of eccentric arms or rods having a single link connected to the lower ends of each pair, link-blocks sliding in said links, a rock-shaft mounted between said standards and provided with rocker-arms, radius rods connecting said rocker-arms and valve-stems, a tumbling-shaft also provided with rocker-arms, saddles carried by the links, rods connecting said saddles with the rocker-arms of the tumbling-shaft, a lever adapted to rotate said rocker-shaft and arranged between said frame-standards, a segmental rack carried by one of said standards, and a pawl or latch carried by the lever adapted to engage with the teeth of said rack and thus regulate the cut-off valves, substantially as described.

602,795. PROCESS OF AND COMPOSITION FOR PRESERVING EGGS. FRANKLIN C. SMITH, Los Angeles, Cal. Filed Mar. 27, 1896. Serial No. 585,092. (No specimens.)

Claim.—1. The improvement in the art of preserving eggs which consists in treating the shells with gum held in solution in a suitable vehicle and mixed with gasolene, substantially as set forth.

2. The improvement in the art of preserving eggs which consists in treating the shells with gum and soap held in solution in a suitable vehicle and mixed with gasolene, substantially as set forth.



3. The improvement in the art of preserving eggs which consists in treating the shells with gum-arabic and borax soap held in solution in a suitable vehicle and mixed with gasolene, substantially as set forth.

4. The compound for preserving eggs consisting of gum-arabic dissolved in a suitable vehicle and mixed with gasolene, substantially as set forth.

5. The compound for preserving eggs which consists of gum-arabic, and soap, dissolved in a suitable vehicle and mixed with gasolene, substantially as set forth.

6. The compound for preserving eggs which consists of gum-arabic, and borax soap dissolved in a suitable vehicle and mixed with gasolene, substantially as set forth.

602,796. WAVE-MOTOR. HIRAM R. ALDEN, Portland, Oreg. Filed May 20, 1897. Serial No. 637,468. (No model.)

Claim.—1. In a wave-motor, in combination with the casing of an upright shaft supported therein, a sleeve loosely supported on said shaft, a water-wheel mounted on said sleeve, a gear fastened upon said sleeve, a train of loose gears cooperating with said fast gear and automatic clutches adapted to establish a variable connection between said water-wheel and its said shaft, so that the rotation of the shaft will be continuous and constant, whether the wheel itself be rotated to the right or the left, substantially as described.

2. In a wave-motor, in combination with the tunnel or waterway, of a gate and a hoisting device for lifting the same, and means whereby each gate will be automatically released, so as to enable it to drop by its own weight, and close the tunnels, in case of an abnormally large body of water being admitted through said tunnel, substantially as described.

3. In a wave-motor, in combination with the tunnel or waterway, of a gate and a hoisting device for lifting the same, and means whereby each gate will be automatically released, so as to enable it to drop by its own weight and close the tunnels in case of an abnormally large

body of water being admitted through said tunnel, and an escape being provided to discharge the excessive volume of water that may collect between the walls above the well-hole, substantially as described.

4. In a wave-motor, in combination with the casing, a vertical shaft supported therein and a water-wheel mounted thereon, adapted to be operated by the oscillations of a column of water, and suitable coöperative connections for said water-wheel and its shaft, of funnel-shaped sheds, 23, 24, to more effectively use the force generated by the water in its oscillations, by directing the same against the periphery of the radial blades of the water-wheel, substantially as described.

602,797. ART OF COATING FABRICS OR PERMEABLE MATERIALS WITH NITROCELLULOSE COMPOUNDS AND PRODUCT PRODUCED THEREBY. FREDERICK G. AMESBURY, London, England, assignor to the Publishing, Advertising and Trading Syndicate, Limited, same place. Filed Sept. 10, 1897. Serial No. 651,248. (No specimens.)

Claim.—1. The herein-described improvement in the art of applying surfaces of nitrocellulose compound to a flexible permeable base, which improvement consists, first, in impregnating the base with a solution of the compound sufficiently fluid to permeate it to a required depth to secure a firm hold thereon, surround the fibers and to an extent fill the interstices thereof; drying the same; superposing thereupon a solution of the compound thicker than the solution for the first coating but sufficiently fluid to be spread over the surface of the dried impregnating compound, thereby further filling the interstices of the base and partially dissolving the dried impregnating compound so as to coalesce or intimately unite therewith, whereby the coat as a whole is homogeneous and intimately united to, or anchored within, the body of the base.

2. The herein-described improvement in the art of applying surfaces of nitrocellulose compound to a flexible permeable base, which improvement consists, first, in impregnating the base with a solution of the compound sufficiently fluid to permeate it to a required depth to secure a firm hold thereon; surround the fibers and to an extent fill the interstices thereof; second, drying the impregnating compound; third, superposing upon the dried impregnating compound a coating of a solution of the compound thicker than the solution for the first coating but sufficiently fluid to be spread over the surface of the impregnating compound, thereby further filling the interstices of the base and partially dissolving the impregnating compound so as to coalesce or intimately unite therewith; fourth, drying the superposed coating; and fifth, applying one or more coatings of the such heavier solution and drying each in turn until a surface of the requisite body has been built up; whereby the coat as a whole is homogeneous and intimately united to or anchored within the body of the base.

3. The herein-described improvement in the art of applying surfaces of nitrocellulose compound to a flexible permeable base, which improvement consists, first, in impregnating the base with a solution of the compound sufficiently fluid to permeate it to a required depth to secure a firm hold thereon, surround the fibers and to an extent fill the interstices thereof; second, drying the impregnating compound; third, superposing upon the dried impregnating compound a coating or a solution of the compound thicker than the solution for the first coating but sufficiently fluid to be spread over the surface of the impregnating compound, further filling the interstices of the base and partially dissolving the impregnating compound so as to coalesce or intimately unite therewith; fourth, drying the superposed coating; and fifth, applying one or more coatings of such heavier solution and drying each in turn until a surface of the requisite body has been built up; whereby the coat as a whole is homogeneous and intimately united to or anchored within the body of the base; and then compacting the coat by heat and pressure.

4. The herein-described improvement in the art of applying surfaces of nitrocellulose compound to a flexible permeable base, which improvement consists, first, in impregnating the base with a solution of the compound sufficiently fluid to permeate it to a required depth to secure a firm hold thereon, surround the fibers and to an extent fill the interstices thereof; second, drying the impregnating compound; third, superposing upon the dried impregnating compound a coating of a solution of the compound thicker than the solution for the first coating but sufficiently fluid to be spread over the surface of the impregnating compound, further filling the interstices of the base and partially dissolving the impregnating compound so as to coalesce or intimately unite therewith; fourth, drying the superposed coating; and fifth, applying one or more coatings of such heavier solution, and drying each in turn, until a surface of the requisite body has been built up, whereby the coat as a whole is homogeneous and intimately united to or anchored within the body of the base; and then compacting the coat by heat and pressure and finally embossing it.

5. The herein-described improvement in the art of applying flexible surfaces of nitrocellulose compound to a flexible permeable base, which improvement consists in impregnating the base to the desired depth with a liquid solution of the compound; then drying the impregnating compound; then superposing thereupon one or more coatings of a heavier solution of the compound containing oil; then, upon the coating thus produced, applying one or more coatings of the compound containing less oil than is contained in the intermediate coatings, drying each in turn.

6. The herein-described process of coating a base with nitrocellulose compound, consisting in applying to the base a coating of a nitrocellulose compound containing little or no oil, and then applying thereto one or more coatings of nitrocellulose compound rich in oil, and then one or more coatings containing little or no oil, drying each coating in turn, substantially as described.

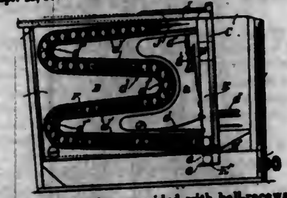
7. The herein-described improvement in the art of applying flexible surfaces of nitrocellulose compound to a flexible permeable base, which improvement consists in impregnating the base to the desired depth with a liquid solution of the compound containing little or no oil; then drying the impregnating compound; then superposing thereupon one or more coatings of a heavier solution of the compound rich in oil, drying each coat in turn; then, upon the coating thus produced, applying one or more coatings of the compound containing less oil than the immediately preceding coating; drying each coat in turn; and, finally, applying one or more finishing coatings of the compound containing materially less oil or none at all.

8. The herein-described improvement in the art of applying a surface of nitrocellulose compound to a flexible permeable base, which improvement consists in impregnating the surface of the base with a liquid solution of the compound free from pigment; then drying the impregnating coating; then superposing upon the dried impregnating coating a thin coating of a heavier solution of the compound containing coloring-matter and oil that is sufficiently fluid to intimately unite with the dried impregnating coating; then drying the superposed coating; and then successively applying coats of solution containing coloring-matter and oil, drying each in turn, until the coating has been built up to the desired thickness and color; and then superposing upon the last of said coats one or more coats of a solution of the compound free from coloring-matter, and drying the same.

9. The herein-described improvement in the art of applying a surface of nitrocellulose compound to a flexible permeable base, which improvement consists in impregnating the surface of the base with a liquid solution of the compound so as to permeate it to a required depth to secure a firm hold thereon; then drying the impregnating coating; then superposing upon the impregnating coating a thin coating of a solution of the compound containing oil and thicker than the solution for the first coating; then drying such superposed coating, and then successively applying coats of solution containing oil, drying each in turn until the coating has been built up to the desired thickness.

10. The herein-described improvement in the art of applying a surface of nitrocellulose compound to a flexible permeable base, which improvement consists in impregnating the surface of the base with a liquid solution of the compound; then drying the impregnating coating; then superposing upon the dried impregnating coating a thin coating of a heavier solution of the compound containing coloring-matter and oil; then drying such superposed coating; and then successively applying coats of solution containing coloring-matter and oil, drying each in turn, until the coating has been built up to the desired thickness and color.

11. The herein-described article of manufacture, consisting of a flexible permeable base, having a coat of nitrocellulose compound of the character described, consisting of successive intimately-united thin coatings, the first of which is of such fluidity as to impregnate the substance of the base to a required depth and secure a firm hold or anchorage to and within the substance of the base as described, and the succeeding coating or coatings of which are less fluid and are respectively coalesced with or intimately united to the preceding coating.



12. The product or article of manufacture herein described, consisting of a flexible permeable base having a coat of nitrocellulose compound of the character described, which coat has a central stratum relatively rich in oil and a stratum on either side of said central stratum deficient in oil, the outer stratum of which forms a continuous surface covering the face of the base, and the inner stratum of which is of such fluidity as to impregnate the substance of the base to the required depth so as to incase the fibers of the flexible base and anchor the coat firmly to and within the substance of the base, substantially as described.

13. The product or article of manufacture herein described, consisting of a flexible permeable base having a coat of nitrocellulose compound of the character described, which coat has a central stratum relatively rich in oil and a stratum on either side of said central stratum deficient in oil, the outer stratum of which forms a continuous surface covering the face of the base.

14. The article of manufacture herein described, consisting of a flexible permeable base having a coat of nitrocellulose compound of the character described attached thereto, which coat has an inner surface or stratum in contact with the base containing no oil, and a stratum rich in oil lying outside of said inner stratum; whereby the base is protected from the oil.

15. The herein-described article of manufacture, consisting of a flexible permeable base, having a built-up coat of nitrocellulose compound of the character described, consisting of successive intimately-united thin coatings as follows: a first coating which is of such fluidity as to impregnate the substance of the base to such a depth as to secure a firm hold or anchorage to and within the substance of the base as described, then a succeeding coat or coatings which are less fluid and are respectively coalesced with or intimately united to the preceding coating, and finally a finishing coating, oil being so used in the coatings that the resulting coat as a whole has a surface containing little or no oil and is rich in oil beneath its surface.

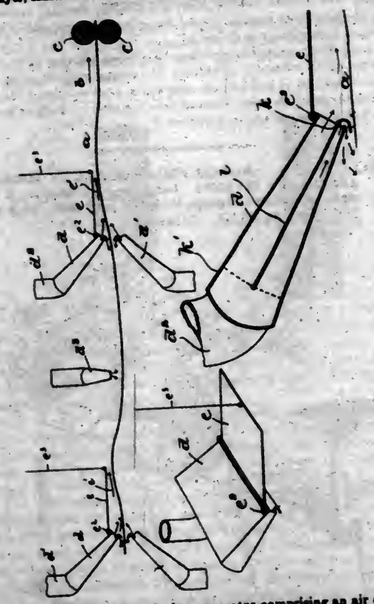
602,798. BALLOT-BOX. HENRY BRAASCH, Los Angeles, Cal. Filed Apr. 12, 1898. Serial No. 677,302. (No model.)

Claim.—1. A ballot-box provided with ball-raceways and with ball-dropping devices arranged to feed one ball at a time from the raceways, the box being adapted and arranged to tilt when the ball-dropping devices are actuated, substantially as and for the purpose set forth.

2. A ballot-box comprising a case open at the top; a frame arranged to fit loosely within such case; ball-raceways, ball-dropping devices arranged to feed one ball at a time from the raceways, and an alarm, all carried by such frame, such frame being adapted to tilt within the case when the ball-dropping devices are actuated to drop a ball, substantially as set forth.

3. A ballot-box provided with a head-receiving recess open at the top; ballot-recording devices arranged to record favorable and adverse ballots; two keys arranged within the recess and adapted to actuate the ballot-recording devices, one of such keys being arranged normally higher than the other key in order to adapt the keys for being actuated respectively by fingers of different lengths.

4. A ballot-box comprising a case open at the top; a removable frame arranged to fit within such case; ball-raceways carried by such frame and adapted to expose the balls to view when the frame is removed from the case; ball-dropping devices, one arranged to drop balls from each of said raceways; an alarm-ball; and suitable intermediate means connecting the ball-dropping devices with the alarm-ball and adapted to sound such ball when either of such ball-dropping devices is actuated.



5. In a ballot-box, the combination set forth of the case open at the top and provided in its bottom with a removable drawer; a frame arranged to fit within the case and to close the top thereof, and provided with a partition; ball-raceways, one arranged upon each side of said partition, and having their outer sides closed by a transparent cover; reciprocating slides arranged to feed balls, one at a time respectively, from the raceways; keys arranged to actuate the reciprocating slides; springs arranged to return the slides to their normal position; and a suitable alarm arranged to be sounded when either of said slides is operated.

6. A ball-ballot box comprising the combination of the case; the removable frame comprising the cover adapted to partially cover the open top of the case, a partition depending from such cover, and an end depending from such cover transverse the partition and arranged to leave a recess at one end of the case; ball-raceways carried by the frame; ball-dropping devices carried by the frame and adapted to be actuated to discharge one ball at a time from said raceways respectively; keys projecting into the recess and adapted to actuate the ball-dropping devices; and a shelf arranged below the keys, substantially as set forth.

7. In a ball-ballot box, the combination set forth of the inclined ball-raceway; the vertically-reciprocating slide arranged to close the end of the raceway and provided with the ball-pocket, the lower wall of such pocket being inclined in a direction opposite the inclination of the raceway.

8. A ball-ballot box comprising a case, and a removable frame arranged to be chambered in the case and provided with a ball-raceway and a ball-feeding device arranged to feed one ball at a time from such raceway into the case, such raceway being adapted to expose all the balls to view when the frame is removed from the case.

602,799. PAPER-DRYING APPARATUS. GEORGE J. BUSH, Ayer, Mass. Filed June 18, 1897. Serial No. 641,241. (No model.)

Claim.—1. A paper-drying apparatus comprising an air delivering nozzle, a plate or air-guide adjacent to the delivering end of said nozzle and extending from the delivering end thereof, and means for feeding a web of paper along one side of the air-guide, the said guide and web forming opposite sides of an air-passage which receives a blast of air from the nozzle, the web being floated or sustained by atmospheric pressure caused by the current of air forced through said passage.

2. A paper-drying apparatus comprising an air delivering nozzle, a plate or air-guide forming one side of an air-passage which receives a blast of air from said nozzle, means for feeding a web of paper in such relation to the nozzle and air-guide as to cause the web to form the other side of said passage, and a second nozzle arranged to deliver a blast of air against the opposite side of the web.

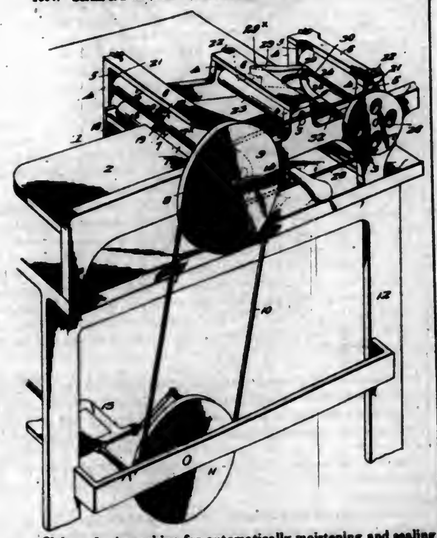
3. A paper-drying apparatus comprising web-feeding means, an air-delivering nozzle arranged to deliver a blast of air obliquely against the web in approximately the direction of movement of the latter, and means for delivering a blast of air upon the web in substantially the opposite direction or backwardly with relation to the movement of the web immediately in advance of the point of impingement of the first-mentioned blast.

4. A paper-drying apparatus comprising web-feeding means, an air-delivering nozzle arranged to deliver a blast of air obliquely against the web in the direction of movement of the latter, and a longitudinal partition within the nozzle, formed to subdivide the blast of air passing therethrough into two parts, said partition having a deflector at one end arranged to deflect one of the parts of the blast.

602,800. TREATING RATAN. MAX P. O. DICKHUTH, Harburg-on-the-Elbe, Germany, assignor to The Firm of H. C. Meyer, Jr., same place. Filed July 16, 1898. Serial No. 686,545. (No specimens.) Patented in England Apr. 2, 1895, No. 6,790; in Belgium Aug. 31, 1895, No. 117,086; in France Dec. 10, 1895, No. 249,695; in Hungary Nov. 17, 1896, No. 7,232, and in Austria Dec. 5, 1896, No. 46/4,869.

Claim.—1. The herein-described process of removing the silicious coating of ratan, which consists in subjecting the cane before splitting to the action of a weak solution of hydrofluoric acid, substantially as described.

2. The herein-described process of removing the silicious coating of ratan, which consists in subjecting the cane before splitting to the action of a weak solution of hydrofluoric acid, washing it in water,



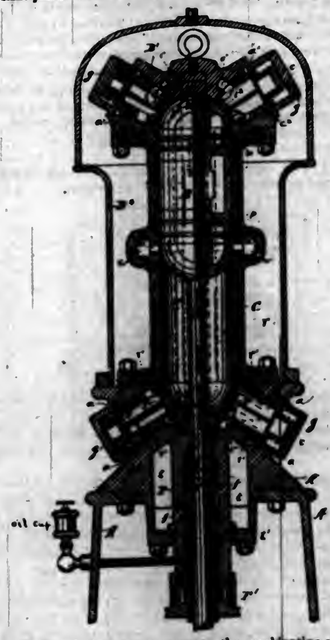
subjecting it to the action of a weak aqueous solution of an alkali, and finally washing it in water, substantially as described.

3. The herein-described process of removing the silicious coating of rattan, which consists in subjecting the cane to the action of a weak solution of hydrofluoric acid, substantially as described.

4. The herein-described process of removing the silicious coating from cane or ratan which consists in subjecting the cane successively to the actions of weakened solutions of hydrofluoric acid and of an alkali, substantially as described

5. The process of removing the silicious coating from cane or ratan which consists in subjecting the cane successively to an attenuated solution of hydrofluoric acid and a weak solution of an alkali the said chemicals being removed from the cane by washing the same in water, substantially as described.

602,801. MACHINE FOR AUTOMATICALLY MOISTENING AND SEALING ENVELOPS. JOSIAH DUPAW, Washington, D. C., assignor of one-half to Leander W. Gifford, same place. Filed May 7, 1897. Serial No. 635,546. (No model.)



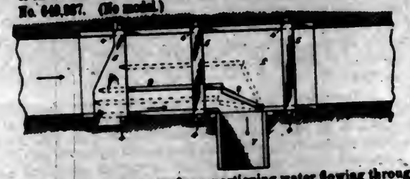
Claim.—1. A machine for automatically moistening and sealing envelops, consisting of a frame, a set of feeding-rollers, moistening devices, intermediate devices for receiving the moistened envelop and closing the flap thereof, said flap-closing devices being movable in and out to adjust them to various sizes of the envelops, and a set of rollers for receiving the envelop from the closing devices and sealing and delivering the same.

2. A machine for automatically moistening and sealing envelops, consisting of a horizontally-disposed frame, mechanism in one end of the frame for moistening and feeding the envelops in open condition, devices arranged intermediate of the frame for closing the moistened flap of the envelop, said flap-closing devices being movable in and out to adjust them to various sizes of envelops, devices in the other end of the machine for sealing and delivering the envelop, and mechanism for imparting motion to the feed-rollers, moistening devices and sealing devices.

3. A machine for automatically moistening and sealing envelops consisting of a frame having a feed table or platform, feed-rollers mounted in the frame contiguous to said platform, a moistening-roller adjacent to the feed-rollers, means for supplying moisture to said roller, intermediate devices secured to the frame for guiding the envelop and closing the moistened flap thereof, said flap-closing devices being movable in and out to adjust them to various sizes of the envelops, sealing-rollers which receive the envelop from said devices and mechanism for operating the moistening-roller, feed-rollers and sealing-rollers.

4. A machine for automatically moistening and sealing envelops, consisting of a frame having a horizontally-disposed feeding-platform, a pair of feed-rollers contiguous to said platform, a moistening-roller for moistening the flap of the envelop, said feed and moistening rollers being separated by a gap to permit the flap of the envelop to fall out of the path of the rollers, intermediate guiding and closing devices, and sealing-rollers for sealing the envelop after it leaves the guiding and closing devices, and mechanism for driving the moistening, feeding and sealing rollers.

602,802. AMMONIACAL-GAS COMPRESSOR. ARTHUR GIESLER, Dayton, Ohio, assignor to the Stilwell-Bierce & Smith-Vaile Company, same place. Filed Oct. 3, 1896. Serial No. 564,502. (No model.)

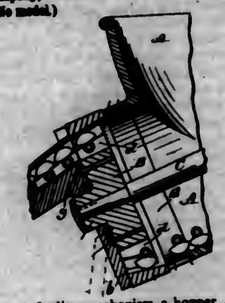


Claim.—1. In a gas-compressor, the combination of a head A', a cylinder mounted on said head, inlet and outlet valves at the upper and lower ends of said cylinder, passages *s* and *s'* in the wall of the cylinder communicating with the suction and discharge pipes through said head, and with the upper valves, and a central annular gas-chamber around the cylinder and communicating with said passages *s*, and with the cylinder through a series of ports *a* which are controlled by the piston, and through which, gas is admitted to the cylinder when the pressure behind the piston becomes less than the pressure at said ports, whereby the said piston may be maintained at a high rate of speed, substantially as described.

2. In a gas-compressor, a cylinder provided with an inlet and an outlet valve communicating with the upper end thereof, inlet and outlet passages *s* for said valves extending from the lower end of the cylinder, and a central annular gas-chamber communicating with the passages *s* and *s'*, and with the cylinder, in combination with a head upon which the cylinder is mounted, and through which, an inlet and outlet is afforded for the upper valves through the passages *s* and *s'*, and inlet and outlet valves in said head communicating with the lower end of the cylinder and having an inlet and outlet also through the head, substantially as described.

3. In a gas-compressor, the combination with a cylinder having inlet and outlet passages *s* and *s'* extending up the sides thereof, and an annular gas-chamber around the central part thereof communicating with the cylinder through a series of ports which are controlled by the piston and through which, gas is admitted to the cylinder when the pressure behind the piston becomes less than the pressure at said ports, inlet and outlet valves communicating with the upper ends of said passages *s* and *s'* and with the cylinder, and a water-jacket inclosing said cylinder and valves, of a head A' having an integral stuffing-box F, and upon which the said cylinder and water-jacket are mounted, and into which the main inlet and outlet pipes enter and communicate with the passages *s* and *s'*, inlet and outlet valves in said head communicating with the lower end of the cylinder and with the main inlet and outlet pipes, and a water-jacket in said head to cool the stuffing-box and lower valves and through which a circulation of water is maintained in water-jacket surrounding the cylinder and upper valves, substantially as described.

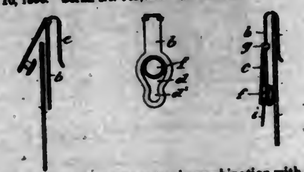
602,803. WATER-GATE. JOHN GREEN, Denver, Colo., assignor of one-half to Cesar Reuter, same place. Filed Aug. 30, 1897. Serial No. 649,967. (No model.)



Claim.—1. In apparatus for apportioning water flowing through an irrigating-canal or other waterway, the combination of a water box or flume having a distributing-passage leading from the bottom thereof, and a separator or deflector extending from the bottom to the top of the box and from a margin of said distributing-passage into the flume-channel for deflecting a predetermined proportion of the entire stream through the lateral passage, substantially as described.

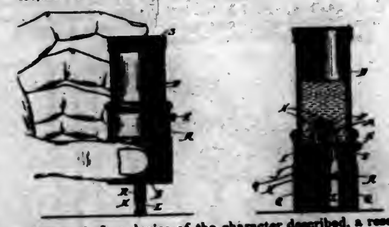
2. In apparatus for apportioning the water flowing through an irrigating-canal or other waterway, the combination of a water-box having a distributing-passage leading laterally from the bottom thereof, a lateral-swinging gate extending from the bottom to the top of the box, and from a margin of said distributing-passage into the flume channel, and means for locking the gate in a plurality of adjusted positions, substantially as described.

3. In water-distributing systems the combination of a water-box and a laterally-swinging gate composed of sections jointed together, substantially as described.



602,804. BUTTON-FEEDING MECHANISM. CHARLES H. HARDEMAN, Philadelphia, Pa., assignor to the Morley Button Sewing Machine Company, Boston, Mass. Filed Aug. 24, 1896. Serial No. 603,382. (No model.)

Claim.—1. A feeding mechanism, a hopper, a trough, and a rotating head provided with a series of notches in its outer edge to receive the shanks of the buttons, combined with a removable ring which surrounds the head, is interposed between the hopper and the trough, and is detachably connected to the hopper, substantially as and for the purposes hereinbefore set forth.

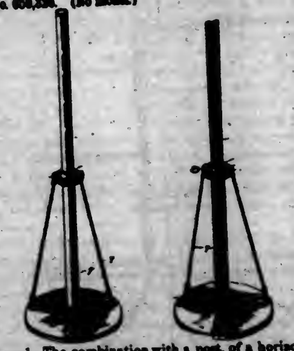


2. In a button-feeding mechanism, a button-hopper, a trough, a shaft and a button-receiving head placed upon the shaft and provided with a series of notches in its outer edge, which is beveled outwardly, combined with a surrounding ring correspondingly beveled upon its inner side, and a suitable mechanism for causing the head and the shaft to revolve, substantially as and for the purposes hereinbefore set forth.

602,805. GARMENT-SUPPORTER. WALTER B. HUMPHREY, Windsor, Conn., assignor to Ashmead G. Rodgers, same place. Filed Sept. 10, 1896. Serial No. 605,360. (No model.)

Claim.—In a garment-supporter, in combination with a body part having a keyhole-slot at the lower end, a clasp having a broadened head constructed to enter the broader part of the slot and to be held in the narrower part, integral arms on the clasp embracing the body part of the supporter, and a hook at the upper end of the supporter, the bend of the hook being of the same size as the shank of the body part of the supporter whereby the clasp is automatically swung outward is its upward sliding movement.

602,806. DEVICE FOR ATTACHING STAMPS, SEALING LETTERS, &c. WILLIAM F. JOHNSTON, Philadelphia, Pa., assignor of one-half to Roscoe Walton, same place. Filed June 5, 1897. Serial No. 639,821. (No model.)



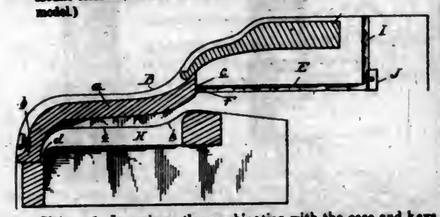
Claim.—3. In a device of the character described, a reservoir-tube having a passage-way leading therefrom, an inturned edge formed by one wall of the passage-way, a conveyer flexibly secured to the tube, a spring-plate formed with the conveyer and projecting into the passage-way, and an absorbent material secured in the conveyer, substantially as set forth.

2. In a device of the character described, a reservoir-tube, a conveyer, a spring-plate formed thereon and projecting upward through a passage leading from the reservoir, feed-strips running through the conveyer, an absorbent material confined between the strips, and means for holding the conveyer in place, substantially as described.

3. The herein-described combination of the presser-block A, a reservoir-tube fitted therein, means for forcing said tube upward, means for preventing the complete withdrawl of the tube from the block, a moistener consisting of a conveyer, a spring-plate projecting therefrom within a passage-way leading from the reservoir, feed-strips of fabric secured within the conveyer and projecting into the reservoir, an absorbent material arranged between the feed-strips, a foot formed by said strips, and a rubber tube stretched around the moistener, substantially as and for the purpose set forth.

4. In combination with a device of the character described, a moistener consisting of a conveyer, a spring-plate formed with said conveyer and projecting upward within a passage-way leading from the reservoir, an inturned edge formed by one wall of the passage-way, feed-strips running through the conveyer and projecting into the reservoir, absorbent material confined between the strips, and a rubber tube stretched around the moistener, substantially as and for the purpose set forth.

602,807. FENCE-POST. WILLIAM H. KIRBALL, Janesville, Mich., assignor of one-half to Derr Darling, same place. Filed Nov. 20, 1897. Serial No. 658,234. (No model.)

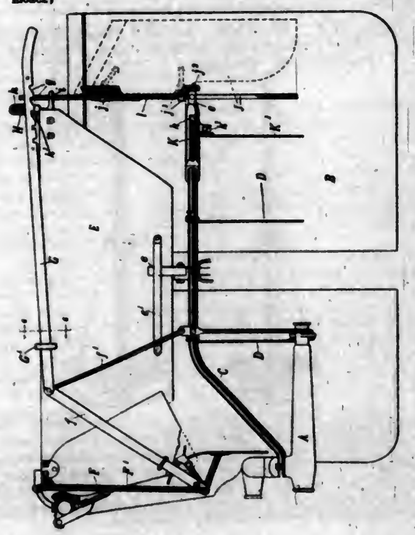


Claim.—1. The combination with a post, of a horizontal bottom plate having a socket in which is fitted the foot of the post, an upper plate fitted on said post independently of the lower plate and arranged parallel to said lower plate, and a series of stay-rods attached to the upper and lower posts, whereby the upper plate may be positioned on the post according to the ground-line and be held thereon in proper position by the stays, substantially as described.

2. The combination of a lower plate having a radially-notched socket, an upper plate also having a radially-notched aperture, an angular post fitted to said plates with its corners adapted to the notches therein, and means for holding said plates in rigid relation to said post and to each other, substantially as described.

3. The combination of a lower plate provided with a step-bearing, a post fitted to said bearing, an upper plate fitted to the post independently of the lower plate, a key fitted to the post and the upper plate to hold the latter firmly in place on the post, and stays attached to the plates, substantially as described.

602,808. FALL-BOARD FOR PIANOS. WILLIAM F. KRAGHT, Mount Clemens, Mich. Filed Apr. 21, 1897. Serial No. 633,105. (No model.)



Claim.—1. In a piano, the combination with the case and keys, of a "fall-board" to cover the keys, guides in the ends of the case, in which bearings on the rear portion of the fall-board engage, and on which it may be slid into the case, and guides for the forward portion of the board, formed and arranged to permit of the downward movement of the forward edge of the board when the latter is in its forward position and to prevent said downward movement while the cover is being slid back to keep it clear of and above the keys in such sliding motion.

2. In a piano, the combination with the case, and keys, of a cover for the keys adapted to be slid backward into the case above the keys, said cover having the downwardly-projecting portion or flanges *b*, of a guide for the rear portion of the cover, and the guides H for the front portion, having the incline *h* for the purpose described.

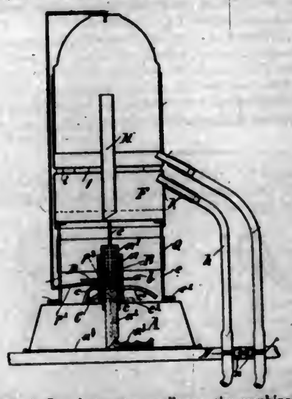
3. In a piano, the combination with the casing and keys of the end boards or arms B, having the guide-slots E and the entering-slots I, of the fall-board having the top *a* and the front flange *b*, the roller-bearing F at the rear of the fall-board engaged in the guide-slots E of the end guides H having the horizontal guide portion *c* and the rear incline portion *h* the parts being arranged as and for the purpose described.

602,809. GRAIN-ADJUSTER FOR HARVESTERS. JOHN W. PRIDMORE, Chicago, Ill. Filed Dec. 23, 1896. Serial No. 616,700. (No model.)

Claim.—1. In combination to form the controlling device of an adjuster for use on an automatic binder to forward the butts of grain, a connection extending from the adjuster to a point convenient for adjustment by the driver, this connection consisting of two parts pivoted together, a rod uniting this connection with the adjustable grain-binder and means for locking the hand end of the connection to the harvester in different positions, substantially as and for the purpose specified.

2. In combination to form the controlling device of an adjuster for use on automatic grain-binders, a connection extending from the adjuster to the driver which connection consists of two bars that are pivoted together, a rod extending from the binder to this jointed connecting-rod, a lock upon a fixed part of the harvester, with means whereby the hand connection can be placed at different positions in the lock and the adjuster be prevented from yielding against the force of the grain but permitted to yield when the adjuster is struck by the binder.

3. In combination to form the controlling device of an adjuster for the butts of grain, a broken connection extending from the adjuster to a fixed point on the harvester convenient to the driver a rod uniting this connection with the binder and means for locking the connection in varying positions, which consists of notches in the connection, a stop on the harvester with which these notches engage and a spring pressing on the connection, and the rear notches having beveled front edges, substantially as and for the purpose specified.



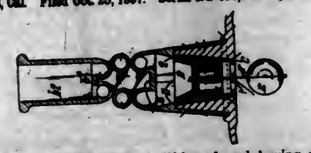
4. In combination with a grain-binder adjustable along the delivery end of the harvester, a bar connecting the binder with the harvester in a plane above that of the stream of grain, a board pivoted to this bar and means for preventing the board from swinging on its pivot, substantially as and for the purpose specified.

5. In combination with a binder adjustable along the delivery end of the elevator of a harvester, a bar connecting the binder with the harvester, one end of which slides through a fixed bearing, which bar is located in a plane practically parallel with that of the deck and above the stream of grain, a wind-board pivoted on the bar and means for locking the board in a vertical position to guide the heads of grain and to lock it in a position practically parallel with the deck, to allow long grain to freely pass beneath it.

6. In combination with a grain-binder adjustable along the delivery end of an elevator-harvester, a bar connecting the movable binder with the rear end of the upper elevator-frame, a wind-board pivoted upon this bar and extending from the head of the elevator down the deck of the binder, the delivery end of the wind-board being adjustably attached to the binder, whereby it can be positioned to and from the central line of the binder.

7. In combination with a binder adjustable along the delivery end of a harvester, a bar connecting the movable binder with the rear end of the upper elevator-frame, a wind-board pivoted on this bar, a lock to prevent the board from swinging, the lower end of the bar being connected to the binder by a sleeve, with means for adjusting the sleeve upon the binder, and a retaining-spring for the heads of the grain also attached to the adjustable sleeve, substantially as and for the purpose specified.

602,810. HOT APPLIANCE. CHARLES W. SPURR, Jr., Brooklyn, N. Y., assignor to the Hot Appliances Company, New York, N. Y. Filed Apr. 23, 1897. Serial No. 633,443. (No model.)



Claim.—1. In a hot-water appliance, the combination of an expansible water-chamber having an opening in its top, a burner beneath the same, a burner-regulator, a vertical connecting-rod having a lateral arm with a downward portion socketed in the expansion-chamber, and a lower arm engaging the burner regulator.

2. In a hot-water appliance, the combination of a burner, a flanged burner-regulator adapted to slide vertically upon the burner, a frictional contact-piece located near the burner, and a regulator-rod journaled near the burner having an arm or end portion rigid therewith to engage both the regulator-flange and the frictional contact-piece.

3. In a hot-water appliance, the combination of an expansible water-chamber, a burner beneath the same, a flanged burner-regulator adapted to slide vertically upon the burner, a vertical connecting-rod socketed in the expansion-chamber at the top, and having a yoke at the bottom which straddles the burner-regulator beneath its flange.

602,811. NON-REFILLING BOTTLE. GEORGE H. WILLIAMS, Los Angeles, Cal. Filed Oct. 25, 1897. Serial No. 656,300. (No model.)

Claim.—1. A flask having a coiled neck and having a liquor-intercepting device between the flask-body and the coil of the neck.

2. A flask having a portion of its neck composed of two tubular coils and having a liquor-intercepting device between the flask-body and the said coils.

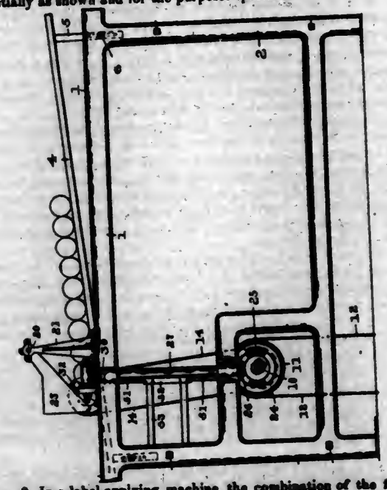
3. The bottle set forth comprising the flask provided with a tapering passage leading therefrom, the tapering hollow stopper open at the top, seated in the passage and arranged to play axially therein; and the coiled neck leading from the tapering passage.

4. The bottle set forth comprising the flask provided with the nipple having the inwardly-tapering passage; the stopper consisting of the frustum of a cone seated in the tapering passage and adapted and arranged to play axially therein; and the separate coiled neck provided with a socket fastened upon the nipple substantially as set forth.

5. The bottle set forth comprising the flask provided with a tapering passage leading therefrom; the tapering hollow stopper open at the top and seated in the passage and arranged to play axially therein; the coiled neck leading from the tapering passage; and means for preventing the stopper from falling sufficiently to close the outlet through the neck when the bottle is inverted.

6. The combination of the flask provided with a nipple having an outwardly-projecting annular shoulder; an elastic packing around the nipple between the shoulder and the body of the flask; a neck provided with a socket fitted upon the nipple and provided with the inwardly-projecting shoulder; and the brace seated in the packing between the shoulders and extending diagonally through the packing and seated against the shoulders.

7. The combination of the flask-body with tapering passage leading therefrom; a tapering stopper seated in the passage and arranged to play axially therein; the neck comprising two tubular coils leading from the tapering passage; and a weight inside the flask-body and connected with the stopper by a flexible connection.



8. The combination of the flask-body with a nipple having a tapering opening therethrough; a valve-seat to seat in the tapering opening and provided with a cylindrical passage having a flaring mouth; a tapering stopper to fit the flaring mouth and having guides within the cylindrical portion of the passage; a weight inside the flask and connected with the stopper by a flexible connection; a guide at the inner end of the valve-seat for the flexible connection; and a neck comprising two tubular coils leading from the tapering passage.

9. The neck with a stopper-seat at one end; a nipple-socket at the other end and an intermediate portion formed of two tubular coils.

10. The combination of the flask having a nipple with flaring opening therein; a valve-seat having a cylindrical passage with flaring mouth and seated in the flaring opening; a neck having a stopper-seat at one end; a nipple-socket in the other end to fit the nipple; an intermediate portion formed of two tubular coils, and within the socket, legs to fit upon the valve-seat and a space between the valve-seat and the mouths of the coils for the play of the stopper; a weight inside the flask; a flexible connection connecting the weight with the stopper; and a support for said connection and to retain the weight in the flask.

602,812. LABEL-AFFIXER. FRANK W. WOERNER, Indianapolis Ind., assignor to James A. Henderson, Danville, Va. Filed Feb. 20, 1897. Serial No. 624,267. (No model.)

Claim.—1. In a label-applying machine, the combination of the frame, the bed-plate adjustably mounted, the guide-strips on said bed-plate one of which is adjustably secured, the swinging frame mounted above said bed-plate carrying the labels and adhesive substance, a pressure-roller carried on the lower end of said frame just in front of the label-applying point, the main shaft, a reciprocating arm operated by a cam on said shaft mounted with its upper end to project through an opening in said bed-plate just behind the position of the can to which the label is being applied, the can-holding mechanism, and the mechanism for operating said swinging frame, all substantially as shown and for the purposes specified.

2. In a label-applying machine, the combination of the frame, the bed-plate, the driving-shaft, the swinging frame carrying the label-receptacle and the receptacle for the adhesive substance mounted above said bed-plate, an arm on the end of the rock-shaft to which said frame is rigidly affixed, a cam on a counter-shaft with which said arm engages, whereby said frame is operated, suitable gearing connecting said counter-shaft and said operating or driving shaft, and the can-holding mechanism, substantially as set forth.

3. In a label-applying machine, the combination of the frame, the bed-plate, the label-applying device at one end of said bed-plate, means for retaining the can in position to be labeled, the bed-plate being formed with an opening behind a can when so positioned, the main shaft beneath, a cam thereon, a reciprocating arm operated thereby and projecting through said opening, whereby the other cans on said bed-plate are held back from the one being operated upon until it has been released, substantially as set forth.

4. In a label-applying machine, the combination of the frame, the can-feeding mechanism, the label-applying mechanism, a driving-shaft, a second shaft 16, journaled at one side of the point where the can receives the label, with its end adapted to rest against one end of said can, gear connecting the same with the driving-shaft, another shaft mounted to reciprocate in a bearing on the opposite side of the machine and provided with a revoluble end which is adapted to bear against the opposite end of said can, said reciprocating shaft being connected to a pitman and crank-wheel, and intermittent gear connecting the same with the driving-shaft, whereby said reciprocating shaft is operated to clamp the cans between its revoluble end and the end of the shaft on the opposite side to hold them while the label is being applied, and rotate them, and then release them, substantially as set forth.

5. In a label-applying machine, the combination of the frame, the operating mechanism and a frame carrying the label-receptacle and adhesive-applying device mounted to swing on a rock-shaft above the bed of the machine, substantially as set forth.

6. In a label-applying machine, the combination of the frame, the can-feeding mechanism, the label-applying mechanism, the main shaft, a shaft journaled with its inner end to bear against the end of the can being labeled and geared to said main shaft, a reciprocating shaft journaled in line with said last-named shaft on the opposite side of the path of said can and adapted to bear against its other end, a crank-wheel with the outer end of said reciprocating shaft connected to its crank-pin, and intermittent gear connecting said crank-wheel with said main shaft, whereby it is operated to impinge and hold, and release said can, as required, substantially as set forth.

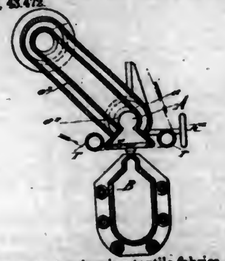
7. In a label-applying machine, the combination, of the frame,

the holding device, a swinging frame hung above the bed-plate and carrying the receptacles for the labels and adhesive substance, and a roller on its lower end which is adapted to bear against the side of the can when being labeled, and the operating mechanism, substantially as set forth.

8. In a label-applying machine, the combination of the frame, the operating mechanism, and a can-holding device consisting of a rotary shaft adapted to impinge one end of the can, and a reciprocating shaft having a separate end mounted to rotate in a socket in its end, which is adapted to impinge the opposite end of said can, substantially as set forth.

9. In a can-labeling machine, the combination of the frame, the operating mechanism, and the can-holding mechanism consisting of the rotary shaft which is adapted to impinge on one end of the can, the reciprocating shaft formed with a socket in its end, a spring in said socket, and a separate clamping end 42 mounted to rotate in said socket on said spring, said clamping end being adapted to impinge the other end of said can, substantially as set forth.

10. In a labeling-machine, the combination of the frame, the can-feeding mechanism, the driving-shaft, the receptacle carrying the labels and adhesive substance mounted on a shaft above the label-applying point, the can-revolving shaft, a cam thereon, and an arm rigidly connected to the shaft carrying said receptacle and extending down to rest upon the face of said cam, whereby upon the completion of the labeling operation the receptacle is lifted to allow the can to escape, substantially as set forth.

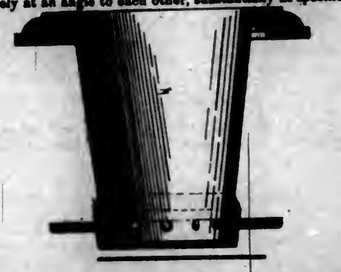


11. In a label-applying machine, the combination, of the frame, the can-feeding mechanism, the receptacle carrying the labels and adhesive substance mounted on a shaft above the label-applying point, a cam operated from the main shaft, and a connection between said cam and said receptacle, whereby it is lifted when required to release a can, substantially as set forth.

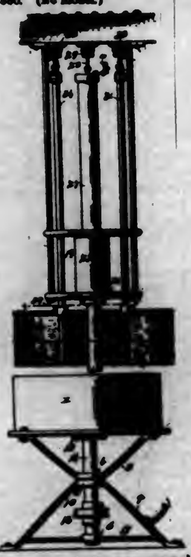
12. In a label-applying machine, the combination of the frame, the can-feeding mechanism, the frame mounted to swing and carrying a receptacle for the labels in which is mounted a spring-pressure plate to keep said labels straight and at the feeding-point, the adhesive holding and applying device, and the operating mechanism, substantially as set forth.

13. In a label-applying machine, the combination, of the frame, the can-feeding mechanism, the label-holding receptacle mounted to swing and carrying a pressure-roller on its lower end, the adhesive-applying mechanism, and the operating mechanism, substantially as set forth.

14. In a label-applying machine, the combination, of the frame, the can-feeding mechanism, the receptacle carrying the labels and adhesive substance in separate compartments, a roller for applying said adhesive, a pressure-roller also carried on said receptacle, the can holding and revolving device, gear for operating the same, and mechanism operated from the same gear for raising and lowering said receptacle, substantially as described and for the purpose specified.



602,813. APPARATUS FOR SINGEING WOVEN FABRICS. FELIX BINDER, Moscow, Russia, assignor to the Société de la Manufacture d'Indiennes Emile Zundel, same place. Filed Nov. 6, 1897. Serial No. 657,673. (No model.) Patented in France Dec. 24, 1896, No. 262,542; in Belgium Dec. 24, 1896, No. 125,365, and in Italy Dec. 26, 1896, XXXII, 43,472.



Claim.—An apparatus for singeing textile fabrics, consisting of a suction-tube provided with a flaring portion having a longitudinal aperture, a cooling-jacket extending around its upper part, a burner-tube below said aperture, and means for aspirating the flame through the textile fabric passing across the aperture of the suction-tube, substantially as set forth.

602,814. HOT-AIR ATTACHMENT FOR HEATING-STOVES. JOHN H. J. CLARE, Hammond, Ind., assignor to Louis H. Clare, same place. Filed Feb. 20, 1897. Serial No. 624,486. (No model.)

Claim.—The combination with a heating stove or furnace, of an attachment comprising a ring removably fitted to the upper end of the stove, a conico-cylindrical body of sheet metal having an outer flange at its upper end by means of which it is removably suspended from the said ring, a shallow cast-metal pan having its rim portion flaring and embracing the lower smaller end portion of the sheet-metal body and firmly attached thereto, and pipes having their outer ends extending through the sides of the stove-body and their inner ends passing through the rim of the pan and the lower portion of the body and projecting a short distance into the said body, and arranged relatively at an angle to each other, substantially as specified.

602,815. ELECTRIC FURNACE. GEORGE S. CLARK, Galveston, Tex., assignor to Sylvain Blum, Hillary Eldridge, and Daniel Johnson Clark, same place, and Sam Lazarus, Sherman, Tex. Filed Feb. 3, 1897. Serial No. 621,980. (No model.)

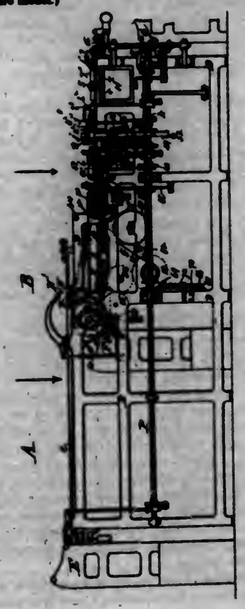
Claim.—1. In an electric furnace, a revoluble fusing-pot having an electrical connection therewith, a carbon electrode supported above the pot, and means for automatically drawing or feeding the material inward toward the carbon electrode as the fusing-pot revolves, substantially as set forth.

2. In an electric furnace, a horizontally-arranged revoluble fusing-pot having a flat bottom and an electrical connection therewith, a non-rotatable carbon electrode supported for vertical adjustment within the pot, and a stationary feeder for supplying material to the electric arc, said feeder having a support entirely independent of the non-rotatable carbon and being arranged in such position relatively to the latter, whereby the pot during its rotation will carry the material bodily or in bulk from a zone without the arc directly within the influence of the latter, substantially as described.

3. In an electric furnace, a revoluble fusing-pot having an electrical connection therewith, an electrode supported centrally above the pot, and a feeding device supported in a stationary position within the pot and constructed and arranged to draw the material inward toward the electrode as the pot revolves, substantially as set forth.

4. In an electric furnace, a fusing-pot having an electrical connection therewith, a carbon electrode supported centrally above the pot, a feeding device supported within the pot, and means for maintaining a relative movement between the pot and the feeding device whereby the latter will automatically draw the material in an inward direction toward the electrode, substantially as set forth.

5. In an electric furnace, a fusing-pot having an electrical connection therewith, a carbon electrode supported centrally above the pot, a spirally-curved plow plate encircling the carbon electrode, and means for maintaining a relative circular movement between the pot and the plow-plate, whereby the latter will serve to draw the material inward toward the electrode, substantially as set forth.



6. In an electric furnace, a stationary supporting-stand, a revoluble circular fusing-pot having a pendent bearing-bracket having a ball-bearing support on said stand, said pot also having an electrical connection therewith, a vertical drive-shaft journaled within the stationary supporting-stand and rigidly fastened at its upper end to the fusing-pot, a carbon electrode supported above the pot, and a stationary feeding device surrounding the electrode within the pot, substantially as set forth.

7. In an electric furnace, a horizontal revoluble fusing-pot having an electrical connection therewith, a stationary guide-frame supported in a plane above the fusing-pot, a vertically-movable carbon-holder slidably mounted in said guide-frame and carrying a carbon electrode, and a vertically-movable support carrying at its lower end a spirally-curved plow plate adapted to encircle the carbon electrode when adjusted within the pot, substantially as set forth.

8. In an electric furnace, a horizontal revoluble fusing-pot having an electrical connection therewith, a stationary guide-frame supported above the pot and having upper and lower guide-plates and a central vertical insulated guide-tube, a vertically-movable carbon-holder slidably working in said guide-tube and carrying a carbon electrode, a pair of supporting-rods slidably mounted in the guide-plates of the guide-frame, and a plow-plate secured to and between the lower ends of said supporting-rods and having a main circular portion and a tangential extension at one terminal, the main circular portion of the plate being concentric with the carbon electrode, and flexible adjusting connections with the upper ends of the carbon-holder and said supporting-rods, substantially as set forth.

9. In an electric furnace, a horizontal revoluble fusing-pot having an electrical connection therewith, a carbon electrode supported above the pot, a vertically-movable support carrying at its lower end a plow-plate adapted to encircle the carbon electrode when adjusted within the pot, a plurality of horizontal supporting-arms extended radially from said vertically-movable support above the plane of the plow-plate, and a protective hood arranged on said supporting-arms and having a pendent circular curtain portion, substantially as set forth.

602,816. PAPER ASSEMBLING AND STAPLING MACHINE. TALBOT C. DUTTON, Pearl River, N. Y. Filed Feb. 20, 1897. Serial No. 624,485. (No model.)

Claim.—1. The combination with a wire-stitching machine and a plurality of sets of traveling tapes conveying a plurality of sheets of paper simultaneously to said machine, of mechanism transmitting motion to the stitching-machine and controlled in its action automatically by the sheet in transit in either plane independently of the sheet or sheets carried in the other plane or planes.

2. The combination with a wire-stitching machine, conveyors carrying the paper to said machine and mechanism actuating the stitching-machine, stop mechanism controlling said actuating mechanism, means for controlling the stop mechanism by the paper in transit through the stitching-machine, and means for timing the action of the stop mechanism, as set forth.

3. The combination with a wire-stitching machine and a plurality of sets of traveling tapes conveying to said machine the component sheets of a pamphlet or book to be stitched, of an electric circuit, electromagnetically-controlled mechanism transmitting motion to said stitching-machine and in electric connection with said circuit, and a plurality of circuit-makers and breakers actuated respectively by the sheets in transit on the aforesaid different sets of tapes as set forth.

4. The combination with a wire-stitching machine and a plurality of sets of paper-conveying tapes leading to said machine to supply thereto a plurality of sheets simultaneously, bars disposed above and beneath each of said sets of tapes, an electric circuit, circuit making and breaking fingers supported on said bars and arranged in sets, each of which is normally in circuit-closing position and has the plane of one of the sets of tapes passing between the terminals to cause the passing paper to break the circuit, and an electromagnetically-controlled mechanism transmitting motion to the stitching-machine in electric connection with the aforesaid circuit as set forth.

5. The combination with the wire-stitching machine and a plurality of sets of paper-conveying tapes leading to said machine to supply thereto a plurality of sheets simultaneously, of an electric circuit, an electromagnetically-controlled mechanism transmitting motion to said stitching-machine, an automatically-operated circuit-closer timed to cause the motion of the stitching-machine to be arrested during the period in which said machine is out of stitching position as set forth.

6. In combination with the wire-stitching machine and a plurality of sets of paper-conveying tapes leading to said machine, an electric circuit, an electromagnetically-controlled mechanism transmitting motion to said stitching-machine, circuit makers and breakers actuated by the sheets in transit on the aforesaid tapes, a rotary cam, a pitman actuated by said cam, and a circuit maker and breaker actuated by said pitman, said cam timing the motion of the pitman to close the circuit during the period in which the stitching-machine is out of contact with the paper as set forth.

7. The combination with a wire-stitching machine and a plurality of sets of traveling tapes conveying a corresponding plurality of sheets simultaneously to said machine, of an electric circuit, electromagnetically-controlled mechanism transmitting motion to said stitching-machine and in electric connection with said circuit, and circuit makers and breakers actuated by the sheets in transit on the aforesaid conveyers.

8. In combination with a wire-stitching machine, a plurality of automatic paper-feeding machines, separate sets of conveyers carrying the sheets of paper from the respective feeding-machines to the stitching-machine, an intermittently-operating gage assembling the sheets in front of the stitching-machine, gages intermittently arresting the movement of the assembled sheets through the stitching-machine to receive the staples or stitches therefrom, an electric circuit, an electromagnetically-controlled mechanism transmitting motion to the stitching-machine, and a plurality of sets of circuit makers and breakers in the respective paths of the sheets to the assembling-gage as and for the purpose set forth.

9. In combination with a wire-stitching machine and a plurality of sets of sheet-conveyers carrying a plurality sheets simultaneously to said machine, an electric circuit, electromagnetically-controlled mechanism transmitting motion to the stitching-machine, a plurality of sets of circuit makers and breakers actuated respectively by the sheets in transit to the stitching-machine, and switches connected respectively with the sets of circuit makers and breakers to cut one or more of said sets out of the circuit as set forth.

10. In combination with a wire-stitching machine, a set of main-sheet conveyers, a set of insert-sheet conveyers and a set of cover-conveyers, all leading toward the stitching-machine, a gage assembling said sheets and cover in front of said machine, and automatic paper-folders folding respectively the main sheet and the insert sheet in their passage to the assembling-gage as set forth.

11. The combination with a wire-stitching machine and tapes conveying the paper to said machine, of a gage temporarily arresting said movement of the paper, a paper-registering device shifting the arrested paper into alinement with the stitching-machine, and inter-

mittently-operating drop-rollers imparting intermittent impulses to the travel of the registered paper to the stitching-machine as set forth.

12. The combination with a plurality of sets of sheet-conveyers disposed one over the other and leading in the same direction, a gage assembling the sheets delivered by said conveyers, and paper-registering devices over the respective sets of conveyers to aline the sheets on said conveyers as set forth.

13. In combination with a wire-stitching machine, a plurality of automatic paper-feeding machines, tapes conveying the sheets from said feeding-machines toward the stitching-machine, a gage assembling the sheets in front of the stitching-machine, and a plurality of paper-registering devices alining the assembled sheets in relation to each other.

14. In combination with a wire-stitching machine, a plurality of automatic paper-feeding machines, a corresponding plurality of sets of tapes conveying the sheets toward the stitching-machine, a gage assembling said sheets in front of the stitching-machine, paper-registering devices alining the assembled sheets in relation to each other, an electric circuit, electromagnetically-controlled mechanism transmitting motion to the stitching-machine, and circuit makers and breakers in the path of the sheets to the assembling-gage and actuated by the sheets in transit.

15. In a paper assembling and binding machine the combination with the stitching or stapling machine and a plurality of sets of tapes conveying sheets of paper simultaneously to said stitching or stapling machine, of a head at the side of the main frame and moving laterally to and from the same, and paper-registering devices over the respective sets of tapes and connected to the aforesaid head to partake motion therefrom as set forth.

16. In a paper assembling and binding machine the combination with the stitching or stapling machine and a plurality of sets of tapes conveying sheets of paper simultaneously to said stitching or stapling machine, of a head sustained at the side of the main frame and movable laterally to and from the same, mechanism imparting said motion to the head, bars mounted on the main frame and extending transversely over the respective sets of tapes and paper-registering devices carried on said bars and connected to the aforesaid head to partake motion therefrom as set forth.

17. In a paper assembling and binding machine the combination with the stitching or stapling machine and a plurality of sets of tapes conveying sheets of paper simultaneously to said stitching or stapling machine, of a reciprocating bar disposed at right angles to the line of travel of the paper, a head fastened to the end of said bar, bars mounted on the main frame and extending transversely over the respective sets of tapes and paper-shifting grippers sliding on said bars lengthwise thereof and connected to the aforesaid head to partake motion therefrom as set forth.

18. In a paper assembling and binding machine the combination with the stitching or stapling machine, a plurality of sets of tapes conveying sheets simultaneously to said stitching or stapling machine and a gage assembling the sheets preparatory to being stitched or stapled, guides mounted on the sides of the main frame, a bar extending across the main frame and sliding in the aforesaid guides, mechanism imparting intermittent reciprocating motion to said bar, a head attached to the end of said bar, guide-bars fixed to the main frame and extending transversely over the respective sets of tapes, paper-shifting grippers sliding on the latter bars, and rods connected to said head longitudinally adjustable and coupled to the grippers to transmit motion from the head to the grippers as set forth.

19. In combination with a plurality of sets of paper-conveying tapes disposed in planes successively one over the other, and a gage assembling the sheets of paper, a head movable laterally toward and from said sets of tapes, mechanism imparting said motion to the head, stationary bars disposed transversely over the respective sets of tapes, paper-shifting grippers sliding longitudinally on said bars and connected to the aforesaid head to partake motion therefrom, rock-shafts opening and closing the respective grippers, levers attached to said rock-shafts, rods coupling said levers together to impart synchronous motion to the rock-shafts, and mechanism imparting motion to said levers as set forth.

20. In combination with the stitching-machine, a plurality of paper-feeding machines, a corresponding number of sets of tapes conveying the sheets of paper from the respective feeding-machines toward the stitching-machine, automatic paper-folders folding the main sheet and insert sheet in their aforesaid travel, a gage assembling the sheets in front of the stitching-machine, paper-registering devices in the paths of the respective sheets to the assembling-gage, and tapes conveying the assembled sheets to the stitching-machine as set forth.

21. In combination with the stitching-machine a plurality of paper-feeding machines, a corresponding number of sets of tapes conveying the sheets from the respective feeding-machines toward the stitching-machine, automatic paper-folders folding the main sheet and insert sheet in their said travel, a gage assembling the sheets delivered thereto by the aforesaid tapes, paper-conveying tapes leading from the assembling-gage to the stitching-machine and intermittently-operating drop-rollers imparting impulses to the travel of the assembled sheets to the stitching-machine as set forth.

22. The combination with the wire-stitching machine a plurality of paper-feeding machines, a corresponding number of sets of tapes conveying the paper toward said stitching-machine and a gage assembling the sheets in their said travel, of paper registering devices each alining one of the assembled sheets, tapes conveying said sheets from the assembling-gage to the stitching-machine, and intermittently-operating drop-rollers imparting impulses to the sheets during the latter travel as set forth.

23. The combination with the wire-stitching machine, a plurality of paper-feeding machines, a corresponding number of sets of tapes conveying the paper toward the stitching-machine and a gage assembling the sheets in said travel, of paper-registering devices alining the assembled sheets, tapes conveying the alined sheets to the stitching-machine, intermittently-operating gages temporarily arresting said movement of the sheets to allow said sheets to be stitched or stapled, and drop-rollers imparting impulses to the sheets between their stoppages by the gages as set forth.

24. The combination with a wire-stitching machine, a plurality of paper-feeding machines, a corresponding number of sets of tapes conveying the paper toward the stitching-machine and a gage assembling the sheets in said travel, an electric circuit, electromagnetically-controlled mechanisms imparting motion to the stitching-machine, circuit makers and breakers in the respective lines of travel of the sheets to the assembling-gage and actuated by the sheets in transit, tapes conveying the assembled sheets to the stitching-machine, gages intermittently arresting said travel of the sheets, and drop-rollers imparting impulses to the sheets between their stoppages by the gages as set forth.

25. The combination with the stitching-machine, of three paper-feeding machines respectively for the main sheet, insert sheet and cover, separate sets of tapes conveying said sheets and cover toward the stitching-machine, the insert-sheet-conveying tapes being in a plane between those of the others of said conveying-tapes, a downward paper-folder over the path of the main-sheet-conveying tapes, an upward paper-folder under the path of the insert-sheet-conveying tapes, a gage assembling all of said sheets in front of the stitching-machine, tapes conveying the assembled sheets to the stitching-machine, gages intermittently arresting this latter movement of the sheets, and drop-rollers imparting impulses to the sheets between the stoppages by the gages as set forth.

26. In combination with the stitching-machine and tapes conveying the paper to said machine, a shaft actuating the stitching or stapling mechanism, a gear-wheel attached to said shaft, a counter-shaft, a positively-driven gear mounted loosely on said counter-shaft, a gear fixed to said shaft and transmitting motion to the gear of the stitching-machine shaft, a clutch for intermittently fastening the loosely-mounted gear to the counter-shaft, an electric circuit, electromagnetically-controlled mechanisms operating said clutch, and circuit makers and breakers actuated by the paper in transit to the stitching-machine and thereby controlling the action of the aforesaid clutch.

27. In combination with the stitching-machine and tapes conveying the paper to said machine, a shaft actuating the stitching or stapling mechanism, a gear-wheel attached to said shaft, a counter-shaft, a positively-driven gear mounted loosely on said counter-shaft, a gear fixed to the counter-shaft and transmitting motion to the stitching-machine shaft, a clutch for intermittently fastening the loosely-mounted gear to the counter-shaft, mechanism actuating said clutch, an electric circuit, a constantly-moving pitman, an electromagnet attached to said pitman, a catch connected to the pitman movably to engage and release the clutch-actuating mechanism and actuated by the armature of the aforesaid magnet, and circuit makers and breakers actuated by the paper in transit to the stitching-machine as set forth.

28. In combination with the stitching-machine, a plurality of paper-feeding machines, a corresponding plurality of sets of tapes conveying the sheets from said feeding-machines toward the stitching-machine, a gage assembling said sheets in front of the stitching-machine, tapes carrying the sheets from the assembling-gage to the stitching-machine, gages intermittently arresting the sheets in said latter movement, a gear-wheel attached to the stitching-machine shaft, a counter-shaft, a positively-driven gear mounted loosely on said counter-shaft, a gear fixed to said shaft and transmitting motion to the gear of the stitching-machine shaft, a clutch for intermittently fastening the loosely-mounted gear to the counter-shaft, an electric circuit, electromagnetically-controlled mechanisms operating said clutch, and circuit makers and breakers actuated by the sheets in transit to the stitching-machine and thereby controlling the action of the clutch as set forth.

29. In combination with the stitching-machine, a plurality of paper-feeding machines, a corresponding plurality of sets of tapes conveying the sheets toward the stitching-machine, automatic paper-folders folding the main sheet and inserting sheets in said transit, a gage assembling the sheets in front of the stitching-machine, tapes conveying the assembled sheets to the stitching-machine, gages intermittently arresting the movement of the sheets in said transit, drop-rollers impelling the sheets during their releases from the aforesaid gages, a gear-wheel on the stitching-machine shaft, a counter-shaft, a positively-driven gear mounted loosely on said counter-shaft, a gear fixed to said shaft transmitting motion to the gear of the stitching-machine shaft, a clutch for intermittently fastening the loosely-mounted gear to the counter-shaft, an electric circuit, electromagnetically-controlled mechanisms operating said clutch, and circuit makers and breakers actuated by the sheets in transit to the stitching-machine.

30. In combination with the stitching-machine provided with a driving-gear on its shaft and tapes conveying to said machine the paper to be stitched or stapled, a counter-shaft having affixed to it a gear for transmitting motion to the gear of the stitching-machine shaft, a positively-driven gear mounted loosely on said counter-shaft and having affixed to it a collar provided with a notch in its periphery, a collar fastened to the counter-shaft and provided with a corresponding notch, a dog pivoted to said fixed collar and provided at one end with a tooth for engaging both of said notches simultaneously, and formed with a heel extending beyond the pivot of the dog, a spring forcing said dog toward its engagement with the aforesaid notches, a rock-shaft, an arm on said shaft traversed by the dog during the rotation of the notched collars, an arm fixed to said shaft for actuating the same, a pivoted cam actuating the latter arm, an electric circuit, electromagnetically-controlled mechanism actuating said cam, and circuit makers and breakers actuated by the sheets in transit to the stitching-machine.

31. The combination with a machine provided with an actuating-gear, and conveyers supplying to said machine the material to be operated on, of a clutch for throwing said machine in and out of gear, a rock-arm actuating the clutch in one direction, a second rock-arm actuating the first rock-arm, a pivoted cam actuating the second rock-arm, a pinion attached to said cam, a reciprocating pitman, a rack carried on said pitman and movable longitudinally thereon and meshing with the aforesaid pinion, an electric circuit, an electromagnet carried on the pitman, the armature pivoted to the pitman and provided with a dog for engaging and releasing the rack, and circuit makers and breakers actuated by the material in transit to the aforesaid machine as set forth.

32. In combination with the stitching-machine provided with an actuating-gear on its shaft, a plurality of paper-feeding machines and a corresponding plurality of sets of tapes conveying the paper to said machine, gages intermittently arresting the movement of the paper to permit the stitching of the same, a counter-shaft having affixed to it a gear for transmitting motion to the gear of the stitching-machine, a positively-driven gear mounted loosely on said counter-shaft and having affixed to it a collar provided with a notch in its periphery, a collar fastened to the counter-shaft and provided with a corresponding notch, a dog pivoted to said fixed collar and provided at one end with a tooth for engaging both of said notches simultaneously and formed at the opposite end with a heel extending beyond the pivot of the dog, a spring forcing said dog toward engagement with the notches, a rock-shaft, an arm on said shaft traversed by the said dog, to actuate the same in opposition to its spring, an arm fixed to said shaft for actuating the same, a pivoted cam actuating the latter arm, a pinion attached to said cam, a reciprocating pitman, a rack carried on said pitman movable longitudinally thereon and meshing with said pinion, an electric circuit, an electromagnet attached to the pitman, the armature pivoted to the pitman and provided with a dog for engaging and releasing the rack-bar, and circuit makers and breakers in the paths of the sheets to the stitching-machine and actuated by the sheets in transit as set forth.

33. In combination with the stitching-machine, paper-feeding machines and tapes conveying the paper to said stitching-machine, gages intermittently arresting the movement of the paper to prevent the stitching of the same, a clutch for throwing the said stitching-machine in and out of gear, a spring forcing the clutch into gear, a rock-shaft having affixed to it an arm for forcing the clutch out of gear, an arm on said rock shaft for operating it, a pivoted cam actuating said arm, a pinion attached to said cam, a positively-actuated pitman, a rack carried on said pitman and movable longitudinally thereon and engaging the aforesaid pinion, an electric circuit, an electromagnet attached to the pitman, the armature pivoted to the pitman and formed with a dog engaging and releasing the rock-bar, circuit makers and breakers actuated by the paper in transit to the stitching-machine, and an automatically-operated circuit-closer timed to close the circuit during the period in which the stitching-machine is out of stitching position as set forth.

34. In combination with two stitching-machines disposed at opposite sides of and on a line at right angles to the central line of the travel of the paper-conveying tapes, a plurality of paper-feeding machines, tapes conveying the paper toward the stitching-machines and gages intermittently arresting the movement of the paper to permit the stitching thereof, gears on the shafts of the stitching-machines, a counter-shaft extending across the entire machine, gears fastened to the two end portions of the counter-shaft and transmitting motion to the gears of the stitching-machine shafts, a positively-driven gear mounted loosely on said counter-shaft and having affixed to it a clutch-collar, a corresponding clutch-collar fastened to the counter-shaft, a dog normally locking the clutch-collars to each other, an electric circuit, electromagnetically-controlled mechanism throwing the dog out of engagement, circuit makers and breakers actuated by the sheets in transit to the stitching-machines, and an intermediate circuit maker and breaker actuated by mechanism timed to close the circuit when the stitching-machines are out of stitching positions as set forth.

35. The combination with a stitching or stapling machine and conveyers carrying the paper to said machine, of a switch disposed to throw misfed sheets from said conveyers and prevent their passage through said machine, and means actuated by the paper in transit on said conveyers and controlling the action of the switch, as set forth.

36. In combination with the set of main tapes, a paper-cutter in the central line of travel of said tapes and two sets of paper-folders disposed to receive the severed sheets, a plurality of paper-feeding machines, a corresponding plurality of sets of tapes leading from said feeding-machines to the main tapes, a gage assembling the sheets at their delivery to the main tapes, and two stitching-machines between the assembling-gage and paper-cutter and adjustable laterally at opposite sides of the central line of travel of the main tapes as set forth.

37. The combination with a stitching or stapling machine, conveyers carrying the paper to said machine and a packing-box receiving the stitched or stapled papers, of a switch disposed to throw misfed sheets from said conveyers and exclude them from the said machine and from the packing-box, an electric circuit, electromagnetically-controlled mechanism actuating said switch, and circuit makers and breakers actuated by the paper in transit to the stitching or stapling machine.

38. The combination with the stitching or stapling machine a packing-box receiving the stitched or stapled papers and a set of main tapes conveying the sheets to said machine, tributary tapes delivering the sheets to said main tapes, a switch located between the main tapes and tributary tapes to divert misfed sheets from the stitching or stapling machine and from the packing-box, and drop-rollers over the delivery of the tributary tapes to facilitate the diversion of the misfed sheets from the main tapes.

39. The combination with the stitching-machine a packing-box receiving the stitched paper and a set of main tapes conveying the paper to said machine, tributary tapes carrying the paper toward the main tapes, a rock-shaft extending across the receiving ends of the main tapes and paper-guides on said rock-shaft to divert misfed sheets from the stitching-machine and exclude said sheets from the packing-box.

40. The combination with the stitching-machine and a set of main tapes conveying the paper to said machine, tributary tapes carrying the paper toward said main tapes, a rock-shaft extending across the receiving ends of the main tapes, paper-guides attached to said rock-shaft, an electric circuit, electromagnetically-controlled mechanism actuating said rock-shaft, and circuit makers and breakers in the places of the tributary tapes to be actuated by the paper in transit.

41. The combination with the stitching-machine and a set of main tapes conveying the paper to said machine, tributary tapes carrying the paper toward the main tapes, drop-rollers over the delivery ends of said tributary tapes, a rock-shaft extending across the receiving ends of the main tapes, paper-guides attached to said rock-shaft, an electric circuit, electromagnetically-controlled mechanism operating the rock-shaft, and circuit makers and breakers actuated by the paper in transit to the main tapes as set forth.

42. The combination with a machine designed to stitch or otherwise operate on paper a packing-box disposed to receive the paper from said machine and conveyers carrying the paper to said machine, of a switch in the path of the paper to said machine to divert misfed sheets from the same, and gripping devices drawing the switched paper from the aforesaid path and excluding said paper from the packing-box.

43. The combination with the stitching-machine, a packing-box disposed to receive the stitched paper and conveyers carrying the paper to said machine, of a switch in the path of the paper to divert misfed sheets from the stitching-machine, contiguously-disposed parallel rollers receiving the switched paper between them and geared to rotate and draw said paper from the aforesaid path and exclude it from the packing-box.

44. The combination with the stitching-machine and conveyers carrying the paper to said machine, of a rock-shaft extending across the receiving end of said conveyers, paper-guides attached to said

rock-shaft and moved thereby to and upwardly from the path of the paper and guides extending downward from said rock-shaft, and gripping devices receiving the downwardly-deflected paper and drawing the same from the aforesaid path.

45. The combination with the stitching-machine, main tapes carrying the paper to said machine, and tributary tapes delivering the paper to said main tapes, of drop-rollers over the delivery ends of the tributary tapes, a switch interposed between the tributary tapes and main tapes to divert misfed sheets from the stitching-machine, and gripping devices drawing the switched paper from the tributary tapes as set forth.

46. The combination with the stitching-machine, main tapes carrying the paper to said machine and tributary tapes delivering the paper to the main tapes, of a switch interposed between the tributary tapes and main tapes to divert misfed sheets from the stitching-machine and controlled by the paper in transit on the tributary tapes, and gripping devices withdrawing the switched paper from the tributary tapes.

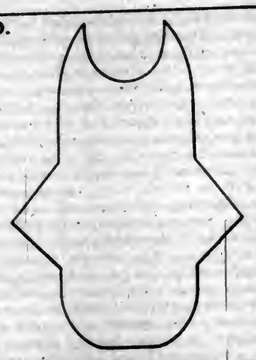
47. The combination with the stitching-machine and main tapes carrying the paper to said machines, a plurality of paper-feeding machines, a corresponding plurality of sets of tapes carrying the paper from said feeding-machines to the main tapes, drop-rollers over the delivery ends of the tributary tapes, a sheet-assembling gage over the main tapes, a rock-shaft extending across the receiving ends of the tributary tapes and normally bridging the space between said tapes and main tapes and switching upward from its normal position, an electric circuit, electromagnetically-controlled mechanism actuating said rock-shaft, and circuit makers and breakers in the planes of the tributary tapes to be actuated by the paper in transit as set forth.

48. The combination with the stitching-machine and conveyers carrying the paper to said machine, of a switch disposed in the path of said paper to throw misfed sheets from the conveyers and prevent their passage to the stitching-machine, an electric circuit, electromagnetically-controlled mechanisms operating said stitching-machine and switch to arrest the action of the stitching-machine during the switching of the paper, and circuit makers and breakers actuated by the paper in transit to the switch.

49. The combination with the stitching-machine, main tapes carrying the paper to said machine, a plurality of paper-feeding machines, tributary tapes conveying the paper from said feeding-machines to the main tapes, drop-rollers over the delivery ends of the tributary tapes, a rock shaft extending across the receiving ends of the main tapes, paper-guides extending from said rock-shaft toward the tributary tapes and normally spanning the space between said tapes and main tapes and moving upward from said normal position, an electric circuit, electromagnetically-controlled mechanisms actuating simultaneously the stitching-machine and rock-shaft to arrest the action of the stitching-machine during the switching of the misfed sheets, and circuit makers and breakers in the places of the tributary tapes to be actuated by the sheets in transit as set forth.

REISSUES.

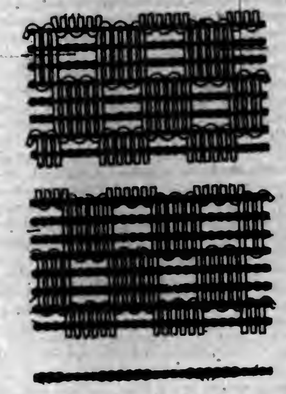
11,660. ALLOY. FRANCIS A. COTELLE, Ivry-Port, France. Filed Jan. 11, 1898. Serial No. 666,375. Original No. 564,094, dated July 13, 1897. Patented in France June 2, 1896, No. 256,852; in Belgium June 30, 1896, No. 122,223; in England June 30, 1896, No. 14,479; in Austria July 31, 1896, No. 46/3,443; in Italy July 31, 1896, No. 43,231; in Luxemburg July 31, 1896, No. 2,582, and in Spain July 31, 1896, No. 19,417.



Claim.—1. The alloy described consisting of copper, eighty parts, tin one hundred and ninety parts, zinc five hundred parts and aluminium two hundred and thirty parts.

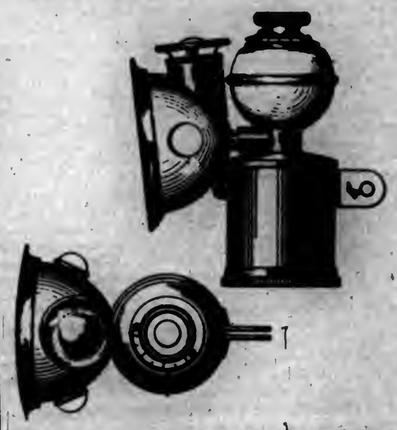
2. The process described, consisting in melting together copper and tin and cooling, adding thereto zinc and then remelting, allowing the mass to cool to a pasty composition, then adding aluminium and finally heating the mass to a high temperature, substantially as described.

DESIGNS.



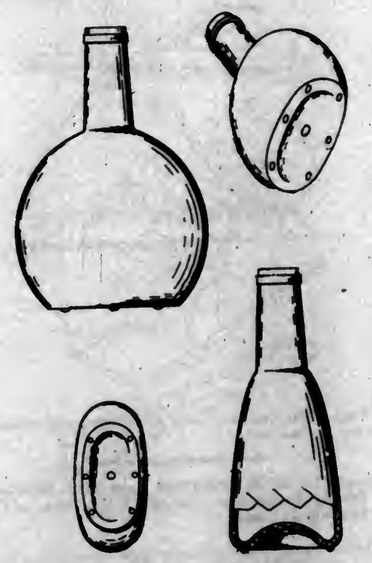
28,480. SHIRT-BOSOM. WILLIAM MUIR ANDREWS, Glasgow, Scotland. Filed Dec. 31, 1897. Serial No. 666,345. Term of patent 7 years.

28,480.



Claim.—The design for a shirt-bosom, substantially as shown and described.

28,481. FABRIC FOR HANGINGS. JOSEPH KOSS, Philadelphia, Pa. Filed Jan. 14, 1898. Serial No. 666,703. Term of patent 3½ years.

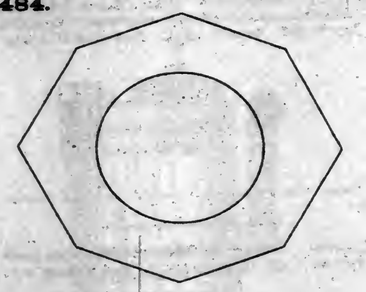


Claim.—The design for a fabric for hangings, as herein described and illustrated.

28,482. LAMP-BODY. FRED K. PHILLIPS, New York, N. Y., assignor to Felix Jollenik, trustee, same place. Filed Feb. 21, 1898. Serial No. 671,203. Term of patent 14 years.

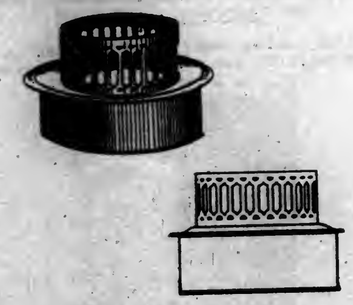
Claim.—The design for a lamp-body as herein shown and described.

28,488. BOTTLE. EDWARD C. MOORE, Closes, Ind., assignor to the Hobbs Glass Company, same place. Filed Feb. 5, 1898. Serial No. 669,897. Term of patent 14 years.

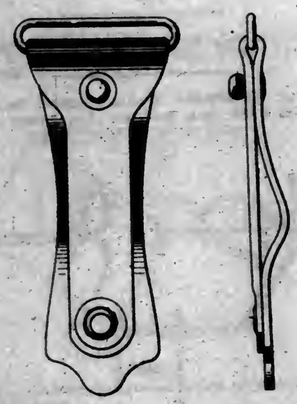


Claim.—The design for a bottle, substantially as herein shown and described.

28,484. TEAPOT OR LIKE ARTICLE. ASHER F. JACKSON, Taunton, Mass. Filed Dec. 3, 1897. Serial No. 660,864. Term of patent 14 years.



28,484.



Claim.—The design for a teapot or like article having the shape and ornamentation as shown and described.

28,485. TOP OR COVER FOR LUNCH-BUCKETS. WILFRED M. ROSENBERG, San Francisco, Cal. Filed Dec. 8, 1897. Serial No. 661,304. Term of patent 14 years.

Claim.—The design for the top or cover of a lunch-bucket, as herein described and shown.

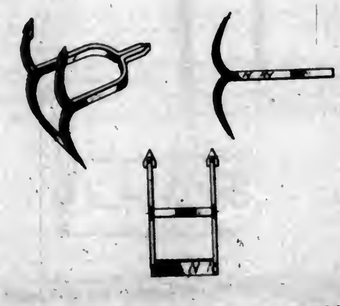
28,486. SUSPENDER-BUCKLE PIECE. WILLIAM BLOOMBERG, New York, N. Y. Filed Dec. 1, 1897. Serial No. 660,641. Term of patent 7 years.

Claim.—The design for a suspender-buckle piece herein shown and described.

28,487. WRENCH-JAW. HENRY J. MARTIN, Chicago, Ill., assignor to the Whitman & Barnes Manufacturing Company, Akron, Ohio. Filed June 23, 1897. Serial No. 643,313. Term of patent 14 years.

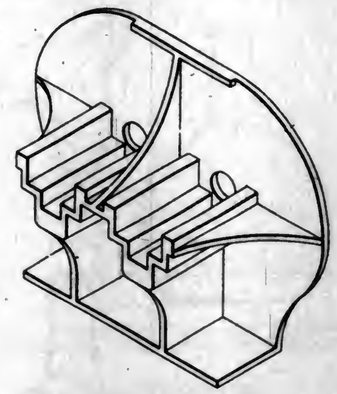
Claim.—The design for a wrench-jaw as herein shown and described.

28,488. DOOR-CATCH. CHARLES L. FROST, Grand Rapids, Mich. Filed Oct. 1, 1897. Serial No. 653,760. Term of patent 14 years.



Claim.—The design for a door-catch herein shown and described.

28,489. LADDER-HOOK. GEORGE W. SLACK, Northville, N. Y. Filed Nov. 13, 1897. Serial No. 658,496. Term of patent 14 years.

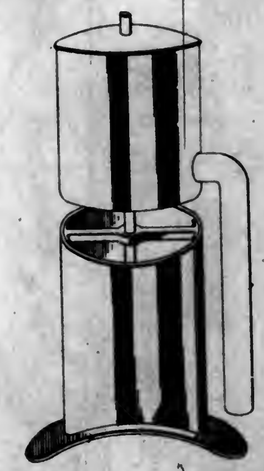


Claim.—The design for a ladder-hook as herein shown and described.

28,490. GARDEN-HOE. WILLIAM F. LUDWICK, Beaumont, Kans. Filed Feb. 3, 1898. Serial No. 669,015. Term of patent 14 years.

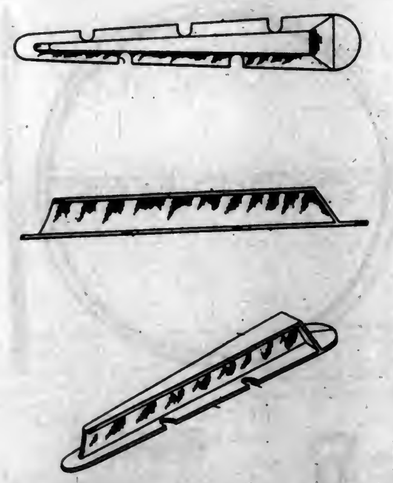
Claim.—The design for a garden-hoe herein shown and described.

28,491. HEAD FOR ROTARY PUMPS. RALPH C. BEVARY, Connersville, Ind., assignor to the P. H. & F. M. Roots Company, same place. Filed Mar. 3, 1898. Serial No. 672,463. Term of patent 14 years.



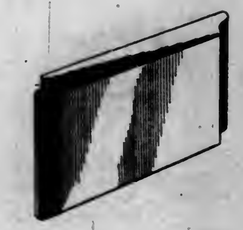
Claim.—The design for a head for a rotary pump, substantially as shown and described.

28,492. BATTERY-ELECTRODE. ZACK TAYLOR and MARTIN L. BRESHAM, Spokane, Wash. Filed Mar. 3, 1898. Serial No. 672,462. Term of patent 7 years.



Claim.—The design for a battery-electrode as herein shown and described.

28,493. CASING FOR SPARK-ARRESTERS. HOBART H. BRIGGS, Tipton, Ind., assignor of two-thirds to Joseph F. Berig and James C. Carlisle, Fostoria, Ohio. Filed Aug. 2, 1897. Serial No. 646,122. Term of patent 14 years.



Claim.—The design for a casing for spark-arresters herein shown and described.

28,494. FOOT-GUARD FOR SWITCHES. JAMES DONOVAN, Three Rivers, Mich., assignor to the Roberts, Throp & Company, same place. Filed Mar. 7, 1898. Serial No. 673,015. Term of patent 14 years.

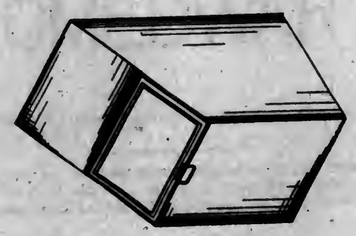
Claim.—The design for a foot-guard for switches, substantially as herein shown and described.

28,495. BRICK FOR HOT-BLAST STOVES. FREDERICK H. FOOTE, Chicago, Ill. Filed Nov. 30, 1898. Serial No. 670,711. Term of patent 7 years.

Claim.—The design for a brick for hot-blast stoves substantially as hereinbefore described.

28,496. HEATING-STOVE. HENRY HOHENFELD, Cincinnati, Ohio. Filed Dec. 23, 1897. Serial No. 664,123. Term of patent 14 years.

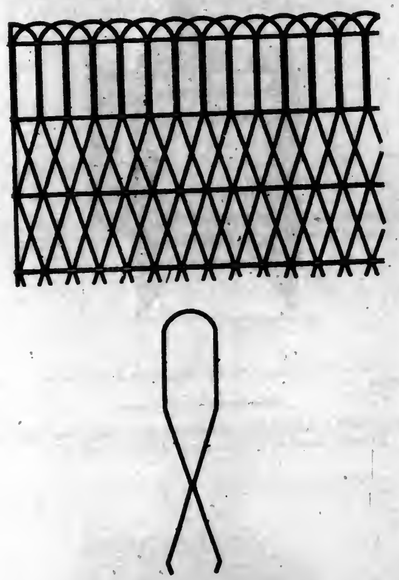
28,496.



Claim.—The design for a heating-stove herein shown and described.

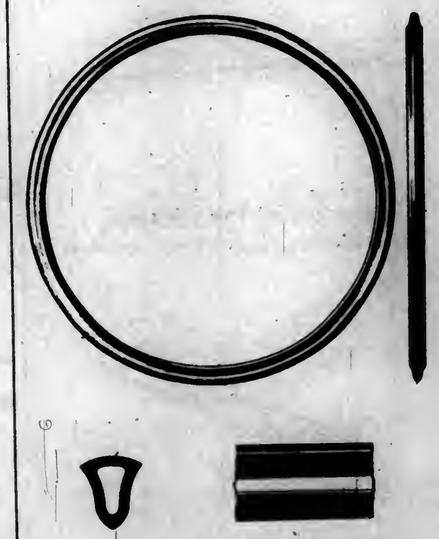
28,497. GAS-STOVE. HENRY ADLER, Allegheny, Pa. Filed June 19, 1897. Serial No. 641,519. Term of patent 14 years.

Claim.—The design for a gas-stove, substantially as herein shown and described.



28,498. GROCER'S CABINET. CLARK H. WYMAN, St. Paul, Minn., assignor to Griggs, Cooper & Co., same place. Filed Dec. 6, 1897. Serial No. 660,960. Term of patent 14 years.

Claim.—The design for a grocer's cabinet, substantially as herein shown and described.



28,499. WITHDRAWN.

28,500. WIRE FENCE. JESSE H. SHOVE, Kokomo, Ind. Filed Dec. 7, 1897. Serial No. 661,112. Term of patent 7 years.

Claim.—The design for a wire fence as herein shown and described.

28,501. BICYCLE-TIRE. JOHN J. RAMSDELL, St. Louis, Mo., assignor to the American Tire Company, New York, N. Y. Filed Feb. 12, 1898. Serial No. 670,148. Term of patent 14 years.

Claim.—A design for a bicycle-tire, substantially as herein shown and described.

TRADE-MARKS

REGISTERED APRIL 19, 1898.

81,467. CERTAIN NAMED STATIONERY. NATIONAL LEAGUE OF COMMISSION MERCHANTS OF THE UNITED STATES, Chicago, Ill. Filed Feb. 7, 1898.

Essential feature.—The representation of a six-pointed star bearing the letters "NLCMUS," with a central circular field upon which is printed the figure of Justice carrying a sword in one hand and a pair of scales in the other, said figure of Justice being shown as standing on a portion of the globe beneath which is arranged a pair of clasped hands. Used since January 7, 1898.

81,468. CHAMOIS LEATHER AND OTHER FINISHED LEATHER. EDWIN A. LAUDELL, Jr., Philadelphia, Pa. Filed Feb. 8, 1898.

Essential feature.—The representation of a fleur-de-lis. Used since January 19, 1898.

81,469. SHOES. V. K. & A. H. JOURS, Lynn, Mass. Filed Feb 24, 1898.

Essential feature.—The word "MIZPAH" and a heraldic display consisting of an escutcheon, upon which is capital letter "J," having griffin-supporters on each side and a crest-crown at the top of the escutcheon. Used since July, 1897.

81,470. CORSET-CLASPS, DRESS-SHIELDS, MACHINE SILK AND THREAD, HOOKS AND EYES, DRESS-STAYS, AND HOSE-SUPPORTERS. JORDAN, MARSH & Co., Boston, Mass. Filed Feb. 10, 1898.

ADELAIDE.

Essential feature.—The word "ADELAIDE." Used since January, 1891.

81,471. PLUM-TREES, SCIONS OF PLUM-TREES, AND PLUMS. THE JEWELL NURSERY COMPANY, Lake City, Minn. Filed Jan. 17, 1898.

AITKIN

Essential feature.—The word "AITKIN." Used since February 1, 1897.

81,472. CERTAIN LUMBER-MILL AND LOG PRODUCTS. THE HALL & HUBBEL COMPANY, Bay Mills, Mich. Filed Jan. 20, 1898.

STAG

Essential feature.—The representation of a stag's head and the word "STAG." Used since November, 1897.

81,473. PIANOS AND ORGANS. GEORGE P. BENT, Chicago, Ill. Filed Feb. 7, 1898.

CROWN

Essential feature.—The word "CROWN." Used since 1878.

81,474. GAS-STOVES. THE MORTON-PRINDLE GAS HEATING COMPANY, LIMITED, London, England. Filed Feb. 24, 1898.

OMEDWÂR

Essential feature.—The word "OMEDWÂR." Used since February 12, 1897.

81,475. PHARMACEUTICAL PRODUCT PREPARED FROM MILK AND USED AS MEDICINE. MAINZ & ROSSI, GESELLSCHAFT MIT BESCHRÄNKTER HAFTUNG, Grünau, Germany. Filed July 30, 1897.

Eucasin.

Essential feature.—The word "EUCASIN." Used since February 21, 1896.

81,476. WELDING COMPOUND. HENRY REBMANN, New York, N. Y. Filed Feb. 9, 1898.

Essential feature.—The representation of an elliptical wagon-spring within which are arranged the words "THE EUREKA WELDING COMPOUND." Used since January 21, 1898.

81,477. GELATINOUS COMPOUNDS. CHARLES P. WALLEY, New York, N. Y. Filed Feb. 2, 1898.

GLUEINE

Essential feature.—The word "GLUEINE." Used since August 1, 1892.

81,478. FARINACEOUS COMPOUND USED AS A DESSERT. WILLIAM PITT GLOVERSKEY, Baltimore, Md. Filed Apr. 5, 1897.

81,478.

TAPINE

Essential feature.—The word "TAPINE." Used since March 1, 1897.

81,479. ALE, BEER, AND PORTER. GRAEFER & GREGG BREWING COMPANY, Hudson, N. Y. Filed Aug. 13, 1897.

THE CHIEF

Essential feature.—The words "THE CHIEF" and the representation of a fireman in full uniform. Used since July 1, 1896.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of Alabama.

WESTERN ELECTRIC COMPANY *v.* HOME TELEPHONE COMPANY *et al.*

Decided February 9, 1898.

1. SCRIBNER—MULTIPLE SWITCHBOARDS FOR TELEPHONE-EXCHANGES.

Claims 2 and 4 of Letters Patent No. 330,061, granted November 10, 1885, to Charles E. Scribner, for multiple switchboards for telephone-exchanges, construed in connection with the prior art and *Held* valid and infringed.

2. SAME—SAME—SAME.

Claim 6 of Letters Patent No. 330,061, granted November 10, 1885, to Charles E. Scribner, for multiple switchboards for telephone-exchanges, construed and *Held* not infringed.

Messrs. Barton & Brown and *Mr. George L. Roberts* for the complainants.

Messrs. Pillans, Torrey & Hanaw, Mr. Charles B. Tilden, and *Mr. James L. Norris* for the defendants.

TOULMIN, *J.*:

This is a suit in equity brought by the Western Electric Company, on Letters Patent of the United States No. 330,061, dated November 10, 1885, as the assignee of Charles E. Scribner, to whom the patent was granted, against the Home Telephone Company, Albert S. Lyons, and Adam Glass. The patent is for improvements in multiple switchboards for use in telephone central offices or exchanges. The complainant is a corporation under the laws of the State of Illinois and has been engaged in furnishing apparatus for telephone-exchanges, it appears, for some years past. The defendant company is an Alabama corporation, and the individual defendants are Albert S. Lyons and Adam Glass, citizens of Alabama, and residents of Mobile, and respectively the president and treasurer of this company.

The bill is of the usual form in patent infringement suits and charges the defendants with infringing the patent stated above by reason of the defendants' use, at their telephone-exchange in the city of Mobile, of certain apparatus called "multiple switchboards."

Originally it was charged that claims 2, 3, 4, and 6 of the Scribner patent were infringed. On the hearing claim 3 was withdrawn from such charge. This leaves before the court only claims 2, 4, and 6 of this Scribner patent, No. 330,061.

The nature and purpose of the invention embodied in this Scribner patent, and the patent itself, will need to be first stated in order to have a clear understanding of the issues involved. The patentee says:

My invention relates to multiple-switchboard signals, and is designed to enable the operators at the different boards to test to determine what lines are in use, while the circuits are so arranged that any two lines may be connected together upon any one of the boards without including in their circuit the resistance of the contact-points of the switches. * * * In all these systems heretofore used the contact-points of the switches have been included in the circuit of two lines when connected together.

My invention is designed to avoid the resistance of these contact-points by the use of circuits and apparatus more simple than any heretofore devised, while the operators are enabled to make the usual tests to determine whether any line wanted is already in use at another board. * * * * * *

It is evident that this arrangement of circuits may be used with various kinds of switches other than the spring-jacks having insulated frames, as described, and as shown in Fig. 1. In Fig. 2 I have shown simple connecting-bolts c' d' e' for making the line connections, means being provided, as shown, for breaking the circuit f' when a connection is made at either bolt. With circuits thus arranged any two lines may be connected directly on either of the boards without including the resistance of the contact-points of the spring-jacks in their circuit, while such signals and tests may be made as may be desired.

Scribner, the patentee, testifying for complainant, states the object of his patent, and, among other things, says:

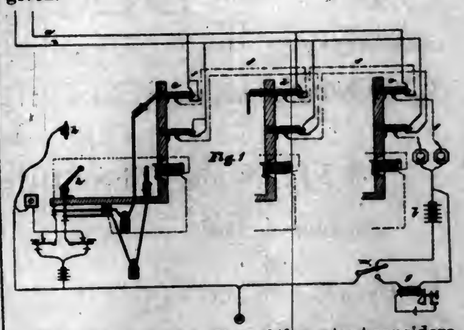
The patent in suit, No. 330,061, is for a multiple switchboard. The result sought to be accomplished by the invention of this patent is the connection between any two subscribers' lines in a telephone-exchange, the exclusion of contact-points from the circuit of such connections, while, at the same time, the indicator-annunciators of such connected lines are temporarily cut off from their respectives lines.

In defining his invention as embodied in this patent, by way of aiding in an understanding of it, Scribner further testified:

The invention of the patent in suit provides a spring-jack switch upon each of the several switchboards for each line, the spring-jack switch being constructed to provide a contact-piece to which the plug made contact when introduced into the spring-jack, a spring normally resting upon a contact-point and circuits with which the line is to be connected. By this construction the line-wire is directly connected with a portion of each spring-jack, this portion being that with which the plug is designed to make contact. The line-wire is also connected with all the contact-points and all of its spring-jacks and thence through the indicating-annunciator and battery and to ground-return. The introduction of a plug into any spring-jack gave a contact between the plug and that portion of the spring-jack directly connected with the line-wire, while at the same time the contact-points of the jack in which the plug was inserted were open and the circuit to the indicating-annunciator interrupted, and this, too, no matter which spring-jack of the line was employed. A plug, when inserted in the spring-jack and having a conducting-cord leading to another plug, would serve, upon the introduction of the second plug into a spring-jack belonging to any line, to connect directly together the two lines without the contact-points and any of the spring-jacks being included in the connected circuit. This construction, with its results, is the principal feature of the patent in suit.

Minnis, a witness for defendants, in his twenty-second answer says:

Without going into any long dissertation upon the specification and claims of the patent in suit, and their interwoven relations one to the other, I think that I can safely boil this down into one specific combination claim, to wit: A multiple telephone-switchboard so arranged that talking-circuits can be established thereon without including in said talking-circuit any of the separable contacts of any of the jacks of either of the



lines incorporated in said talking-circuits, and without preventing or interfering with the operation of the usual apparatus commonly employed for the production of what is generally known and described as a busy-test, substantially as described.

I do not perceive any substantial difference, if any difference at all, in the statement of the invention by these opposing witnesses. Lockwood, an expert witness for complainant, in speaking of the separable contact-springs and the defective operation resulting from the failure to cut them out of the talking-circuit, as made when subscribers are to talk over the line, (his reference being to the art as it existed prior to the advent of the Scribner patent,) says:

> When such separable spring-contacts are thus introduced into an electrical circuit it is a fact that at each pair a certain resistance or opposition to the perfect passage of the electrical current is introduced into the circuit; or, in other words, when two portions of the circuit-conductor are held in contact by pressure only their resistance is greater than if at such point of the circuit the metallic conductor, such as a wire, had been undivided. In many forms of applications of electrical circuit this additional resistance at each spring-contact makes no appreciable difference to the passage of the current, but the electrical current employed in speaking telephony is very delicate and very weak, and requires that the resistance of the circuit shall be as low as possible, in order that its passage through the said circuit from one subscriber's station to the other shall be facilitated.

Thus it will be seen that there were weighty objections to the multiple switchboards prior to the Scribner patent, because in them a talking-circuit composed of two subscribers' lines and their connections effected in the exchange office included the separable contacts of all the spring-jacks of the two lines embraced in such circuit. The several or perhaps numerous contacts, the evidence shows, were liable to and often did maintain poor electrical union, often filled between their touching points more or less with dust or other foreign substance, which impaired and even sometimes destroyed their contact, electrically speaking, and such several separable contact-points of each line at each board or board-section also constituted a series of breaks or breakable points in the talking-circuit depended upon by users of telephones for the transmission of speech. The evidence in this case is strongly persuasive, if not wholly convincing, that the invention embodied in the patent involved herein overcame and eliminated these difficulties and produced a substantial and meritorious advance in this useful art. By means of this invention, as expressed in the patent and as shown by the evidence, the series of separable contacts of each of any two lines to be brought together are cut out of the talking-circuit when any two of the spring-jacks on a board or board-section are electrically connected by a pair of plugs and their conducting-cords. Thus, referring to Fig. 1 of the patent, if the upper plug is inserted into the spring-jack or switch *c* in the upper left-hand part of the figure and then the lower plug is inserted into the spring-jack or switch on the same left-hand board the subscriber's line *a* and the subscriber's line *b* will become electrically connected for talking purposes. At the same time each of the upper spring-jacks or switches *d* and *e* of the line *a* will be cut out of the circuit, and each of the spring-jacks or switches of the line *b* lowest under *d* and *e* will also be cut out.

A representation of Fig. 1 of this patent is here given.

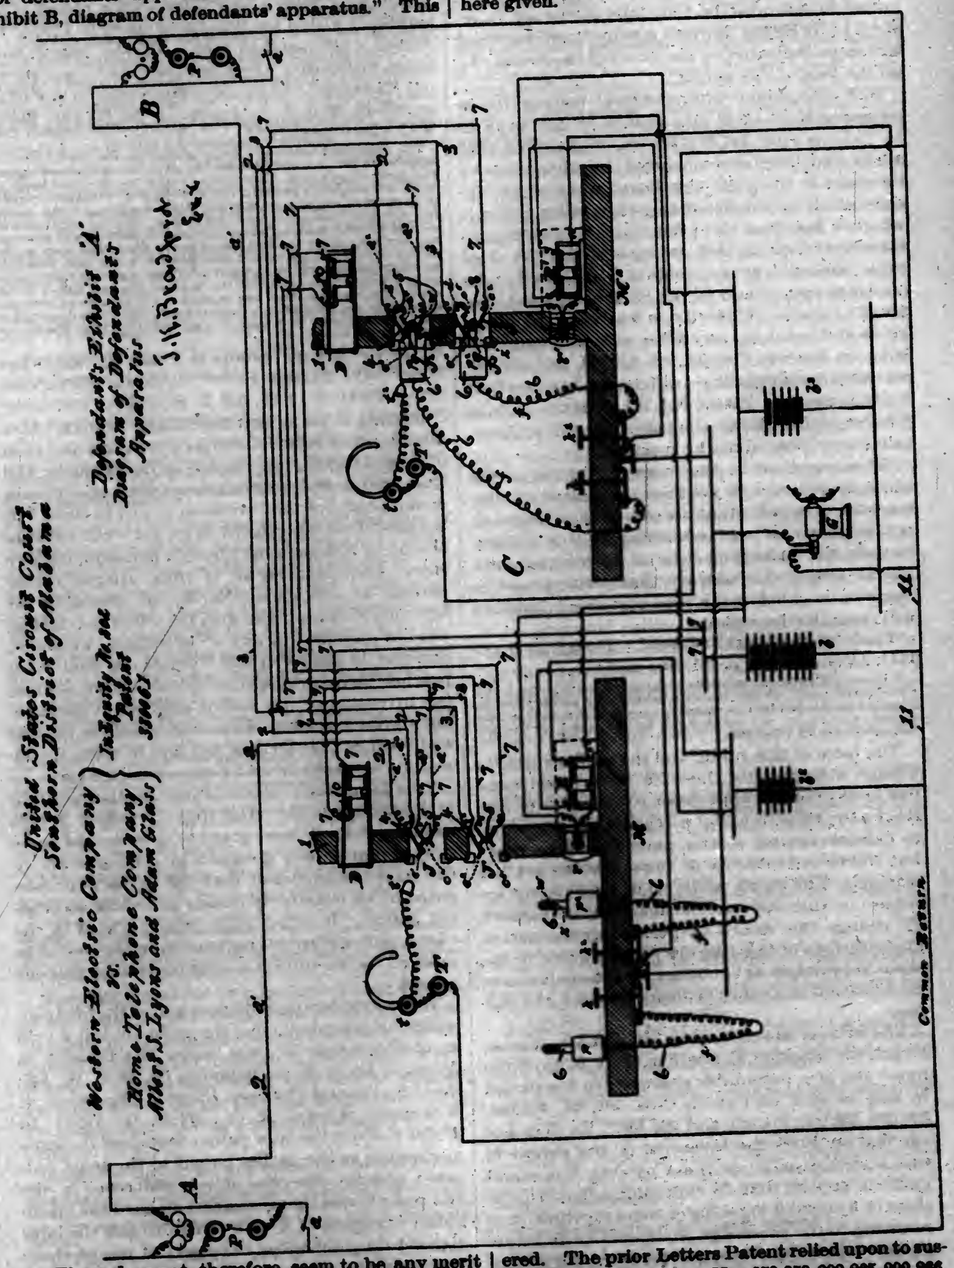
With this understanding of the patent consideration will now be given to the defenses urged by counsel for defendants. These are:

1. That there is such failure and insufficiency of proof adduced by the complainant to establish the charge of infringement that no proper determination of such issue is possible.

2. That the state of the art prior to the grant of the patent in suit was such as to preclude the allowance of any claims having the scope and capable of the construction that can be inferred from the terms of the claim and from the face of the patent.

3. That by the well-known construction of the statute no original patent should have been granted for the subject-matter covered or defined by the claims of the patent in suit, such subject-matter having been so far and so clearly disclosed by prior patents to the same grantee that the rights of the latter were thereby relegated to his remedy by reissue and not susceptible to protection by this patent.

4. That the patent on which this suit is founded is not infringed by defendants, even if it be admitted, tentatively, that said patent is valid and capable of a broad construction.



5. That the patent in suit is void as to the claims in issue, under the decision of the Supreme Court in *Miller* v. *Eagle Manufacturing Co.* (66 O. G., 845; 151 U. S., 201) and *Thomson-Houston* v. *Winchester Avenue Railroad Co.* (73 O. G., 2155) and authorities therein cited.

6. That if it be admitted for the sake of argument that the patent in suit has any legality whatever the claims in said patent can only be saved by the narrowest construction, rigidly restricting them to the precise form, construction, and arrangement shown and described.

The first objection indicated above seems to be based upon the position that the diagram drawing introduced by complainant, and marked "Complainant's exhibit diagram defendants' apparatus," was not a correct representation of the multiple switchboard admitted by defendants to be used by them in their exchange at Mobile. Aside from whether defendants are right in contending that such exhibit is not an accurate representation of said apparatus, the defendants themselves offered

in evidence as a correct representation of the apparatus alleged to be an infringement two diagram drawings marked "Defendants' exhibit A, diagram of defendants' apparatus" and "Defendants' exhibit B, diagram of defendants' apparatus." This drawing "A," described by defendants' witness as a correct illustration of defendants' apparatus.

A representation of defendants' "Exhibit A" is here given.

There does not, therefore, seem to be any merit in this first objection urged by defendants.

The second defense urged will next be considered. The prior Letters Patent relied upon to sustain this proposition are Nos. 252,259, 292,865, 293,866, 330,059, 330,060, 294,482, and 269,238. The last two

here named, although not found in defendants' brief, are nevertheless in the record and are referred to in complainant's brief. The point urged in this second defense is that in view of the above patents there is such an exhibition of the prior art that the patent in suit must be judicially construed in respect of its claims down to a scope narrower than the scope indicated by the terms of the claims and on the face of this patent.

But defendants' witness Clark, responding to cross-questions 48, 49, and 50, says he does not find in Patents Nos. 292,866, 330,059, and 330,060 that when two lines are connected together without reference to the particular board upon which the connection is completed there is a talking-circuit which is free from all of the separable switch-contacts of the spring-jack switches of the two lines thus connected, as such feature is exhibited in defendants' system and in the Scribner patent, No. 330,061, in suit. This witness was asked to distinguish and point out any differences that may exist between Patents Nos. 292,866, 330,059, and 330,060, and after detailing alleged differences he states that he finds that the Patent No. 292,866 is the same as the Patent No. 330,061, the patent in suit, with certain exceptions, which he specifies.

Whatever then be the merit or demerit or the accuracy or inaccuracy of these statements and discussions, it remains that the patents mentioned do not, as they now exist, according to this witness, contain the invention covered by complainant's patent, but, on the contrary, that changes must be made in them before it is even pretended that they will show this invention.

The Supreme Court in *Topliff* v. *Topliff* (59 O. G., 1257; 145 U. S., 156, p. 161) has said:

It is not sufficient to constitute an anticipation that the device relied upon might, by modification, be made to accomplish the function performed by the patent in question, if it were not designed by its maker, nor adapted, nor actually used, for the performance of such functions.

The force of this ruling and the similar ruling in *Clough* v. *Barker* (106 U. S., 166–175) is made manifest in its practical application to the rights of parties by the reflection that all earlier patents set up in defense against a later patent sued upon are but the record evidence of the status the art has reached. The rights under such later patent are subject to what this record evidence actually shows. To change this record by permitting theoretical modifications of these earlier patents would be the same in principle as to change by interpolation or modification any other evidence between the parties.

The witness Minnis (answer 24) discusses at great length the question of whether there is anything novel and of a patentable character in the patent in suit in view of Patents Nos. 292,865, 292,866, 330,059, 330,060, 294,482, and 269,438. He does not say that he finds the invention of the patent in suit in either or all of these patents, but would make it appear that by changing some or all of them or by combining some of them together, thus resorting to the process of modifications and reorganizations, he would then arrive at this invention. For instance, he says:

Thus it will be seen by means of these four patents we have been brought up step by step to an arrangement and combination almost identical with that shown in the patent in suit.

But this "almost," with its indefinite bounds, forms the missing link and, it is thought, brings this form of attack on complainant's patent substantially within the rule pronounced in *Topliff* v. *Topliff*, *supra*, and *Clough* v. *Barker*, *supra*, and is also within the objections to such a course pointed out by Judge Coxe in the case of *Johnson* v. *Forty-second St. M. & St. N. Avenue R. Co.*, (33 Fed. Rep., 500,) where he says:

The defendant assembles every similar device, description or suggestion in the particular art not only, but also in analogous and even remote arts. Everything which has the least bearing upon the subject is brought in and arranged by a skilful expert in an order of evolution which resembles most clearly the invention which is the subject-matter of attack. Having thus reached a point where but a single step, perhaps, is necessary to success, and knowing from the inventor exactly what that step is, the expert is asked if the patent discloses invention, and, honestly no doubt, answers in the negative. There is always the danger, unless care is taken to divest the mind of the idea added to the art by the inventor, that the invention will be viewed and condemned in the light of ascertained facts. With his description for a guide, it is an easy task to trace the steps from the aggregation to the invention.

"In the law of patents it is the last step that wins," says Justice Brown in *Barb Wire Fence Cases*, (58 O. G., 1555; 143 U. S., 275.)

Bearing in mind that defendants' witness Clark distinguishes between the patent in suit and such of these alleged prior patents as he considers, and that defendants' other witnesses, Paca and Minnis, do not point out the invention in suit in these earlier patents, it is pertinent to consider the rebuttal offered by complainant through Scribner, the patentee, who discusses all of these alleged earlier patents, as also Patent No. 306,669, offered by defendants in connection with the Clark deposition, but not discussed by any of defendants' witnesses. Scribner in answers 1 and 7 points out that these patents, three of which are his own, do not contain the invention of the patent sued on. Complainant's witness Haskins also considers these patents and testifies that he does not find in them the invention in question, and I concur in this view.

This discussion disposes of the third proposition of defendants to the effect that the patent in suit should not have been granted because the same subject-matter was disclosed in prior patents to the same patentee and that his rights were relegated to his remedy by reissue and not to an original patent. It is not clear from my view of the "prior patents" to this patentee how they could be reissued for the subject-matter covered by this one patent.

These considerations dispose also of the fifth contention of defendants that the patent in suit is void as to the claims in issue, under the decision in *Miller* v. *Eagle Manufacturing Co.* (66 O. G., 845; 151 U. S., 186) and *Thomson-Houston Electric Co.* v. *Winchester Avenue R. Co.*, (73 O. G., 2155.) In *Miller* v. *Eagle* the later patent contained the same mechanism as the earlier patent to the same patentee, and the essential or only difference in the two patents was that the earlier claimed the mechanism in respect of its two functions and the later claimed the mechanism in respect of one of those functions, the case presenting one in which there was no division of mechanism, but only a division

of functions, as between the two patents. There is nothing of that sort as between the patent in suit and any of the patents offered by the defendants.

In the additional brief filed on behalf of defendants considerable space is devoted to showing that Patent No. 321,390, dated June 30, 1885, issued upon an application filed October 25, 1879, contains a substantial disclosure of the separable-contact-cutting-out feature, defendants contending that everything disclosed by the patent in suit, except possibly the peculiar form of the apparatus and the particular form of the test-circuit, belongs to the patentee's earlier patent, No. 321,390, and say that the idea of excluding one set of contacts at the same time connection is made with another set is clearly set forth in this Patent No. 321,390, and that the patent in suit was therefore void or anticipated. This Patent No. 321,390 describes its spring-jacks thus:

One part, B', of the switch I term the "line" portion, and the other part, B, I term the "test" portion.

These portions are not used simultaneously, but each is used when occasion requires for its own particular purpose.

Defendants' witness Minnis, (answer 23,) speaking of these contacts in Patent No. 321,390, says that—

both of these contact-switches being of a separable character, the insertion of a plug would still leave in the circuit those contact-switches between the plug and the point of entry of the line into the switchboard.

It appears, then, that upon entering the plug of a connecting-cord into any of the series of switches there would still be left in the talking-circuit the separable contact-points of all the intervening switches located between the plugged switch and the point of entry of the talking-line into the switchboard. This statement accords with the testimony of the patentee, Scribner, in his answer to question 7, wherein he says:

In this Patent No. 321,390, instead of a single switch upon each multiple switchboard, there are two switches for each telephone-line, and these two switches are insulated from each other, and the contact-points of all the switches of a given telephone-line are included in the line-circuit of the telephone-line. A connection of any two lines of this system gives a talking-circuit through these contact-points, thus introducing an objectionable resistance—a defect which the patent in suit was designed to and does obviate. Neither the construction nor the result of the patent in suit can be possibly secured by any employment of the apparatus of my Patent No. 321,390.

The witness Haskins, for the complainant, in answering question 8, in his deposition says:

I will next consider Mr. Scribner's patent No. 321,390, of June 30, 1885. This patent also contains the same objectionable feature of including in the talking-circuit the contacts of the switches when two subscribers are connected for conversation, and accordingly has no significance.

Then Minnis in his twenty-third answer speaks of certain changes to be made in Patent No. 321,390 to make it accomplish the result effected by the patent in suit. For instance, he says that "a substitution of one bolt with two sets of contact-switches would be an absolute equivalent of the two bolts, each having a contact-switch."

Again he says:

Going a step further and substituting for this bolt with two sets of contact-switches [of] a bolt with one set of contact-switches and one solid switch-contact, and we have an arrangement under which the insertion of the plug in any switch would leave no separable contacts included in the circuit thus established.

If Patent No. 321,390 covers, broadly, the identical invention covered by the patent in suit, as is claimed by defendants' counsel, why the substitution or change of bolts and contact-switches as suggested by witness Minnis? Why any change of construction in the arrangement shown in Patent No. 321,390 if it possesses all the functions of the patent in suit?

The grant of Letters Patent is *prima facie* evidence that the patentee is the first inventor of the device described in the Letters Patent and of its novelty. The burden of overcoming the *prima facie* case made out by the production of the patent is upon the defendant, and the defense of want of novelty must be clearly established before a court will be justified in setting aside the patent on this ground. Not only is the burden of proof to make good this defense on the party setting it up, but it has been held that "every reasonable doubt should be resolved against him." (*Cantrell* v. *Wallack*, 35 O. G., 871; 117 U. S., 689; *Palmer* v. *Corning*, 70 O. G., 1497; 156 U. S., 342.)

This disposes of all of defendants' propositions, except the fourth and sixth, which go to the point that there is no infringement by defendants of the patent sued on and to the further point that the claims can only be saved by a narrow construction restricting them to the exact form, construction, and arrangement described by the patent in suit and illustrated therein. It does not seem to admit of doubt that this patent accomplishes a new result—namely, the direct connection of two subscribers' lines through the usual plugs and cords, at the same time cutting out of the talking-circuit thus formed all the separable contacts belonging to such lines and cutting out the conductors leading to the individual annunciators. The instrumentalities employed to accomplish this result are not, individually, new instrumentalities, but they are brought together in a new relation, combination, or organization, and thereby produce this advance in the art of telephony, and which, according to the evidence in this case, is meritorious in respect to its practical utility and the advantages it affords in the actual use of telephones by simplifying the apparatus in telephone-exchanges and by improving the tone and efficiency of talking-circuits through the elimination of objectionable resistance to the low current employed in such circuits.

As defendants' "Exhibit A" is accepted by both parties to the suit as a substantially correct representation of defendants' apparatus as used in their exchange, that exhibit has been adopted by me as the basis of comparison with the patent sued on. Defendants' witness Clark in answer 23 says:

The said defendants' "Exhibit A" represents correctly the apparatus as used in the switchboard at Mobile, Ala., by the Home Telephone Co. This is a correct drawing.

Clark was further asked:

In defendants' system the circuit of each telephone-line may be traced normally from the subscriber's station through the separable contact of the different spring-jack switches of the line and thence through the line-annunciator and thence back to the subscriber's station. Is not this correct?

A. Yes, sir. (Cross-answer 78.)

Referring to Fig. 1, for example, of the patent in suit, is not each spring-jack of each line provided with three contacts, one contact being normally open and the other contacts being normally touching each other or closed together?

A. Yes, sir. (Cross-answer 79.)

Is not the same true as to the spring-jacks of defendants' system?

A. Yes. (Cross-answer 80.)

When a connecting-plug is inserted in a spring-jack of the patent in suit, is not the normally open contact of the spring-jack switch closed to the plug to form a circuit to the telephone-line, while at the same time the separable contacts are disconnected so as to cut off the portion of the line or the branch which contains the line-annunciator?

A. Yes, sir. (Cross-answer 81.)

Is not the same true of defendants' system?

A. Yes, sir. (Cross-answer 82.)

In the case of the patent and in the case of defendants' system, when two lines are connected together, none of the sepa-

rable contacts of such lines are included in the united circuit of the two lines, that is, in the talking-circuit. Is this correct?

A. Yes, sir. (Cross-answer 86.)

And said witness Clark was further asked:

Referring to Fig. 1 of the patent in suit, do you not find a branch from the telephone-line connected with the normally open contact of the spring-jack switches of such line?

A. Yes, sir. (Cross-answer 87.)

Referring to defendants' apparatus, as illustrated in defendants' "Exhibit A," are not their contact-springs c' and c^3, of the spring-jack switches of the telephone-line of station A, and are not these contacts c' and c^3 both branched from the said telephone-wire, and are they not normally open?

A. Yes, sir. (Cross-answer 88.)

Paca, another of defendants' witnesses, stated that—

exhibits "A" and "B," diagrams of defendants' apparatus, correctly represent the arrangement of the circuits and apparatus at the exchange of the Home Telephone Co. in Mobile.

The patentee, Scribner, was asked:

Bearing in mind the prior state of the art and that testimony [the testimony in behalf of defendants] in so far as the same relates to claims 2, 4, and 6, please state whether this system, as used at Mobile, contains the invention of the patent as pointed out in said claims, giving your reasons at length for any opinions you may express.

A. The invention of the patent as set forth in claims 2, 4, and 6, to which you call my attention, is, in my opinion, realized in defendants' apparatus. In fact I think it will be apparent that the defendants have copied in their exchange the combination of devices described in each of the claims 2, 4, and 6. (Answer 6.)

Some distinction between the patent in suit and the defendants' apparatus is sought by counsel for defendants to be made in respect to the "open branch" in the patent (wire for connecting contacts of the several boards) and the wires a^3, a^3, and a^4 of defendants' apparatus; but their function is the same and the difference between such wires and their arrangement is one merely of form. The subject-matter, however, of this patent and the subject-matter of defendants' apparatus, for operative purposes, are not things whose essence is their form. Hence the rule of infringement laid down by the Supreme Court in *Union Paper Bag Machine Co.* v. *Murphy* (13 O. G., 366; 97 U. S., 120, 125) seems applicable here. In that case the Court says:

Except where form is of the essence of the invention, it has but little weight in the decision of such an issue, the correct rule being that, in determining the question of infringement, the court or jury, as the case may be, are not to judge of similarities or differences by the names of things, but are to look at the machines or their several devices or elements in the light of what they do, or what office or function they perform, and how they perform it, and to find that one thing is substantially the same as another, if it performs substantially the same function in substantially the same manner to obtain a like result, always bearing in mind that devices in a patented machine are different in the sense of the patent law when they perform different functions or in a different way, or produce a substantially different result. Nor is it safe to give much heed to the fact that the corresponding devices in two machines, organized to accomplish the same result, are different in shape or form the one from the other, as it is necessary in every special investigation to look at the mode of operation or the way the device works and at the result, as well as at the means by which the result is attained.

This patent was not "the mere carrying forward of new or more extended application of the original thought" shown in Patent No. 321,390, as claimed by defendants' counsel; nor was it "a change only in form, proportion or degree, doing substantially the same thing in the same way by substantially the same means" as Patent No. 321,390.

It is true that it was a patent for new combinations of what were old elements when considered by themselves; but—

a new combination, if it produces new and useful results, is patentable though all the constituents of the combination were well known and in common use before the combination was made. (*Palmer* v. *Corning*, *supra*.)

My opinion is that the patent in suit accomplished an absolutely new and useful result—that it was a pioneer invention.

The principle is well settled in the patent law that where an invention is one of a primary character, and the mechanical functions performed by the machine are, as a whole, entirely new, all subsequent machines which employ substantially the same means to accomplish the same result are infringements, although the subsequent machine may contain improvements in the separate mechanisms which go to make up the machine. (*Morley Machine Co.* v. *Lancaster*, 47 O. G., 297; 129 U. S., 263.)

I will now consider the claims specifically in connection with defendants' "Exhibit A" and interpolate numerals after the elements of the claims, placing the same numerals on what I find to be the corresponding elements in the said exhibit.

Thus claim 2 reads:

2. At a telephone-exchange central office, the combination of multiple switchboards [1] with telephone-lines [2 and 3] each permanently connected to a metallic portion of its switch upon each board, each telephone-line being also connected through the contact-points [5] of its switches and to ground, and means [6] whereby the circuit of the branch wire [7] of any given line is opened [as at 8] when a connection [contact 9] is made with the line [3] at any board, whereby any two lines [2 and 3] may be connected together [as at 9] upon either of the boards [1] without including in their circuits the contact-points [5] of either of their switches.

And claim 4 reads:

4. The combination, with a telephone-line [2 or 3] provided at each switchboard [1] of a multiple system with a connecting bolt or switch, [4 5,] of a portion [7] of said line connected through an annunciator [10] to ground, [11,] and means [6] for breaking said line [7] when a connection is made with the telephone-line [2 or 3] at either one of its bolts or switches, [4 5,] substantially as and for the purpose specified.

From this comparison of the patent in suit with the model or diagram of the apparatus shown to be in use by the defendants it seems clear to me that the defendant, the Home Telephone Company, has adopted substantially the invention alleged to be infringed.

In determining the question of infringement the court is not to judge about similarities or differences by the names of things, but is to look at the machines, or several devices or elements, in the light of what they do or what office or function they perform, and to find that one thing is substantially the same as another if it performs substantially the same function in substantially the same way to obtain the same result. (*Cantrell* v. *Wallack*, *supra*.)

There is no conflict in the testimony as to the fact that the invention covered by the patent in suit and the apparatus in use by defendants accomplish the same result, and there is no material conflict as to the construction and operation of the respective apparatus or devices shown by the patent and the admitted diagrams in the case, but there is a want of harmony in the conclusion of the witnesses on the conceded facts. There is a difference in their expert opinion on the question whether the two machines or devices are substantially identical and employ substantially the same means to obtain the result, which it is conceded is the same; but the comparison made brings me to the conclusion, agreeably also to the weight of the evidence, that claims 2 and 4 are infringed.

As to claim 6 I think that the construction or details of the spring-jacks as elements enter somewhat into the organization it sets forth, and as defendants' detail construction of spring-jacks is not clearly exhibited my decision as to this claim 6 is that infringement is not shown.

It is not shown in the evidence that defendants Albert S. Lyons and Adam Glass have in their individual capacity violated any of complainant's rights or that they have individually derived any profit or advantage from the patent sued on. No reason is shown why a decree should be rendered against them as individuals. As to them, therefore, the bill is dismissed at complainant's cost. (*Howard* v. *St. Paul Plow Co.*, 45 O. G., 1067; 35 Fed. Rep., 743; *Boston Woven Hose Co.* v. *Star Rubber Co.*, 50 O. G., 1450; 40 Fed. Rep., 167; *Consolidated Fastener Co.* v. *Columbia Fastener Co.*, 79 Fed. Rep., 795.)

The bill is sustained as to claims 2 and 4 and dismissed as to claim 6, and a decree will be entered accordingly and for an injunction and an accounting of the profits and damages in respect to claims 2 and 4, the injunction not to be operative until sixty days after the entry of the decree on account of the public inconvenience that might result in summarily enjoining the defendant, the Home Telephone Company, in the use of its switchboards.

Amended Rules of Practice.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 13, 1898.

The following rules of the Rules of Practice of the United States Patent Office (edition of June 18, 1897) are amended to read as follows:

RULE 135. Upon the filing of the appeal the same shall be submitted to the Primary Examiner, who, if he find it to be regular in form, shall, within *five* days from the filing thereof, furnish the Examiners-in-Chief with a written statement of the grounds of his decision on all the points involved in the appeal, with copies of the rejected claims and the references applicable thereto. The Examiner shall at the time of making such statement furnish a copy of the same to the appellant. If the Primary Examiner shall decide that the appeal is not regular in form, a petition from such decision may be taken directly to the Commissioner, as provided in Rule 145.

RULE 145. Upon receiving a petition stating concisely and clearly any proper question which has been twice acted upon by the Examiner, and which does not involve the merits of the invention claimed, or the rejection of a claim, and also stating the facts involved and the point or points to be reviewed, an order will be made fixing a time for hearing such petition by the Commissioner, and directing the Examiner to furnish a written statement of the grounds of his decision upon the matters averred in such petition within *five* days *after being notified of the order fixing* the day of hearing. The Examiner shall at the time of making such statement furnish a copy thereof to the petitioner. No fee is required for such a petition.

C. H. DUELL,
Commissioner.

Department of the Interior, April 13, 1898.
Approved:
C. N. BLISS,
Secretary of the Interior.

[CIRCULAR.]

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 14, 1898.

Rules 135 and 145 of the Rules of Practice have been amended to require Examiners to file their answers to appeals and petitions within five days after the appeals and petitions have been submitted to them.

In fixing the day of hearing, the docket clerk will give such time as may be necessary, having regard to the distance of parties and the time required by the mails.

The attention of Examiners is called to the requirement in Rule 64, and questions of form will be insisted upon only in applications found to present patentable subject-matter. In requiring division the Examiners will observe the decisions of the Commissioners, and furnish such references and other information as will enable the applicant to divide intelligently. (*Ex parte De la Sala*, 1898 C. D., 3; *ex parte Stearnes*, 1890 C. D., 49.)

C. H. DUELL,
Commissioner.

Attorneys.

(ORDER No. 1,197.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 21, 1898.

With the approval of the Secretary of the Interior, William C. Raymond, of Syracuse, N. Y., is hereby disbarred from practice before the United States Patent Office for gross misconduct, pursuant to the provisions of section 487 of the Revised Statutes.

C. H. DUELL,
Commissioner.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., April 15, 1898.

SIR: The Secretary of the Interior has ordered that William P. Gregg, of Ottawa, Ill., be not recognized as attorney or agent in the prosecution of any claim or other matter before this Department or any Bureau thereof, as of date of March 16, 1898.

Department order of the 16th ultimo, disbarring William B. Gregg, of Ottawa, Ill., is hereby canceled and revoked.

Very respectfully,
EDWARD M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

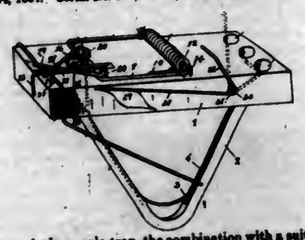
PATENTS



GRANTED APRIL 26, 1898.

602,817. SCRAP OR SAMPLE BOOK. EDWARD M. ANDERSON, Jersey City, N. J. Filed Sept. 7, 1897. Serial No. 650,708. (No model.)

Claim.—In a scrap-book, the binding-strips D, placed on the inside of the folds of the leaves A, the ends of said strips being formed over the edge of the several leaves, clamping them together, said leaves with clamp being secured to the back B, substantially as and for the purpose specified.

602,818. MOLE-TRAP. WILLIAM M. BALL, Auburn, Nebr. Filed Apr. 24, 1897. Serial No. 633,630. (No model.)

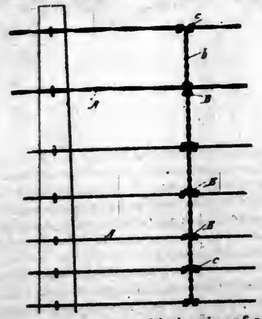
Claim.—1. In a mole-trap, the combination with a suitable block or base, of a snare-shield secured thereto at one end, a snare adapted to lie close to or within the shield, and means for actuating the opposite end of said snare, substantially as described.

2. In a mole-trap, the combination with a suitable block or base, of a snare-shield grooved to receive the snare, substantially as described.

3. In a mole-trap, the combination with a suitable block or base, of a snare-shield secured to the lower side thereof and having one of its edges grooved to receive the snare and its opposite edge sharpened, substantially as described.

4. In a mole-trap, the combination with a suitable block or base, of a snare-shield, a snare-wire, a spring for actuating said wire, and a trigger for holding and releasing said spring, substantially as described.

5. In a mole-trap, the combination with a suitable block or base, of a snare-wire, a spring for actuating said wire, a snare-shield, a trigger for said spring, and a trip for engaging and releasing the trigger, substantially as described.



6. In a mole-trap, the combination with a suitable base or block, of a snare-wire fastened at one end and partially underlying the block and passing therethrough, a spring arranged above the block for drawing upon the other end of said wire, a trigger for holding said spring, a trip for engaging and releasing said trigger, and a safety-catch for holding the trigger, substantially as described.

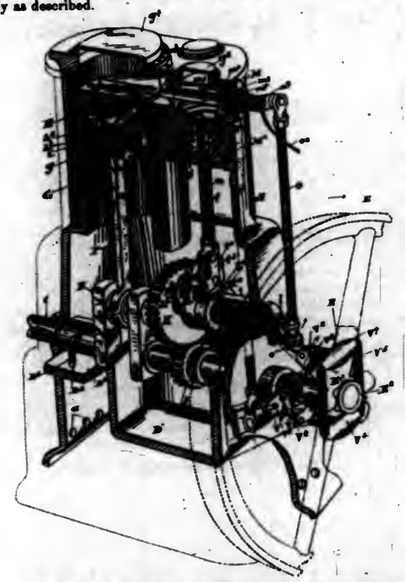
7. In a mole-trap, the combination with a suitable block or base, of a snare-wire fastened at one end and passing therethrough and partially underlying the block, a spring on the upper side of the block for pulling the free end of said wire, a pivoted trigger for engaging said spring, and a trip pivotally mounted at one side of the block and having a short arm to engage said trigger, and a long arm to project across the mole-path, substantially as described.

8. In a mole-trap, the combination with a suitable block or base, of a snare-wire, actuating means therefor, and a movable flagstaff arranged to be actuated by the means which actuates the snare-wire, substantially as described.

9. In a mole-trap, the combination with a suitable block or base, of a snare-wire, an actuating-spring for said wire, and a flagstaff pivotally mounted on said block or base and having a portion thereof arranged in the path of the spring, substantially as described.

602,819. WIRE-FENCE STAY. WILLIAM C. BARRICK, New Midway, Md. Filed Dec. 3, 1897. Serial No. 660,696. (No model.)

Claim.—1. The combination, with the wires of a fence, of a series of stays each formed of a doubled and twisted wire shank having coils at one end encircling one of the wires and having a loop at its other end overlapping the next adjacent wire and engaging with the shank of the next stay, one of the end stays being inverted and reversed so that one of the fence-wires is held in position between two of the said loops, substantially as described and shown.



2. The combination, with the wires of a fence, of a stay comprising a shank of twisted wires, coils at one end of the shank engaging with the top wire of the fence, and a loop at the other end of the said shank and extending under the second fence-wire; and a second similar stay having its coils engaging with the third fence-wire and its loop extending over the second fence-wire, the shank of each said stay being passed through the loop of the other stay, substantially as set forth.

602,820. GAS-ENGINE. MILTON BUCK, Racine, Wis. Filed Mar. 1, 1897. Serial No. 625,665. (No model.)

Claim.—1. In combination the crank-shaft, cylinder, connecting-rod, hollow piston provided with a convex downwardly-depending head portion, pin extending through the piston on which the connecting-rod is journaled, saucer-shaped cap for the connecting-rod and holes in the center of the same and leading through the bushing to the pin as and for the purpose specified.

2. In combination, the casing, the cylinder and the piston, the explosion-chamber, and the igniter comprising a sleeve secured in the casing, a spring-blade extending therefrom into said explosion-chamber, a second sleeve within the first and insulated therefrom, a stem journaled in the second sleeve and extending inwardly past the end of the blade and provided with a lateral extension, a pin projecting laterally from the extension adapted to contact and break contact with said blade, a connection from said stem to a battery, means for operating the stem from a crank journaled to the casing, and the spring-finger secured to the casing and insulated therefrom adapted

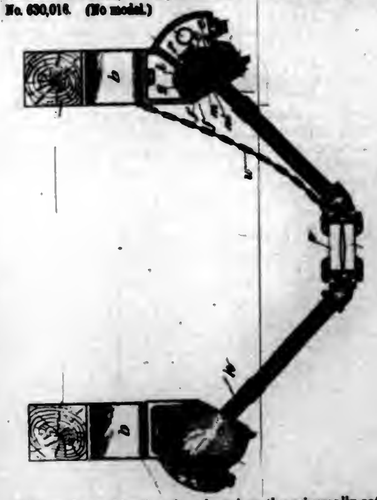
to engage with said crank and to be disengaged therefrom, substantially as described.

3. In a machine of the class described, a vaporizer provided with a cylindrical casing with suitable upper internal head and open at the bottom, an oil-pipe leading into the casing above the head, a ring of perforations above the head in the periphery and a spiral groove extending from top to bottom of the cylindrical casing, perforations in the same and an outer casing therefor situated below the vapor-supply valve as and for the purpose specified.

4. In a machine of the class described, a vaporizer provided with a cylindrical casing with suitable upper internal head and open at the bottom, an oil-pipe leading into the casing above the head, a ring of perforations above the head in the periphery, a spiral groove extending from top to bottom of the cylindrical casing, perforations in the same, an outer casing therefor situated below the vapor-supply valve and a wrapping of wicking surrounding the cylindrical casing as and for the purpose specified.

5. In a machine of the class described, a vaporizer provided with a cylindrical casing with suitable upper internal head and open at the bottom, an oil-pipe leading into the casing above the head, a ring of perforations above the head in the periphery, a spiral groove extending from top to bottom of the cylindrical casing, perforations in the same, and a trough formed around the exterior of the cylinder at the bottom and a waste-pipe leading therefrom and an outer casing therefor situated below the vapor-supply valve as and for the purpose specified.

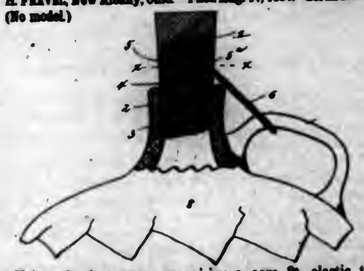
6. In combination the open-ended vaporizer, the perforations at the bottom of the casing to admit the air, the oil-supply pipe for the vaporizer, the cylindrical valve with longitudinal bottom ports, internal cylinder with corresponding ports, the ports in the outer supply-valve cylinder and inner cylinder leading into the supply-chamber and a valve connecting the supply-chamber with the explosion-chamber as and for the purpose specified.



7. In combination, the casing, the cylinder and piston, the explosion-chamber, the igniter therein, and means for operating the same, a gas-inlet into the casing, a vaporizer below said inlet, a supply-chamber, and a three-way valve in communication with the gas and vapor inlets and adapted to control the supply of the same to the supply-chamber, the inlet from the supply-chamber to the explosion-chamber, and the valve for controlling the same, substantially as described.

8. In combination, the cylinder and piston, the explosion-chamber, the exhaust therefrom, the valve for controlling the same, the supply-chamber, the inlet therefrom to the explosion-chamber, the second valve for controlling said inlets, the main and counter shafts, the L-shaped levers pivoted at one end to a fixed support and having their opposite ends bifurcated, the valve-rods depending from the valves having their lower ends positively connected to said L-shaped levers, and the roller carried by the levers adapted to be operated upon by the cams, substantially as described.

9. The combination with supply-valve and internal cylinder thereof with suitable ports as specified, of the means for positively operating the same in its opening-and-closing action comprising the stem R^3 rod R^4, governor on the main shaft and means between the governor and the rod controlling the length of the upward movement of such rod as and for the purpose specified.



10. The combination with the supply-valve and internal cylinder thereof with suitable ports as specified, of the stem R^3 rod R^4 governor on the main shaft comprising the levers V^3 pivoted on the brackets V^2 secured to the hub of the fly-wheel and having weights V^4 at one end and bent arms at the other provided with pins V', the arm V pivotally connected to the rod R^4 and provided with a sleeve-shaped end swung on the main shaft, an annular groove in the sleeve-shaped end into which the pins V' extend, an obliquely-set pin v^5 secured in the arm V designed to coact with the oblique hole v^6 made in the casing as and for the purpose specified.

602,821. STEAM-PIPE COUPLING FOR RAILWAY-CARS. CHARLES B. BENSON, Wallingford, Conn. Filed Mar. 30, 1897. Serial No. 630,016. (No model.)

Claim.— In combination, the sphere-box, the universally-rotatable sphere hung in said box with fluid-tight joints between the two, the tube adapted to have reciprocation and rotation in said sphere with fluid-tight joints between the two, and means adapted for making said sphere and tube temporarily unrotatable as to each other, all substantially as described and for the purposes set forth.

602,822. STOPPER FOR JUGS. HERMAN G. BOTTON and CHAS. H. FRAVEL, New Albany, Ohio. Filed Aug. 17, 1897. Serial No. 648,561. (No model.)

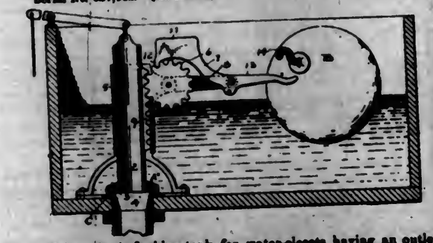
Claim.—1. A stopper comprising a core 2^2, elastic thimbles placed thereon, an eye 9 swiveled in said stopper, and a ring 6 in said eye for connecting said stopper to the handle of a jug or similar vessel.

2. A stopper comprising a core 2^2, elastic thimbles $3\ 3^2$ secured to said core, a ring 5 loose on said core having a swiveled eye 9, and a link 6 in said eye for attaching the stopper to the handle of a jug or similar vessel.

3. A stopper for jugs and similar vessels comprising two parts with means for connecting those parts so as to form a channel or groove between them, a loose ring in said groove or channel, and a loop for connecting said ring with the handle of the jug.

4. A stopper for jugs and similar vessels comprising an upper part and a lower part of elastic material with means for connecting said parts so as to form a channel or groove between them, a loose ring in said channel or groove, and a loop for connecting said ring with the handle of the vessel.

602,823. WATER-FILTER. FRED BOOK and THEODORE HUSS, Saginaw, Mich. Filed July 14, 1897. Serial No. 644,502. (No model.)



Claim.—1. A water-filter of the class described, comprising a filtering-stone, a metal cap secured on the discharge end of the stone and having a central threaded orifice, a cap for the casing inclosing the stone provided with a central orifice in line with the orifice of the metal cap of the stone, a drip-piece adapted to pass through the orifice of the casing-cap and engage the threaded orifice of the metal cap, a lug on the drip-piece adapted to press against the outside of the casing-cap and when the drip-piece is screwed in make a water-tight connection between the metal cap and the casing-cap, as described.

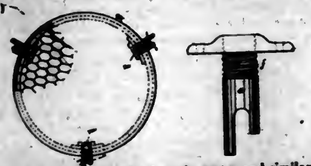
2. In a water-filter of the class described, the combination with a filtering-stone provided with a metal cap, as described, the casing-cap, and the drip-piece adapted to secure the casing-cap and the metal cap of the stone in water-tight connection, of the casing for the stone adapted to engage the casing-cap, means for making their connection water-tight, the casing provided with a central threaded bored lug upon its upper end, a coupling having one end adapted to engage the lug, the other end adapted to receive any size pipe smaller than the coupling, and means in the coupling for securing the coupling to a large or small pipe as specified.

3. In a water-filter of the class described, the coupling for securing the filter to the intake-pipe, comprising a tube adapted at one end to receive and engage the filter, the other end adapted to receive the intake-pipe of any size smaller than the coupling, a washer between the ends of the filter and intake-pipe, and means, such as set-screws, for securing the intake-pipe within the coupling, and means, such as turning the end of the filter into the coupling and against the washer for making a water-tight connection, as specified.

602,824. FLUSHING-TANK FOR WATER-CLOSETS. CHARLES P. CARROLL and JOHN I. GORMAN, Cleveland, Ohio. Filed Mar. 12, 1897. Serial No. 627,112. (No model.)

Claim.—1. A flushing-tank for water-closets having an outlet and a valve to close the same having a hollow stem, a rack on said stem and a gear engaging said rack, means to lift said valve and stem, a pawl to engage said gear and hold said valve in raised position, and a float having a projection constructed to release said pawl and allow said valve to drop to its seat, substantially as described.

2. A flushing-tank, and an outlet-valve therefor, having a hollow stem with a rack thereon supported in a casing, a pinion supported in said casing and engaging said rack, a pawl pivoted on said casing and having a counterweighted end engaging said gear, and its other end constructed to be engaged by a projection on a float to release said gear, and a float having a hook to engage said pawl when the float descends, substantially as described.



3. The tank and the tubular outlet-valve stem having a rack rigidly connected therewith, and means connected directly to said stem to raise said stem and rack together, in combination with a pinion engaging said rack and a member to engage and lock said pinion when the valve is raised and thereby hold the valve in suspended position, and a free float disconnected from said member and having a projection to engage and release said member when the float descends, substantially as described.

602,825. SPECTACLE OR EYEGLASS CASE. JOHN CASEY and MURRAY S. CHEEK, Philadelphia, Pa. Filed June 29, 1896. Serial No. 597,315. (No model.)

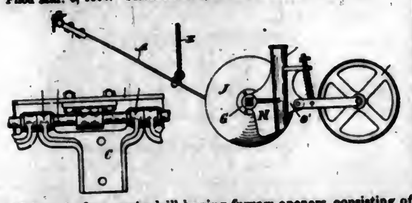
Claim.—A case consisting of a bulging body, a mouth having walls with diverging edges, and a lid hinged to said body, the sides of said lid converging from the outer edge of the same to the hinge of said lid, said hinge being straight.

602,826. FASTENER FOR BARRELS, CRATES, &c. GEORGE J. CAVE, Elizabeth, N. J. Filed Aug. 24, 1897. Serial No. 649,404. (No model.)

Claim.—1. In a fastener for barrels, crates and similar packing and storing vessels or containers, the combination with a tubular socket arranged on the said barrel or other container and having its outer end transversely slotted forming long and short lips, of a locking bolt normally lying between said lips, and having an arm entering into locking engagement with the cover of the barrel or other container, a second arm extending into the tubular socket and a spring within the said tubular socket fastened at one end to said socket and at the other end to the said bolt, substantially as set forth.

2. The combination with the package-body, of a tubular socket arranged on the walls of said body, a U-shaped locking-bolt, one prong of which is inserted into the open end of said socket and held by a spring allowing longitudinal movement of the bolt, the other prong lying outside of the package and being adapted to enter into locking relation with the cover, substantially as set forth.

3. The combination with a barrel or other package-body, of a tubular socket fitted within said package-body and threaded at its inner end, a plate correspondingly threaded to receive said tubular socket, and having means whereby it is fastened to the inner side of said package-body; the opposite end of said tubular socket being provided with long and short lips, a spring fastened within said tubular socket, and a locking-bolt having a U-shaped tongue with long and short prongs, the longer prong being arranged longitudinally within said tube and held by said spring, and the shorter prong lying outside of said tube, free to turn into and from locking engagement with the cover, substantially as herein set forth.



4. The improved fastener for barrels, &c., comprising a tubular socket projecting from the body of the barrel adjacent to the end thereof, and a bolt having an arm lying within said tubular socket and serving as a pivot upon which the bolt may be turned, and a second arm extending inward past the edge of the barrel-cover and preventing movement of the cover upward or laterally outward but allowing said cover to be opened upon the bolt as a hinge, said cover being suitably perforated near its periphery to receive said arm substantially as set forth.

5. In a fastener for barrels, the combination of a tube transversely slotted at one end forming lips, a locking-bolt lying normally in said slot between said lips and having an arm extending into locking engagement with the cover of the barrel, a second arm extending into the tube, and a spring within said tube fastened at one end to said tube and at the other end to said arm, substantially as set forth.

6. In a fastener for barrels, the combination with a tubular socket having one end transversely slotted forming lips, of a locking-bolt and a spring normally holding said bolt in said slot, the locking-bolt having an arm which extends into the tubular socket and serves as a pivot upon which the bolt may be turned when withdrawn from the slot against the power of the spring, one of said lips being longer

than the other to prevent turning of the bolt in that direction, and a second arm upon said bolt adapted to enter into locking engagement with the cover of the barrel, substantially as set forth.

602,827. SEEDING-MACHINE. EDWARD CRENSHAW, THOMAS BRENNAN, Jr., and LIVERETT W. HOMER, Louisville, Ky., assignors to the Brennan & Co. Southwestern Agricultural Works, same place. Filed Mar. 6, 1897. Serial No. 626,267. (No model.)

Claim.—1. In a grain-drill having furrow-openers consisting of concavo-convex disks rigidly attached to studs on the convex side of said disk, said stud passing through to the concave side and fitting within hubs, with drag-bars attached only to the concave side of said disks, substantially as and for the purpose described.

2. In a grain-drill, the furrow-openers consisting of concavo-convex disks attached rigidly to studs on the convex side of said disk, said stud passing through to the concave side and fitting within hubs, flat drag-bars attached only on the concave side of said disks, substantially as and for the purpose described.

3. In a grain-drill, flat spring-pressure bars attached to concavo-convex disks only on the concave side, said disks being rigidly attached to studs on the convex side, said stud passing through to the concave side of the disk, with a hub arranged for journaling same and supporting the grain-spout, substantially as and for the purpose described.

4. In a grain-drill or disk harrow, a single spring-pressure drag-bar attached to a hub receiving a stud to provide a journal for the disk on the concave side, said stud passing through to the convex side of the disk and rigidly attached thereto, substantially as and for the purpose described.

5. In a grain-drill having furrow-openers, consisting of concavo-convex disks rigidly attached to a stud on the convex side thereof, said stud passing through and entering a hub on the concave side of the disk, said hub attached to the single drag-bar, with the grain receiver or spout on the opposite or convex side of the disk, substantially as and for the purpose described.

6. In a grain-drill or disk harrow, a hub attached to the single drag-bar and receiving a stud attached to the convex side and passing through the disk and arranged to provide a journal for the disk on the concave side of said disk, a spacing-pin within said hub and rigidly clamped at one end of it to receive the stud on the concave side of the disk, substantially as and for the purpose described.

7. In a grain-drill the single drag-bar attached to a hub, a spacing-pin rigidly clamped at one end of said hub to receive the stud on the concave side of the revolving disk and to support the grain spout or receiver on the opposite or convex side of the disk, said disk rigidly attached to the stud on the convex side, substantially as and for the purpose described.

8. In a grain-drill the drag-bar attached to a hub, a spacing-pin fitting within said hub and rigidly clamped at one end, said pin being threaded at each end to receive clamping-nuts and having a small portion at each end square to hold it rigid and prevent it revolving, with a collar bearing against internal shoulders at one end of the hub, substantially as and for the purpose described.

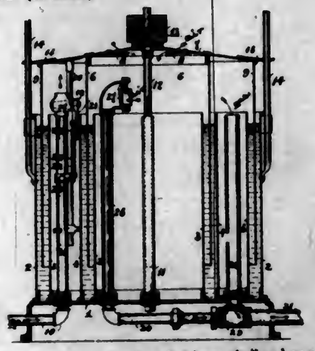
9. In a grain-drill in combination with a hub attached to the drag-bar, a spacing-pin rigidly clamped within said hub and provided with a collar at one end to bear against the internal shoulders of the hub and a shoulder at the opposite end so as to hold the disk securely in place but permit it to revolve freely, substantially as and for the purpose described.

10. In a grain-drill furrow-opener consisting of a concavo-convex disk provided with a hollow stud on its concave side adapted to fit into a hub attached to the drag-bar and revolve freely therein, a clamping-bolt or spacing-pin passing through both the hub and the stud holding them firmly together but permitting the free revolution of the disk, substantially as and for the purpose described.

11. In a grain-drill a concavo-convex disk provided on its concave side with a hollow stud adapted to fit within a hub attached to the drag-bar, a grain spout or receiver on the opposite or convex side of the disk, all these parts held together by a clamping-pin passing through them and rigidly attached to the hub but permitting the free revolution of the disk, substantially as and for the purpose described.

12. In a grain-drill provided with furrow-openers consisting of concavo-convex revolving disks, with fixed or non-revolving scrapers or supports on the concave sides of the disks; bolted at one end to the hub attached to the drag-bar and at the other to the grain-spout carrier, substantially as and for the purpose described.

13. In a grain-drill or disk harrow the drag-bars attached to the hub of the disks by an adjustable attachment consisting of the elongated opening or slot to receive the rear bolt in combination with the washer for changing the angle of the disk, substantially as and for the purpose described.

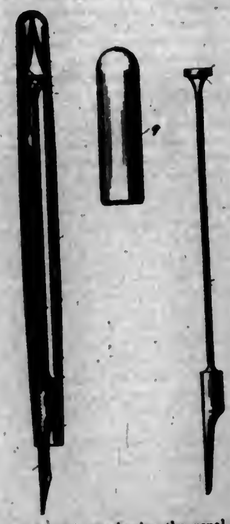


14. In a grain-drill or disk-harrow construction, a flat drag-bar under spring-pressure attached to a hub, said hub receiving a stud rigidly attached to the disk on the convex side and passing through to the concave side thereof, said drag-bar attached at one end to the hub on the concave side only of said revolving disk and at the other end pivotally attached to the frame, substantially as and for the purpose described.

15. In a grain-drill, the combination of a grain spout or receiver on the convex side of a revolving disk and attached thereto by a spacing-pin passing through the hub, a supporting-hub receiving a stud attached on the convex side of the disk on the opposite or concave side of said disk attached to the drag-bar and means for connecting said drag-bar pivotally to the frame of the drill, substantially as and for the purpose described.

16. In a grain-drill the combination of a concavo-convex disk or furrow-opener provided with a hollow stud on its concave side revolving within a hub attached to the drag-bar and on the convex side a grain spout or receiver having a forwardly-extending projection with a square or angular opening to receive the angular portion of a spacing-pin, which passes through the hub and the stud of the disk and holds the parts firmly together and in place, substantially as and for the purpose described.

17. In a grain-drill having furrow-openers consisting of concavo-convex disks carrying on the same journals grain receiver or spout, said spout provided with a lug on its rear side to which may be bolted a bracket to guide and control the pressure-wheels, substantially as and for the purpose described.



602,828. APPARATUS FOR MIXING AIR AND GAS. WILLIAM C. CLARKE, New York, N. Y., assignor to the Acetylene Apparatus Manufacturing Company, of West Virginia. Filed July 27, 1897. Serial No. 646,064. (No model.)

Claim.—1. The combination of an inner shell and an outer shell, an inner bell and an outer bell whereby are formed in connection with said shells a gas-chamber and an air-chamber, said bells adapted to be moved into and out of said shells, a gas supply for the gas-chamber, a valve for controlling said supply having means in connection with it for holding it normally open, air-valves automatically controlled for said air-chamber and adapted to be opened when the bells are moved out of the shells and a device carried by the bells for closing the valve against the means for holding it open when the bells are moved out of the shells whereby the gas-supply will be temporarily shut off and permit the bells to move into the shells again to force the air and gas out of their respective chambers to be mixed, substantially as described.

2. The combination of an inner shell and an outer shell, an inner bell and an outer bell whereby are formed a gas and an air chamber, said bells adapted to be moved into and out of said shells, a gas-supply pipe in the gas-chamber, a valve in said gas-pipe, a device supported from the dome of the gas-chamber for actuating the gas-valve, an air-eduction pipe in the air-chamber, a suction-valve therein, air-valves carried in the dome of the air-chamber opening to the atmosphere as the bells are moved out of the shells and adapted to close on the descent of the bells, which movement of the bells forces the air and gas from out their respective chambers to be mixed, substantially as described.

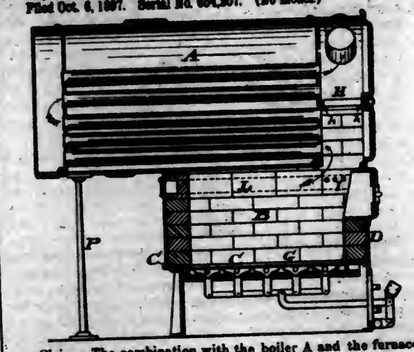
602,829. FOUNTAIN-PEN. WILLIAM P. COUPER, Washington, D. C. Filed Oct. 29, 1897. Serial No. 656,806. (No model.)

Claim.—1. A fountain-pen having the usual writing appliances at one end of the casing and having a filling-nozzle at the other end, and means for filling the reservoir through the nozzle, substantially, as described.

2. A fountain-pen having a pen-point and feeder at one end and having a nozzle at the opposite end, and having a piston within the casing for drawing the ink through the filling-nozzle and into the casing and a valve in the piston for permitting the ink to pass the piston, substantially, as described.

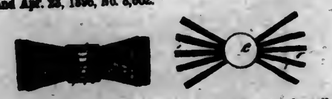
3. In a fountain-pen, the combination of a casing having a pen-point and feeder at one end, of a filling-nozzle at the opposite end of the casing, a stem secured to the feeder and extending substantially the length of the casing, a piston carried by the stem, and a valve in the piston and opening toward the stem, substantially, as described.

4. In a fountain-pen, the combination of a casing having a pen-point and feeder at one end, of a filling-nozzle at the opposite end of the casing, a stem secured to the feeder and extending substantially the length of the casing, a piston carried by the stem, a valve in the piston that opens toward the stem, a screw in the casing to limit the outward movement of the piston, substantially, as described.



5. In a fountain-pen, the combination of a casing having a pen-point and feeder at one end, and having a filling-nozzle at the opposite end, of a stem formed on the feeder, a piston on the stem, a valve in the piston that opens toward the stem and a screw in the casing to limit the outward movement of the piston, substantially, as described.

602,830. REVERSING DEVICE. JOHN W. CRAW, New York, N. Y. Filed June 12, 1897. Serial No. 640,441. (No model.)



Claim.—In the combination of an automatic reversing mechanism, having a large friction-disk and two smaller friction-disks adapted to be moved into alternate conjunction with the said large disk, a horizontal cam secured to a horizontal lying worm-gear, two arms having rollers moving on the surface of the cam, two forked levers, a longitudinally-movable rod having the roller-arms and forked levers aforesaid attached to it, a hub forming part of each of the smaller friction-disks having a circumferential groove, which said forked levers engage, for the purposes specified, substantially as illustrated and described.

602,831. HEATING-BOILER. LEWIS S. DANIELS, Cleveland, Ohio. Filed Oct. 6, 1897. Serial No. 654,207. (No model.)

Claim.—The combination with the boiler A and the furnace B, inclosed in a sheet-metal casing and supported on a metal ash-pit, and the grate G, and having the air-flues L L in the side walls, of the horizontal partition H dividing the smoke-chamber at the front of the boiler, for directing the fire rearwardly through the lower flues, thence forwardly through the upper flues, substantially as described.

602,832. INSTRUMENT FOR PREVENTING DEPOSIT ON INTERIORS OF KETTLES, &c. WILLIAM L. DAHL, London, England. Filed Dec. 24, 1897. Serial No. 663,357. (No model.) Patented in England Apr. 23, 1896, No. 8,602.

Claim.—1. The new article or instrument herein described for preventing deposit in kettles and the like consisting of loofah strips connected together at one end by a wire or string whose ends are joined to form a ring with the loofah strips projecting radially from it.

2. The new article or instrument herein described for preventing deposit in kettles and the like consisting of loofah strips connected together at one end by a wire or string whose ends are joined to form a ring with the loofah strips projecting radially from it and held in place by buttons.

602,833. PROCESS OF BURNING ACETYLENE GAS. EDWARD H. DUKENMIER, New York, N. Y. Filed Dec. 31, 1895. Serial No. 573,884. (No specimens.)

Claim.—The process of burning acetylene gas, which consists in superheating the same, before its delivery at the point of combustion, to a suitable temperature substantially as specified to prevent the deposition of carbon at the burner, substantially as described.

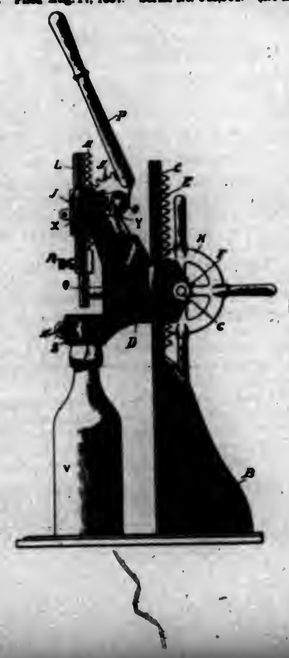
602,834. CONDENSATION PRODUCT FROM SALICYLIC AND GALLIC ACIDS. OSCAR DOEBNER, Halle-on-the-Saale, Germany, assignor to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Nov. 4, 1897. Serial No. 657,363. (Specimens.) Patented in Germany Mar. 3, 1896, No. 94,261.

Claim.—1. The process for producing a new condensation product from salicylic acid and gallic acid consisting in allowing phosphorous oxychlorid to react on a mixture of equimolecular proportions of salicylic and gallic acids which reaction may be carried out in the presence of a solvent and diluent, such as toluene, subsequently removing the formed metaphosphoric acid by pouring the mixture on ice-water, washing the thus-obtained solid mass, and drying the final product substantially as described.

2. As a new article of manufacture the new condensation product from salicylic and gallic acids having probably the formula:

being a white amorphous powder insoluble in water, ether, chloroform, soluble with readiness in caustic alkalies, being precipitated from its solution in cold caustic alkalies by the addition of acids, substantially as described.

602,885. ACETYLENE-GAS BURNER. EDWARD J. DELAR, Philadelphia, Pa., assignor, by mesne assignments, to the Acetylene House Lighting Company, of West Virginia. Filed Jan. 6, 1897. Renewed Mar. 19, 1898. Serial No. 674,535. (No model.)

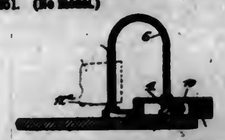


Claim.—A burner for acetylene gas, the same consisting in a body portion, having one of its ends provided with a conical tip, and radiating portions c^2, and its opposite end provided with arms, having shoulders, as described, the said body portion being provided with an internal chamber, contracted at the point of the top, and an external cap adapted to be fitted over the inner burner, said external cap being provided at its tip with an opening larger than the opening in the tip of the inner burner, and an air space or chamber between the tips of the inner and outer burners, substantially as shown and described.

602,886. BOTTLE-CAPPER AND CORK-PRESSER. ALPHONSE DOLLFUS, Philadelphia, Pa. Filed Aug. 10, 1897. Serial No. 647,712. (No model.)

Claim.—In a device of the character described, a base having ears projecting upward from the ends thereof, bridges having screw-holes therethrough extending across between the ears, a movable jaw pivoted between the ears at one end, said jaw having said pivoted end recessed, a spring coiled about the pivot-bolt, having one end bearing against the walls of the recess and the opposite end fitting against one of said bridges, means for operating said movable jaw, and dies formed in said jaws, substantially as described.

602,887. CORKING-MACHINE. ALPHONSE DOLLFUS, Philadelphia, Pa. Filed Aug. 17, 1897. Serial No. 648,501. (No model.)



Claim.—1. A machine for corking bottles consisting of a base, a standard projecting upward therefrom, guideways formed upon the upper portion of said standard, a series of teeth formed upon the upper portion, a bracket adapted to slide upon the guideways, a spindle journaled in the rear portion of the bracket, a pinion carried by said spindle and meshing with the teeth, a hand-wheel for revolving the spindle, a spring for retaining the spindle against accidental rotation, a plunger-bar fitted to slide vertically in the bracket, teeth formed upon said plunger-bar, a segmental gear journaled in the bracket and meshing with the last-named teeth, an operating-handle formed with the segmental gear, a plunger carried by the plunger-bar, a housing formed with the bracket, and a flared bushing fitted within the housing, substantially as and for the purpose set forth.

2. In combination, a base, a standard, guideways formed upon said standard, teeth E also formed upon the standard, a bracket adapted to slide upon said ways, a pinion meshing with the teeth, means for operating said pinion, a plunger-bar, teeth M formed upon said bar, a segmental gear meshing with the last-named teeth, an operating-handle formed with the segmental gear, a gage-screw carried by the bracket and adapted to limit the downward movement of the operating-handle, a plunger detachably secured within the plunger-bar, a housing formed with the bracket, and a bushing having a flared opening therethrough secured within the housing, all arranged substantially as and for the purpose set forth.

3. A machine for corking bottles consisting of an upright standard, guideways formed on the upper portion thereof, a series of teeth also formed on said upper portion, a bracket adapted to slide on the guideways, a spindle journaled in the rear portion of the bracket, a pinion carried by said spindle meshing with the teeth, a hand-wheel for operating the spindle, a spring for retaining the spindle against accidental rotation, a plunger fitted in the bracket to slide vertically and means for raising and lowering said plunger independently of the bracket, substantially as set forth.

4. In a corking-machine, a bracket, a plunger-bar slidable vertically therein, a plunger secured to the plunger-bar, a rack-bar formed on the plunger-bar, a segmental gear journaled in the bracket meshing with said rack-bar, a handle on the gear, a lug on the side of the bracket, a set-screw threaded therethrough to strike the handle, a supporting-standard on which the standard is slidably mounted, and means for raising and lowering the bracket and holding it in position, substantially as set forth.

602,888. LETTER OR MILL FILE. SEMLE DESENBERG, Chicago, Ill., assignor to William Lumley, same place. Filed Mar. 1, 1898. Serial No. 672,251. (No model.)

Claim.—1. The combination with the impaling-wires, and the vertically-pivoted transfer-wires, of a bodily-movable normally-bowed combined spring and motion-transmitter connected at its ends to the pivoted portions of said transfer-wires, substantially as set forth.

2. The combination with the impaling-wires, and the vertically-pivoted transfer-wires, of separated arms or members projecting inwardly from the pivotal portions of said transfer-wires, and an intermediate bodily-movable spring connected at its ends to said arms or members and serving to transmit the motion from one transfer-wire to the other, substantially as set forth.

3. The combination with the impaling-pins and rotatable guard-wires, of crank-arms on said guard-wires projecting toward each other, and a coil-spring having its ends inserted over and crowded between the ends of and being held in place by said crank-arms, substantially as set forth.

4. The combination with impaling-pins and rotatable guard-wires, of crank-arms on said guard-wires turned toward each other, and having stems on their inner ends, and a coiled spring having its ends inserted over said stems, and tending to force said crank-arms apart, substantially as set forth.

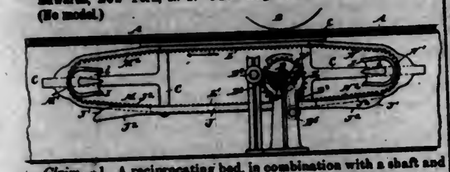
5. The combination with impaling-pins and rotatable guard-wires, of a casting having the bosses 4, in which said wires are journaled, crank-arms on said wires having their free ends bent upward, and a spring crowded between and coiled up over said ends, substantially as set forth.

602,889. SADDLE FOR BICYCLES. CHARLES S. DESPENCER, London, England, assignor, by mesne assignments, to the Rumsey Cycle Saddle Company, New York, N. Y. Filed Dec. 28, 1896. Serial No. 617,189. (No model.)

Claim.—1. The combination with a saddle or seat, of suspending-links therefor pivoted on transverse axes, so as to give a longitudinal swinging movement to the seat, and pivoted also on longitudinal axes, so as to give a transverse or lateral swinging movement, substantially as described.

2. The combination with a saddle or seat, of suspending-links therefor pivoted at one end on transverse axes to extensions from the seat, and at the other end, pivoted on both transverse and longitudinal axes to a supporting-standard, substantially as described.

3. The combination with a saddle or seat, of suspending-links therefor in front and rear, pivoted at their lower ends on a transverse axis to extensions from the seat and at their upper ends pivoted on both a longitudinal and a transverse axis to a supporting-standard, the said longitudinal axis of the front and rear links being in alinement, whereby the seat itself has a capacity for movement about a single longitudinal axis and also a longitudinal movement constituting a combination of the movements of its respective ends due to the swinging of the links by which they are individually suspended, substantially as described.



4. The combination with a saddle or seat, of extensions therefrom projecting downwardly on either side of the saddle-post, and U-shaped links jointed at their lower ends to the said projections and at their upper ends, jointed to a supporting-standard on both transverse and longitudinal axes, substantially as described.

5. The combination with a saddle or seat, of two downwardly-extending bars at each end, those at the rear being separated more widely than those at the front and suspending-links, one for each end of the seat, having their lower ends spread apart a distance corresponding to the distance between the said bars at the corresponding end of the seat and jointed thereto on transverse axes, and at their upper ends supported on a common longitudinal horizontal line about which they are free to swing laterally, and also jointed at the same ends so as to swing about transverse axes passing through their respective points of support, substantially as described.

6. The combination with a saddle or seat and bars extending downwardly therefrom, of the U-shaped links G and G' jointed at their lower ends to the said bars and at their upper ends, engaging with loops F F so as to swing freely on both horizontal and transverse axes, and wearing-pieces G^3 interposed between said links and loops, substantially as described.

7. The combination with saddle or seat A, of front and rear extensions B' and B^2, the latter being separated a wider distance apart than the former, and diagonal brace-bars B^3 joining the upper part of B' with the lower part of B^2 and curved or spread apart a distance corresponding to the separation of the bars B^2 at the rear end and the bars B' at the front end of the saddle or seat, substantially as described.

602,840. BED-MOTION FOR CYLINDER PRINTING-MACHINES. WILLIAM C. DURYEA, Mawmsburg, N. J., assignor to himself, and George Edwards, New York, N. Y. Filed Aug. 7, 1897. Serial No. 647,206. (No model.)

Claim.—1. A reciprocating bed, in combination with a shaft and two oppositely-inclined spiral gears thereon, and a rack comprising two inclined portions joined by a curved portion adapted to serve with said gears in slowing, stopping, and reversing the motion of said bed at the end of its stroke, all substantially as herein specified.

2. A reciprocating bed, in combination with a shaft, a spur-gear and two oppositely-inclined spiral gears thereon, a rack meshing with said spur-gear and serving to drive the bed through a portion of its stroke, and a rack comprising two inclined portions joined by a circular portion serving with said spiral gears in slowing, stopping, and reversing the motion of said bed at the end of its stroke, all substantially as herein specified.

3. A reciprocating bed, in combination with a shaft, a spur-gear and two oppositely-inclined spiral gears thereon, two horizontal racks, one above and the other below said spur-gear and serving with the latter to drive the bed through the middle portion of its stroke in either direction, racks comprising two inclined portions joined by a curved portion, arranged one at each end of the pair of said horizontal racks, serving with said spiral gears in slowing, stopping, and reversing the motion of said bed at each end of its stroke, all substantially as herein specified.

4. A reciprocating bed, in combination with a shaft and its bearings arranged to allow said shaft to rise and sink, a spur-gear and two oppositely-inclined spiral gears on said shaft, two horizontal racks, one above and the other below said spur-gear and serving with the latter to drive the bed through the middle portion of its stroke in either direction, racks comprising two inclined portions joined by a curved portion, arranged one at each end of the pair of said horizontal racks, serving with said spiral gears in slowing, stopping, and reversing the motion of said bed at each end of its stroke, all substantially as herein specified.

5. A reciprocating bed, in combination with a shaft, a spur-gear and two oppositely-inclined spiral gears thereon, two horizontal racks, one above and the other below said spur-gear and serving with the latter to drive the bed through the middle portion of its stroke in either direction, racks comprising two inclined portions joined by a curved portion, arranged one at each of the pair of said horizontal racks, serving with said spiral gears in slowing, stopping, and reversing the motion of said bed at each end of its stroke, and with a guide at each end serving to hold said spiral gears in proper relation to their racks, all substantially as herein specified.

6. A reciprocating bed, in combination with a shaft and its bearings arranged to allow said shaft to rise and sink, a spur-gear and two oppositely-inclined spiral gears on said shaft, two horizontal racks, one above and the other below said spur-gear and serving with the latter to drive the bed through the middle portion of its stroke in either direction, racks comprising two inclined portions joined by a curved portion, arranged one at each end of the pair of said horizontal racks, serving with said spiral gears in slowing, stopping, and reversing the motion of said bed at each end of its stroke, and with a guide at each end, an arm moving with said shaft, and a guide-rail engaged by said arm, serving with said guide to hold the shaft and its gears in proper relation to the racks, all substantially as herein specified.

7. The bed A arranged to be reciprocated in ways, in combination with the frame C carried by said bed, the horizontal racks L, L' and inclined and curved racks M, M', M^3 and N, N', N^3 mounted in said frame, the shaft D and bearing D', swinging arm D^3 supporting one end of said shaft, and the spur-gear E and spiral gears F and G carried by said shaft, all arranged to serve substantially as and for the purposes herein set forth.

8. The bed A arranged to be reciprocated in ways, in combination with the frame C carried by the said bed, the horizontal racks L, L' and inclined and curved racks M, M', M^3 and N, N', N^3 mounted in said frame, the shaft D and bearing D', swinging arm D^3 supporting one end of said shaft, and the spur-gear E and spiral gears F and G carried by said shaft, the roller H, and guide I having the groove i engaged by said roller, all arranged to serve substantially as and for the purposes herein set forth.

9. The bed A arranged to be reciprocated in ways, in combination with the frame C carried by the said bed, the horizontal racks L, L' and inclined and curved racks M, M', M^3 and N, N', N^3 mounted in said frame, the shaft D and bearing D', swinging arm D^3 supporting one end of said shaft, the spur-gear E and spiral gears F and G carried by said shaft, the roller H, guide I having the groove i engaged by said roller, the guide-rail J having inclined and curved faces J', J^3 thereon, and the roller D^4 on said swinging arm engaging said guide-rail, all arranged to serve substantially as and for the purposes herein set forth.

602,841. LACING-HOOK FOR SHOES. LEWIS F. EARL, Philadelphia, Pa. Filed May 12, 1897. Serial No. 636,167. (No model.)

Claim.—1. As a new article of manufacture, a lacing-hook consisting of a body part adapted for attachment to a shoe or garment and provided with an upwardly-extending post, in combination with a jaw of stamped sheet metal pivoted to and enveloping the upper and forward part of said post and presenting a nose which seats itself upon the body and having a shoulder or surface below the pivot to receive the lace and by which the hook is held closed.

2. As a new article of manufacture, a lacing-hook consisting of

a body part adapted for attachment to a shoe or garment and provided with an upwardly-extending post, in combination with a jaw pivoted to and enveloping the upper and forward part of said post and presenting a nose which seats itself upon the body and having a shoulder or surface below the pivot surrounding the forward part of the post to receive the lace and by which the hook is held closed, and the lace held out of contact with the post and a spring held to the body and acting upon the shoulder or lower edge of the lace-receiving surface of the jaw to hold it normally in an open position.

3. As a new article of manufacture, a lacing-hook consisting of a body part adapted for attachment to a shoe or garment and provided with an upwardly-extending post, in combination with a jaw of stamped sheet metal pivoted to the outer side of said post and presenting a nose which seats itself upon the body and having a shoulder or surface below the pivot formed by laterally-extended flanges directed toward each other in front of the post to receive the lace and by which the hook is held closed, and also clear of the post and a spring to hold the jaw normally open.

4. As a new article of manufacture, a lacing-hook consisting of a body part having an eyelet adapted for attachment to a shoe or garment and provided with an upwardly-extending post, in combination with a jaw pivoted to said post and presenting a nose which seats itself upon the body and having a shoulder or surface below the pivot to receive the lace and by which the hook is held closed, and a spring having a loop encircling the eyelet and a flat extension arranged above the body part to hold the jaw normally open.

5. As a new article of manufacture, a lacing-hook consisting of a body part adapted for attachment to a shoe or garment and provided with an upwardly-extending post, in combination with a jaw formed of stamped sheet metal bent into box shape to fit over the post and pivoted to said post on the outside and further presenting a nose which seats itself upon the body and having a shoulder or surface formed by the sides being bent inward below the pivot to surround the forward part of the post and receive the lace and by which the hook is held closed and the lace held clear of the post.

6. As a new article of manufacture, a lacing-hook consisting of a body part adapted for attachment to a shoe or garment and provided with an upwardly-extending post, in combination with a jaw formed of stamped sheet metal bent into box shape to fit over the post and pivoted to said post and further presenting a nose which seats itself upon the body and having a shoulder or surface formed by the sides being bent inward below the pivot to receive the lace and by which the hook is held closed, and a spring to hold the jaw normally open.

7. A lacing-hook consisting of the body E having the annular rim *c* and post G, in combination with the sheet-metal jaw H having its sides bent down to inclose the post and pivoted thereto and also having said sides bent inward as at I to form a surface against which the lace presses, and a spring K carried by the body and pressing upward against the part I to hold the jaw open.

8. In a lacing-hook, the combination of a body-post adapted for attachment to the garment or shoe having an upwardly-extending post, with a spring-actuated jaw extending around said post and pivoted thereto and having its nose adapted to press upon the body part when closed under the action of the shoe-lace.

9. In a lacing-hook, the combination of a body part adapted for attachment to the garment or shoe having an upwardly-extending post, with a jaw extending around said post and pivoted thereto and having a surface below its pivot for receiving the lace and having its nose adapted to press upon the body part when closed under the action of the shoe-lace, and a spring to normally hold the jaw open or in a raised position.

10. In a lacing-hook, the combination of a body part having means for attachment to the shoe or garment and an upwardly-extending post formed with pivot-pins extending from each side, with a box-shaped stamped sheet-metal jaw extending over or embracing the post and clamped in a pivoted condition upon the pins, and a spring to hold the jaw open.

11. In a lacing-hook, the combination of a body part adapted for attachment to the garment having an upright post, with a jaw formed of stamped metal enveloping and pivoted to the upper end of the post so as to shield it and having its sides extended downward to form shoulders to receive the lace at a point in front of the post and also rearward extensions to act upon the body part and limit the upward movement of the jaw.

12. In a lacing-hook, the combination of a body part adapted for attachment to the garment having an upright post, with a jaw formed of stamped metal enveloping and pivoted to the upper end of the post so as to shield it and having its sides extended downward to form shoulders to receive the lace at a point in front of the post and also rearward extensions to act upon the body part and limit the upward movement of the jaw, and a spring carried by the body part acting upon the shoulders of the jaw to normally hold it in position.

13. As a new article of manufacture, a lacing-hook consisting of a body part adapted for attachment to a shoe or garment and provided with an upwardly-extending post, in combination with a jaw pivoted to said post and presenting a nose movable to and from the body portion and having a shoulder below the pivot and forward of the post to receive and support the lace when the hook is closed, and a spring carried by the body part with the forward portion permanently held at a distance from the pivot of the jaw to permit the lace to freely pass above it under the movable nose and in front of its shoulder the said spring constantly acting upon the pivoted jaw to cause it to normally open when the tension on the lace is relieved or removed.

14. As a new article of manufacture, a lacing-hook consisting of a body part adapted for attachment to a shoe or garment and provided with an upwardly-extending post, in combination with a jaw pivoted to said post and presenting a nose movable to and from the body portion and having a shoulder below the pivot and forward of the post to receive and support the lace when the hook is closed and having an extended portion acting in connection with the body portion to limit the possible opening of the jaw under the action of the spring, and a spring carried by the body part constantly acting upon the pivoted jaw to cause it to normally open when the tension on the lace is relieved or removed.

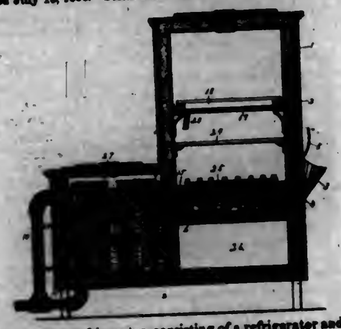
602,842. LACING-HOOK FOR SHOES, GLOVES, &c. LEWIS F. EARL, Philadelphia, Pa. Filed July 20, 1897. Serial No. 645,294. (No model.)

Claim.—1. The combination with a garment, of a lacing-hook consisting of a primary part secured to said garment near its edge and having an arched portion hinged or jointed at one end to the primary part on an axis arranged obliquely to the edge of the garment and directed toward that part of the edge first to be acted upon when lacing the garment and having its opposite end bent over and under to form a hook-shaped recess whereby the arched and hinged or jointed portion may fall down and away from the edge of the garment under the action of gravity and when unlaced present the bent edge of the hook outward.

2. The combination of a garment, with a lacing-hook consisting of a primary part secured to said garment near its edge and having an arched portion hinged or jointed at one end to the primary part on an axis arranged obliquely to the edge of the garment and having its opposite end bent over and under to form a hook-shaped recess and further provided with a lateral tongue or extension about which the lace may be wrapped to move the hook during the lacing operation.

3. As a new article of manufacture, a lacing-hook consisting of a primary part adapted to be attached to a shoe or other garment, in combination with an arched portion hinged or jointed to the primary part at one end and having its other end bent over and under to form a hook-shaped recess and further provided with a lateral tongue or extension having a downwardly-projecting flange at its extreme outer edge about which tongue the lace may be wrapped to move the hook during the lacing operation.

4. As an article of manufacture a lacing-hook for shoes and other garments consisting of an eyelet D having the flange E, the two bearings F stamped upward thereon, and interposed tongue G at one side of the eyelet located between the bearings, in combination with the arch-shaped hook H having one end provided with outwardly-extending journal-pins A adapted to the bearings F and held therein by the interposed tongue and having its other or free end bent over and under to form the hook-shaped recess S and continued laterally as at I to form a tongue or lateral projection adapted to be received upon the flange E of the eyelet.



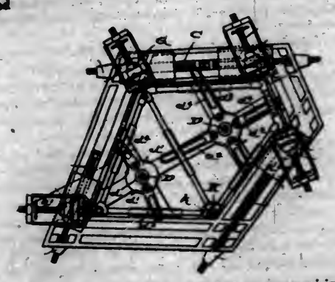
5. As an article of manufacture a lacing-hook for shoes and other garments consisting of an eyelet D having the flange E, bearings F, and interposed tongue G, in combination with the arch-shaped hook H having one end provided with journal-pins A adapted to the bearings F and having its other or free end bent over and under to form the hook-shaped recess S and continued laterally as at I to form a tongue or lateral projection adapted to be received upon the flange E of the eyelet and further having its extreme end bent downward as at *i* to extend over the edge of the said flange E of the eyelet.

6. The combination of a shoe or garment having two parts to be drawn together separated by a slit or opening the said parts being united at one end and separable toward the other and in which each part thereof is provided near its edge with a series of lacing-hooks each consisting of a primary part secured to the garment near the edge and a lacing-hook proper pivoted to the primary part on an axis arranged obliquely to edges of the garment to be drawn together and having its free end bent under to form a hook-shaped recess and also provided with a lateral extension or tongue directed obliquely away from the opening in the garment when the hook is closed.

7. The combination of a shoe or garment having two parts formed with parallel edges adapted to be drawn together at intervals from one end toward the other and in which each part thereof is provided near its edge with a series of lacing-hooks each consisting of a primary part secured to the garment and a lacing-hook proper pivoted to the primary part on an axis arranged obliquely to the edge of the garment to be drawn together and having its free end bent under to form a hook-shaped recess and also extended to form a lateral extension or tongue directed toward the portion of the opening to be finally closed and about which tongue the lace may be wrapped after being placed in the hook portion to draw the lacing-hook into locking position over the lace.

8. As a new article of manufacture, a lacing-hook consisting of a primary part furnished with means for attachment to the garment, in combination with an arched portion hinged or jointed to the primary part at one end and having its other end bent over and under to form a hook-shaped recess and further provided with a lateral tongue received directly upon the primary part to limit the movement of the said lateral projection toward the garment.

602,843. REFRIGERATOR. JOHN H. RHEES, Monmouth, Ill. Filed July 18, 1896. Serial No. 599,661. (No model.)

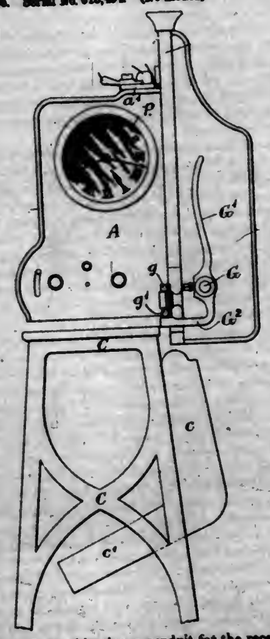


Claim.—In a refrigerator, consisting of a refrigerator and a deep-water compartment, the double, A-shaped pipe 7, connecting the refrigerator-compartment with the deep-water compartment, extending above the water, open at the top and provided with a lid, substantially as shown and described.

602,844. MACHINE FOR COMPOSING BICYCLE-FRAMES. REINHARD FELGNER, Magdeburg, Germany. Filed July 26, 1897. Serial No. 646,055. (No model.)

Claim.—1. A machine for constructing bicycle-frames comprising a base-plate, tubing-sleeves and fitting-clamps adjustably secured thereon and means for moving the clamps, substantially as described.

2. A machine for constructing bicycle-frames comprising a base-plate having ways upon the upper side, carriages sliding upon the ways and means for adjusting the same longitudinally of the sides of the base-plate, fitting-clamps adjustably secured upon the carriages, and tubing-sleeves adjustably secured upon the base-plate, substantially as described.



3. A machine for constructing bicycle-frames comprising a base-plate, ways upon the upper side thereof, carriages sliding upon the ways, fitting-clamps adjustably secured upon the carriages, standards projecting upwardly from the base-plate, disks secured upon the standards, arms pivotally secured to and projecting radially from the disks, and tubing-sleeves adjustably secured to the arms, substantially as described.

4. A machine for constructing bicycle-frames comprising a base-plate; ways upon the upper side thereof, carriages sliding upon the ways, a plate revolubly secured upon each carriage, a clamp slidingly secured upon the plate, a frame vertically adjustable in the clamp-frame, a pin arranged in the frame normally held in a projected position, a sleeve in which the pin moves and means for projecting the same independent of the pin, substantially as described.

5. A machine for constructing bicycle-frames comprising a base-plate, a stationary standard extending upwardly therefrom to receive the crank-hanger, standards projecting upwardly therefrom carrying tubing-sleeves adjustable in relation thereto, and fitting-clamps movable upon the base-plate and means for moving the same, substantially as described.

602,845. WORKMAN'S TIME-RECORDER. PETER G. GIROUD, Newark, N. J., assignor to James S. MacCoy, New York, N. Y. Filed Dec. 12, 1896. Serial No. 615,434. (No model.)

Claim.—1. In combination, a conduit for the reception of a record-slip, means for automatically placing type adjacent to the conduit, a printing-hammer in position to strike the record-slip against the type, a spring for actuating the hammer, an operating-shaft, a handle for operating the shaft, a cam for raising and discharging the hammer when the handle is moving in one direction, and a cam for partially raising the hammer when the handle is moved in the opposite direction, the said cams being under the control of the operating-shaft, substantially as set forth.

2. In combination, a conduit for the reception of a record-slip,

means for printing the slip, an adjustable stop for determining the position of the slip while being printed and an adjustable gage in an exposed position and connected with the said stop for adjusting the stop to its proper position with respect to the record-slip, substantially as set forth.

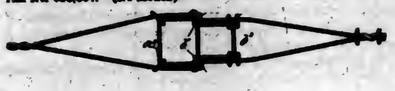
3. In combination, a conduit for the reception of a record-slip, means for printing the slip, a gate-stop for holding and releasing the slip, mechanism for retaining the gate open for a predetermined time, and means under the control of the printing mechanism for actuating the said gate-opening mechanism, substantially as set forth.

4. In combination, a conduit for the reception of a record-slip, means for printing the slip, a gate, a gate-opening device, a motor mechanism for actuating said gate-opening device and means under the control of the printing mechanism for actuating the motor mechanism substantially as set forth.

5. In combination, a conduit for the reception of a record-slip, a movable gate for stopping and releasing the slip, a rocking rod connected with the gate to open it, a spring for actuating the rod, a movable dog carried by the rod, a cam arranged to pass freely by said dog in one direction and engage the dog to operate the rocking rod when moved in the opposite direction, a printing mechanism, and means under the control of the printing mechanism for operating said cam, substantially as set forth.

6. In combination, a motor mechanism with an escapement, a conduit for the reception of a record-slip, a movable gate for stopping and releasing the slip, a gate-opening device, a cam under the control of the motor mechanism to operate the gate-opening device, a printing mechanism and means under the control of the printing mechanism for winding the motor mechanism when the printing mechanism is operated, substantially as set forth.

7. In combination, a conduit for the reception of a record-slip, a printing mechanism, an inking-ribbon, a ribbon-feeding device, an angle-lever located intermediate the printing mechanism and ribbon-feeding device and having one arm connected with the ribbon-feeding device and another arm connected with the printing mechanism, and means under the control of the printing mechanism for operating said lever when the printing mechanism operates, substantially as set forth.



8. In combination, a conduit for the reception of a record-slip, a printing mechanism, an inking-ribbon, a ribbon-feeding device, comprising a supply-roller, a pair of feed-rollers, means for moving one of said rollers, one adapted to be rotated by the other into and out of engagement with the other roller and means for imparting a rotary movement to the feed-rollers when the printing mechanism operates, substantially as set forth.

9. In combination, means for retaining a record-slip in position to be printed, type for making the impression, a lever for forcing the record-slip against the type, means for raising the said lever at intervals, means for feeding an inking-ribbon comprising a ratchet-wheel, a pawl and a swinging arm carrying the pawl, means for releasing the pawl from the ratchet-wheel at a predetermined point in its movement, and a connection between the lever-operating mechanism and the arm carrying the pawl whereby the pawl works idly during a portion of the lift of the operating-lever and operates its ratchet-wheel during another portion of the lift of the operating-lever, substantially as set forth.

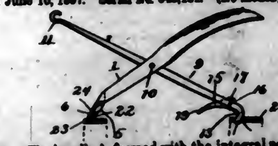
10. In combination, a casing comprising a fixed portion and a portion hinged to swing toward and away from the fixed portion, type-wheels and their actuating mechanism mounted in the fixed portion of the casing, an inking-ribbon mounted in the fixed portion of the casing, mechanism mounted in the fixed portion of the casing for feeding the ribbon, a swinging impression-platen mounted in the hinged portion of the casing, means for operating it and a connection of such form between said platen-operating means and the mechanism for feeding the inking-ribbon that the hinged portion of the casing may be swung away from the stationary portion of the casing without disconnecting operative parts, substantially as set forth.

11. In combination, a casing comprising a stationary and a hinged section, means for locking the sections in closed adjustment, a time-train and motor-train arranged one above the other within the stationary portion of the casing, type-wheels controlled by said time and motor trains arranged at the side of the casing adjacent to the hinged section, a conduit for the reception of a record-slip carried by the hinged section, a platen-operating lever mounted in said hinged section and means for operating said lever, substantially as set forth.

602,846. HINGE. HORACE D. GRADDEN, Avon, Conn., assignor of one-half to Edward Shelton, Hartford, Conn. Filed May 20, 1897. Serial No. 638,807. (No model.)

Claim.—The combination of the hinge-pin with the two hinge-halves each made of a single piece of round wire extended into a leaf, twisted into coils completely encircling said pin and also formed into a second leaf within said first-mentioned leaf and extending in the same general direction therewith, all substantially as described and for the purposes set forth.

602,847. DEVICE FOR DRAWING AIR-TUBES INTO PNEUMATIC-TIRE CASINGS. WILLIAM HERRON, Chicago, Ill., assignor to the Morgan & Wright, same place. Filed Feb. 7, 1898. Serial No. 669,213. (No model.)



Claim.—1. A device for drawing inner air-tubes into pneumatic-tire casings, comprising a holder adapted to receive an end portion of an inner air-tube and further adapted to traverse the annular bore or passage within a pneumatic-tire casing; a hitch which can be extended from one end of the holder, and caused to take a hold upon an end portion of the inner air-tube and then drawn back so as to draw such end of the inner tube within the holder; and a cord by which the hitch can be thus drawn back, substantially as set forth.

2. A device for drawing inner air-tubes into pneumatic-tire casings, comprising a holder adapted to receive an end portion of an inner air-tube and further adapted to traverse the annular bore or passage of a pneumatic-tire casing; a hitch consisting of a loop adapted for taking hold of an end portion of an inner air-tube and arranged to be both drawn out from and drawn back within the holder for the purpose set forth; and a cord by which the loop can be drawn back within the holder, substantially as described.

3. A device for drawing inner tubes into pneumatic-tire casings comprising a holder adapted to traverse the annular bore or passage of a pneumatic-tire casing and recessed back from one end to receive an end portion of an inner air-tube; a hitch comprising a loop which is threaded to slide through the opposite end of the holder and arranged to be drawn out from the receiving end of the holder so as to permit it to engage an end portion of an inner tube, and also to be drawn within the holder so as to draw the end portion of the inner tube within such holder; and a cord formed or connected with a portion of the loop which extends from the end of the holder opposite the receiving end thereof, substantially as described.

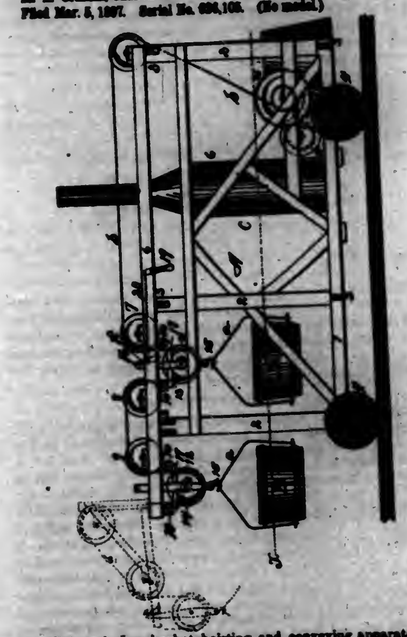
4. A device for drawing inner tubes into pneumatic-tire casings comprising a cord B provided with a loop B', and a holder A provided with a recess extending back from one end and adapted to receive an end portion of an inner tube, and further provided with bores or passages *a*, through which the loop is threaded, substantially as described.

602,848. BUTTONER. CARL J. HOLMBERG, Minneapolis, Minn. Filed June 10, 1897. Serial No. 640,181. (No model.)

Claim.—The handle 1, formed with the integral parallel arms 4 4, terminating at their outer ends in an integral shoe 5, provided with an orifice 6 and a V-shaped recess 7, in combination with the lever 9, fulcrumed between said arms, and having one end provided with an integral toe 12, having a beveled edge 13, and the trigger 14, pivoted to said lever and having its parallel arms 15 15 extending on each side of said toe, substantially as shown and described.

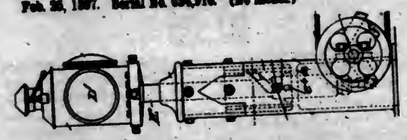
602,849. POWER-FRAME FOR PUMPS. RICHARD J. HUSTER, Goodwill Hill, Pa. Filed Aug. 5, 1897. Serial No. 647,294. (No model.)

Claim.—The combination with the vertical shaft 1, the lower bearing-box 2, and the upper bearing-box 5 provided with a series of sockets 7, of the adjustable shoes 10 10 provided with the V-shaped notches 9, the diagonal brace-rods 8 8 extending from said shoes to said bearing-box 5, and the parallel brace-rods 19 and 20, also connecting said bearing-boxes with said shoes, and each provided with a turnbuckle 21, substantially as shown and described.



602,850. NON-REFILLABLE BOTTLE. GEORGE IVORY, Huntington, Utah. Filed Dec. 10, 1896. Serial No. 615,599. (No model.)

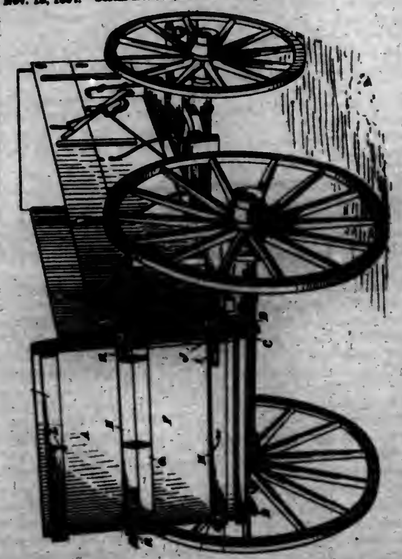
Claim.—A non-refillable bottle comprising the cylindrical neck 1, provided with the flange 2, an annular extension 3, projecting above and outwardly over the said flange, so as to form a recess between the flange and extension, said recess adapted to receive and retain an inflammable cord 5, the said extension 3 extending cylindrically within the mouth of said bottle parallel with the neck 1, and terminating in an annular shoulder 4, substantially as shown and described.



602,851. BUCKET HOISTING AND CONVEYING MACHINE. SAMUEL JACKSON, Syracuse, N. Y., assignor to George D. Granger, Martin B. Granger, Charles W. Granger, and Edwin Jackson, same place. Filed Mar. 5, 1897. Serial No. 626,105. (No model.)

Claim.—1. In a bucket hoisting and conveying apparatus, the combination of a frame mounted upon wheels, means upon said frame for rotating said wheels for the purpose of propelling the frame to and fro, buckets provided with bails, pulleys having downward-extending hooks adapted to engage with said bails, and upward-extending arms terminating in hooks, and laterally-extending arms for the purpose of limiting the upward movement of the pulleys, a rope or chain secured at one end to the forward end of the top sills of the frame, and its opposite end provided with means for winding it up, said rope or chain being adapted to engage with the pulleys for the purpose of raising and lowering them, and means for holding the said pulleys in their raised position as set forth.

2. In a bucket hoisting and conveying apparatus, the combination of a frame mounted upon wheels and having idlers suitably mounted upon top, buckets provided with bails, pulleys having downward-extending hooks adapted to engage with said bails, and upward-extending hooks adapted to engage with said bails, and arms 18 for the purpose of holding them in their raised position, a rope or chain secured at one end to the forward end of the top sill of the frame, its opposite end adapted to be wound upon a windlass and adapted to travel over said idlers and engage with the pulleys substantially as described for the purposes set forth.



602,852. POT SIGNAL. HENRY JOHNSON, Rahway, N. J. Filed Feb. 25, 1897. Serial No. 624,910. (No model.)

Claim.—1. In a signal, a vertically-movable shaft, a signal-operating shaft having an arm connected at its free end to the vertically-movable shaft, an operating-wheel carried by the signal-operating shaft for actuating the arm to raise and lower the vertically-movable shaft and a stop-arm carried by the said wheel for determining the limit of the upward movement of the vertically-movable shaft and protecting the same from shocks, substantially as set forth.

2. The combination with the vertically-movable shaft and the means for elevating it, of a cylindrical shell fixed to the shaft-support and provided with a winding groove having a straight portion at its lower end and a laterally-projecting pin carried by the shaft in position to enter the groove to rotate the shaft, substantially as set forth.

602,858. RID-GATE. WALTER H. JUHT, Audubon, Iowa. Filed Nov. 13, 1897. Serial No. 658,451. (No model.)

Claim.—1. The combination with a wagon, of a swinging end-gate therefor, a sliding bar carried thereby having a screw-threaded

rear end adapted to pass through a strap on the end-gate, a hand-nut engaging said screw-threaded end for effecting the movement of the bar, a chain secured at one end to the wagon and at its opposite end to the sliding bar and adapted to be placed in engagement with said bar at a point adjacent its attachment to the wagon, substantially as described and for the purpose stated.

2. The combination with a wagon-bed, of a swinging end-gate therefor, fastening means for said end-gate comprising a chain, one end of which is secured to the wagon-bed, an enlarged link or ring interposed in said chain at a point adjacent the said secured end, a sliding bar carried by the sides of said gate to which the other end of the chain is fastened, having on its inner end a hook adapted to be engaged by the enlarged link of the chain and having its outer end screw-threaded and adapted to pass through a strap on the end-gate, and a hand-nut engaging said screw-threaded end, substantially as described and for the purpose stated.

602,854. LUBRICATING DEVICE. CHRISTIAN H. C. KOCH, Chicago, Ill. Filed Mar. 12, 1897. Serial No. 627,199. (No model.)

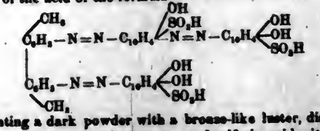
Claim.—1. A lubricating device for journals comprising two pads made of felt or the like, twisted around a supporting device, so as to form substantially cylindrical pads which present the edge or grain of the felt to the journal, the two pads twisted in opposite directions and placed in the journal-box so that the motion of the journal tends to tighten the folds of one pad and loosen the folds of the other.

2. A lubricating-pad for journals comprising two sheets of felt or the like bound together near their middle, and twisted so that the edges presenting the ends of the grain are exposed all along the surface of the pad, the pad being substantially cylindrical, and a binding device connected with said felt so as to hold the sheets in position.

3. A lubricating-pad for journals and the like, comprising one or more sheets of flexible material bound together near their middle and twisted so that the edges presenting the ends of the grain are exposed substantially along the entire surface of the pad, a binding device for holding said flexible pieces in their twisted position, the pieces adapted to be more tightly twisted so as to reduce the size and to allow the pad to be inserted in the journal-box, the tendency of said pad to untwist insuring contact of the pad with the journal.

4. A lubricating-pad for journals or the like, comprising two or more sheets of flexible material bound together near their middle and twisted so as to be formed into a cylindrical pad, the edges presenting the ends of the grain of the material being exposed and forming the surface of said pad, the parts so disposed that the size of the pad may be reduced before it is inserted in position by twisting the folds more tightly, said pad being kept in contact with the journal by the tendency of the folds to untwist.

5. A lubricating-pad for journals and the like, comprising a flexible pad made of flexible material, a holding device about which said flexible material is twisted, so that the edges of the material are presented to the journal, and a binding device for holding said flexible material in its twisted position.



602,855. BLUE-BLACK TRISAZO DYE. KARL KRENKLER and AUGUST BLANK, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Nov. 4, 1897. Serial No. 657,213. (Specimens.)

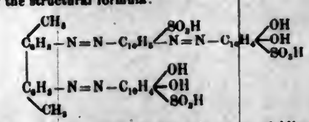
Claim.—1. The process for producing new trisazo dyestuffs by first combining in an alkaline solution one molecule of a tetrazotized paradiamin, such as benzidin, tolidin, dianisidin, with one molecule of amidonaphtholsulfo-acid G, secondly rediazotizing the resulting intermediate product and finally coupling the intermediate product thus obtained with two molecules of alpha, alpha, dioxynaphthalene alpha, monosulfo-acid, substantially as described.

2. The process for producing a new trisazo dyestuff by first coupling equimolecular proportions of a tetrazoditolyl salt and of amidonaphtholsulfo-acid G, secondly diazotizing the intermediate product thus obtained and finally combining the resulting tetrazo body with two molecules of alpha, alpha, dioxynaphthalene alpha, sulfo-acid, substantially as described.

3. As new articles of manufacture the new trisazo dyestuffs derived from the diazotized intermediate product from one molecule of a tetrazotized paradiamin, such as benzidin, tolidin, dianisidin, with one molecule of amidonaphtholsulfo-acid G by combination with two molecules of alpha, alpha, dioxynaphthalene alpha, monosulfo-acid, representing dark powders, dissolving in water with a blue color, dyeing unmordanted cotton blue shades which when treated with solutions of chromium and copper salts change into blackish blue, substantially as described.

4. As a new article of manufacture the specific dyestuff derived from the diazotized intermediate product from tetrasoditolyl and amidonaphtholsulfo-acid G by combination with two molecules of alpha, alpha, dioxynaphthalene alpha, monosulfo-acid, being an alkaline salt of the acid of the formula

representing a dark powder with a bronze-like luster, dissolving in water with a blue color, in concentrated sulfuric acid with a greenish-blue color yielding on reduction with stannous chlorid in hydrochloric-acid solution a mixture of reduction products from which tolidin and a diamidonaphtholsulfo-acid can easily be isolated, substantially as described.



602,856. BLACK TRISAZO DYE. KARL KRENKLER and ADOLF ISRAEL, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Nov. 4, 1897. Serial No. 657,330. (Specimens.) Patented in Germany Sept. 15, 1891, No. 65,262; in England Dec. 23, 1891, No. 22,641; in France Apr. 28, 1892, No. 221,233; in Italy June 30, 1892, XXVI, 32,191, and LXIII, 186, and in Austria-Hungary Oct. 3, 1892, No. 1,942 and No. 16,570.

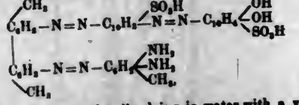
Claim.—1. The process for producing new trisazo dyestuffs by first combining one molecule of a tetrazotized paradiamin such as benzidin, tolidin, or dianisidin with one molecule of a beta-monosulfo-acid of alpha-naphthylamin such as 1.6 and 1.7, secondly diazotizing the resulting intermediate product and finally combining the tetrazo compound thus produced with two molecules of 1.8 dioxynaphthalene, 4 sulfo-acid, substantially as described.

2. The process for producing a new trisazo dyestuff by first combining equimolecular proportions of a tetrazo-ditolyl salt and a beta-monosulfo-acid of alpha-naphthylamin such as 1.6 and 1.7, secondly diazotizing the intermediate product thus obtained and finally coupling the resulting tetrazo compound with two molecules of 1.8 dioxynaphthalene, 4 monosulfo-acid, substantially as described.

3. As new articles of manufacture the trisazo dyestuffs derived from the diazotized intermediate product from one molecule of a tetrazotized paradiamin, such as benzidin, tolidin, dianisidin, with one molecule of a beta-monosulfo-acid of alpha-naphthylamin by combination with two molecules of 1.8 dioxynaphthalene, 4 sulfo-acid, representing dark powders soluble in water with blue color and yielding on unmordanted cotton blue shades which when treated with solutions of chromium and copper salts change into black, substantially as described.

4. As a new article of manufacture the specific dyestuff derived from the diazotized intermediate product from one molecule of tetrazoditolyl with one molecule of a beta-monosulfo-acid of alpha-naphthylamin by combination with two molecules of 1.8 dioxynaphthalene 4 monosulfo-acid, being an alkaline salt of an acid having most probably the structural formula:

representing a dark powder dissolving in water yielding blue solutions, soluble in concentrated sulfuric acid with a blue color from which solution a blue flaky precipitate is separated on the addition of ice, dyeing unmordanted cotton blue shades which when treated with solutions of chromium and copper salts change into black fast to washing, substantially as described.



602,857. BLACK TRISAZO DYE. KARL KRENKLER, ADOLF ISRAEL, and AUGUST BLANK, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Nov. 4, 1897. Serial No. 657,276. (Specimens.) Patented in Germany Sept. 15, 1891, No. 65,262; in England Dec. 23, 1891, No. 22,641; in France Apr. 28, 1892, No. 221,233; in Italy June 30, 1892, XXVI, 32,191, and LXIII, 186, and in Austria-Hungary Oct. 3, 1892, No. 1,942 and No. 16,570.

Claim.—1. The process for producing new trisazo dyestuffs by first combining one molecule of a tetrazotized paradiamin such as benzidin, tolidin, dianisidin, with one molecule of a beta-monosulfo-acid of alphanaphthylamin such as 1.6 and 1.7, secondly diazotizing the intermediate product thus obtained and finally coupling the resulting tetrazo compound thus obtained with one molecule of 1.8 dioxynaphthalene, 4 monosulfo-acid and finally combining the body thus produced, which contains still one free diazo group, with a metadiamin of the benzene series such as metaphenylenediamin, substantially as described.

2. The process for producing a new trisazo coloring-matter by first combining in equimolecular proportions a tetrazoditolyl salt and a beta-monosulfo-acid of alphanaphthylamin such as 1.6 and 1.7, secondly diazotizing the resulting intermediate product, thirdly coupling the tetrazo compound thus obtained with one molecule of 1.8 dioxynaphthalene, 4 monosulfo-acid and finally combining the body thus produced which contains still one free diazo group with meta-tolylenediamin, substantially as described.

3. As new article of manufacture the new trisazo dyestuffs derived from the diazotized intermediate product from a tetrazotized paradiamin such as benzidin tolidin, dianisidin, with one molecule of a beta-monosulfo-acid of alphanaphthylamin by combination with first one molecule of 1.8 dioxynaphthalene, 4 monosulfo-acid and subsequently with one molecule of a metadiamin of the benzidin series such as metaphenylenediamin, or metatolylenediamin, representing dark powders soluble in water with violet-gray to violet-black color and yielding on unmordanted cotton violet-black shades which, when treated with solutions of chromium and copper salts change into black fast to washing, substantially as described.

4. As a new article of manufacture the specific dyestuff derived from the diazotized intermediate product from one molecule of tetrazoditolyl with one molecule of a beta-monosulfo-acid of alphanaphthylamin by combination with first: one molecule of 1.8 dioxynaphthalene, 4 monosulfo-acid and subsequently with one molecule of metatolylenediamin, being an alkaline salt of an acid having most probably the formula:

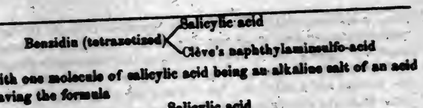
representing a dark powder dissolving in water with a violet-gray color, soluble in concentrated sulfuric acid with a blue color from which solution a violet-black precipitate is obtained on the addition of ice, yielding on unmordanted cotton violet-black shades which when treated with solutions of chromium and copper salts change into greenish-black fast to washing, substantially as described.

602,858. BROWN TRISAZO DYE. KARL KRENKLER and EDUARD MARTI, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Nov. 23, 1897. Serial No. 659,582. (Specimens.) Patented in Germany Sept. 15, 1891, No. 65,262; in England Dec. 23, 1891, No. 22,641; in France Apr. 28, 1892, No. 221,233; in Italy June 30, 1892, XXVI, 32,191, and LXIII, 186, and in Austria-Hungary Oct. 3, 1892, No. 1,942 and No. 16,570.

Claim.—1. The process for producing new trisazo dyestuffs by combining the diazo derivatives of the diazo compounds hereinbefore defined such as the combination of one molecule of tetrazodiphenyl with one molecule of salicylic acid and one molecule of Clève's naphthylaminsulfo-acid, having the general formula

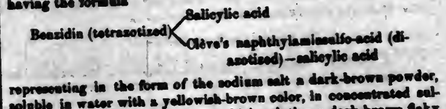
with one molecule of an orthooxycarbonic acid of the benzene series substantially as hereinbefore described.

2. The process for producing a new trisazo dyestuff by combining the diazo derivative of the body having the formula



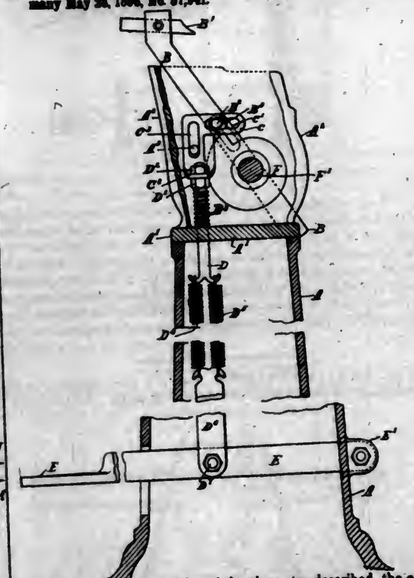
with one molecule of salicylic acid substantially as described.

3. As new articles of manufacture the new trisazo dyestuffs obtainable from the diazo derivatives of the diazo compounds, such as the combination of one molecule of tetrazodiphenyl with one molecule of salicylic acid and one molecule of Clève's naphthylaminsulfo-acid, having the general formula:



with one molecule of an orthooxycarbonic acid of the benzene series, being dark powders, soluble in water with a color varying from yellowish brown to brown, dyeing unmordanted cotton from yellowish-brown to brown shades which when treated with solutions of chromium and copper salts become more reddish brown and faster to washing and against the action of light, capable of dyeing wool in acid-baths shades similar to those produced on cotton substantially as described.

4. As a new article of manufacture the specific dyestuff obtainable from the diazo derivative of the body, having the formula:

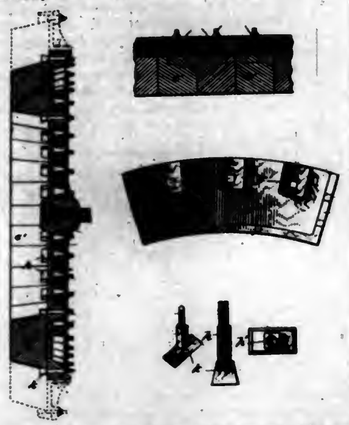


with one molecule of salicylic acid being an alkaline salt of an acid having the formula

representing in the form of the sodium salt a dark-brown powder, soluble in water with a yellowish-brown color, in concentrated sulfuric acid with a blue color from which solution a dark-brown flaky precipitate is obtained on the addition of a sufficient quantity of ice, dyeing unmordanted cotton yellowish-brown shades which when treated with solutions of chromium and copper salts become more reddish brown and faster to washing and against the action of light, yielding on wool in acid-baths yellowish-brown shades which on a treatment with chromium salts become fast against milling substantially as described.

602,859. STITCH INDENTING AND SEPARATING MACHINE. JOB LEE, Kettering, England. Filed June 22, 1896. Serial No. 596,460. (No model.) Patented in England Oct. 1, 1895, No. 18,909, and in Germany May 26, 1896, No. 87,941.

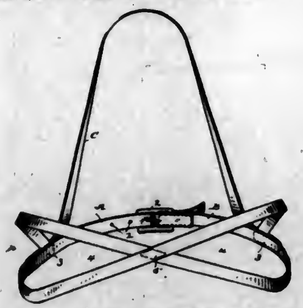
Claim.—1. In a machine of the character described, the combination with a vibrating bar, and a stitch-separating tool carried by said bar, of a treadle-lever, a yielding connection between the latter and the vibrating bar whereby a downward movement of the treadle-lever causes a similar movement of the bar but permits a movement of the latter in an opposite direction independently of the treadle-lever, a rotatable cam adapted to operate the vibrating bar as long as the treadle-lever is depressed to positively move the bar upwardly at each rotation of said cam and a spring applied and arranged to move and hold the said bar out of action when the treadle is released.



2. In a machine of the character described, the combination with a vibrating bar, and a stitch-separating tool carried thereby, of a treadle-lever, a link having a slot-and-pin connection with the vibrating bar, a yielding connection between the link and treadle-lever, a rotatable cam operating to vibrate the bar, and a spring arranged to move and hold the said bar and tool out of action when the treadle is released in the manner and for the purpose specified.

3. In a machine of the character described, the combination with a vibrating bar, and a stitch-separating tool carried thereby, of a link having a slot-and-pin connection with the bar, a rotatable cam operating to vibrate the bar as described, a treadle-lever, a yielding connection between the latter and the link, and a spring operating to raise the link and remove the bar out of operative relation with the cam when the treadle-lever is raised, all as and for the purpose specified.

4. In a machine of the character described, the combination with a vibrating bar and an indenting or separating tool carried thereby,



of a cam for moving said bar in one direction, a treadle and spring connection between the same and said bar for holding the latter to its operating-cam, the arrangement being such that said spring connection is put under tension by operating the treadle, and a spring for moving and holding the bar beyond the range of action of the cam when the treadle is released.

602,860. GRINDER. HERMANN LINDEMANN, Reichenbach, Germany. Filed May 21, 1897. Serial No. 637,502. (No model.)

Claim.—A grinder consisting of a radial disk formed with a central hub, a circumferential flange or rim extending around the outer periphery of the disk, a raised radial flange extending around the one disk, and is connected to the hub, a series of grinding-blocks secured in said disk, said blocks being held in position by wedges engaging the disk, an auxiliary disk formed in sections and adapted to be secured to the main disk to receive grinding-blocks, to increase the grinding-surface of the grinder, substantially as shown and described.

602,861. BABY-HARNESS. LUCY R. J. LYON, Bridgeport, Conn. Filed Nov. 1, 1897. Serial No. 657,006. (No model.)

Claim.—In a baby-harness, the combination with straps A and B crossing each other and secured together at the point 5 so as to form a double breast-strap, one end of each of said straps A and B being secured to its fellow at some distance from said fellow's other end so as to form apertures 4 through which the child's arms pass, a buckle 2 by means of which the free ends of straps A and B are adjustably connected, and a rein-strap or supporting-loop C having one end secured to the strap A and the other end to strap B on either side of the harness and in the rear of the arm-aperture 4, substantially as shown and described.

602,862. FINGER-GUIDE FOR MUSICAL INSTRUMENTS. PHILIP MARCUSSE, Baltimore, Md. Filed July 14, 1897. Serial No. 644,892. (No model.)

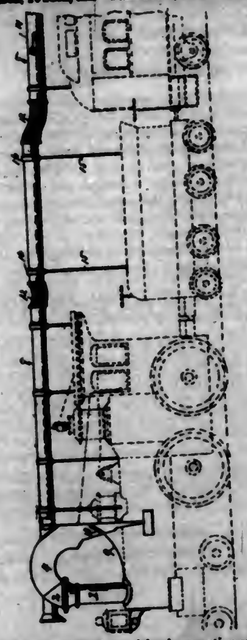
Claim.—1. A finger-board having curved lines inscribed thereon at various angles, said lines inclosing a numeral or other indicating characters, as and for the purpose described.

2. A finger-board having curved lines thereon adapted to register with the contour of the finger, when the finger is in proper position for producing a desired note.

3. A finger-board having a series of curved lines thereon adapted to register with the contour of the finger when the finger is in proper position and a second series of curved lines distinguishable from the first-named series, as and for the purpose described.

602,863. HOSE-COUPLING. FRANK H. MARSHALL, Marietta, Ohio. Filed June 3, 1897. Serial No. 639,209. (No model.)

Claim.—In a hose-coupling, the combination with a female member provided with a tabular extension adapted to be secured inside of a hose, and further provided with a conical recess therein, of a male member provided with a similar extension, a conical projection upon said male member, elastic packing carried upon said conical projection, a strap provided with convexly-curved lugs pivoted to one of said members, and lugs upon the opposing member adapted to engage said strap, substantially as described.



602,864. ROLLING-MILL. WATT D. MATTHEWS, Pittsburg, Pa., assignor of one-half to David H. Matthews, New Castle, Pa. Filed Sept. 18, 1897. Serial No. 652,204. (No model.)

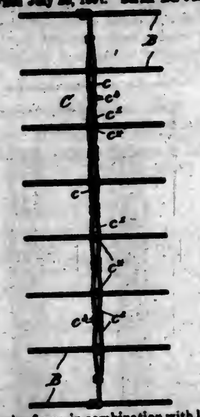
Claim.—1. The combination of a journal-bearing, a housing therefor, provided with a threaded hole for a screw, and a wedge having a slot wider inside than at its edge, a screw whose end substantially fits said slot and works in said threaded hole, whereby the turning of the screw will either push in the wedge or retract it, substantially as described.

2. The combination in a rolling-mill of a foundation for the same provided with a series of chutes 5 below the rolls to deliver the scale therefrom, solid supports between said chutes arranged under the housings to sustain the sets of rolls, a perforated plate 3 running lengthwise over the foundation to bind the same, and a trough arranged beneath said chutes to receive the scale from said chutes and provided with an outlet for the water entering the trough with the scale, all substantially as described and shown.

602,865. DEVICE FOR CARRYING OFF CINDERS AND SMOKE. ARMSTRONG P. MILLER, Baltimore, Md., assignor of one-half to Charles Philip Lawrence, Towson, Md. Filed Oct. 4, 1897. Serial No. 654,491. (No model.)

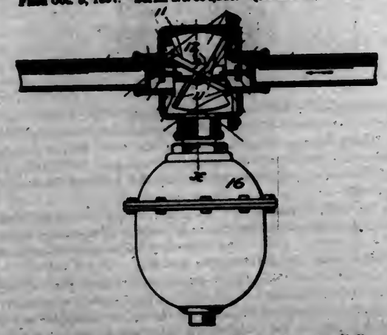
Claim.—1. The combination, with a locomotive smoke-stack of a gooseneck pivotally secured thereto at its front end, a conductor, and two receptacles communicating with the rear portion of the gooseneck, substantially as set forth.

2. The combination, with the smoke-stack of a locomotive, of an extension and a gooseneck secured thereto, the extension being provided with a bell-mouth and the rear portion of the gooseneck being bifurcated, receptacles communicating with the bifurcations, and a conductor communicating with the gooseneck above the conduits and a screen in the conductor, adjacent to the gooseneck, substantially as set forth.



3. The combination, with the smoke-stack of a locomotive, of a gooseneck pivotally secured at its front end to the upper end thereof, the rear end of which is bifurcated, of a conduit communicating with each of the bifurcations, the upper end of each conduit being provided with a head extending substantially half-way around, a receptacle at the end of each conduit, and a guide from the upper ends of said conduits for supporting the end of the gooseneck, and a conductor, communicating with the gooseneck, substantially as set forth.

602,866. MEAT-PRESS. FLORENCE M. MCKOWN, Boothbay, Me. Filed May 20, 1897. Serial No. 638,716. (No model.)



Claim.—In combination, a meat-press consisting of a receptacle for holding the meat and the pressing mechanism, said pressing mechanism consisting of a base-plate having lugs upon the under side thereof, a screw projecting upwardly therefrom, a follower-plate adapted to be placed within said receptacle, and having a hub F threaded to engage the screw, a winged nut 7 working upon said screw, and adapted to force the follower-plate downward, substantially as set forth.

602,867. WIRE FENCE. HERMAN HEIL and FRANK H. RUSSELL, Dayton, Ohio. Filed July 20, 1897. Serial No. 645,312. (No model.)

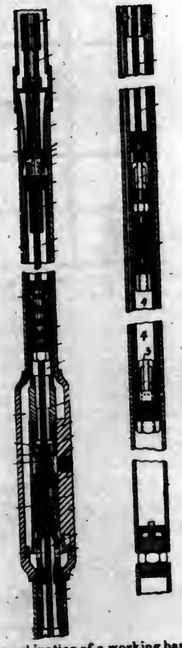
Claim.—In a wire-fence, in combination with longitudinal wires or runners, of a stay consisting of a series of linked members, of which each of the terminal members consists of a single strand having one end coiled around the upper or lower runner and the other end coiled about the body of the strand to form a loop, the complemental or intermediate links of the stay each consisting of a double-looped strand, the ends of the strand being coiled in opposite directions upon the body of the link, the links of the stays being coupled or looped together to form a substantially universal joint *e*, adapted to receive and retain an intermediate runner and to support the same in position and permitting of a vertical movement of said runner, substantially as shown and described.

602,868. STEAM-SEPARATOR. ELIS NELSON, Minneapolis, Minn. Filed Oct. 5, 1897. Serial No. 654,112. (No model.)

Claim.—1. The combination, with a series of radially-arranged inclined wings or blades, each provided with a flange 11 opposed to the passage of steam or water, of a suitable case wherein said blades are arranged and whereto the steam-pipe is connected, substantially as described.

2. The combination, with a cylindrical case, whereto the steam-pipe may be attached, of a series of inclined blades therein, and provided with deflecting-flanges 11, substantially as described.

3. The combination, with a suitable case, having a central outlet, of an annular flange arranged about the central outlet, and a series of inclined blades, provided with deflectors or flanges 11 to direct the water of condensation outward, and against the end of the case, substantially as described.



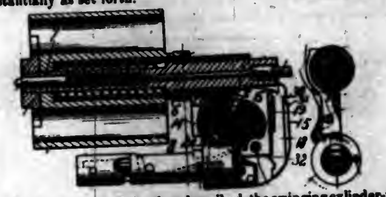
4. The combination, with a cylindrical case, of a series of rotating blades, inclined and arranged about a common axis, said blades provided on their farther edges with troughs or flanges, and said

flanges being extended from one blade to the other, as and for the purpose specified.

5. The combination, with a casing, of inclined blades arranged in said casing and provided on opposite edges with oppositely-inclined flanges 11, whereby water entering either end of the casing will be caught, substantially as described.

6. The combination, with a suitable case, of the pipe connections at opposite ends thereof, the fan-like device revoluble within said case and substantially concentric therewith, said device having inclined blades provided upon opposite edges with flanges or deflectors 11, raised flanges or troughs about said pipe connections, and a water-outlet intermediate between said pipe connections, substantially as described.

602,869. PUMP. JOSEPH O'NEIL, Taylorstown, Pa. Filed Feb. 17, 1897. Serial No. 623,793. (No model.)

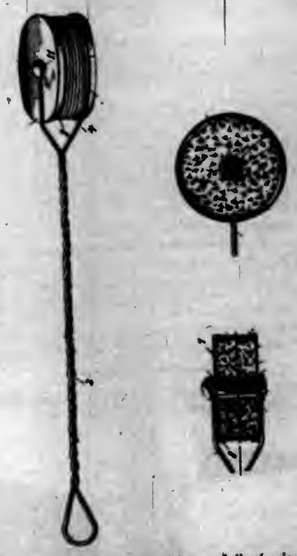


Claim.—1. The combination of a working barrel; a piston working therein; an auxiliary pump-barrel; a draft-piston working therein; a valve-rod connecting said pistons and a valve-vented chamber immediately below the draft-piston for the purpose of relieving the under side of said piston from pressure on the downward movement of the pump.

2. In pumps the combination of a double piston; a lower piston and an intermediate fluid-distributer provided with a passage to pass the fluid up the well and a valve-controlled discharge-passage to relieve the pressure beneath the upper piston.

3. In pumping devices, a lock, consisting of a base-piece; springs attached to said base-piece: a shoulder on the connecting-collar between the well-tubing and the pumping device, said shoulder engaging said springs when the pumping device is in position, and a cross-head, through which said springs pass, loosely mounted on the valve-stem, and fitted, to be forced up, and release said springs from engagement with said shoulders.

602,870. REVOLVER. GEORGE A. OWEN, Springfield, Mass. Filed Aug. 2, 1897. Serial No. 646,777. (No model.)



Claim.—1. In a revolver of the class described, the swinging cylinder-yoke and the ejector-piston, combined with a spring-actuated vibratory ejector-lever hung on said yoke, a pawl carried on said lever for engagement with said piston, means actuated by the swinging movement of said yoke in bringing the cylinder to firing position, whereby said lever is cocked and temporarily so held and said pawl is brought into engagement with said piston, and means set in action by the subsequent outwardly-swinging movement of said cylinder and yoke, whereby said lever is disengaged and said pawl is driven against, and imparts a shell-ejecting movement to said piston, substantially as set forth.

2. In a revolver of the class described, the swinging cylinder-yoke and the ejector-piston, combined with a spring-actuated vibratory ejector-lever hung on said yoke, an endwise-moving pawl carried on said lever for engagement with said piston, means actuated by the swinging movement of said yoke in bringing the cylinder to firing position, whereby said lever is cocked, and temporarily so held, and said pawl has said endwise movement imparted thereto, and is brought into engagement with said piston, and means set in action by the subsequent outwardly-swinging movement of said cylinder and yoke, whereby said lever is disengaged and said pawl is driven against, and imparts a shell-ejecting movement to, said piston, substantially as set forth.

3. In a revolver of the class described, the swinging cylinder-yoke and the spring-actuated ejector-piston, combined with a vibratory ejector-lever hung on said yoke, a sliding pawl carried on said lever for engagement with said piston, means actuated by the swinging-movement of said yoke in bringing the cylinder to a firing position whereby said lever is cocked, a spring-actuated latch pivotally attached to said yoke for automatic engagement with said lever when the same is cocked, and means for imparting said sliding movement to said pawl whereby it is brought into position for engagement with said piston, and mechanism set in action by the subsequent outwardly-swinging movement of said cylinder and yoke, whereby said lever is disengaged and said pawl is driven against, and imparts a shell-ejecting movement to, said piston, substantially as set forth.

602,871. FIRE-LIGHTER. FRANK H. FROEHLICH and STEPHEN F. DORR, Antigo, Wis. Filed Mar. 31, 1897. Serial No. 630,126. (No model.)

Claim.—A fire-lighter comprising a coil of wire, metal plates closing the ends of the coil, a fastening device connecting the plates and holding the same and the coil together, a handle provided with a forked end straddling the coil and connected to the terminals of the fastening device, a sleeve arranged on the latter and interposed between the plates, and a filling of refractory material arranged in the space between the sleeve and the coil, substantially as and for the purpose described.

602,872. PROCESS OF PRODUCING CHEMICAL COMPOUNDS BY ELECTROLYSIS. JOSEPH W. RICHARDS and CHARLES W. RENFEW, Bethlehem, Pa. Filed July 6, 1897. Serial No. 643,542. (No specimens.)

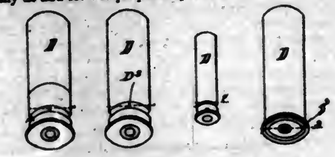
Claim.—1. The process of obtaining compounds electrolytically, which consists in passing an alternating current through electrodes of similar composition immersed in an electrolyte, one or more of whose constituents forms alternately at each electrode, by electrolytic attack thereon, a compound, partially derived from the consumption of that pole, which is insoluble in either the electrolyte or the products formed at the opposite pole for the time being, and which is precipitated from the electrode of consumption, substantially as described.

2. The process of obtaining compounds electrolytically, which consists in passing an alternating current through electrodes of similar composition immersed in an electrolyte, one or more of whose constituents forms alternately at each electrode by electrolytic attack thereon a compound, partially derived from the consumption of that pole, which is insoluble in the electrolyte, and which is precipitated from the electrode of consumption, while one product of the electrolysis at the opposite pole for the time being is a liberated gas, substantially as described.

602,873. PROCESS OF ELECTROLYTICALLY MANUFACTURING METALLIC SULFIDS. JOSEPH W. RICHARDS and CHARLES W. RENFEW, Bethlehem, Pa. Filed July 6, 1897. Serial No. 643,543. (Specimens.)

Claim.—The process of manufactering pure metallic sulfids which consists in employing an anode of or containing the metal or metals whose sulfid is desired in a solution containing a hyposulfite salt as an electrolyte in conjunction with any suitable cathode; passing a current of electricity therethrough; and precipitating the sulfid of the metallic base present in the anode, substantially as described.

602,874. PLUMB-LEVEL. THOMAS H. ROACH, Fort Wayne, Ind. Filed June 10, 1897. Serial No. 640,121. (No model.)



Claim.—1. A plumb-level having a stock with a central transverse opening through its sides; a reservoir having parallel sides of transparent material and a circular interior chamber, secured within said opening; a mobile liquid within said chamber having its upper surface coincident with the diameter of said chamber; a disk or ring having an interior circular opening and adapted to be secured over the said reservoir upon each side thereof and having a graduated scale upon the outer face of each disk; the orifice 8 for introducing the liquid within the reservoir, and means for hermetically sealing it therein; all arranged substantially as described and shown.

2. A plumb-level having a stock-body with a central transverse opening through its sides; a reservoir having parallel sides of transparent material and a circular interior chamber, secured within said opening by proper lugs; a mobile liquid within said chamber having its upper surface coincident with the diameter of said chamber; a disk having an interior circular opening secured on each side of the stock over the reservoir; a graduated scale upon the sides of the chamber within said disks; the orifice 8 and means for hermetically sealing the liquid in said chamber; all arranged substantially as described and shown.

3. A plumb-level, having a stock-body with a central transverse opening through its sides; a reservoir secured by proper lugs within said opening having parallel transparent sides and a circular interior chamber; a mobile liquid within said chamber having its upper surface coincident with the diameter thereof; a disk or rim having an interior circular opening adapted to be secured to the stock upon one side of the said reservoir, and having a graduated scale to indicate feet and inches of inclination of the stock by the registering of the liquid with the scale, and upon the other or reverse side another disk or rim having also a circular opening and adapted to be secured to the stock and having a graduated scale to indicate the inclination of the stock according to the metric system as the liquid registers therewith; the orifice 8 for introducing the liquid within the reservoir, and means for hermetically sealing it therein; all arranged substantially as described.

602,875. CARTRIDGE-SHELL. JAMES K. ROSS, Springfield, Ohio. Filed Oct. 16, 1895. Serial No. 565,945. (No model.)

Claim.—A shell having an annular depression located around the cylindrical portion of it, near to the rear end thereof, and provided with one or more passages D^2, located in said annular chamber, substantially as and for the purposes specified.

602,876. STOP-MOTION FOR SEWING-MACHINES. LOUIS SCHULTZ, New York, N. Y., assignor to Louise Schultz, same place. Filed Dec. 16, 1896. Serial No. 615,869. (No model.)

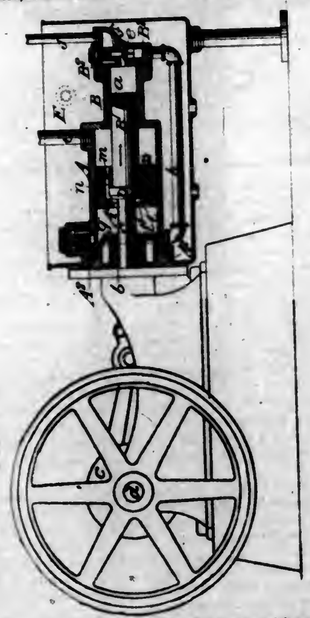
Claim.—1. The combination of a movable thread-feeler constructed to engage a thread, a lever arranged to engage the feeler, means for actuating said lever to hold the feeler stationary when the thread is slack, means for moving the feeler away from the thread when the latter breaks and disengages the feeler, a releasing or stop mechanism, and mechanism actuated by the feeler for throwing the releasing or stop mechanism into action upon the breakage of the thread, substantially as described.

2. The combination with a thread-feeler constructed to engage a thread and a releasing or stop mechanism, of a lever arranged to engage the feeler, means for throwing said lever into engagement with the feeler and hold the latter in the thread-path when the thread is slack and throw said lever out of engagement with the feeler and release the latter when the thread is taut, a spring operating to normally move the feeler away from the thread, and means engaged by the feeler when it moves away from the thread and constructed and arranged to actuate the releasing or stop mechanism, substantially as described.

3. A movable eye or thread-feeler combined with a lever or actuator for the feeler, a link and cam for causing the lever to intermittently move the feeler to the thread-path when the thread is slack and to release the feeler when the thread is tightened, a spring for moving the feeler in opposition to the lever, a releasing or stop mechanism toward which the feeler moves on being released by the lever, and means, substantially as described, for securing the cooperation of the feeler and stop mechanism.

4. A sewing-machine needle, and a thread-feeler, combined with a lever or actuator for moving the feeler to the needle-path, a stop mechanism toward which said feeler normally moves, means substantially as described for moving the lever to carry the feeler to and hold the same at the needle-path while the needle passes through said feeler and until the needle returns and clears the feeler and tightens the thread and for then moving the lever to release the feeler for allowing the latter to draw on the tightened thread so as to feel the latter substantially as described.

5. The combination with a sewing-machine, of a movable feeler having an eye for the passage therethrough of the needle and thread, a lever arranged to engage the feeler to move the same and bring its eye into coincidence with the needle, means for throwing said lever into and out of engagement with the feeler, means for retracting the feeler from the needle, a releasing or stop mechanism; and means, substantially as described, operated by the feeler when the latter is retracted for throwing the releasing or stop mechanism into action, substantially as described.



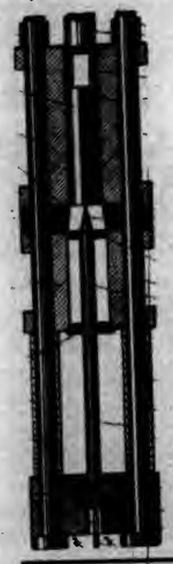
6. A sewing-machine provided with a needle shuttle-race and a shuttle, a movable eye or feeler, a lever or actuator for moving the feeler into position for the passage of the needle when the thread is slack and then releasing said feeler when the thread is tightened, a spring for moving the feeler away from the needle, a releasing or stop mechanism, and cooperating means substantially as described between the feeler and the stop mechanism substantially as described.

7. A sewing-machine provided with a shuttle, bars or guiding-rails forming a race for the shuttle, a thread eye or feeler having an arm guided by a shuttle-race rail, a lever or actuator and a spring for reciprocating the feeler-arm, and a releasing or stop mechanism and cooperating means substantially as described between the feeler-

arm and the stop mechanism, said shuttle-race rail having a throat for the passage or entrance of the needle substantially as described.

8. A sewing-machine comprising a needle, combined with a thread eye or feeler, a lever or actuator, a spring, and a releasing or stop mechanism toward which the feeler is moved by the spring, and co-operating mechanism substantially as described between the feeler and stop mechanism, said various parts being timed with relation to one another so that the lever moves the feeler into alinement with the needle and holds said feeler while the thread is slack and the point of the needle passes by and returns clear of the feeler, and the lever releases the feeler for actuation by the spring when the thread is drawn tight substantially as described.

602,877. COMPRESSOR FOR AIR, &c. HENRY C. SERGEANT, Westfield, N. J., assignor to the Ingersoll-Sergeant Drill Company, New York, N. Y. Filed June 4, 1897. Serial No. 639,417. (No model.)



Claim.—1. In a compressor the combination with two compression-cylinders and corresponding pistons of unequal caliber arranged in line, of a valve affixed to the smaller piston for opening and closing passages through the larger one by a limited movement of the smaller one relatively to the larger one, substantially as herein described.

2. In a compound compressor the combination with two compression-cylinders of unequal caliber arranged in line with each other, of two pistons on one rod fitted to said cylinders respectively, the piston of smaller caliber being affixed to the said rod, and the piston of larger caliber having passages through it and containing a valve-seat and being so attached to the smaller piston as to permit an independent movement of the one relatively to the other, a valve affixed to said rod and smaller piston and adapted to said valve-seat for opening and closing the passages through the larger piston by the movement of the smaller one, substantially as herein described.

3. The combination with the low-pressure piston having passages through it and containing a valve-seat and a stop facing said seat, of the high-pressure piston passing freely through said low-pressure piston and having affixed to it a valve located between said seat and stop and serving to open and close said passages and also to transmit motion from the high-pressure piston in opposite directions to the low-pressure piston, substantially as herein described.

602,878. MACHINE FOR MANUFACTURING METAL TUBES. THOMAS B. SHARP and FREDERICK BILLING, Birmingham, England. Filed June 23, 1897. Serial No. 641,910. (No model.) Patented in England May 31, 1897, No. 13,326.

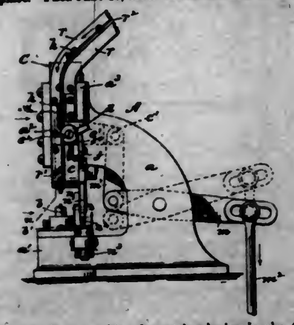
Claim.—In combination the die adapted to receive the blank, the removable end piece therefor, the guiding-cylinder, means for holding said parts together, the washers within the cylinder, the pointed piercer supported centrally of the cylinder by said washers, means for holding the piercer against longitudinal movement, and means for moving the blank against the point of the piercer, substantially as described.

602,879. CAR-COUPLING. GEORGE W. SHILLIS, Newark, N. J. Filed Apr. 20, 1897. Serial No. 633,019. (No model.)

Claim.—1. The combination with the draw-bar having the head *a'*, the knuckle fulcrumed thereon, said knuckle having an inward arm extending into said body to engage the pin and be locked thereby, of said pin having a lateral projection *g* and a lever for throwing the said knuckle to its outward or uncoupling position automatically when the pin is raised, the said lever having a limited independence of movement on its fulcrum while maintaining a constant engagement with the pin, substantially as set forth.

2. The combination with the draw-bar having a head and a knuckle fulcrumed therein, of a pin sliding in said head to and from coupling engagement with said knuckle, said pin having bearings for the knuckle-throwing lever at one side thereof, and said knuckle-throwing lever engaging both said pin and said knuckle to throw the latter open when the pin is raised, the said lever being slotted at its fulcrum to permit a limited sliding of said lever on said fulcrum and the bearings at the points of engagement of said lever with the pin being inclined to the direction of sliding movement of said pin, substantially as set forth.

3. The combination of a draw-bar, a knuckle fulcrumed thereon, a slotted lever for throwing the said knuckle outward to its uncoupled position, and a pin having a lateral projection, the upper face of which is upturned and a lever arranged on loose bearings, substantially as set forth.

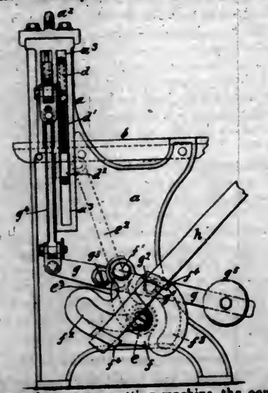


602,880. PLIERS. JOHN T. SMITH, Rock Fall, Conn.; Otis A. Smith administrator of said John T. Smith, deceased. Filed Feb. 12, 1897. Serial No. 623,068. (No model.)

Claim.—1. The combination with two handle-levers having inwardly-extending arms which are pivoted together, of two jaws pivotally attached to the outer ends of said handle-levers, said jaws each formed with differentially-spaced holes extending through their sides and fulcrum-plates adjustably secured to the opposite sides of said jaws by pins which may be passed through either of the holes in the said jaws, substantially as described.

2. The combination with two handle-levers having inwardly-extending arms which are pivoted together, of two jaws pivotally attached to the outer ends of said handle-levers, said jaws each formed with differentially-spaced holes extending through their sides, a fulcrum-plate also formed with a plurality of holes at each end, arranged in pairs and differentially spaced, and pins adapted to extend through said plates and jaws for engaging said plate with said jaws and whereby the fulcrum of the pliers may be changed, substantially as described.

602,881. MACHINE FOR SETTING LACING-HOOKS. STEPHEN N. SMITH, Providence, R. I., assignor to the Union Eyelet Company, same place. Filed June 13, 1896. Serial No. 595,268. (No model.)



Claim.—1. In a machine for setting lacing-hooks, the combination with a fixed setting-die and a stationary runway for the hooks, of a vertically-reciprocating plunger provided with a hook-guide forming a continuation of said runway, an intermittingly-revoluble feed-wheel mounted in the plunger and communicating with the runway, means for actuating said plunger and feed-wheel, and an oscillating separator controlled by the plunger's movements for transferring the hooks singly and successively from the runway to the feed-wheel, substantially as described.

2. In a machine for setting lacing-hooks, the combination with the fixed setting-die *b*, a stationary die-holder having said die adjustably mounted therein and a stationary runway for the hooks, of the revoluble hook-feeding wheel *f*, a horizontal shaft *s* having said wheel secured thereto, a vertically-reciprocating plunger carrying said shaft and wheel, a vertically-movable runway arranged below and communicating with the said stationary runway and forming an anvil with the feed-wheel for resisting the force exerted in setting the hooks, and means substantially as described for intermittingly rotating the feed-wheel, substantially as set forth.

3. In a machine for setting lacing-hooks, the combination with the stationary setting-die *b* and the fixed runway *r*, along which the lacing-hooks slide, of the vertically-reciprocating plunger member *c* provided with an auxiliary lower runway adapted to communicate with and form a continuation of said fixed runway, a revoluble feed-wheel mounted in the lower end of the plunger provided with a series of peripheral recesses *f'* arranged to receive the heads of the hooks therein and coacting with the said lower runway to form a guide for the hooks, a separator device working in a plane parallel with the face of the runway for delivering the hooks singly to the feed-wheel, and yielding stops or holders for maintaining the feed-wheel and its bottom hook in position while the latter is being attached to the boot or shoe, or other material, substantially as hereinbefore described.

4. In a machine for setting lacing-hooks, the combination with the vertically-reciprocating plunger provided with a feed-wheel and lower runway member, of the spring-resisted check-lever *w* pivoted to the plunger for holding the bottom hook in position while it is being set, and the yielding stop or catch *l* in contact with the feed-wheel, substantially as hereinbefore described.

602,882. PAPER-CUTTING MACHINE. SWAN SMITH, Brooklyn, N. Y., assignor of one-half to George Everson and Joseph W. Masters, same place. Filed July 14, 1897. Serial No. 644,572. (No model.)

Claim.—1. In a paper-cutting machine the combination of a clamp-plate with a rock-shaft connected thereto, and having a crank-arm, an eccentric pivoted thereto, a lever engaging the eccentric, and a knife connected to the lever, substantially as specified.

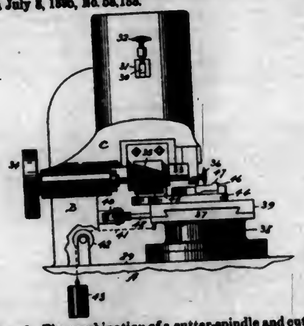
2. In a paper-cutting machine the combination of a clamp-plate with a rock-shaft connected thereto, and having a crank-arm, a slotted eccentric pivoted thereto and guided upon the rock-shaft, a lever having a pin that engages the eccentric, and a knife connected to the lever, substantially as specified.

602,883. WATER-FILTER. EMIL TYDEN, Chicago, Ill., assignor to the Metropolitan Filter Company, same place. Filed June 21, 1897. Serial No. 641,610. (No model.)

Claim.—1. In combination with a filter, a reservoir connected with the filtered-water chamber of the filter adapted to receive filtered water from the latter and to deliver the same back thereinto, and a cock for drawing water from the filtered-water chamber.

2. In a filter, in combination with a filtered-water chamber hav-

ing a cock for drawing water therefrom at the bottom; a reservoir communicating with the filtered-water chamber at the top of the latter, whereby the filtered water from said chamber overflows into the reservoir and returns by the same passage when the water is drawn from the bottom of the chamber.



3. In a filter, in combination with the water-inlet pipe, a check-valve adapted to be seated by backflow through said pipe to prevent the emptying of the filter as described.

4. In a filter, in combination with the central supply-pipe G, the filtering-cylinder H outside the same and the outer cylinder O, whereby there are formed two annular chambers F and W located respectively between the inner pipe and the filtering-cylinder and between the filtering-cylinder and the outer cylinder; the cap V which closes the chamber F at the top having a waterway through it leading from the pipe G to the outer chamber W, and a faucet leading from the lower end of said outer chamber W, whereby the drawing of water from said faucet scours the outer surface of the filtering-cylinder.

5. In a filter, in combination with the water-inlet pipe, the filtering-cylinder and the outer cylinder, the cap which closes the upper end of the chamber between the inlet-pipe and the filtering-cylinder and which has a central waterway affording communication from the pipe to the space outside the filtering-cylinder; a reservoir communicating with the upper part of the space inside the filtering-cylinder and having no communication with the space outside the same; a drain-cock leading from the lower part of the space inside the filtering-cylinder, and a faucet leading from the lower part of the space outside the cylinder, all combined and operating for the purpose set forth.

6. In a filter, in combination with the central inlet-pipe G, filtering-cylinder H and outer cylinder O and their respecting intervening chambers F and W; the cap V which closes the upper end of the chamber F, said cap having a hollow hub constituting a valve-chamber having a lower support and connected at said support to the upper end of the pipe, said chamber having an upper port through the cap, and the valve U lodged in said chamber and adapted to seat downwardly at the lower port thereof, and having its stem extending up through the upper port, and the cap B of the outer cylinder arranged to stop the end of the stem when the valve U is intermediate the upper and lower ports of the valve-chamber.

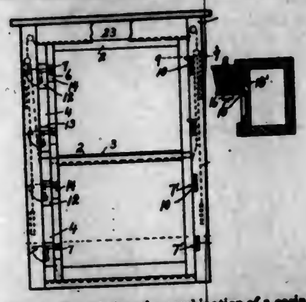
602,884. MACHINE FOR MILLING VARIABLE GROOVES IN SCREW-DIES. ANTON URBAN, Vienna, Austria-Hungary, assignor to the Russell & Erwin Manufacturing Company, New Britain, Conn. Filed Oct. 25, 1897. Serial No. 656,283. (No model.) Patented in Austria July 8, 1896, No. 58,188.

Claim.—1. The combination of a cutter-spindle and cutter mounted thereon for milling grooves, a carriage for holding the work to be milled, means for moving the carriage along relatively to the cutter and means for holding the cutter-shaft and middle line of the groove being milled at progressively-varying angles as the carriage is fed along, substantially as described.

2. The combination of a cutter-spindle and cutter mounted thereon, with a work-holding carriage, and an axis or pivot upon which the carriage and the cutter-spindle may swing relatively to each other to change the angle of the cutter-spindle to the line of the groove cut thereby, the said axis being in alinement with the junction of the spindle-axis and the edge of the cutter, substantially as described.

3. The combination of a cutter-spindle, and cutter mounted thereon with a work-holding carriage, an axis or pivot upon which the carriage and cutter-spindle may swing relatively to each other to change the angle of the cutter-spindle to the line of cut, and means for governing the distance between the axis of the cutter and surface of the die-block, substantially as described.

4. The combination of a cutter-spindle and cutter with a work-holding carriage, feeding mechanism for said carriage, an axis or pivot upon which the carriage and cutter-spindle may swing relatively to each other to change the angle of the cutter-spindle to the line of cut, driving mechanism for the cutter-spindle and feed, and flexible and sliding connections with the driving mechanism for the swinging member, substantially as described.



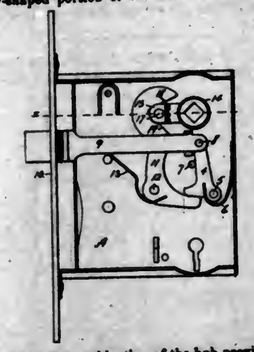
5. The combination of a cutter-frame, a cutter-spindle and cutter mounted thereon, a die-carriage bed mounted to swing on an axis which extends at right angles to the axis of the cutter-spindle, a carriage mounted to slide on said bed, a cam or wedge mounted on said carriage and a device engaging said wedge to govern the swinging movement of the carrier as it passes along under the cutter, substantially as described.

6. The combination of a cutter-frame, a cutter-spindle and cutter mounted thereon, a swinging carriage-bed, a carriage mounted to slide on said bed, feeding devices for feeding the carriage along on its bed, means for swinging the bed and carriage as the carriage is fed along, and a flexible and sliding connection between the feeding devices of the carriage and the pulley where the power is applied, substantially as described.

7. The combination of a cutter-frame, a cutter-spindle and cutter mounted thereon, a die-carriage bed mounted to swing on an axis which extends at right angles to the axis of the cutter-spindle, a carriage mounted to slide on said bed, means for swinging the carriage-bed and carriage as the carriage is fed along, and means for moving the cutter and carriage away from each other when the cutter is passing the ledge at the edge of the die-block, substantially as described.

8. The combination of a cutter-frame, a cutter-spindle and cutter mounted thereon, a die-carriage bed mounted to swing on an axis that is perpendicular to that of the cutter-spindle, the die-carriage mounted to slide on said bed, the cam or wedge mounted on said carriage, and a device for bearing on the face of said wedge or cam for swinging the bed and carriage on their axis, substantially as described.

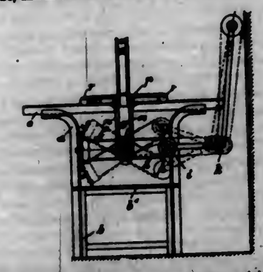
602,885. WINDOW. FRANK VETTERS, Chicago, Ill. Filed May 26, 1896. Renewed Mar. 11, 1898. Serial No. 673,541. (No model.)



Claim.—1. In a window the combination of a casing, a sash having a side made of a fixed and a separable section, said casing and fixed sash side section having each a pin, and a hook pivotally supported in the separable section and adapted to fix the separable section either to the sash side or to the casing by means of said pins, the two sash-sections being horizontally separable, substantially as described.

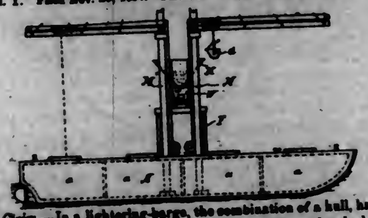
2. In a window the combination of the casing, a sash having a side made of a fixed and a separable section, said casing and fixed sash side section having each a pin, a hook pivotally supported in the separable section and adapted to fix the separable section either to the sash side or to the casing by means of said pins, the two sash-sections being horizontally separable, and a hinge on the opposite sash side, substantially as described.

3. In a window the combination of the casing, a sash having a side made of a fixed and a separable section, said casing and fixed sash side section having each a pin, a hook pivotally supported in the separable section and adapted to fix the separable section either to the sash side or to the casing by means of said pins, the two sash-sections being horizontally separable, and sash-weights connected to the detachable section and adapted to hold the hooks engaged with the pin either on the fixed sash-section or on the casing, substantially as described.



602,886. LATCH. HENRY G. VOIGT, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Dec. 16, 1897. Serial No. 662,372. (No model.)

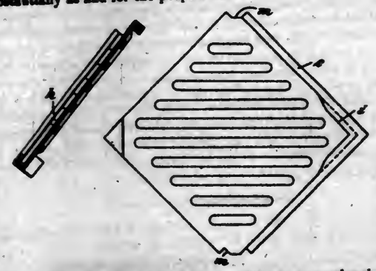
Claim.—1. The combination of the latch-bolt with the shorter lever 4 to which said latch-bolt is pivoted, a spring for said lever, the longer lever 11 acting on the lever 4 and having a V-shaped recess, a spring for said lever, and the latch-hub having a projection for engaging the V-shaped portion of the said lever 11, substantially as described.



2. In a latch, the combination of the hub provided with a wing and operating projection, with the spring-lever 11 for moving the latch-bolt through the said hub, said lever having a V-shaped recess with its two sides inclined at different angles for being engaged by the said operating projection, substantially as described.

602,887. CARVING-MACHINE. ARNOLD WAGNER, Breslau, Germany. Filed Aug. 26, 1894. Serial No. 521,502. (No model.) Patented in France Aug. 17, 1894, No. 242,807; in Germany Sept. 23, 1894, No. 83,230, and in Austria Oct. 23, 1895, No 45/3,962.

Claim.—In a machine for copying plastic articles, the combination of a middle frame adjustable in vertical and horizontal direction and adapted to swing around its horizontal axis, with a frame pivotally connected to the middle frame, and tool-holders pivotally arranged in the said frame, substantially as and for the purpose set forth.



602,888. LIGHTERING VESSEL. JOHN H. WALSH, New York, N. Y. Filed Nov. 29, 1897. Serial No. 660,094. (No model.)

Claim.—In a lightering-barge, the combination of a hull, having partitions, a stationary frame centrally secured upon the deck and carrying a hopper and a weighing-machine, two masts, each having a boom or booms carrying travelers and extending in opposite directions from their respective masts toward each end of the barge, and means for operating the working parts of the booms, as and for the purposes herein shown and described.

602,889. ROOFING-TILE. ABRAHAM WEIL, Stuttgart, Germany. Filed May 5, 1896. Serial No. 590,703. (No model.) Patented in Germany Oct. 14, 1894, No. 83,870; in England Mar. 31, 1896, No. 7,698, and in Switzerland Oct. 15, 1896, No. 12,715.

Claim.—1. In roofing-tiles the combination of the upper overlapping fillets having notched grooves, with lower overlapping fillets provided at the point where they come together with short projecting tongues *i* being plane and taking into the upper overlapping fillets, substantially as and for the purpose set forth.

2. In roofing-tiles, the combination of the upper overlapping fillets having notched grooves, with lower overlapping fillets provided at the point where they come together with short projecting tongues being plane and taking into the upper overlapping fillets, and zigzag-shaped corners engaging with the zigzag-shaped corners of the adjacent tiles, substantially as and for the purpose stated.

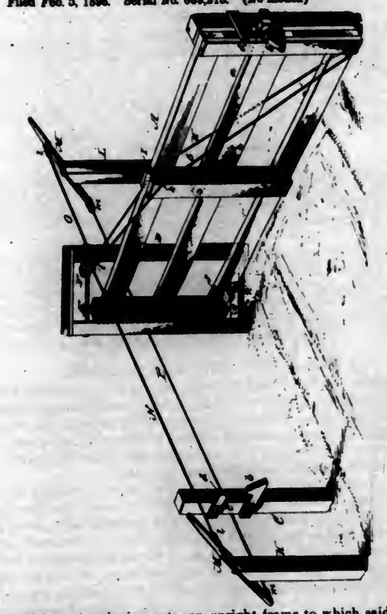
602,890. MACHINE FOR CUTTING STONE. GRÉGOIRE WIDOUX and HUBERT MACHEPY, Soignies, Belgium. Filed Jan. 27, 1897. Serial No. 620,957. (No model.) Patented in Belgium June 9, 1896, No. 121,841, and in France Oct. 17, 1896, No. 248,008.

Claim.—1. In combination with a cutting-wire, basins containing liquid for causing the descent of the wire by gravity, a counterbalance for each basin and means for lessening the weight in the basins to elevate the wire, the said basins acting to depress the wire-supports while the counterweights tend to lift the same when the weight of the basins is lessened, substantially as described.

2. In combination with a cutting-wire, basins containing liquid for causing the descent of the wire by gravity, means for lessening the weight in said basins to elevate the wire, a counterbalance-weight for each basin and the tanks in which the same are immersed, said tanks acting to diminish the weight of the counterbalance-weight during the time the basins act for depressing the wire-supports, and permitting the use of sufficient counterweight to prevent the wire-supports from falling to the floor, in case the wire becomes broken at which time the counterweight rises out of the tank.

3. In combination with the cutting-wire, depressing-weights for causing the descent of the wire by gravity, a counterbalance-weight for each depressing-weight and tanks in which the counterweights are immersed, said tanks acting to diminish the weight of the counterweights when the depressing-weights act to depress the wire-supports and permitting the use of sufficient counterweight to prevent the wire-supports from falling to the floor should the wire break at which time the counterweight would rise out of the tank.

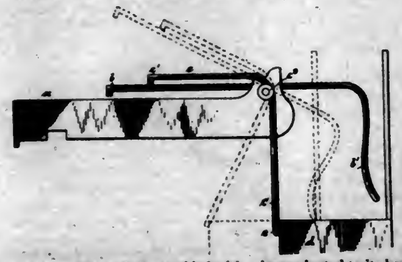
602,891. NUT-LOCK. JOHN BERRYMAN, Florissant, Colo., assignor to Henry C. Hamilton, Richard Gepson, Joseph Bowman, and Henry Trowbridge, Cripple Creek, Colo. Filed July 17, 1897. Serial No. 643,010. (No model.)



Claim.—1. A screw-bolt provided with a nut having an opening therein the walls of which converge longitudinally, and also laterally toward the bore of said nut, in combination with a key also tapering

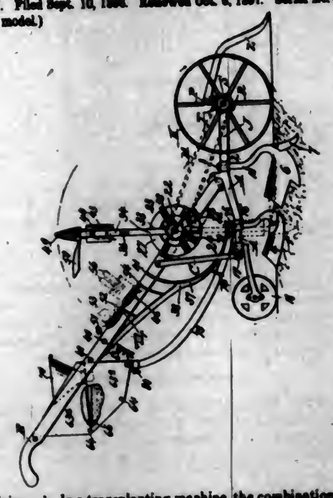
longitudinally and laterally adapted to be inserted within said opening and be wedged between and against the sides of the screw-threads of said bolt, substantially as described.

2. A screw-bolt provided with a nut having an opening provided with a longitudinally and laterally tapering key therein, the inner face of which is plane and provided with engaging edges adapted to be wedged between and against the sides of the screw-threads of said bolt and thereby lock the nut thereon, substantially as described.



3. A screw-bolt provided with a nut having an opening therein, the walls of whic converge longitudinally from end to end, and also laterally toward the bore of the nut, in combination with a key tapering longitudinally from end to end, and also laterally, the inner edge of which is squared and serrated to provide serrated engaging edges, said key adapted to be inserted within the said opening in the nut and be wedged between and against the sides of the screw-threads of the bolt, substantially as described.

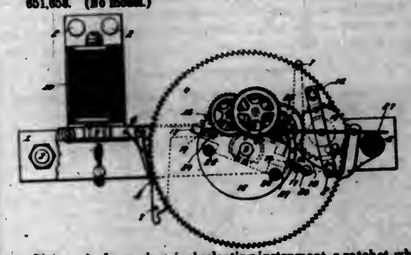
602,892. **FARM-GATE.** AUGUSTUS F. BRYA, Champaign, Ill. Filed Feb. 5, 1896. Serial No. 668,213. (No model.)



Claim.—A swinging gate, an upright frame to which said gate is pivoted and disposed at an acute angle thereto, a transverse and horizontal guide-rod connected to the frame, a grooved pulley engaging therewith, stay-rods connected to the gate and extending through eyes upon the end of a pivoted hanger and connecting with the pulley, and operating-levers, and wires connected to the levers and connecting with the pulley, substantially as and for the purpose specified.

602,893. **LOOM-FORK.** JOHN CATTERALL, New Bedford, Mass. Filed Oct. 7, 1897. Serial No. 654,476. (No model.)

Claim.—A loom-fork, provided with a lever pivoted to its body, having one of its ends adapted to bear upon the rear portion of the fork at certain times, and its opposite end projecting within the path of the "lay" of the loom, and adapted to be operated therewith, substantially as, and for the purpose described.



602,894. **TRANSPLANTER.** WILLIAM R. CHESSMAN, Freehold, N. J. Filed Sept. 10, 1896. Renewed Oct. 6, 1897. Serial No. 654,990. (No model.)

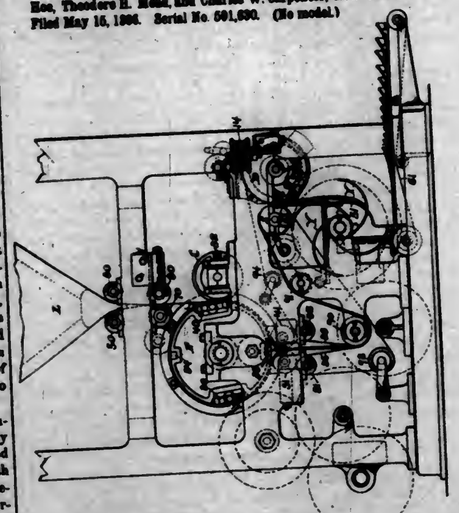
Claim.—1. In a transplanting-machine, the combination with the plant-wheel 23 the spring-fingers 34, the hollow band 27, the cap 32, the catch 31, the spokes 28 and the hollow sleeve 29 substantially as described.

2. In a transplanting-machine the combination with the plant-wheel constructed as described, the spring-fingers 34, the spreader 37, the clamp 43, the knife 44, the check-bridge 45, the bulge 46, the clamps 47, the dibber 49, the cover or scraper 50, the hollow plate or cup 51 and the needle 52 of the tank and plant-box 63 having false bottom 66, with an opening therein covered by the cap 68, the funnel 70, the rubber tube 73, the faucet 75, the suction-cap 76, the trip 79, cap 76 and spring 77 substantially as described.

602,895. **ELECTRICAL SELECTOR.** LOUIS W. CROFOOT and FRANK R. GRANGER, Aberdeen, S. D. Filed Sept. 14, 1897. Serial No. 651,658. (No model.)

Claim.—1. In an electrical selecting instrument, a ratchet-wheel, impelled by a succession of electrical impulses and provided with means for limiting its movement to one tooth at each electrical impulse, having mounted upon its surface in an eccentrical position a small gear-wheel with a coil-spring attached thereto, in combination with a partially-toothed gear-wheel mounted concentrically with, but revolving independently of, said ratchet-wheel provided with means for being held temporarily in a fixed position, with which the teeth of the small gear-wheel will engage as it is being carried around upon the ratchet-wheel, said partially-toothed gear-wheel having a sufficient number of teeth to wind up the coil-spring sufficiently to furnish the power to do the work required.

2. In an electrical selecting instrument, a ratchet-wheel impelled by a succession of electrical impulses and provided with a means for limiting its movement to one tooth at each electrical impulse, having mounted upon its surface in an eccentrical position a small gear-wheel with a coil-spring attached thereto, a partially-toothed gear-wheel, concentric with the ratchet-wheel but revolving independently, which has a hole or pocket in its surface, in combination with two trips hinged in diametrically opposite positions upon a fixed support and constantly pressed by springs against the surface of the partially-toothed gear-wheel, one or the other of said trips engaging with the hole or pocket in the partially-toothed gear-wheel for the purpose of holding it in one or the other of two diametrically opposite positions, while the small gear-wheel, as it is carried around by the ratchet-wheel, engages with its teeth and winds up the coil-spring sufficiently to furnish the power, when released, to impel the partially-toothed gear-wheel forward one-half a revolution, and a means for disengaging the trip from the hole or pocket in said partially-toothed gear-wheel whenever the ratchet-wheel reaches a point in its revolution which is when the coil-spring has been sufficiently wound up and before the teeth of the small gear-wheel escape from the teeth of the partially-toothed gear-wheel, substantially as set forth.



3. In an electrical selecting instrument, a ratchet-wheel, electrically impelled, provided with means for limiting its movement to one tooth at each electrical impulse, carrying upon its surface a small gear wheel, with coil-spring attached thereto which is wound up, as the ratchet-wheel revolves, by the engagement of the small gear-wheel with the teeth of a partially-toothed operating gear-wheel, mounted concentrically with said ratchet-wheel, but revolving independently thereof, two trips hinged to stationary supports, in diametrically opposite positions, constantly pressed by springs against the surface of said operating-wheel, and one or the other of said trips, by engagement with the operating-wheel, holding it temporarily in a fixed position, in combination with a tripping device carried upon the surface of said ratchet-wheel, which will engage with said trips, at two diametrically opposite points in its revolution, whereby said operating-wheel is released from the trip and permitted to be thrown forward one-half a revolution, by the unwinding of the coil spring, and is a series of like instruments, the ratchet-wheels of which move in unison by the same electrical impulse, the instrument selected being adjusted to operate at this particular point of the revolution of its ratchet-wheel, will perform its work without operating any of the other instruments in the circuit or system which are adjusted to operate at other points in the revolutions of their ratchet-wheels.

4. In an electrical selecting instrument, two trips hinged in diametrically opposite positions to stationary supports and constantly pressed by springs against the surface of an operating-wheel and holding the same temporarily in a fixed position, in combination with a ratchet-wheel electrically impelled, means for limiting its movement to one tooth at each electrical impulse, carrying a small gear-wheel upon its surface with coil-spring attached thereto which engages with said operating-wheel while it is held in a fixed position, and a means for engaging and disengaging with said trips at two diametrically opposite points in the revolution of said ratchet-wheel, whereby the operating-wheel is at first released from its fixed position, and a means for retarding the movement of said operating-wheel sufficiently to permit it to become reengaged with said trips when said trips are released from their engagement with said ratchet-wheel, and a means for returning said operating-wheel to its fixed position when it is disengaged from the small gear-wheel, and the coil-spring attached thereto unwinds, without the performance of any work by the selecting instrument.

5. In an electrical selecting instrument, an operating-wheel, temporarily held in a fixed position, carrying upon its surface a speed-governing mechanism which retards the revolution of said operating-wheel (when released from its fixed position) by means of a lever-arm which has one end attached to the main axis of said speed-governing mechanism and the other end has a bearing against one of two diametrically opposite fixed standards, actuating the speed-governing mechanism and retarding the revolution of said operating-wheel as it is being impelled forward, until said lever-arm passes off from its bearing; in combination with a small gear-wheel having a coil-spring attached thereto and mounted upon the surface of a ratchet-wheel electrically impelled one tooth at each electrical impulse, means for releasing said operating-wheel from its fixed position when said ratchet-wheel is stopped in its revolution at a point which will permit the selecting instrument to perform its work without affecting any other selecting instrument in the circuit or system.

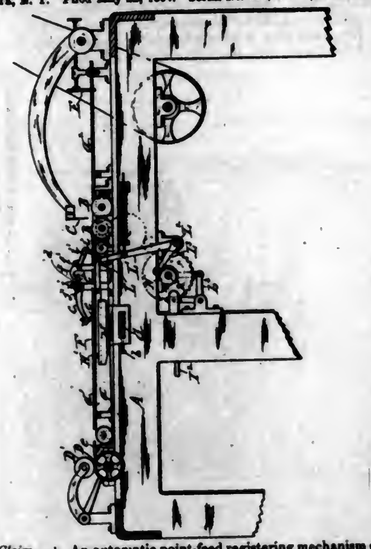
6. In an electrical selecting instrument an operating-wheel temporarily held in a fixed position, carrying upon its surface a speed-governing mechanism which retards the revolution of said operating-wheel (when released from its fixed position) by means of a lever-arm which has one end attached to the main axis of said speed-governing mechanism and the other end has a bearing against one of two diametrically opposite fixed standards, actuating the speed-governing mechanism and retarding the revolution of said operating-wheel when it is impelled forward until said lever-arm passes off from its bearing; a ratchet-wheel with pawl and retractile spring attached to the main wheel and axis of the speed-governing mechanism, which will throw said lever-arm forward to its normal position when escaping from its outward bearing, and return the operating-wheel, with its mounted mechanism, to its normal position when said lever-arm does not escape from its outward bearing; in combination with a small gear-wheel with coil-spring attached thereto, and mounted upon the surface of a ratchet-wheel electrically impelled one tooth at each electrical impulse, means for temporarily releasing said operating-wheel from its fixed position and means for stopping and restoring said operating-wheel to its fixed position when said ratchet-wheel continues to revolve beyond the point of each release and the selecting instrument performs no work.

602,896. **MEANS FOR PROTECTING NEWSPAPERS AGAINST RESALE.** LUTHER C. CROWELL, Brooklyn, N. Y., assignor to Robert Hoe, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed May 15, 1896. Serial No. 591,690. (No model.)

Claim.—The combination with folding mechanism for imparting a fold to a printed sheet, of mechanism operating to pass a metallic device through the free edges or plies of said folded sheet and clench said metallic device in place to unite said edges or plies and seal the same from being spread open, substantially as described.

602,897. **SHOE DIP AND POLISHER.** NATHAN D. DABOLL, Plainfield, N. J. Filed Mar. 22, 1897. Serial No. 628,633. (No model.)

Claim.—1. The combination in a device for the purpose specified, of a rectangular block having a front pad of yielding material, and a facing-section composed of a fabric D having the long end tongues I and side wings I^2 perforated, and the short end tongues or tabs folded, all substantially as herein specified.



2. The combination with a brush-back, of a rectangular block having a series of pins *b*, removably engaging recesses in the back, a pad B', secured to the lower surface of the latter, a facing-section composed of the fabric D, secured upon said block by having its folded tongues I and wings I^2 engaged by the pins *b*, and means as the thumb-screw C, for detachably securing the brush-back and block together, all constructed and arranged substantially as herein specified.

3. The combination with a brush back, of a rectangular block having the pad B' secured to its lower surface, a facing-section composed of the fabric D, secured upon said block by tongues I wings I^2, the pad C adapted to be interposed between the brush-back and the block, and means as the thumb-screw C for detachably securing the brush-back and block together, all constructed and arranged substantially as specified.

4. The combination in a polishing-brush, of a brush-back, a rectangular block having a yielding pad secured upon its lower surface, a facing section of fabric adapted to cover said pad and having tongues

and wings extending over the upper surface of the block, means for securing said tongues and wings, another pad adapted to be interposed between the brush-back and the block, means as a thumb-screw for detachably securing to each other, the two last-mentioned portions, and an upper dip portion similar in construction to the polisher and secured to the brush-back by a clamping-screw, all substantially as herein specified.

602,898. PAPER-REGISTERING MACHINE. TALBOT G. DEXTER, Pearl River, N. Y., assignor to the Dexter Folder Company, New York, N. Y. Filed May 22, 1897. Serial No. 637,654. (No model.)

Claim.—1. An automatic point-feed registering mechanism comprising a longitudinally-movable bed receiving upon it the paper to be registered, means for moving the paper with said bed, and a registering instrument provided with a pin or point entering the slit in the paper directly over the aforesaid bed.

2. An automatic point-feed registering mechanism comprising longitudinally-movable beds moving the paper by frictional contact, registering-points entering the slits in the paper directly over said beds, and means for releasing the paper from friction of the beds simultaneously with the entering of the points into the slits.

3. In combination with conveyers carrying the sheet into position for registering it, beds receiving the delivered sheet upon them and provided with friction-surfaces to move the sheet, mechanism imparting longitudinal movement to said beds, and registering instruments pressing the sheet into frictional contact with the beds and provided with registering-pins entering the slits in the sheet, and thereby relieving said sheet from friction of the beds, as set forth.

4. In combination with the sheet-conveyers and sheet-arresting gage, a bed projecting intermittently above the plane of said conveyers and traveling longitudinally during said projection to carry the sheet with it, and a paper-registering instrument operating on the sheet while carried by said bed, as set forth.

5. In combination with the sheet-conveyers and sheet-arresting gage, a friction-bed projecting intermittently above the plane of the conveyers and traveling during said projection parallel with the lines of the travel of the aforesaid conveyers, and a paper-registering instrument over said bed and provided with means for engaging a slit made in the paper for that purpose, as set forth.

6. In combination with the sheet-conveying tapes, an end gage alternately advancing to and receding from its sheet-arresting position, longitudinally-movable beds receiving upon them the arrested sheet, means for moving the sheet with the beds, and registering instruments directly over the beds and provided with means for engaging slits made in the paper for that purpose, as set forth.

7. In combination with the folding-rollers, sheet-conveying tapes and sheet-arresting gage, beds projecting intermittently above the plane of said tapes and moving longitudinally during its projection, and registering instruments over said beds and moving to and from the same and provided with registering-pins inclined to enter into slits in the paper while moving with the beds and to release the paper during its passage through the bite of the folding-rollers.

8. In combination with the folding-rollers, sheet-conveying tapes and sheet arresting gage, longitudinally-movable beds projecting intermittently above the plane of the tapes, mechanism imparting reciprocating motion to said beds, registering instruments over said beds and movable to and from the same, registering-pins attached to said instruments, and mechanism lifting the registering instruments successively-increased distances from the beds to release the registered sheet and to permit free passage of the succeeding sheet.

9. In combination with the sheet-conveying tapes and sheet-arresting gage, longitudinally-moving slides beneath the plane of the tapes, elastic friction-beds mounted on said slides, mechanism shifting the planes of the tapes in relation to the slides and causing the latter to carry the beds intermittently above said plane, mechanisms moving the slides reverse from the travel of the tapes during the aforesaid projection of the beds, and registering instruments bearing on the sheet carried on the said projecting beds, as set forth.

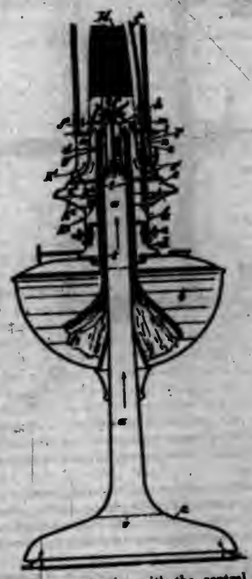
10. In combination with the main frame and sheet-conveying tapes, a bar extending across the machine beneath the tapes and fastened to the aforesaid frame, shoes secured to said bar adjustably toward and from the central line of travel of the paper carried on the tapes, longitudinally-movable slides riding in said shoes, friction-beds mounted on said slides, mechanism shifting the plane of the paper in relation to that of the said beds and causing the latter to project intermittently above the aforesaid plane, mechanisms moving the slides reverse from the travel of the tapes during the aforesaid projection of the beds, and registering instruments bearing on the sheet carried on the projecting beds, as set forth.

11. In combination with the main frame and sheet-conveying tapes, a bar extending across the machine beneath the tapes and secured to the frame, shoes attached longitudinally adjustable to said bar, longitudinally-movable slides riding in said shoes, soft-rubber beds mounted on said slides, mechanisms shifting the plane of the tapes and causing the aforesaid beds to intermittently project above said plane, mechanisms moving the slides reverse from the travel of the tapes during the aforesaid projection of the beds, and registering instruments supported over the tapes adjustably to conform to the adjustment of the slides and movable to and from the beds, and mechanism actuating the registering instruments to bear on the sheet carried on the projecting beds, as set forth.

12. In combination with the main frame, sheet-conveying tapes and sheet-arresting gage, a transverse bar beneath said tapes and secured to the main frame, shoes mounted on said cross-bar adjustably in relation to the distance between the shoes, slides riding in said shoes, friction-beds mounted on said slides, mechanism intermittently raising and lowering the tapes to planes above and beneath the plane of the aforesaid bed, mechanism imparting to the aforesaid slides a longitudinal movement, a shaft extending across the machine above the plane of the beds, registering-arms mounted on said shaft adjustably to conform to the positions of the aforesaid beds and operating on the sheet directly over the beds, a rock-shaft parallel with the aforesaid shaft, cams secured to said rock-shaft adjustably to conform to the positions of the registering-arms and imparting oscillatory motion to said arms, and mechanism actuating said rock-shaft, as set forth.

13. In combination with the sheet-carrying bars and the gage alternately advancing to and receding from its sheet-arresting position, a bed immediately below the plane of the sheet-carrying bars and moving in unison with said gage, and a point-feed registering instrument operating upon the sheet directly over said bed, as set forth.

14. In combination with the alternately advancing and receding sheet-arresting gage, vertically-movable frames, tape-roller shafts pivoted to said frames to carry the tapes intermittently to and from their sheet-conveying position, longitudinally-movable beds immediately under the plane of the sheet-carrying bars and moving in unison with the aforesaid gage, and point-feed registering instruments operating on the sheet directly over said beds, as set forth.



15. In combination with the main frame, alternately advancing and receding sheet-arresting gage and its supporting-bars moving correspondingly, a transverse bar secured to the main frame, shoes mounted on said transverse bar, longitudinally-movable slides supported on said shoes and connected to the aforesaid gage-supporting bars to move in unison therewith, friction-beds mounted on said slides, vertically-movable frames, and the tape-roller shafts pivoted to said frames to carry the tapes to and from their sheet-conveying position, as set forth.

602,899. MARSHMALLOW-RUNNER. RALPH W. DOUGLAS, St. Joseph, Mo. Filed Nov. 5, 1896. Serial No. 611,107. (No model.)

Claim.—The combination in a marshmallow-runner of the waterproof bag A, metal runner B having projections or flanges F and H and nozzles C C, strips J J having flanges K K, cut-off slide D having openings E E in bottom and turned edges L L to operate in the flanges K K, spring N and loop O and lever P pivoted on fulcrum R and engaging the loop T on slide of the runner and handle M, by which to operate said slide, substantially as, and for the purposes set forth.

602,900. PETROLEUM-LAMP FOR INCANDESCENT LIGHTS. ARTHUR DUFFEK, Vienna, Austria-Hungary, assignor of one-half to Johann Kahn, same place. Filed Apr. 15, 1897. Serial No. 632,203. (No model.)

Claim.—1. The combination with the central draft-tube contracted at its outlet, of a smaller tube arranged axially in and extending above the outlet of said draft-tube, and deflecting devices for deflecting the air issuing from the draft and smaller tubes laterally and downwardly, respectively, for the purpose set forth.

2. The combination with the central draft-tube contracted at its outlet, and a smaller tube arranged axially in and extending above said draft-tube and a deflector at the outlet of the smaller tube provided with perforations and having a convex upper face and diverging concave deflecting-surfaces on its under side, of the concave-convex auxiliary deflector *p*, substantially as and for the purpose set forth.

3. The combination with a central-draft wick-burner and means for dividing the body of air issuing from the central draft-passage and diverting a portion thereof laterally across the upper end, and another portion downwardly toward said burner; of a gallery provided with a conical cap of greater diameter than and projecting above the burner, said gallery provided with air-inlet ports below its cap and with radial air-passages opening into said cap near the upper open end thereof, for the purpose set forth.

4. The combination with a central-draft wick-burner, and means for dividing the body of air issuing from the central draft-passage and diverting one portion laterally across the upper end, and another portion downwardly toward said burner; of a gallery provided with air-inlet ports and with a conical cap of greater diameter than and projecting above the burner, an open-top air-chamber provided with air-inlet ports surrounding said cap and communicating with the gallery, and radial air-passages extending through said open-top air-chamber and leading to the aforesaid cap, for the purpose set forth.

602,901. SNOW-GUARD. HENRY M. HOLLIS, Boston, Mass. Filed Mar. 8, 1897. Serial No. 626,366. (No model.)

Claim.—1. A wire snow-guard having at one end a foot to extend and be held frictionally beneath the longitudinal edge of a slate or shingle, and bent to form a snow-stop laterally offset from said foot, the other end of the guard acting as a brace against torsion of the snow-stop, said ends cooperating to automatically lock the guard in place, substantially as described.

2. A snow-guard formed of a single piece of wire having one end flattened and turned laterally to extend and be held frictionally beneath the longitudinal edge of a slate or shingle, and bent to form a laterally-offset loop-like snow-stop, the other end of the guard entering between adjacent slates or shingles, the said ends acting to automatically lock the guard in place, substantially as described.

3. A wire snow-guard having at one end a foot to extend and be held beneath the longitudinal edge of a slate or shingle, and bent between its ends to form a snow-stop laterally offset from said foot, and oblique to the direction of pressure thereupon, the other end of the guard acting as a brace against torsion of the snow-stop, and automatically locking the guard in place, substantially as described.

4. A snow-guard made of a single piece of wire bent between its ends to form an upturned loop-like snow-stop, the ends of the wire being flattened and bent oppositely to extend beneath the longitudinal edges of adjacent slates or shingles, the snow stop being oblique to the direction of pressure, substantially as described.

5. A wire snow-guard bent between its ends to form an upturned loop-like snow-stop, the ends of the wire being flattened and bent oppositely to extend beneath the longitudinal edges of adjacent slates or shingles, the snow-stop acting to normally press the ends in opposite directions, substantially as described.

602,902. REVERSIBLE-BLADE PROPELLER. CHARLES W. PUSTER, New Haven, Conn. Filed Dec. 15, 1896. Serial No. 615,706. (No model.)

Claim.—1. In a reversible-blade propeller mechanism, a wheel-hub divided longitudinally into a plurality of sections, a blade piv-

otally supported in each of said sections, a screw-cap engaging the threaded outer end of said hub, and a spanner-nut, engaging the inner end thereof, substantially as and for the purpose described.

2. In a reversible-blade propeller mechanism, a wheel-hub divided longitudinally into a plurality of sections each of which sections is provided with a blade-opening and with a boss surrounding said opening at the outer side thereof, combined with a plurality of blades each of which is provided with a shank which enters one of the openings in said hub and with a flange which bears against the boss adjacent to said opening, substantially as described.

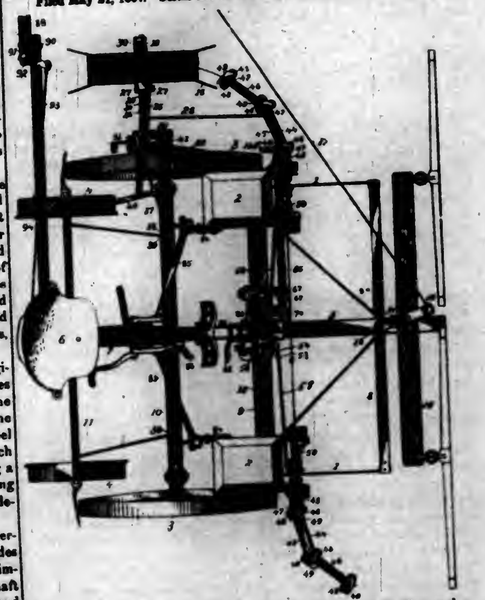
3. In a reversible blade propeller mechanism, the combination with a wheel-hub and a plurality of blades revolubly seated in said hub, of a propeller-shaft entering said hub and having a crank connection with each of said blades, a sleeve surrounding said shaft, means for locking said wheel-hub to said sleeve at its rear end, a thrust-bearing engaging said sleeve at its front end, and means for revolving said shaft and for imparting a longitudinal movement thereto to actuate said blades about their axes as a center, substantially as described.

4. The combination with a propeller-wheel having reversible blades and a propeller-shaft, of intermediate connection between said shaft and the blades of said wheel whereby longitudinal movement of the former will impart a rotary movement to the latter about their axes, an internally-threaded ring supported adjacent to the front end of said shaft, an exteriorly-threaded sleeve engaging the thread of said ring and having a portion thereof projecting between two stops on said shaft, and means for imparting a revolving movement to said sleeve, whereby a longitudinal movement will be imparted to said sleeve and the shaft to reverse the position of the propeller-blades, substantially as described.

5. The combination with a reversible-blade propeller and a longitudinally movable propeller-shaft operatively connected to the blades of said wheel, of an internally-threaded ring located adjacent to the front end of said shaft, an exteriorly-threaded sleeve engaging the thread of said ring, said sleeve carrying at one end a sprocket-wheel and having at its opposite end an internally-projecting portion which enters between two collars secured to said shaft, a shaft carrying a hand-wheel and a second sprocket-wheel, and a chain connecting said sprocket-wheels, arranged and operating substantially as described.

6. The combination with a reversible-blade propeller a propeller-shaft and intermediate connections between said shaft and the blades of said wheel whereby longitudinal movement of the former will impart a reversing movement to the latter, of a motor the crank-shaft of which carries a sleeve coupling the end of which embraces and has a spline-and-groove connection with the front end of said propeller-shaft, an exteriorly-threaded sleeve loosely embracing said sleeve-coupling and having a portion thereof swivelly connected to said shaft, an internally-threaded ring hung to a fixed support and engaging said threaded sleeve, and means for imparting a revolving movement to said sleeve, arranged and operating substantially as described.

7. The combination with a reversible-blade propeller and a propeller-shaft operatively connected with the blades of said propeller for reversing the movement thereof, of universally-supported bearings supporting said shaft adjacent to each of its ends, and means substantially as described for imparting both a revolving and a longitudinal movement to said shaft.



8. The combination with the wheel-hub composed of the longitudinal sections 5 6 having blade-openings surrounded by the bosses 10, of the blades 11 12 having shanks 13 and flanges 14, crank-disks 15 secured to said shanks within the hub, shaft 4 having the studs or pins 18 engaging notches or recesses in said disks and means for revolving said shaft and for imparting longitudinal movement thereto, substantially as described.

9. The combination with the hub composed of the sections 5 6 having the blades 11 12 revolubly seated therein, of the longitudinally-movable shaft 4 entering said hub and engaging said blades through an intermediate crank mechanism, sleeve 19 surrounding said shaft, screw-cap 8 inclosing the outer end of said hub, and spanner-nut 9 embracing the inner end of the hub and locking it to said sleeve, substantially as described.

10. The combination with the shaft 4, of the ring 44 hung upon horizontally-disposed pivots, interiorly-threaded ring 46 supported by vertical pivots within said ring 44, exteriorly-threaded sleeve 53 engaging the thread of said ring 46 and provided with the internal flange 54, collars 55 and 56 located on said shaft upon opposite sides of said flange, and means for revolving said sleeve, substantially as described.

11. The combination with the motor-shaft 3 having the sleeve 48 secured thereto, of shaft 4 entering said sleeve and having a spline-and-groove connection therewith, exteriorly-threaded sleeve 53 embracing the sleeve 48 and having sprocket-wheel 59 secured thereto at its front end and having the internal flange 54 at its rear end, internally-threaded ring 46 hung upon a universal joint and engaging said sleeve 53, collars 55 56 on shaft 4 at opposite sides of said flange 54, and shaft 61 carrying the hand-wheel 64 and a sprocket-wheel which has chain connection with said wheel 59, arranged and operating substantially as set forth.

602,908. CORN-PLANTER. George D. Haworth, Chicago, Ill. Filed May 21, 1897. Serial No. 637,639. (No model.)

Claim.—1. In a check-row planter the combination of a reel capable of translatory transposition from one side of the planter to the other, and check-row mechanism adapted to convey the wire to and from the reel.

2. In a check-row corn-planter, the combination of a reel adapted to be mounted on either side of the planter, and a guide to carry the wire across the planter in front of the reel, whereby the check-row mechanism of the planter may be actuated by the wire in act of reeling or unreeling.

3. In a check-row planter, the combination of a cross-wire check-rower having wire-receiving and wire-discharging guides on its ends, and a reel adapted to be mounted on either side of the planter in line with the guides of the check-rower, whereby the wire may pass to or from the reel through the check-rower.

4. In a check-row corn-planter, the combination of a reel, and check-row mechanism the wire-guides of which are swingable across the face of the reel, whereby the wire may be guided to the reel by swinging the wire-guides of the check-rower.

5. In a check-row planter, the combination of a laterally-shiftable reel, and check row mechanism forming a guide for the reel, substantially as set forth.

6. In a check-row corn-planter, the combination of a laterally-shiftable reel, and check-row mechanism the wire-guides of which are swingable across the face of the reel, whereby the shift of the reel and the swing of the guides may one complement the other, substantially as set forth.

7. In a check-row planter, the combination of a reel-shaft, a reel shiftable lengthwise of the shaft, a relatively stationary guide for the wire and a swingable lever on the reel-frame connected with the reel, whereby the wire may be distributed evenly on the reel by shifting the reel on its shaft, substantially as set forth.

8. In combination with a check-row wire-reel applicable to either side of a planter and driven by a chain running over a smooth pulley, a friction-developing arm, as 31, having chain bearing surfaces on opposite sides and a central finger to engage the pulley, substantially as set forth.

9. In a wheel-carried implement having a sidewise-extended member, as a planter and marker-bar, a horizontally-swingable draft-hitch at or near the normal center of draft of the implement, and a connection between the sidewise-extended member and the draft-hitch adapted to utilize the resistance of the side member in drawing the draft-hitch toward such resistance, substantially as set forth.

10. In a planter, the combination of a rotatable seed-disk having cells therethrough, a grain-dislodger swung in fixed bearings above the seed-disk in position to enter the cells thereof, and a fixed surface against which the dislodger strikes when it is forced from a cell, substantially as set forth.

11. In a planter, the combination of a rotatable seed-disk having cells therethrough, a finger pivoted in fixed bearings above the line of rotation of the cells, a weight tending to carry the swinging end of the finger into the cells, and a fixed surface against which the weight strikes when the motion of the seed-plate forces the finger out of a cell, whereby the rebound caused by the weight striking the surface is utilized to carry the finger into the next succeeding cell with a quick, forcible action.

12. In a planter, the combination of a rotatable seed-disk having cells therethrough, a finger pivoted in fixed bearings above the line of rotation of the cells, a weight tending to carry the swinging end of the finger into the cells, and a fixed elastic surface against which the weight strikes when the motion of the seed-plate forces the finger out of a cell, substantially as set forth.

13. In drill-gearing for corn-planters, the combination of a shaft adapted to be driven from a planter-wheel, a crank on the shaft, a pitman on the crank, and an L-lever connected at one end with the pitman and at the other end with the shake-bar of the planter, substantially as set forth.

14. In drill gearing for corn-planters, the combination of a shaft adapted to be driven from a wheel of the planter, a clutch member on the shaft making and breaking connection therewith by motion longitudinally thereon, a crank in the shiftable clutch member, an L-lever connecting from one end with the shake-bar of the planter, and a pitman on the crank having its extended end recessed in the direction of the motion of the clutch and engaged with the other end of the L-lever, substantially as set forth, whereby the pitman may move with the shiftable clutch member without disengaging the L-lever.

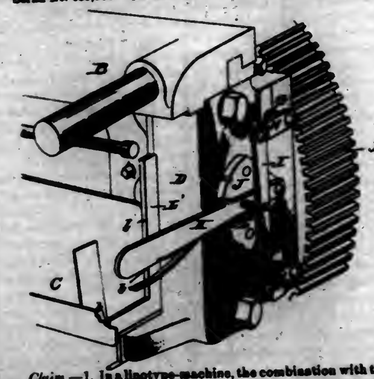
15. In drill-gearing for corn-planters, the combination of a shaft adapted to be driven from a wheel of the planter, a clutch member on the shaft making and breaking connection therewith by motion longitudinally thereon, a crank in the shiftable clutch member, an L-lever connecting from one end with the shake-bar of the planter, a pitman on the crank having its extended end recessed in the direction of the motion of the clutch and engaged with the other end of the L-lever, an obliquely-slotted swingable arm connected with the clutch member, and a finger extended into the slot and partaking of the tilting motion of the wheel-frame in act of raising the runners, whereby the drill-gearing is automatically disconnected from the shake-bar when the runners are raised.

16. In drill-gearing for corn-planters, the combination of a clutch, an upward extended vertically-swingable arm slotted obliquely and connected with the shiftable member of the clutch, and a finger extended into the slot of the arm and partaking of the tilting motion of the wheel-frame when the runners are raised, substantially as set forth.

17. In a corn planter, the combination of a rock-frame pivoted centrally and having a pedal at each end, an L-plate, a rod connecting the rock-frame with an arm of the L-plate and a rod connecting the other arm of the L-plate with the shake-bar of the planter, substantially as set forth.

18. A check-row arm for corn-planters, comprising a primary bar having a limited amount of horizontal swing on the planter, a secondary bar having a limited amount of horizontal swing on the primary bar and forming a continuation thereof, upward-extended rollers disposed in pairs at the pivots of the bars and the outer end of the secondary bar, and a horizontal wire-guard traversing the space between the upper ends of each pair of rollers and terminating out of contact with one of the rollers, whereby the check-row wire may be raised out of the arm, substantially as set forth.

19. A check-row arm for corn-planters comprising a bracket adapted to be attached to the planter-frame, a block pivoted on the bracket and having downward-extended studs to engage the bracket and limit its swing, a primary bar fixed at one end in the block on the bracket and having a similar block fixed on its swinging end, and a secondary bar pivotally connected with the swinging end of the primary bar in position to be controlled by the studs on the block thereof, substantially as set forth.



20. A check-row arm for corn-planters comprising a primary truss-bar composed of an upper member and a lower member, and a secondary bar pivotally connected with the primary bar and bearing on an extension of the lower member thereof, substantially as set forth.

21. In a corn-planter, the combination of a runner-frame, a wheel-frame having a central elevation, lifting mechanism for the runner located on the central elevation of the wheel-frame, and straps extending obliquely downward and sidewise from the lifting mechanism to the runner-frame, substantially as set forth.

22. A marker-bar for planters composed of two parts pivotally conjoined, an end of one of the parts being recessed and the other part having a swingable stop adapted to engage the recess, substantially as set forth.

23. In a marker-bar for planters, the combination of bar 95, bar 89 pivotally connected with a side of bar 95 and recessed in its end, U-bar 93 embracing bar 95 in position to engage the recess, and a line 98 connected with the U-bar and provided with a hook 94 between its ends, substantially as set forth.

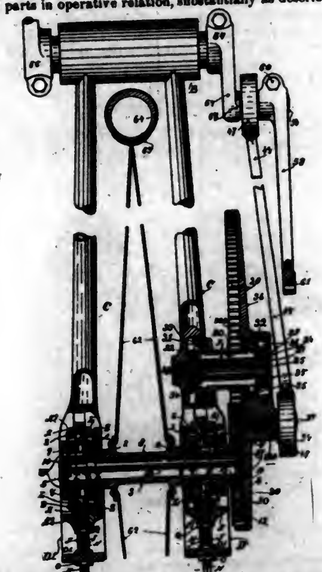
602,904. ATTACHMENT FOR LINOTYPE-MACHINES. Frank A. Hill and William H. Sherar, St. Louis, Mo. Filed May 6, 1897. Serial No. 635,311. (No model.)

Claim.—1. In a linotype-machine, the combination with the knife-block, of the stationary and movable knives, and a plate yieldingly supported in the inner face of the knife-block for engaging the slug as it issues from the machine and smoothing down any fins or burs which may be present on the type edge of the slug, said plate being provided with a plurality of grooves arranged in line with the ribs on the slug whereby said ribs fit into the grooves and permit the body portion of the slug to fit close against the plate, as the slug is forced past the plate; substantially as described.

2. The combination with a knife-block, of a movable knife mounted therein, of a right and left hand screw which engages the movable knife and the knife-block at its differently-threaded portions respectively, arms on the ends of said screws, a link connecting said arms, a lever engaging said link for moving the same and the screws simultaneously, and a sector with which said lever cooperates; substantially as described.

3. The combination with a knife-block, of a stationary knife and a movable knife, screws G engaging the ends of the movable knife, arms H on the ends of screws G, a link I connecting the outer ends of arms H, a handle K connected to link I, a notched sector J, and a retaining-pawl on handle K which cooperates with the notches on the periphery of sector J; substantially as described.

602,905. SHOE-LACE FASTENER. John R. Kennedy, Montreal (Canada). Filed Apr. 16, 1897. Serial No. 632,570. (No model.)



Claim.—A shoe-fastening hook open at its front and ends so that a lace can be slipped laterally into engagement with it, and provided with a projection *b'* at one end of its base, and a spring secured to the opposite end of the upper part of the hook with its free end bearing on the said base in front of the said projection, substantially as described and shown.

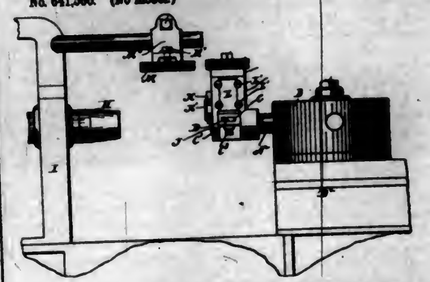
602,906. BICYCLE DRIVING-GEAR. Walter H. G. Kidd, Denver, Colo. Filed Aug. 30, 1897. Serial No. 649,960. (No model.)

Claim.—1. The combination of the rear-fork tubes, the cross-heads, having a ball-raceway the cross-head cups and the studs and check-nuts, and the blocks connecting the studs to the cross-heads, with the rear wheel's hub having a shoulder, a disk thereon bearing against said shoulder, a keyway in said hub; a steel ring keyed loosely to said hub and keyway; a felt dust-guard ring around

said steel ring; a cone on said hub loosely keyed to said keyway; a second cone threaded to said hub and opposed to the first-named cone, a second steel ring and felt dust-guard ring at the side of said threaded cone, a circular row of balls between said cones and the raceway of said cross-head, a nut threaded to the end of said hub and means for adjusting said threaded cone and nut to maintain the several parts in operative relation, substantially as described.

2. In a bicycle driving-gear a ball-bearing comprising a V-shaped ball-raceway, two independent opposing cones mounted on a hub, stud or axle, one of which is threaded to said hub or stud and adjustable relatively to the other, a steel ring at the outside of each cone, a felt ring dust-guard surrounding said steel ring and engaging the sides of said cone and said raceway, a circular row of balls between said raceway and said cones, a laterally-supporting disk or ring on the inner side of the cone and raceway and a nut threaded to the opposite side of said raceway from said lateral support and to said hub or stud and adapted with said threaded cone to secure the various parts of the ball-bearing in operative relation, substantially as described.

3. The combination in a bicycle driving-gear of the rear-fork tubes, the cages, the rear wheel, the hub of the rear wheel extending into and through said cages and adjustably supported therein by ball-bearings, a rawhide pinion secured to the end of said hub comprising a disk of rawhide clamped between two plates, an introverted hub on one plate provided with depending keys, keyways in the end of the said hub in which said plate-keys fit, an introverted hub on the opposite plate adapted to project into the hub of said rear wheel, a bolt extending through the hub of said plate and through the hub of said rear wheel and a nut and check-nut threaded to the end of said bolt and resting against the opposite end of said rear wheel's hub, substantially as described.



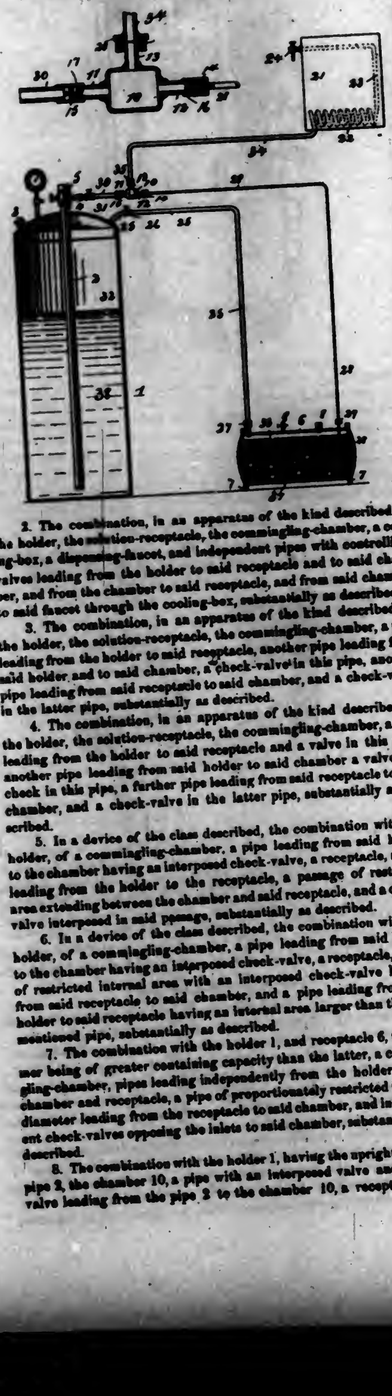
602,907. CUSHION-TIRE. JOHN P. KUHLE, Chicago, Ill. Filed Nov. 8, 1897. Serial No. 657,782. (No model.)

Claim.—1. A solid-cushion tire for vehicle-wheels having a flat base, with longitudinal ribs or projections formed therein, and a supporting-rim having side flanges arranged to support the tire against lateral displacement and having flat supporting-surfaces to receive the flat bearing-surfaces of said tire-base, and seats to receive said ribs or projections, in combination with binding-wires embedded longitudinally in said tire and located above the flat portions of the tire-base but in line with said ribs or projections, as and for the purpose set forth.

2. A solid-rubber tire having longitudinally-arranged binding-wires embedded therein, and having a flat base with longitudinal ribs or projections formed therein at points directly opposite said binding-wires, said binding-wires located above the flat surfaces or portions of the tire-base, a flat portion of such base being interposed between said ribs, in combination with a supporting rim or plate having flat portions and seats or depressions to receive the flat portions and ribs of said tire, the surface of said plate or rim located between the seats formed therein being slightly higher than the other portions of said surface, as and for the purpose set forth.

602,908. BOX-TOOL FOR SCREW-MACHINES OR LATHES. JOSEPH P. LAVIGNE, New Haven, Conn. Filed June 21, 1897. Serial No. 641,560. (No model.)

Claim.—1. A box-tool having a box, a tool-holder located therein and comprising an upwardly-extending stem, a horizontally-arranged head containing a horizontal opening for the reception of the tool which is held so as to cut by its forward end, and means for raising and lowering the said tool-holder by means of its upwardly-projecting stem.



2. A box-tool having a box, a tool-holder located therein and comprising an upwardly-extending stem, a horizontally-arranged head containing a horizontal opening for the reception of the tool which is held so as to cut by its forward end, and a screw entering the upper end of the stem and projecting above the box, and providing for raising and lowering the tool-holder, as desired.

3. A box-tool having a vertically-movable tool-holder, and means for raising and lowering the same including a wheel located above and connected with it and exposed for being engaged by an independently-supported rack by means of which the wheel is turned in one direction or the other for raising and lowering the tool-holder as the work progresses, so as to change the character of the cut.

4. In a screw-machine or lathe, the combination with a box-tool having a vertically-movable tool-holder, and a wheel connected with the said holder for raising and lowering the same; of an adjustable horizontally-arranged rack located in position to be engaged by the said wheel which it actuates in rotation in one direction or the other as the machine operates, substantially as set forth.

602,909. APPARATUS FOR MAKING AND DISPENSING MINERAL WATERS. PETER B. MALMSTROM, New York, N. Y. Filed Feb. 26, 1897. Serial No. 625,127. (No model.)

Claim.—1. In an apparatus of the class described, the combination of the following instrumentalities, a holder containing carbonated water and having a top gas-pressure, a receptacle containing a mineral-salt solution, a commingling-chamber in which the carbonated water and mineral-salt solution is combined, a pipe leading from the carbonated-water holder to the said chamber, a pipe leading from the gas-space to the said receptacle, a pipe leading from the said receptacle to said chamber, and check-valves located at each of the entrances to said chamber and interposed in the line of the flow of said fluids, substantially as described.

2. The combination, in an apparatus of the kind described, of the holder, the solution-receptacle, the commingling-chamber, a cooling-box, a dispensing-faucet, and independent pipes with controlling-valves leading from the holder to said receptacle and to said chamber, and from the chamber to said receptacle, and from said chamber to said faucet through the cooling-box, substantially as described.

3. The combination, in an apparatus of the kind described, of the holder, the solution-receptacle, the commingling-chamber, a pipe leading from the holder to said receptacle, another pipe leading from said holder and to said chamber, a check-valve in this pipe, another pipe leading from said receptacle to said chamber, and a check-valve in the latter pipe, substantially as described.

4. The combination, in an apparatus of the kind described, of the holder, the solution-receptacle, the commingling-chamber, a pipe leading from the holder to said receptacle and a valve in this pipe, another pipe leading from said holder to said chamber a valve and check in this pipe, a further pipe leading from said receptacle to said chamber, and a check-valve in the latter pipe, substantially as described.

5. In a device of the class described, the combination with the holder, of a commingling-chamber, a pipe leading from said holder to the chamber having an interposed check-valve, a receptacle, a pipe leading from the holder to the receptacle, a passage of restricted area extending between the chamber and said receptacle, and a check-valve interposed in said passage, substantially as described.

6. In a device of the class described, the combination with the holder, of a commingling-chamber, a pipe leading from said holder to the chamber having an interposed check-valve, a receptacle, a pipe of restricted internal area with an interposed check-valve leading from said receptacle to said chamber, and a pipe leading from said holder to said receptacle having an internal area larger than the last-mentioned pipe, substantially as described.

7. The combination with the holder 1, and receptacle 6, the former being of greater containing capacity than the latter, a commingling-chamber, pipes leading independently from the holder to said chamber and receptacle, a pipe of proportionately restricted internal diameter leading from the receptacle to said chamber, and independent check-valves opposing the inlets to said chamber, substantially as described.

8. The combination with the holder 1, having the upright siphon-pipe 2, the chamber 10, a pipe with an interposed valve and check-valve leading from the pipe 2 to the chamber 10, a receptacle 6, a pipe 25 having a valve 26 between the holder and receptacle, and the restricted siphon-pipe 28 having an interposed check-valve extending to the chamber 10 and receptacle 6, substantially as described.

9. The combination with the upright holder 1, the upright siphon-pipe 2 extending to the bottom and through the top of the holder, the commingling-chamber 10, a pipe 30 extending between said chamber and pipe 2 and having an interposed valve 5 and a check-valve, a horizontally-disposed receptacle 6, a pipe 25 leading from the top of the holder 1 to the top of the receptacle and having a valve 26, and a smaller pipe 28 having an interposed check-valve leading from the bottom of the receptacle 6 to the chamber 10, substantially as described.

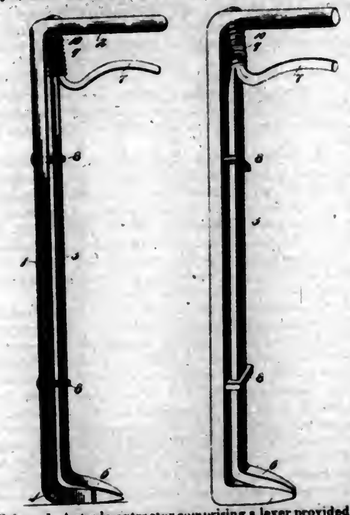
10. The combination with the holder 1, receptacle 6, and chamber 10, and the regulated passages between them, of the cooling-box, a pipe-coil therein, a dispensing-faucet, and pipes 23, 34 leading from the coil to the chamber 10 and faucet respectively, substantially as described.

11. The combination with the gas-holder 1, the stand-pipe 36, a series of separate receptacles as 6, a pipe with an interposed controlling-valve leading from each of the receptacles to the gas-space in the holder, the pipe 2 in the holder connecting the stand-pipe 36, a separate commingling-chamber for each receptacle, a pipe leading from each of the receptacles to its respective commingling-chamber, a series of pipes leading from the stand-pipe 36 to each of the commingling-chambers, and valves interposed in the pipes leading to the said commingling-chambers, substantially as described.

12. The combination with the gas-holder 1, the stand-pipe 36, a series of separate receptacles as 6, a pipe with an interposed controlling-valve leading from each of the receptacles to the gas-space in the holder, the pipe 2 in the holder, a separate commingling-chamber for each receptacle, a pipe leading from each of the receptacles to its respective commingling-chamber, a series of pipes leading from the stand-pipe 36 to each of the commingling-chambers, valves interposed in the pipes leading to the said commingling-chambers, a cooling-box and coils therein, a series of independent pipes 34 each leading from each of the commingling-chambers to a separate coil in the cooling-chamber, a series of dispensing-faucets and separate pipes leading from each of the cooling-coils to said faucets, each of the faucets being in connection with each of the independent commingling-chambers, substantially as described.

602,910. ROLLED-STEEL BOLSTER FOR CARS. JOHN M. MAHR, Chicago, Ill. Filed Dec. 9, 1897. Serial No. 661,393. (No model.)

Claim.—1. In a car-bolster, a rolled-steel truss-shaped beam having upper and lower flanges and an intermediate web, the web being longitudinally slitted at each end of the beam, and provided with shoulders and offset portions lapping past each other, and rivets or other devices inserted through the lapped portions of said web for securing the same together, the upper and lower flanges of the beam being bent or inclined, one or both, at an angle to each other, the two slitted edges of the web abutting against the two shoulders or offsets at the lapped portions of the slitted web, substantially as specified.



2. In a car-bolster, a rolled-steel truss-shaped beam having upper and lower flanges and an intermediate web, the web being longitudinally slitted at each end of the beam, and provided with shoulders and offset portions lapping past each other, and rivets or other devices inserted through the lapped portions of said web for securing the same together, the upper and lower flanges of the beam being bent or inclined, one or both, at an angle to each other, and said web having also a triangular or gore-shaped piece cut out on each side of the middle of the beam to enable said upper and lower flanges to be bent or inclined toward each other, and the slitted and shouldered portion of the web lapped, substantially as specified.

3. The combination in a car-bolster of a pair of truss-shaped rolled-steel beams placed side by side and secured together, and each having upper and lower flanges and an intermediate web, the web having a longitudinal slit at each end and provided with abutting shoulders and offset portions lapping past each other and rivets securing the lapped portions together, the upper and lower flanges of each beam being bent or inclined, one or both, at an angle to each other, substantially as specified.

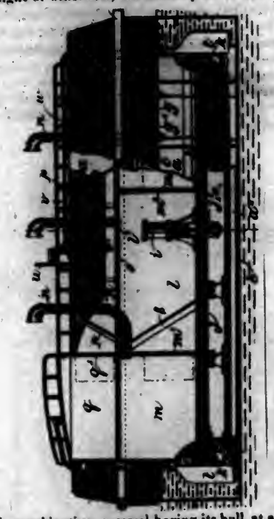
4. The combination in a car-bolster of a pair of truss-shaped rolled-steel beams placed side by side and secured together, and each having upper and lower flanges and an intermediate web, the web having a longitudinal slit at each end and provided with abutting shoulders and offset portions lapping past each other and rivets securing the latter portions together, the upper and lower flanges of

each beam being bent or inclined, one or both, at an angle to each other, and said web having also a triangular or gure-shaped piece cut out at each side of the middle, substantially as specified.

602,911. STAPLE-EXTRACTOR. CLAUDE G. MITCHELL, Chrisman, Ill., assignor of one-half to Chandler Mitchell, same place. Filed July 8, 1897. Serial No. 643,878. (No model.)

Claim.—1. A staple-extractor comprising a lever provided at one end with a staple-engaging arm, and a spring-actuated clamping-bar slidingly mounted in suitable guides of the lever, and capable of a limited movement longitudinally thereof, said clamping-bar being provided with a clamping-arm arranged adjacent to the staple-engaging arm and adapted to clamp a staple to prevent the same from becoming separated from the device during the extracting operation, substantially as described.

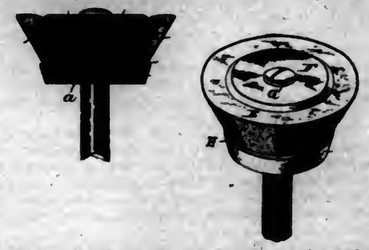
2. A staple-extractor comprising a lever provided at one end with a handle and at its other end with an arm, said handle and arm extending from the same side of the lever, a clamping-bar disposed longitudinally of the lever in suitable guides thereof and capable of a limited sliding movement lengthwise of the same, said clamping-bar being provided at its ends with a handle and a clamping-arm arranged adjacent to the inner sides of the staple-engaging arm and the handle of the lever, and a spring for holding the clamping-arm in engagement with the staple, substantially as described.



602,912. LIFE-BOAT. WILLIAM W. MCGWIRR, Dungarvan, Ireland. Filed Aug. 6, 1897. Serial No. 647,373. (No model.)

Claim.—1. In a life-boat or other vessel the combination of a hull of approximately triangular form in transverse section amidships, a protecting cage or frame inclosing or surrounding said hull, and ballast-weights outside said hull and located at the outer or extreme edge of the floor or base of said cage, substantially as set forth.

2. In a life-boat or other vessel, the combination, with the hull, of a protecting cage or frame, netting covering said frame at and above the water-line, ballast-weights outside said hull and located at the outer or extreme edge of the floor or base of said cage amidships or thereabout, and floats or air-bags at or above the normal water-line and lying between said hull and said cage, around the hull, substantially as set forth.

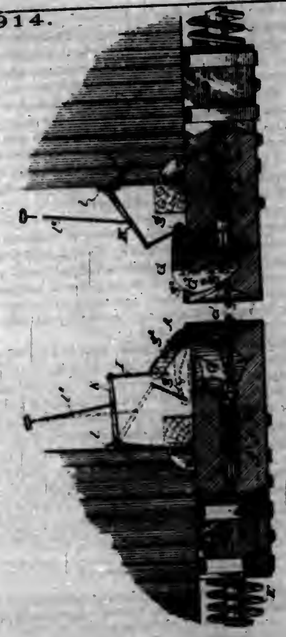


3. In a life-boat or other vessel, the combination, with the hull, of a protecting cage ortframe, ballast-weights outside said hull and located at the outer or extreme edge of the floor or base of said cage, floats or air-bags at or above the normal water-line and lying between said hull and said cage, and netting covering the sides of said frame and extending from such sides to the hull at or near the water-line substantially as set forth.

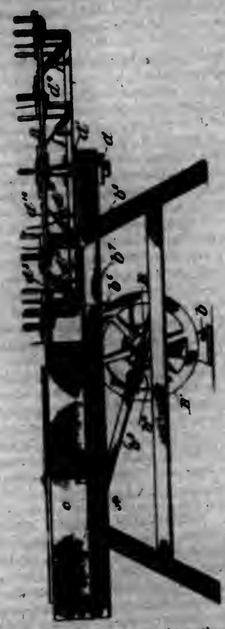
4. In a life-boat or other vessel, the combination, with the hull, of a protecting cage or frame, ballast-weights outside said hull and located at the outer or extreme edge of the floor or base of said cage amidships or thereabout, floats or air-bags at or above the normal water line and lying between said hull and said cage, around the hull, means for retaining said floats in position, and a flexible netting serving as a means to catch a person endeavoring to reach said vessel from a height or otherwise, substantially as set forth.

5. In combination, a vessel having its hull, at a point amidships, approximately triangular in transverse section the apex portion being uppermost, a protecting cage or frame inclosing or surrounding said hull, ballast-weights outside said hull and located at the outer or extreme edge of the floor or base of said hull, netting covering said frame at and above the water-line, floats or air-bags retained between said hull and said cage at or about the normal water-line, means for varying the value of the lever-weights amidships by inflation or deflation of air-floats, and means for propelling said vessel.

602,913. BUFFING-WHEEL. THOMAS A. HOBBS, Brockton, Mass. Filed Sept. 28, 1897. Serial No. 653,306. (No model.)



Claim.—A buffing-wheel made up of a shaft screw-threaded at one end; a cup loosely mounted upon the screw-threaded portion of that shaft; a stop on that shaft against which the cup abuts; a sleeve, with an internal screw-thread engaging the screw-threaded portion of the shaft; disks at each end of the sleeve; means to move one disk toward the other; a cushion clamped between the disks, and a band of sandpaper or the like upon the face of the conical cushion and clamped between the cup and the cushion, all substantially as described.



602,914. CAR-COUPLING. WILLIAM C. PERKINS, Rocky Hill Station, Ky. Filed Dec. 21, 1896. Serial No. 616,473. (No model.)

Claim.—A car-coupling comprising a two-part draw-head having a horizontal link-recess, a longitudinal propeller-recess, and a vertical recess, an elbow-shaped latch located in the vertical recess, and a spring-actuated propeller-block located in the longitudinal recess, the said propeller-recess extending part through the inner end of the link-recess and communicating at a point coincident with the vertical recess, forming a shoulder against which the propeller-block normally abuts to hold the same slightly in the rear of the path of travel of the latch, the draw-head section being divided horizontally in the line of the propeller and link-recess to admit of the removal and repair of the spring-actuated propeller-block substantially as described.

602,914.

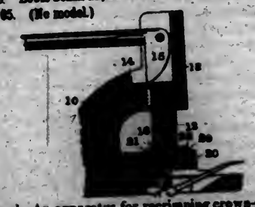
602,915. BAG-STRINGING MACHINE. GEORGE S. PRICHARD and JAMES W. TAYLOR, Goldsborough, N. C., assignors of one-fifteenth to James Edgar Smith, Washington, D. C. Filed July 7, 1897. Serial No. 643,711. (No model.)

Claim.—1. In a bag-stringing machine the combination with a frame, of a needle-carriage, needles, a wheel, bag-standards secured to said wheel on its rim in line with the spokes thereof, a power-shaft connected with the needle-carriage by a crank-shaft, a lever pivoted to the frame having one leg engaged by a cam-groove on the power-shaft and having its other leg provided with a spring-latch, the said spring-latch extending into the path of the wheel-spokes and being adapted to pass said spokes when oscillated in one direction and to move said spokes with it when oscillated in the other direction, indentations upon the wheel in line with the standards and spokes thereof, and a spring-detent adapted to engage the said indentations and hold the bag-standards nearest thereto in line with the central line of reciprocation between the needles.

2. In a bag-stringing machine, a frame, ways secured to said frame, a needle-carriage adapted to reciprocate within said ways, needles secured to said carriage, a power-shaft, a crank-shaft pivoted to and connecting the said power-shaft and the needle-carriage, a wheel mounted upon the frame with its rim nearly touching the aforesaid ways, the said rim lying approximately in the plane of reciprocation of the needles, and within about one-half of their forward thrust, the said rim having indentations on its outer edge which are in radial alinement with the spokes of the wheel and have adjacent to them also in alinement with said spokes bag-holding standards, a spring-detent secured to the needle-ways and adapted to engage the indentations in the rim of the wheel, a cylinder secured upon the power shaft, a cam-groove in the said cylinder having its points of lateral departure lying within a plane approximately at a right angle to a plane passed through that diameter of the power-shaft which coincides with a line connecting the center of said shaft with the center of the crank-pin when the crank is at its greatest thrust, a lever pivoted to the frame having one end engaged by the said cam-groove, and having a spring-latch upon its other end, the said spring-latch projecting into the path of the spokes of the wheel, and adapted to move the wheel by said spokes in one direction through an arc equal to that measured between said spokes.

3. In a bag-stringing machine, a needle-carriage, needles secured thereto, means for reciprocating the same, in combination with a wheel mounted approximately in the plane of reciprocation of the said needles and within the path thereof, the said wheel being provided with bag-holding standards, gripping-hooks on either side of said standards, and means for revolving the said wheel by intermittent impulses through arcs equal to the distance between said bag-holding devices.

4. In a bag-stringing machine the combination with standards adapted to receive and hold the bags, of gripping-hooks adapted to enter the hem of the bag and stretch the same away from the said standards.



5. In a bag-stringing machine, the combination with bag-holding standards, of gripping-hooks pivoted eccentrically on both sides of said standards and adapted to move in a curve approaching the said standards until they nearly touch it and then to recede therefrom.

6. In a bag-stringing machine the combination with bag-holding standards of gripping-hooks pivoted on either side thereof, the said gripping-hooks being provided with needle-guides.

7. In a bag-stringing machine the combination with eccentrically-mounted gripping-hooks, one on either side of a bag-standard, of means adapted to move the said hooks toward the said standard at the same time.

8. In a bag-stringing machine the combination with a wheel, a power-shaft and a pair of reciprocating needles, of bag-standards secured upon the rim of the said wheel having eccentrically-mounted gripping-hooks on either side of them, means for holding the said standards in line between the said needles as they are thrust forward and retracted within the outer edge of the rim of the wheel, and means for moving said wheel over an arc equal to the distance between the standards upon it when the needles retract from the outer edge of its rim and before they enter it again.

602,916. APPARATUS FOR RECRIMPING CROWN-SEALS FOR BOTTLES. LOUIS SCHAFER, St. Louis, Mo. Filed Dec. 29, 1897. Serial No. 664,165. (No model.)

Claim.—1. An apparatus for recrimping crown-seals for bottles, consisting of a die, one part of said die adapted to receive used crown-

seals, and having a series of recrimping indentations, and the other part of said die having two sets of projections on circular parts of different diameters registering with the indentations of the other part of the die, to recrimp the crown-seals substantially as set forth.

2. In an apparatus for recrimping crown-seals, a nozzle for spraying the crown-seals when in the die to cleanse and purify the same and to soften the cork thereof, and a die for recrimping and refluring the edges of the crown-seals and for pressing out the indentations in the corks thereof.

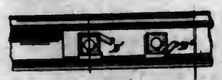
3. In an apparatus for recrimping crown-seals, a die adapted to receive used crown-seals and having suitable recrimping projections and indentations, a plunger for forcing the parts of the die together to recrimp the crown-seals, a lever for operating said plunger, and a lever and suitable connections for ejecting the crown-seals from the die after they are recrimped.

602,917. SELF-RETAINING SPLINT. BERNARD SCHEINEMAN, New York, N. Y. Filed June 3, 1897. Serial No. 639,268. (No model.)

Claim.—1. The herein-described splint consisting of the plates 2 and 3 connected to each other at the ends; and the tubal sheath 9 for embracing and confining the plates; substantially as and for the purpose set forth.

2. The herein-described splint consisting of the plates provided with the recesses 7, 7, adjacent their free ends; and the tubal sheath having an elastic core 11 for holding the said sheath in position; substantially as described.

602,918. POCKET-REGISTER. CHARLES SEBASTIAN, St. Louis, Mo., assignor to Alexander S. Mann, same place. Filed May 24, 1897. Serial No. 637,941. (No model.)



Claim.—1. In a pocket-register, a suitable chamber, a cent-wheel mounted in the same and adapted to be operated from the periphery of the chamber, a series of teeth along the outer edge of the wheel, numerals carried by one of the faces of the wheel and corresponding in number to the number of teeth, suitable plates forming the walls of the chamber, numerals indicating the amount of purchase formed on the outer surface of one of the plates, the number of numerals on the cent-wheel being a multiple of the number carried by the plate, a certain number of teeth of the cent-wheel projecting beyond the edge of the chamber and corresponding in number to the number of numerals carried by the plate of the chamber, a limiting peripheral shoulder formed on or carried by the walls of the chamber for indicating the limit of advance for the cent-wheel, and a suitable opening formed in the numbered plate or wall of the chamber for reading the numerals carried by the cent-wheel, substantially as set forth.

2. In a pocket-register, a suitable chamber, a dial-plate forming one of the walls of the same, central inward depressions formed in the walls of the chamber, a pivotal pin having bearings in the inwardly-depressed portions of the walls, a cent-wheel mounted on said pivotal pin, the opposite faces of the cent-wheel being adapted to bear frictionally against the inner surfaces of the depressed portions of the walls, a dollar-disk operated by the movement of the cent-wheel, and an annular depressed ridge formed on or carried by one of the walls of the chamber against which the dollar-disk is adapted to bear frictionally to prevent accidental displacement of the disk when the device has once been set or adjusted to indicate a certain purchase, numerals or equivalent characters being carried by the dial-plate to indicate the amount of purchase in cents, and means carried by the walls of the chamber for indicating the limit of advance for the cent-wheel in the act of recording a purchase, substantially as set forth.

3. In a pocket-register, a chamber, plates forming walls for the same, one of said walls forming a dial-plate, a cent-wheel rotatably mounted between the walls, a peg projecting from one of the faces of the cent-wheel, a dollar-disk mounted on the dial-plate and having a series of numbered lobes formed along the outer edge thereof, the peg of the cent-wheel being adapted to advance the said disk by entering the depressions formed between the lobes, a series of numerals being formed on the dial-plate for indicating the amount of purchase, and a corresponding series being also carried by the dial-plate for rectifying by subtraction any excess registered by the cent-wheel over the actual amount of purchase, a series of teeth formed along the outer edge of the cent-wheel, a number of teeth corresponding to the two series of numerals carried by the dial-plate projecting beyond the edges of the chamber within which the wheel is mounted, shoulders formed on the walls of the chamber to indicate the limit of any advance for the cent-wheel, and suitable openings formed in the dial-plate for reading the numbers carried by the cent-wheel and dollar-disk substantially as set forth.

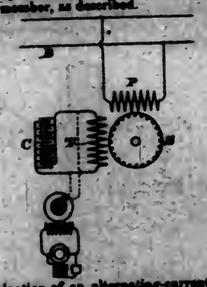
4. In a pocket-register, a chamber, walls 1, 2 for the same, the wall 2 serving as a dial-plate, central depressions formed in said walls, a pivotal pin having outer or terminal heads or expanded ends located at the base of the depressions, an inwardly-depressed annular ridge formed on the dial-plate, a dollar-disk pivoted along the inner surface of the dial-plate and bearing against the annular depressed ridge formed in said plate, a cent-wheel carried rotatably on the pivotal pin and adapted to cooperate with the dollar-disk, characters being formed on the dial-plate to indicate the amount of purchase by cents, a series of teeth formed along the edge of the cent-plate, a certain number of said teeth corresponding to the number of characters on the dial-plate projecting beyond the edge of the chamber, the parts operating as and for the purpose set forth.

602,919. NUT-LOCK. HARRISON R. STADDAN and HENRY C. JONES, Cincinnati, Ohio. Filed Dec. 26, 1896. Serial No. 617,004. (No model.)

Claim.—1. In a nut-lock, a locking device formed in one piece, consisting of a key having a fixed clamp projecting at an angle therefrom, and a clamp adapted to be bent, in combination with the nut to be locked and a washer, beneath it to form a space to receive a portion of said device and be held by the nut from lateral disengagement, substantially as set forth.

2. In a nut-lock, a locking device formed in one piece, consisting of a key having a fixed clamp projecting at an angle from the key, and a clamp adapted to be bent, in combination with a nut cut away to form a space to receive a portion of said device and be held by the nut from lateral disengagement, substantially as set forth.

3. A nut-lock, formed in one piece, comprising two keys adapted to take against and fit between a nut and fish-plate, and a clamp adapted to take and be bent behind a portion of said nut whereby the keys are held in engagement with and the nut locked, substantially as set forth and for the purpose specified.



4. A nut-lock, formed in one piece, comprising a key adapted to bear against and fit between a nut and fish-plate, a fixed clamp adapted to take behind a portion of said nut when the key is inserted longitudinally between the nut and fish-plate, and a flexible clamp having a notch or lug adapted to form a base whereby said clamp is bent to lock or unlock said key, as desired, substantially as set forth and for the purpose specified.

5. A nut-lock, formed in one piece, comprising a key adapted to bear against and fit between a nut and a fish-plate, a fixed clamp adapted to take behind a portion of said nut when the key is inserted longitudinally between the nut and fish-plate, a clamp adapted to be bent behind a portion of said nut when the key is inserted between the nut and fish-plate to lock said key in engagement with the nut, substantially as set forth and for the purpose specified.

602,920. ALTERNATING-CURRENT INDUCTION-MOTOR. CHARLES P. STEINMETZ, Schenectady, N. Y., assignor to the General Electric Company, of New York. Filed Feb. 12, 1897. Serial No. 623,067. (No model.)

Claim.—1. The method of compensating for the self-induction and magnetizing current of an alternating-current motor, which consists in inducing from the secondary of the motor leading currents in a tertiary closed circuit in inductive relation to the secondary member.

2. The method of compensating for the self-induction and magnetizing current of an alternating-current induction-motor, which consists in balancing the lagging currents in the primary and secondary members by leading currents in a closed circuit in inductive relation to the secondary member, as described.

3. The combination of an alternating-current induction-motor, having primary and secondary circuits, with a tertiary circuit on the primary member, and means for causing the currents in the tertiary circuit to lead the electromotive force, as described.

4. The combination with the primary and secondary members of an induction-motor of a tertiary circuit receiving induced currents through the secondary of the motor and a condenser in the tertiary circuit, as set forth.

5. The combination of an alternating-current induction-motor having a primary winding connected or adapted to be connected across the mains of a single-phase circuit, a closed-circuit secondary member, a tertiary coil in inductive relation to the primary through the secondary member during the normal operation of the motor, and a phase-advancing device in the circuit of the tertiary coil, as set forth.

6. The combination with an induced winding of an alternating-current induction-motor, of a source of leading currents of a frequency independent of the speed of the motor, so connected to said induced winding as to compensate for the lagging current throughout the motor, substantially as described.

7. The combination of an alternating-current induction-motor and a tertiary closed circuit in inductive relation to the primary through the secondary member of the motor, during the normal operation of the machine, with a source of leading currents in the tertiary circuit, whose frequency corresponds to the frequency in the primary of the motor, and is independent of the speed of the secondary member, as set forth.

8. The combination in an alternating-current induction-motor having primary and secondary circuits, of a tertiary closed circuit arranged on the primary member of the motor at an angle of ninety degrees from the primary winding, a multiphase secondary, and a source of leading currents in the tertiary circuit.

9. In an alternating-current induction-motor, the combination of a source of leading currents of a frequency independent of the speed of the motor and an inductive connection between the motor-windings and the source of leading currents, the value of the leading current being so proportioned as to compensate not only for lag in the external circuit, but also for lag in the motor itself.

10. The combination with the two members of an alternating-current induction-motor and their circuits, of a tertiary circuit receiving current by induction from one member of the motor through the other member, and a source of leading current in the tertiary circuit.

11. The combination with the primary and secondary circuits of an alternating-current induction-motor, of a tertiary circuit on the primary member in inductive relation to the secondary member, and at an angle of ninety degrees from the primary circuit, and a condenser in the tertiary circuit, adjusted so as to compensate not only for lag in the external circuit, but also for lag due to the self-induction and magnetizing current of the motor.

12. The combination of an induction-motor having a winding connected across a single-phase circuit and supplied with current therefrom, a closed-circuit secondary member, a tertiary circuit closed upon a condenser, the capacity of which is proportioned so as to balance or substantially balance the self-induction and magnetizing current in the motor.

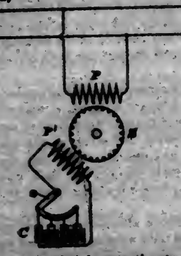
13. The combination of an induction-motor having primary and secondary windings, and a tertiary circuit in inductive relation to the primary through the secondary, with a source of leading currents, and a step-up transformer inductively closing the tertiary circuit through the said source, substantially as described.

14. The method of reducing the self-induction of an alternating-current motor which consists in generating leading currents in a tertiary winding, and reflecting back an advanced wave through the armature to the primary.

15. In an alternating-current motor the combination of a pair of single-phase mains, a field-winding fed therefrom, a secondary member, an additional field-winding receiving current by induction from said secondary, and a condenser in shunt to said additional winding.

16. The combination in an alternating-current motor of a primary winding, a relatively movable secondary winding, and a tertiary winding in inductive relation with the primary winding through the secondary during the normal operation of the motor, and a phase-advancing device in circuit with the tertiary winding.

17. The method of compensating for phase displacement in an induction-motor, which consists in generating, by the inductive action of the currents flowing in the induced member of the motor, an electromotive force in a tertiary circuit, and causing the current in said tertiary circuit to lead the electromotive force, and reflecting back an advanced wave through the secondary to the primary.



18. The method of compensating for phase displacement in an induction-motor, which consists in generating, by the inductive action of the currents flowing in the induced member of the motor, an electromotive force in a tertiary circuit, fixed with relation to the primary circuit of the motor, and causing the current in said tertiary circuit to lead the electromotive force, and reflecting back an advanced wave through the secondary to the primary.

19. The combination in an alternating-current motor of a primary winding, a relatively rotatable secondary winding, and a tertiary winding so arranged that the mutual induction between the said tertiary winding and the primary winding is small when the motor is at rest, and increases as the motor begins to move, and a source of leading current in the circuit with the tertiary winding.

20. The combination in an alternating-current motor of a primary, a tertiary, a phase-advancing device arranged to act upon the current in the tertiary, and a secondary capable of rotation with respect to the primary and tertiary, constructed in such a manner that the coefficient of mutual induction between the secondary and the primary or tertiary is substantially constant at all positions of the secondary.

21. The combination in an alternating-current motor of a primary, a tertiary so arranged that the coefficient of mutual induction between the primary and the tertiary is small when the motor is at rest, a phase-advancing device arranged to act upon the current in the tertiary, and a secondary capable of rotation with respect to the primary and tertiary, constructed in such a manner that the coefficient of mutual induction between the secondary and the primary or tertiary is substantially constant at all positions of the secondary.

602,921. ALTERNATING-CURRENT INDUCTION-MOTOR. CHARLES P. STEINMETZ, Schenectady, N. Y., assignor to the General Electric Company, of New York. Filed Feb. 12, 1897. Serial No. 623,068. (No model.)

Claim.—1. The method of giving starting torque to an alternating current induction-motor upon a single-phase circuit, which consists in producing and maintaining leading currents in a closed electric circuit in inductive relation to the primary and secondary circuits of the motor, as set forth.

2. The method herein described, which consists in maintaining leading currents in a closed circuit in inductive relation to the primary and secondary circuits of an alternating-current motor running on single-phase circuits to lend starting torque to the motor, and when the motor is at speed compensating for self-induction and magnetizing current by maintaining balancing leading currents in the motor through a source of capacity, as set forth.

3. The method of starting and running an alternating-current motor, which consists in passing alternating current through a primary winding, generating thereby a current in a secondary winding, inducing by the joint action of said primary and secondary windings an electromotive force in a tertiary winding, and causing the current in the tertiary winding to lend the said electromotive force.

4. The method of starting and running an alternating-current motor, which consists in passing alternating current through a pri-

mary winding, generating thereby a current in a secondary winding, inducing by the joint action of said primary and secondary windings an electromotive force in a tertiary winding, and causing the current in the tertiary winding to lead the said electromotive force, and reflecting back from the tertiary an advanced wave, to reduce the lagging currents in the machine.

5. The combination of an alternating-current motor for single-phase circuits, having primary and secondary windings, a tertiary circuit in inductive relation to both the primary and secondary windings, and means for causing the current in the tertiary to lead the electromotive force, as set forth.

6. In an alternating-current motor for single-phase circuits, the combination with a primary winding, of a tertiary winding displaced therefrom by an angular distance other than one-fourth of the polar pitch, a secondary winding capable of rotation relatively to said primary winding, and means for causing the current in the tertiary to become leading.

7. In an alternating-current motor for single-phase circuits, the combination with a primary winding, of a secondary winding capable of rotation relatively to said primary winding, and a tertiary winding in inductive relation with the primary winding both directly and through the secondary, and a phase-advancing device so connected as to advance the phase of the current in the tertiary circuit.

8. In an alternating-current motor for single-phase circuits, the combination with a primary winding of a secondary winding capable of rotation relatively to said primary winding, and a tertiary winding in inductive relation with the primary winding both directly and through the secondary, and an adjustable phase-advancing device so connected as to advance the phase of the current in the tertiary circuit.

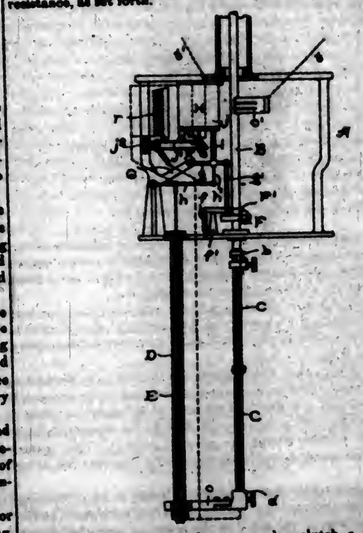
9. The combination of an induction-motor, having a delta-wound primary member, one branch of which is connected across a single-phase circuit, and a condenser connected across a second branch of the primary winding and in inductive relation to the secondary member, as set forth.

10. The combination in an alternating-current induction-motor for single-phase circuits of a primary winding, a secondary winding, a tertiary winding wound on the primary member and displaced from the primary winding by an angular distance other than one-fourth of the polar pitch, a source of leading currents in the tertiary winding, and means for regulating the value of the leading current in the tertiary circuit.

11. The combination of an alternating-current motor for single-phase circuits, having primary and multiphase secondary windings, a tertiary circuit in inductive relation to both the primary and secondary windings, and means for causing the current in the tertiary to lead the electromotive force, as set forth.

12. The combination in an alternating-current motor of the single-phase type of a primary winding, a relatively-rotatable secondary winding so designed that the coefficient of mutual induction between the secondary winding and either of the other windings is substantially constant at any position of the secondary, and a tertiary in inductive relation with the primary both directly and through the secondary.

13. The combination in an alternating-current motor of the single-phase type of a primary winding, a relatively-rotatable secondary winding so designed that the coefficient of mutual induction between the secondary winding and either of the other windings is substantially constant at any position of the secondary, and a tertiary in inductive relation with the primary both directly and through the secondary, and a phase-advancing device arranged to act upon the tertiary.



14. A single-phase alternating-current motor having its inducing member wound with windings displaced approximately one-third of the polar pitch, one of said windings being connected to a pair of single-phase mains, and one being shunted by a condenser.

602,922. ELECTRIC-ARC LAMP. ELIHU THOMSON, Swampscott, Mass., assignor to the General Electric Company, of New York. Filed Nov. 4, 1897. Serial No. 657,434. (No model.)

Claim.—1. In an electric-arc lamp, the combination with carbon-feeding mechanism, of a thermo electric expansive device, and a series electromagnetic controlling apparatus, responsive to variations in the current passing through the lamp governing the operation of the thermo-electric expansive device, as set forth.

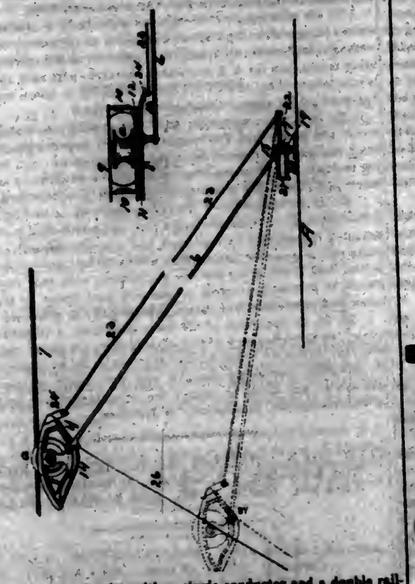
2. In an electric-arc lamp, the combination, with carbon-feeding mechanism, of a thermo-electric expansive device, an electromagnetic controlling apparatus in series therewith, and a resistance acting as a shunt to the thermo-electric expansive apparatus, the whole being so arranged that the electromagnet controls the circuit of the expansive device and of the shunting resistance.

3. In an electric-arc lamp, the combination with the carbon-feeding mechanism, of an expansion-wire connected therewith, an electromagnet in the lamp-circuit, yielding contacts, one of which is connected to the core of said electromagnet, and a resistance, the whole being so arranged and connected that in one position of the core of the electromagnet and contacts controlled thereby, the expansion-wire is included in circuit, but in a second position shunted by said resistance, as set forth.

4. In an electric-arc lamp, a carbon-clutch, a thermo-electric expansion-wire, a spring-controlled mechanism connecting said wire with said clutch for raising and lowering the latter, an electromagnet, a pair of spring-contacts normally closed, one of which is connected to the core of the electromagnet, and a resistance acting as a shunt to the expansion-wire, the whole being so arranged that the electromagnet controls the circuit of the expansion device of the shunting resistance.

5. The combination in an electric-arc lamp, of a carbon-feeding mechanism, a hot wire or equivalent expansion device for regulating the action of the feeding mechanism, and means arranged in series with and intermittently opening and closing the circuit of the expansion device upon comparatively small changes of the current in the lamp-circuit from the normal value, as set forth.

6. In an electric-arc lamp, the combination of a feeding mechanism, an expansion-conductor or equivalent device for regulating the action of the feeding mechanism, and means for automatically regulating or controlling the circuit of the expansion-conductor arranged in series with the expansion device so as to augment or intensify the variations of current in the expansion-conductor in comparison with variations of current in the lamp-circuit.



7. The combination in an electric lamp, of a feeding mechanism, an expansion-conductor or equivalent device for regulating the feeding mechanism, an electromagnet in series with the expansion-conductor, and a circuit controlling or changing device under control of said magnet and serving to intensify the variations of current in the expansion conductor in comparison with the current changes in the magnet, as set forth.

602,923. TROLLEY. JAMES E. WELLS, Syracuse, N. Y. Filed May 1, 1897. Serial No. 634,601. (No model.)

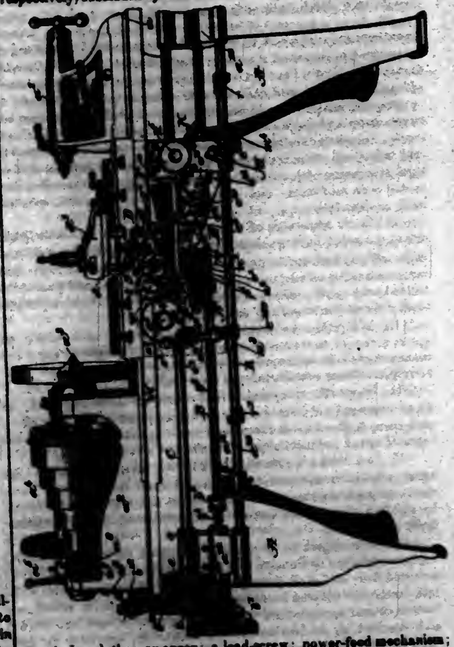
Claim.—1. In an electric trolley, a contact-frame comprising sides arching in opposite directions, cross-bars connecting them, one side having a longitudinal groove in its upper face or edge, and the other having a rigid longitudinal flange, and a rolling contact mounted between said sides, combined with a suitable trolley-arm upon which said frame is mounted.

2. In an electric trolley, the combination with a base provided with an arm and a suitable trolley-pole mounted upon said base, of a contact-frame mounted to swing upon said pole and comprising sides arching in opposite directions from a horizontal plane, cross-bars connecting them, one side having a grooved upper edge arching over from said plane, and the other a rigid flange arching below said plane, a contact mounted between said sides, and a rod connecting one end of said frame to said base-arm, whereby any vertical movement of said pole will not shift said frame out of a horizontal position although shifted vertically.

3. In an electric trolley, the combination with a base provided with an arm, a trolley-pole mounted upon said base, a contact-frame mounted to swing upon said pole, a contact in said frame, a fender upon one end of said frame, and a rod flexibly connecting one end of said fender to said base-arm whereby any vertical movement of said arm will swing said frame, fender and rod to keep said frame horizontal.

4. The combination with a single conductor and a double railway-track, of a pair of contact-frames carried by arms connected to cars moving in opposite directions, each comprising sides arched in opposite directions, one provided with a longitudinal groove and the other with a rigid flange and a contact mounted between said sides, whereby when two frames meet, while moving in opposite directions, the flange on one will enter the groove upon the other forcing one contact away from said conductor and guiding it into reëngagement therewith when said frames separate.

5. The combination with a single conductor, of a pair of contacts each mounted in a frame comprising sides, one of which is provided with a groove widened at one end, and the other being provided with a rigid flange, whereby the nose of the flange on one will enter the mouth of the groove on the other, and guide one frame away from and back into reëngagement with said conductor whereby said contact-frames moving in opposite directions meet and pass each other unassisted.



6. In an electric trolley, a contact-frame comprising rigid sides arching in opposite directions from a horizontal plane, beveled cross-bars in said plane connecting said sides and constituting pilots to guide either of two frames meeting from opposite directions into position to pass above or below the other by the engagement of the lower side of one frame, with the upper side of the other whereby the trolley-wheel of either is kept out of engagement with the frame of the other, during such passage.

602,924. REGRIND-LATHE. BENJAMIN A. WHEELER, Worcester, Mass., assignor to the Draper Machine Tool Company, same place. Filed Aug. 28, 1897. Serial No. 649,888. (No model.)

Claim.—1. In a lathe; a traveling tool-carrier; a lead-screw and power-feed mechanism adapted respectively to actuate said carrier, each independently of the other, and devices, under the control of the operator at the tool-carrier, to regulate the rate of longitudinal feed of said tool-carrier by said power-feed mechanism, substantially as described.

2. In a lathe; a traveling tool-carrier; its apron; a lead-screw and power-feed mechanism adapted respectively to actuate said carrier, each independently of the other, and means movable with said tool-carrier and continually under the control of the operator at said apron, to regulate the rate of travel of said tool-carrier and apron, when actuated by said power-feed mechanism, substantially as described.

3. In a lathe; a traveling tool-carrier: actuating mechanism therefor, including power-feed mechanism and a lead-screw adapted to operate independently of each other; and devices under the control of the operator at the tool carrier, to regulate the rate of actuation of said tool-carrier by said power-feed mechanism and lead-screw respectively, substantially as described.

4. In a lathe; an apron: a lead-screw; power-feed mechanism; and variable speed mechanism movable with, and to permit the actuation of, said apron by said lead-screw and power-feed mechanism respectively, at different rates of speed, substantially as described.

5. In a lathe; a traveling tool-carrier: actuating means therefor, including power-feed mechanism and variable-speed mechanism; and means, under the control of the operator at the tool-carrier to regulate the speed transmitted to the latter through said mechanisms, substantially as described.

6. In a lathe; a traveling tool-carrier; actuating means therefor, including power cross and longitudinal feed mechanism and variable-speed mechanism carried by said tool-carrier; and a selector device to govern the speed transmitted by said variable-speed mechanism and power cross and longitudinal feed mechanism to the tool-carrier, substantially as described.

7. In a lathe; the bed; a rotatable lead-screw extended in parallelism with said bed; a tool-carrier adapted to traverse said bed and screw longitudinally; and means movable with said carrier and operative during traversing movement of the same to rotate said lead-screw.

8. In a lathe; a rotatable lead-screw; an apron adapted to be actuated by rotation of said screw to traverse longitudinally; variable-speed mechanism carried by said apron; and means to permit rotation of said lead-screw at times by said mechanism, substantially as described.

9. In a lathe; a rotatable lead-screw; an apron adapted to traverse said lead-screw longitudinally; variable-speed mechanism carried by said apron and adapted to be operatively connected with said lead-screw at times to rotate the same and cause the apron to traverse; and a selector device for said variable-speed mechanism, substantially as described.

10. In a lathe; a rotatable shaft or screw; an apron adapted to traverse said shaft longitudinally; a plurality of different-sized gears surrounding said shaft coaxially, movable with said apron, and adapted respectively to be connected operatively with said shaft to rotate the same at times, substantially as described.

11. In an apparatus of the class described; a rotatable lead-screw; a stock of gears surrounding said screw coaxially and normally free to rotate independently thereof; an intermediate member adapted when rotated to rotate said lead-screw; and means to govern actua-

tion of said intermediate member by said gears, substantially as described.

12. In an apparatus of the class described; a lead-screw; a stock of connected, varnished gears surrounding said shaft coaxially; a clutch member adapted when actuated to operate said screw; a cooperating clutch member adapted to be driven by said stock; and means to operate said clutch, substantially as described.

13. In an apparatus of the class described, the frame; a lead-screw rotatably mounted in suitable bearings on said frame and an apron free to travel on the frame lengthwise of the screw; a quill mounted in suitable bearings on said apron and provided with a stock of varnished gears; said quill being of suitable internal diameter to receive said lead-screw and permit free relative axial movement between screw and quill, during travel of the apron lengthwise of said screw; an annular clutch member coaxially arranged with respect to said screw and connected rotatively therewith, but capable of free axial movement with said apron; a cooperating clutch member connected with said stock; and means to operate said clutch, substantially as described.

14. In an apparatus of the class described, a rotatable lead-screw; an apron having a device adapted to be operatively connected with said lead-screw, to permit the apron to be fed thereby; and means mounted on said apron, to engage and rotate said lead-screw to feed said apron; said means being arranged in close juxtaposition to said device, substantially as described.

15. In a lathe; a rotatable lead-screw; an actuating-shaft; an apron arranged to traverse said screw and shaft longitudinally; and means carried by said apron to connect said screw and shaft operatively, at times, substantially as described.

16. In a lathe; a rotatable lead-screw; an actuating-shaft; an apron arranged to be actuated by said screw; and means carried by said apron to permit rotation of said screw by said shaft, at different rates of speed, substantially as described.

17. In a lathe; a rotatable lead-screw; an actuating-shaft; an apron adapted to traverse said screw and shaft longitudinally; and means to permit actuation of said apron by said actuating-shaft both by rotation of said lead-screw, and independently thereof, substantially as described.

18. In an apparatus of the class described, an actuating-shaft; an apron adapted to traverse said shaft longitudinally; a lead-screw actuated from said shaft through the medium of means movable with said apron and adapted to actuate said apron; means to permit actuation of said apron by said shaft independently of said lead-screw; and interlocking devices to prevent concurrent operation by said shaft of said lead-screw and said independent means, substantially as described.

19. In a lathe; a lead-screw; an apron adapted to be actuated by said lead-screw and also by independent actuating means; controlling devices to govern respectively the actuation of said apron by said lead-screw and by said independent actuating means; and interlocking devices intermediate said controlling devices to prevent concurrent operation by said shaft of said lead-screw and said independent means, substantially as described.

20. A controller of the class described, comprising a disk, provided with a suitable handle and having slots to serve as actuating means for nut members; said disk being also provided with a projection to receive and cooperate with a slotted portion of an interlocking lever to actuate said lever directly, substantially as described.

21. In a lathe; a lead-screw; an apron adapted to be fed thereby and provided with power-feed mechanism; an open-and-shut nut for said lead-screw, and a nut-controller; a clutch device for said power-feed mechanism; and an interlocking lever or link connecting said nut mechanism and clutch, to permit the said clutch to be governed and operated by movement of said nut-controller, substantially as described.

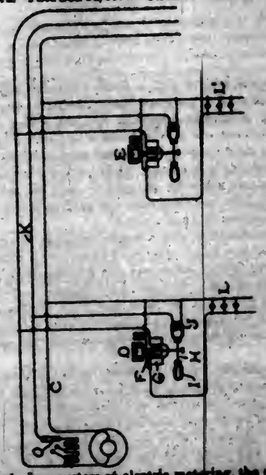
22. In a lathe; an apron; power-feed mechanism and variable-speed mechanism both movable with said apron and adapted to be connected operatively at times to permit actuation of said power-feed mechanism at different rates of speed, substantially as described.

23. In a lathe; an apron, and power-feed mechanism carried thereby, including a worm; variable-speed mechanism also carried by said apron and adapted to be connected operatively with said worm at times to permit actuation of said power-feed mechanism at different rates of speed, substantially as described.

24. In a lathe; an apron; variable-speed mechanism and power-feed mechanism carried thereby; a clutch intermediate said mechanisms, and a controller for said clutch; and an actuating-shaft connected operatively with said variable-speed mechanism, substantially as described.

25. In a lathe; a rotatable lead-screw; an apron; variable-speed mechanism carried thereby and adapted to rotate said lead-screw at times; and actuating mechanism connected operatively with said variable-speed mechanism, and including cooperating cones of auxiliary multiple-speed gears, any cooperating pair of which may be made effective by the operator, at will, substantially as described.

26. In a lathe; an apron; a shaft; gears and independent separating-rings thereon; a feathered spline carried thereby; and a handle for said spline, said handle being extended toward and arranged to move near the path of said apron; all constructed and arranged to operate in the manner and for the purpose set forth.



27. In an apparatus of the class described; a rotatable lead-screw; an apron having a device adapted to be operatively connected with said lead-screw, to permit the apron to be fed thereby; actuating mechanism for said lead-screw, movable with said apron, and means intermediate said device and mechanism to insure concurrent operation of the same, substantially as described.

28. In a lathe; an apron; an actuating-shaft; a rotatable lead-screw, and power-feed mechanism, actuated respectively from said shaft, and adapted respectively to actuate said apron; and interlocking means to prevent concurrent actuation of said apron by said lead-screw and power-feed mechanism, substantially as described.

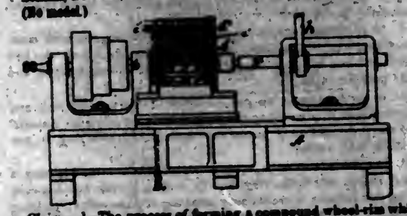
29. In an apparatus of the class described; a tool-carrier; an actuating-shaft; a rotatable lead-screw, and power-feed mechanism, actuated respectively by said shaft, and adapted respectively to actuate said tool-carrier; controlling means for said power-feed mechanism; and interlocking devices cooperating with said controlling means, to prevent concurrent actuation of said apron by said lead-screw and power-feed mechanism, substantially as described.

30. In an apparatus of the class described; a rotatable lead-screw; an apron having a device adapted to be connected operatively with said lead-screw to permit said apron to be fed by rotation thereof; actuating mechanism movable with said apron, to rotate said lead-screw; and means to control the actuation of said lead-screw by said mechanism, substantially as described.

602,925. SYSTEM OF ELECTRIC METERING. HERBERT C. WIRT, Schenectady, N. Y., assignor to the General Electric Company, of New York. Filed Dec. 31, 1897. Serial No. 665,094. (No model.)

Claim.—1. In a system of electric metering, the combination of circuit-mains, a motor mechanism for registering the consumption of energy, and automatic means for varying the damping or retarding effect of the motor.

2. In a multirate electric meter, the combination of a motor mechanism, for registering the consumption of energy in an electric circuit, a retarding mechanism which governs the speed of the motor mechanism, and means for altering the retarding or braking effect to change the rate of registration during certain portions of the day.



3. In a two-rate meter, the combination of a motor mechanism for registering the consumption of energy, a damping or retarding mechanism opposing the action of the motor mechanism, and a second retarding mechanism which assists the first when it is desired to give a discount to the consumer.

4. In a metering system, the combination of a number of meters located at various points in the system, each meter comprising a motor mechanism, a register and, retarding mechanism, and means for controlling the retarding mechanism of a number of the meters from a common point, as for example, a station or substation.

5. In a system of electric metering, the combination of a plurality of meters situated at the points of consumption, each meter consisting of a motor and retarding mechanism, a recording device, and an auxiliary retarding mechanism, the arrangement of the auxiliary retarding mechanism being such that it can be controlled from a distant point to change the rate of registration, independent of the energy passing through the meter.

6. In an electric meter, the combination of a motor mechanism, actuated by the energy consumed in the circuit, a retarding mechanism comprising a closed-circuit conductor moving within the field of a permanent magnet, an additional retarding device comprising an electromagnet, and means for controlling the action of the electromagnet.

602,926. MEANS FOR MAKING WHEEL-RIMS. JOHANN SEILER, Hawiel, Germany. Filed Feb. 4, 1897. Serial No. 622,615. (No model.)

Claim.—1. The process of forming a compound wheel-rim which consists in forming a cylinder with deep grooves, surrounding it by a second cylinder, forming the same with shallow grooves, subdividing the telescoped cylinders into rings, and uniting the edges of the rings, substantially as specified.

2. In a machine for forming wheel-rims the combination of a spinning-roll with a cylindrical former having a series of parallel grooves, and with a sectional disk *d*, adapted to reinforce the bottom of the work-piece and to constitute an abutment for the free end of the former, substantially as specified.

602,927. SAWMILL-CARRIAGE. ULRIK ANDERSON, Eau Claire, Wis. Filed Aug. 4, 1897. Serial No. 647,672. (No model.)

Claim.—1. In a device of the class described, the combination of a bracket designed to be mounted on a sawmill-carriage frame and provided with a depending stem, a longitudinal guide designed to be mounted on an axle and having longitudinal ways, and a longitudinally-reciprocating slide, mounted in the ways of the guide and provided with longitudinal flanges 22, spaced apart and receiving the said stem and having parallel inner faces, the end portions of the inner faces being disposed longitudinally of the sawmill-carriage, and the central portions being arranged diagonally of the same and adapted to force the stem laterally and offset and coact the sawmill-carriage frame, substantially as described.

2. In a device of the class described, the combination of a bracket provided with a recess and having transverse ways at opposite sides thereof, a guide having longitudinal ways and interlocked with the transverse ways of the bracket, whereby the latter is slidingly connected with the former, a stem mounted on the bracket, and a reciprocating slide mounted in the ways of the guide and provided with flanges forming offsetting and coacting ways and fitting in the recess of the bracket, said offsetting and coacting ways receiving the said stem, substantially as described.

3. In a device of the class described, the combination of a guide having longitudinal ways and designed to be mounted on an axle, a bracket designed to be secured to a sawmill-carriage frame, provided with transverse ways and interlocked with the guide, and a longitudinally reciprocating slide mounted in the ways of the guide and engaging the bracket to offset and coact the same, substantially as described.

4. In a device of the class described, the combination of a bracket having a central recess and provided with grooves at the end walls thereof, a guide having longitudinal ways and provided at opposite sides with recessed extensions forming projections fitting in the said grooves, antifriction-rollers arranged in seats of the projections and interposed between the latter and the bracket, a slide mounted in the ways of the guide and engaging the bracket to offset and coact the same, and antifriction-rolls interposed between the slide and the guide, substantially as described.

5. In a device of the class described, the combination of a bracket having a stem, a guide composed of upper and lower portions detachably connected and adapted to fit around an axle, the upper portion of the guide being sectional and provided with longitudinal ways, said guide being interlocked with the bracket, and a slide arranged in the ways of the guide and provided with offsetting and coacting ways to receive the stem, substantially as described.

6. In a device of the class described, the combination of a bracket having a central recess or depression and provided at its ends with L-shaped arms, a guide provided with longitudinal ways and interlocked with the bracket, and a reciprocating slide mounted in the guide and having its movement limited by the L-shaped arms, said slide being provided with offsetting and coacting ways and engaging the bracket, substantially as described.

7. In a device of the class described, the combination of a bracket, a guide having longitudinal ways, adjustable bars arranged at the sides and bottom of the ways, a slide mounted in the ways of the guide and provided with offsetting and coacting ways to engage the bracket, antifriction rolls interposed between the bars and the slide, and adjusting-screws mounted on the guide and engaging the bars to take up the wear, substantially as described.

8. In a device of the class described, the combination of a bracket designed to be secured to a sawmill-carriage, a guide interlocked with the bracket and designed to be mounted on an axle, a reciprocating slide mounted in the guide, extending beyond the same and provided with offsetting and coacting ways to engage the bracket, and an arched bracket-piece detachably connected to the ends of the slide, substantially as described.

9. In a device of the class described, the combination with a sawmill-carriage frame, an axle supporting the same, of offsetting devices located at the ends of the frame and each comprising a bracket secured to the frame and having transverse ways, a guide mounted on the adjacent axle, interlocked with the bracket and having longitudinal ways, and a reciprocating slide mounted in the guide, provided with offsetting and coacting ways and engaging the bracket, the depending curved bracket-piece connected with one of the slides and provided at its bottom with a sleeve, a pitman-rod having one end arranged in the sleeve, and a connecting-rod having one end secured to the curved bracket-piece and its other end attached to the slide of the other offsetting and coacting device, substantially as described.

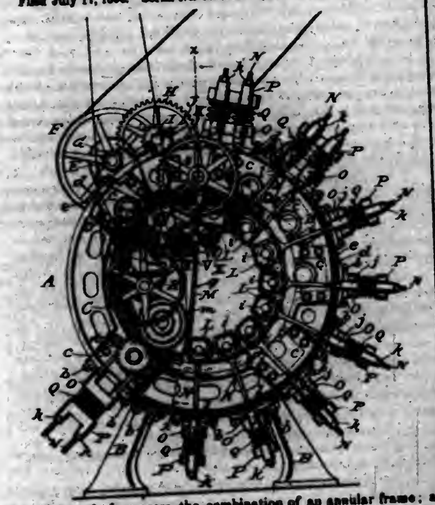
10. In a device of the class described, the combination of a bracket having transverse ways, a longitudinal guide interlocked with the bracket, a reciprocating slide mounted in the ways of the guide and having offsetting and coacting ways engaging the bracket, and pivoted dogs mounted on the bracket and arranged to engage the slide, substantially as described.

11. In a device of the class described, the combination with a sawmill-carriage, of offsetting mechanism having a movable member provided with an opening, and a cushion adapted to abut against a fixed portion of the sawmill-carriage frame and comprising a spring arranged in said opening, a plunger fitting in the same and projecting therefrom, and an elastic disk interposed between the plunger and the spring and adapted to expand when the plunger is forced inward, whereby an air-cushion is formed, substantially as described.

12. In a device of the class described, the combination with offsetting mechanism of a brake-wheel, a brake-band arranged on the brake-wheel, and means connected with and operated by the offset-

ting mechanism for causing the band to engage the wheel during the offsetting and onsetting operations, substantially as described.

13. In a device of the class described, the combination with offsetting mechanism, of a brake-wheel, a band arranged on the wheel, a weighted lever connected with the band and adapted to cause the same to engage the wheel with the desired pressure, pawls interposed between the ends of the band, and connections between the pawls and the offsetting mechanism whereby when the latter is operated the band will be applied to the brake-wheel, substantially as described.



14. In a device of the class described, the combination with a saw-mill-carriage frame, and offsetting mechanism, of a brake-wheel, a band arranged on the wheel, a weighted lever fulcrumed on one end of the band, a link connected with the other end of the band and with the weighted lever, pawls interposed between the ends of the band and adapted to hold the latter normally off the wheel, and connections between the pawls and the offsetting mechanism, whereby the band will be released when the said mechanism is operated, substantially as described.

15. In a device of the class described, the combination with a saw-mill-carriage frame, and offsetting mechanism, of a brake-wheel, a band arranged on the brake-wheel, a weighted lever fulcrumed on one end of the band, a link pivoted to the lever and provided with an adjusting-screw engaging the other end of the band, and connections between the band and the offsetting mechanism, substantially as described.

16. In a device of the class described, the combination of a saw-mill-carriage frame, and a reciprocating offsetting-slide having a triangular recess and a socket, of a brake-wheel, a band arranged on the wheel, means for causing the band to engage the wheel, a pair of angularly-disposed pawls interposed between the ends of the band and engaging the same, and a rock-shaft journaled in suitable bearings, engaging the pawls and having a crank-arm fitting in the triangular recess of the slide and the socket of the same, substantially as described.

17. In a device of the class described, the combination with a saw-mill-carriage frame, a reciprocating offsetting-slide, and a guide, of a brake-wheel, a band arranged on the brake-wheel, a weighted lever connected with the band, a pair of angularly-disposed pawls interposed between and engaging the ends of the band, and a rock-shaft connected with the slide, journaled on the guide and arranged to engage the pawls, substantially as described.

602,928. PRESS. VALERIUS D. ANDERSON, Cleveland, Ohio. Filed July 17, 1896. Serial No. 599,538. (No model.)

Claim.—1. In a press, the combination of an annular frame; a ring or drum rotatable within said frame; a series of pressure-rolls arranged within the drum; and an endless flexible belt or chain, passing between the rollers and the ring or drum, substantially as described and shown.

2. In combination with a ring or drum, an endless flexible belt or chain within the drum; and pressure devices within the belt or chain, serving to press the same toward the inner surface of the ring or drum.

3. In combination with a rotatable ring or drum, a series of pressure-rollers within the drum; and a flexible belt or chain arranged to travel between the drum and the rollers, substantially as described and shown.

4. A press, consisting of an external frame; a ring or drum within said frame; supporting-rollers for said ring; an endless flexible belt or chain within the ring; a series of pressure-rollers within said belt or chain; pressure devices adapted to hold the rollers against the belt with a yielding pressure; and means for imparting motion to the ring, the belt, and the rollers.

5. In a press, an annular frame A provided with undercut circumferential grooves *a* to receive and permit adjustment of bolts; and bolts *b* having their heads seated in said grooves, substantially as set forth.

6. In a press, a chain belt composed of a plurality of independent chains arranged side by side and in close proximity to one another, substantially as set forth.

7. In combination with an outer ring or drum, and with inner supporting or pressing rollers; an intermediate chain belt, the belt and rollers being adapted to mesh or interlock substantially as and for the purpose explained.

8. In combination with ring or drum C, internal rollers L and interposed belt M, a crushing-roll arranged to act upon the material fed to the press, before it passes between the belt and ring, to prepare it for their action.

9. In combination with a press comprising a rotatable ring, a series of rollers within the ring, and an endless flexible belt between the ring and rollers; a preliminary crushing or gage roller; yielding supports for said roller; and a belt-shifting lever or device arranged in proximity to the yielding roll-supports and serving to shift the belt whenever the gage-roller is moved a predetermined distance by the passage beneath it of unyielding substances.

10. In a press, the combination of a frame, a ring rotatable therein; an endless flexible belt within the ring; pressure-rollers within the belt; a feed trough or hopper; and a worm or screw serving to deliver material from the trough or hopper to the pressing mechanism.

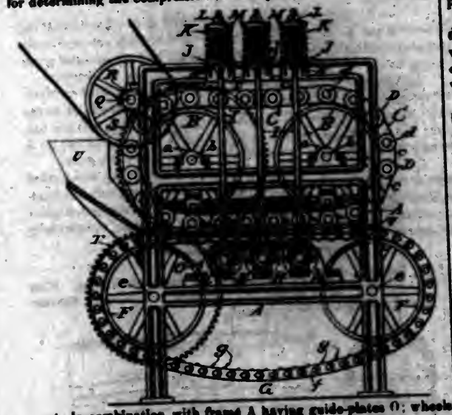
11. In combination with ring C, rolls L located within said ring; intermediate belt M; a rotary brush V bearing against one face of said belt; and a supporting-roll X bearing against the opposite face of said belt.

12. In combination with ring C; rolls L within said ring; belt M between the ring and rolls; scraper U bearing against the interior of the ring; brush V in contact with belt M; and hopper Y, provided with a worm or screw, and located within the ring, substantially as described and shown.

13. In combination with ring C; belt M within said ring; rollers L within the belt; hanger W; and scraper U, brush V, and roll X all adjustably mounted in said hanger and located within the ring.

14. In combination with a press substantially such as described and shown; hangers or supports W provided with slots; boxes movable in said slots and provided with clamping-nuts; and cleaning devices carried in said boxes; all substantially as described and shown.

15. In a press, the combination of an outer rim or drum; a series of pressure-rolls; and an endless belt, said belt passing between the rollers and the drum and being contained wholly within the latter.



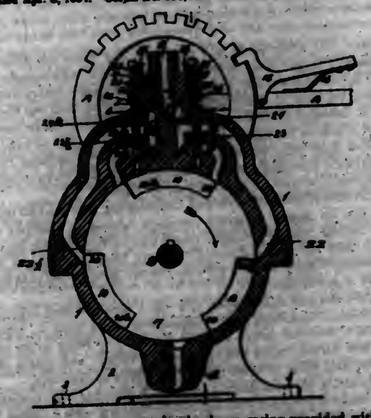
16. In combination with a hollow or annular drum, a chain belt arranged within the same; rolls for sustaining said belt and maintaining its outer face in proximity to the inner face of the drum; and a belt of fibrous or woven material interposed between the drum and belt, substantially as set forth.

602,929. PRESS. VALERIUS D. ANDERSON, Cleveland, Ohio. Filed Aug. 13, 1896. Serial No. 602,694. (No model.)

Claim.—1. In a press, the combination of a frame; wheels or drums mounted in said frame; an endless chain belt passing about said wheels or drums; supporting bars or rails within said belt to guide and support its working face; a second pair of wheels or drums; a second endless chain passing about said wheels or drums, composed of separate parallel chains, and having its face opposed to that of the first belt; and means substantially such as shown and described for pressing and holding the second belt against or close to the first, throughout an extended area.

2. In a press, the combination of a frame A, wheels or drums B B mounted therein; a chain belt C passing about said wheels; rollers D carried by said chain belt; tracks or bars E for said rollers; wheels or drums F, F, mounted in the frame A; endless chain belt G passing about said wheels and consisting of a series of separate parallel chains; and means substantially such as described and shown for pressing and holding belt G against or close to belt C, throughout an extended area.

3. The herein-described press, comprising a frame A; wheels or drums B B; endless chain belt C provided with rollers D; track-rails E E for said rollers; wheels or drums F, F; endless chain belt G; pressure-rollers H serving to press belt G toward belt C; saddles P located between the rollers H; draw-rods I; springs K; and means for determining the compression of said springs.



4. In combination with frame A having guide-plates O; wheels B B mounted in said frame; endless chain belt C passing about said wheels; supporting-bars E for said belt; wheels F F also mounted in frame A; endless chain belt G passing about said wheels; pressure-rollers H beneath the upper section of belt G; collars or boxes A applied to the journals of rollers H and guided by plate O; draw-rods I carrying the sleeves A, and springs K applied to said rods.

5. In combination with frame A; endless chain belts C and G and their supporting or carrying wheels; guide-plates O; sleeves or collars A adapted to support a series of rollers guided by said plates; draw-rods I carrying said sleeves; and springs K applied to said rods.

6. In combination with chain belt C and its supports; chain belt G, consisting of a plurality of parallel chains, one provided with teeth *g*; carrying wheels F F for said chain; pressure-rollers H for chain G; and a saddle P interposed between proximate rollers H to prevent sagging of belt F, the wheels F, rollers H and saddle P being all recessed to receive or permit the passage of teeth *g*; substantially as described and shown.

7. In a press, the combination of two endless belts arranged face to face through a portion of their length, one composed of separate parallel chains; carrying wheels or drums for said belts; and means substantially such as shown and described for pressing and holding the opposing faces of the two belts in close proximity.

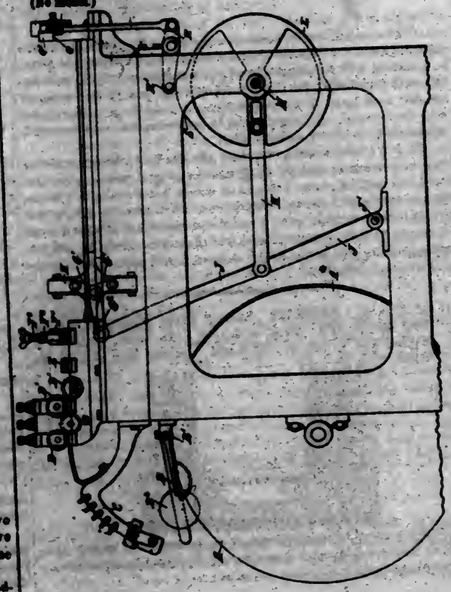
602,930. ROTARY ENGINE. WILLIAM S. BATE, Brooklyn, N. Y. Filed Apr. 3, 1897. Serial No. 630,186. (No model.)

Claim.—1. A rotary engine having a casing provided with two ports leading to different parts thereof, a piston, and the plate-valve provided with two ports adapted to admit fluid alternatively to one or the other of two ports in the casing, substantially as described.

2. A rotary engine having a casing provided with two ports leading to different parts thereof, a piston, and the plate-valve provided with two ports for admitting fluid alternatively to one or the other of the ports in the casing and an inlet-port intersecting the casing-ports provided with a throttle-valve, substantially as described.

3. A rotary engine having a casing with two ports leading to different parts thereof on both sides of the casing, a piston, plate-valves each having two ports adapted to admit fluid alternatively to one or the other of said sets of ports according to the direction in which the engine is running, substantially as described.

4. A rotary engine having a casing provided with two ports leading to different parts thereof on both sides of the casing, a piston, two plate-valves each having two ports admitting fluid alternatively to either set of the ports according to the direction in which the engine is running, and an inlet-port leading to the casing-ports and a combined throttle and reversing-plug, substantially as described.



5. In the valve-casing 4, of a rotary engine, the combination of cylinder inlet-ports 21 and 22, with a slide-valve 23, having steam-ports 24 and 25 and m arranged in relation to said cylinder inlet-ports that the supply of steam or other motive agent through a valve-casing inlet-port 11, and throttle-valve plug 6, may be cut off from either one of said cylinder inlet-ports, while being admitted to the other, allowing the steam or other motive agent in the cylinder port and chamber to cut off to drive a piston 17.

6. In the valve-casing 4, of a rotary engine the combination of cylinder inlet-ports 21 and 22, and 21½ and 22½, with slide-valves 23 and 23½ having ports 24 and 25, and 24½ and 25½, and so arranged in relation to said cylinder inlet-ports that the supply of steam or other motive agent through a valve-casing inlet-port 11, and throttle-valve plug 6 may be cut off from either port of such pair of said cylinder-ports as may be in communication with the motive supply, (while being admitted to the other), allowing the steam or other motive agent in the cylinder port and chamber so cut off to drive a piston.

7. A rotary engine having a casing provided with two ports leading to different parts thereof, a plate-valve provided with two ports, a piston, a piston-shaft, a cam on said shaft and connecting mechanism to operate the valve to periodically admit to and cut off the supply of fluid to the piston, substantially as described.

8. The improved rotary engine herein described comprising the cylinder-casing with an inlet and an exhaust port, a piston, a throttle-valve, ports leading to different parts of the casing and plate-valves with two ports for controlling the flow of the steam or fluid to the piston and means for periodically opening and closing said valves, substantially as described.

602,931. MANUFACTURE OF WIRE SPOKES FOR WHEELS. JOHN BATEY, Dublin, Ireland. Filed Oct. 2, 1897. Serial No. 653,783. (No model.)

Claim.—1. The combination of a drum upon which the wire to be straightened is wound, a brake bearing on the wire, a curved surface with pins projecting from it in zigzag course over which the wire is first led to bend the wire in one direction, the rollers for subsequently bending the wire in the opposite direction, the gripper carried by a slide, the toggle-levers for actuating the gripper, the rod jointed to the central joints of the toggle-levers, and mechanism for giving a to-and-fro endway movement to this rod so as when the rod is moved in one direction to first close the gripper and then move the slide endwise to draw the wire forward through the straightening appliances, and when the rod is moved in the opposite direction to first open the gripper and then move the slide backward, and the cutter for cutting off a length of wire which projects beyond the gripper.

2. The combination of wire-straightening appliances, the gripper, the slide by which it is carried, the toggle-levers, the to-and-fro end-way-moving rod, jointed to the central joints of the toggle-levers, the cutter, and mechanism for causing the cutter to partially cut through the wire when the slide completes its forward movement and to complete the cut just before the slide commences its next forward movement.

3. The cutter formed of two rings held together, face to face, and capable of being moved one over the other, and both free to turn while in action, substantially as described.

4. The combination of the curved surface over which the wire is first led, the bending-rollers through which the wire next passes, and mechanism for first closing the gripper onto the wire and then moving it endwise to draw the wire forward and afterward to open the gripper and then move it backward.

5. The combination of the curved surface with pins projecting from it in a zigzag course, over which the wire is first led to bend the wire in one direction, the rollers for subsequently bending the wire in the opposite direction, the gripper, the slide by which it is carried, the toggle-levers, the to-and-fro end-way-moving rod jointed to the central joint of the toggle-levers, and the cutter for cutting off lengths of wire after they have been drawn forward by the gripper.

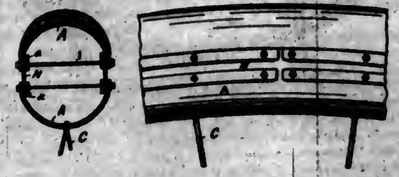
602,932. WIRE-FENCE TOOL. JOSEPH A. BRABENDER, Sykes, Pa. Filed Jan. 11, 1898. Serial No. 666,242. (No model.)

Claim.—1. A fence-tool comprising the handle 1 formed with the integral jaw 4, the crescent-shaped arms 2, 3 and the parallel plates 5, 6, formed with the longitudinal guide-shoulders 7, 7, in combination with the sliding bar 18 formed with the jaw 19 and recess 17 and the hand-lever 13 fulcrumed between said plates and provided with the integral right-angular toe 16 projecting into said recess 17, substantially as shown and described.

2. A wire-fence tool, comprising the handle 1, formed with the integral crescent-shaped arms 2, 3, and the integral right-angular jaw 4 and the parallel plates 5, 6, one of which is formed with the stationary cutting-jaw 10, in combination with the reciprocating bar formed with the angular jaw 19 and the recess 17, and the hand-lever 13 formed with the integral toe 16 and the cutting-blade 14, and fulcrumed on the bolt 12, removably secured in said plate, substantially as shown and described.

602,933. FIREPLACE. RICHARD BOWEN, Darlington, England. Filed Nov. 27, 1896. Serial No. 613,595. (No model.) Patented in England Nov. 1, 1893, No. 20,616, and in France June 14, 1894, No. 239,301.

Claim.—1. A household-fireplace consisting of a trough open only at its top and formed as regards all its sides of comparatively non-heat-conducting refractory material.



2. A household-fireplace consisting of a trough formed of comparatively non-heat-conducting refractory material and open at its top only; and a grate fixed at a point between the bottom and top of the trough.

3. In a household-fireplace, the combination of a fire-box having its bottom and all its sides closed and formed of thick comparatively non-heat-conducting and refractory material; and a removable grate resting on the sides of the box intermediate the top and bottom.

4. A fire-box formed entirely of comparatively non-heat-conducting refractory material made in the shape of a trough open at its top only; supports B formed at a point intermediate the top and the bottom; and a grating C resting on the supports, whereby an ash-pit is formed below the grate and a box for the fire above the grate.

5. The combination of a fire-box open only at its top, and formed both as regards its sides and bottom of thick comparatively non-heat-conducting refractory material carrying within it a suspended grate in combination with an iron frame inclosing the same, substantially as described.

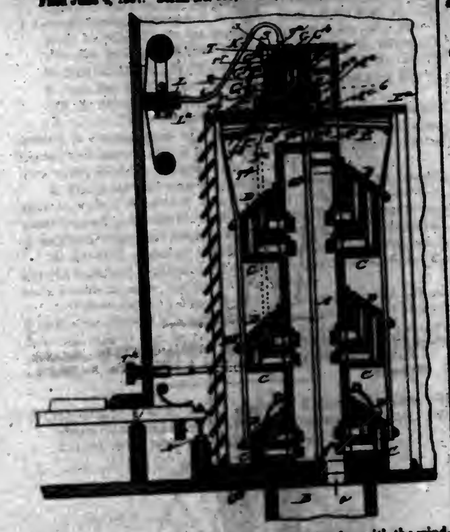
602,934. TIRE. ROBERT BOWMAKER, Liverpool, England. Filed Apr. 12, 1897. Serial No. 631,794. (No model.) Patented in England June 1, 1896, No. 11,991.

Claim.—1. A tire comprising two annular metallic sections substantially semicircular in cross-section, said sections being formed with seats or grooves in their edges; annular rubber sections H extending across from the grooves and fitting therein; and means for securing said sections in place.

2. In a tire formed of a resilient metal tube, the combination therewith of brackets secured at intervals direct to the inside periphery of the tire, the brackets being so arranged as to receive and hold the spokes substantially as described, whereby the use of a wheel-rim is dispensed with.

602,935. TIRE. ROBERT BOWMAKER, Bootle, England. Filed Oct. 13, 1897. Serial No. 655,060. (No model.)

Claim.—1. A tire made of a metal rim and outer non-pneumatic tread of larger diameter than the rim so as to pass completely around it circumferentially and air cushions or springs interposed in the space between, in combination with spring-couplings, one end of which is fastened to the outer tread inside, and the other passed through a hole in the rim and tightened up by a nut on the outside, whereby a tight joint between the tread and rim is obtained while allowing for a movement of the tread in absorbing vibration when traveling along a road, substantially as described.



2. In tires of the kind described, coupling together the two parts of the tire by means of spring-couplings, located at intervals all around the tire, and so arranged that while holding the two halves together they will freely allow of vibration being absorbed by the air cushions or springs located between the two parts of the tube substantially as set forth.

3. In a tire, the combination of a rim A provided with concave seats *a;* tread B provided with oppositely-disposed seats *b;* inflatable tubes D mounted in said seats; a plate E extending across the seats *b* and bearing upon the upper sides thereof; and means for connecting said plate with the rim, substantially as described.

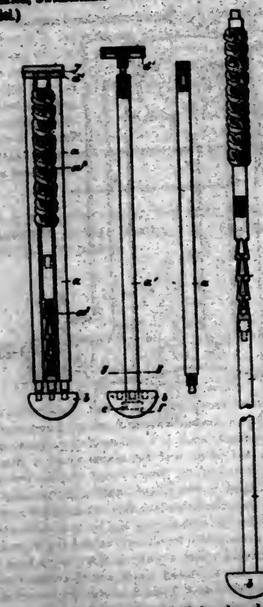
4. In a tire, the combination of a rim A provided with concave seats *a;* tread B provided with oppositely-disposed seats *b;* tubes D mounted in said seats; and an air-tube connecting the tubes D.

5. In a tire, the combination of a rim A provided with concave seats *a;* tread B having oppositely-disposed seats *b;* air-tubes D mounted in said seats; a plate E extending across the upper part of seats *b;* and a spring connection between said plate and the rim.

602,936. PNEUMATIC-ORGAN. MELVILLE CLARK, Chicago, Ill. Filed June 4, 1897. Serial No. 639,204. (No model.)

Claim.—1. In a pneumatic-organ, in combination with the wind-chest, the motor-pneumatic and the valve which controls the communication of the same with the wind-chest; the primary pneumatic to which such valve is attached, said valve having its stem extending through the port which the valve controls, and the guide O, made of wire coiled to encompass the stem and having its ends extended to bear against the sides of the port.

2. In a pneumatic-organ, in combination with the wind-chest and the primary pneumatic exterior thereto, a duct which leads therefrom terminating within the wind-chest; a tube connected into the duct and constituting a continuation thereof, such tube extending through the wind-chest, and a duct in the bottom wall of the wind-chest into which said tube is connected, said duct in the bottom wall leading to a port in the vicinity of the manual, and a valve operated by the manual to control said port.



3. In a pneumatic-organ, in combination with an erect wind-chest having read-blocks mounted on its vertical walls, motor-pneumatics above the read-blocks and primary pneumatics above the motor-pneumatics adapted to control the latter, a duct from each primary pneumatic leading through the wall of the wind-chest at the upper part; a duct leading through the wall of the wind-chest at the lower part, and a valve actuated by the manual-key which controls the outer end of said duct, and a tube within the wind-chest connecting the duct at the upper part with the duct at the lower part.

4. In a pneumatic-organ, in combination with the primary pneumatics which have each a duct leading to a pair of ports located at a coupler-board seat, such coupling-board seat, and a coupling-board having ports arranged in pairs which correspond to and are adapted to register with the ports of the ducts which lead from the pneumatics respectively; ducts which connect one coupler-port of each pair with a coupler-port on octave above, and the other coupler-port with a coupler-port on octave below, and suitable means for moving the coupler transverse to ports to register or not register with the ports in the seat.

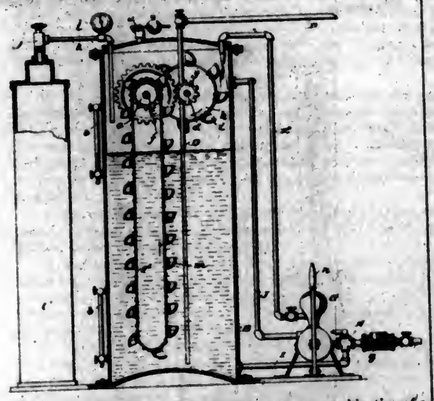
5. In a pneumatic-organ, in combination with primary pneumatics having each a duct leading to two ports at a coupling-board seat, all said ports constituting two sets, one of the ports pertaining to each pneumatic being in one set and the other port being in the other set, such coupling-board seat and coupling-boards pertaining to the several octaves respectively, each board having ports arranged in two sets corresponding to the two sets of the coupling-board ports, one set of the coupler-board ports being adapted to register with one set of the coupler-seat ports pertaining to a given octave, and the other set of the coupler-board ports being adapted to register with the other set of the coupler-seat ports pertaining to the next octave, and means for independently moving each coupler-board to cause its ports to register with the seat-ports.

6. In a pneumatic-organ, a coupling mechanism which consists of ducts connecting primary pneumatics pertaining to the several notes to be coupled, such ducts being grouped in octave sets, a part or section of each of the ducts of each octave group being formed in one and the same unitary part of the structure, said part being movable at will to disconnect and close all the ducts of the octave group.

602,937. CLEANING DEVICE FOR GUN-BARRELS. HANS W. BELL, Zurich, Switzerland. Filed Nov. 17, 1897. Serial No. 658,906. (No model.)

Claim.—1. In a cleaning device of the class described, the combination with a plurality of divisions arranged to be detachably connected end to end, of means secured to one of said divisions for receiving one end of each of the other divisions, and a securing device arranged to be detachably connected to one of said divisions at the end opposite said means and to engage the corresponding ends of the other divisions, substantially as described.

2. In a cleaning device of the class described, the combination with a terminal division having a handle secured at one end, of a securing device arranged to be detachably connected to the opposite end of said terminal division, a cleaning-division and a plurality of intermediate divisions arranged to be secured between the handle and the securing device and to be connected end to end in a detachable manner, substantially as described.



3. In a cleaning device of the class described, the combination with a terminal division having a handle provided with a plurality of recesses in its inner face, a plurality of intermediate divisions each provided with a threaded stud arranged to enter a socket in the corresponding opposite end of the adjacent division, and a cleaning-division arranged to be connected to the intermediate divisions, said cleaning and intermediate divisions being arranged to enter the recesses in the handle, of a securing device provided with a stud adapted to be threaded into one end of the terminal division and arranged to engage the intermediate and cleaning divisions whereby all the parts are held in a compact form.

4. In a cleaning device of the class described, the combination with a plurality of intermediate divisions and a terminal division provided with means for holding one end of each of the other divisions, of a pair of cleaning-divisions arranged to be detachably connected to each other, said cleaning-divisions when united being equal in length to each intermediate division and arranged to be held at one end by the handle, and a securing device arranged to engage one end of the terminal division and to hold the corresponding ends of the intermediate divisions and one end of the cleaning-divisions whereby all the parts are held in a compact form.

602,988. APPARATUS FOR CARBONATING LIQUIDS. CHARLES A. SAUNDERS, New Orleans, La., assignor to Charles Monselice, same place. Filed June 14, 1897. Serial No. 641,202. (No model.)

Claim.—1. In an apparatus for carbonating liquids, the combi-

nation of a closed vessel adapted to contain liquid and carbonic-acid gas, a liquid-elevator arranged in said vessel, a liquid-supply pipe leading from a source of supply into the closed vessel, and mechanism arranged to be operated by the stream of water from said supply-pipe and connected with the liquid-elevator so as to transmit motion to the same, substantially as specified.

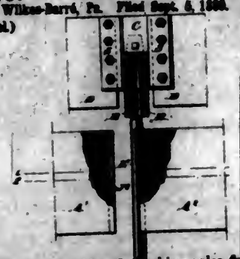
2. In an apparatus for carbonating liquids the combination of a closed vessel, a pump, a conduit leading from the eduction-chamber of the pump to the closed vessel, a liquid-conduit connecting the induction-chamber of the pump and the closed vessel, a pipe J, connecting the upper portion of the closed vessel and the pump, and a water-elevator arranged in the closed vessel and operative by the stream of liquid from the first-named conduit, substantially as specified.

3. In an apparatus for carbonating liquids, the combination of a closed vessel adapted to contain liquid and carbonic-acid gas, a liquid-elevator arranged in said vessel, a pump, a pipe leading from the discharge of the pump into the closed vessel, and mechanism arranged to be operated by the stream of liquid from said pipe and connected with the liquid-elevator so as to transmit motion to the same, substantially as specified.

4. In an apparatus for carbonating liquids, the combination of a closed vessel adapted to contain liquid and carbonic-acid gas, a liquid-elevator arranged in said vessel, a pump, a pipe leading from the discharge of the pump into the closed vessel, mechanism arranged to be operated by the stream of liquid from said pipe and connected with the liquid-elevator so as to transmit motion to the same, and a pipe connecting the closed vessel and the induction-chamber of the pump, substantially as specified.

5. In an apparatus for carbonating liquids, the combination of a closed vessel adapted to contain liquid and carbonic-acid gas, a liquid-elevator arranged in said vessel, a pump, a pipe leading from the discharge of the pump into the closed vessel, mechanism arranged to be operated by the stream of liquid from said pipe and connected with the liquid-elevator so as to transmit motion to the same, a pipe I, connected with the closed vessel, a three-way cock connected with said pipe I, and also with a pipe leading from a source of liquid-supply, and a pipe leading to the induction-chamber of the pump, substantially as specified.

6. In an apparatus for carbonating liquids, the combination of a closed vessel adapted to contain liquid and carbonic-acid gas, a pump, a pipe leading from the discharge of the pump into the closed vessel and a water-elevator arranged and adapted to discharge in the closed vessel and operative by the stream of water from the pipe, substantially as specified.



7. In an apparatus for carbonating liquids, a closed vessel forming part of a closed cycle, a pipe forming part of the closed cycle and having its discharge end arranged in the closed vessel, a water-elevator arranged in the closed vessel and operative by the stream of water from the pipe, and means for maintaining a circulation of liquid through the closed cycle, substantially as specified.

602,989. LEMONADE-SHAKER. JAMES L. GREEN and ZACK R. GREEN, Kansas City, Mo. Filed June 29, 1897. Serial No. 642,869. (No model.)

Claim.—The combination with a lemonade-shaker provided with a roughened cone or mound rising from the base, of a hollow cap or cone provided internally with pointed teeth 5 to be embedded in the skin of a lemon, and with a handle, substantially as shown and described.

602,940. MANUFACTURE OF CARRIAGE-AXLES. ORLANDO C. HALL, Wilkes-Barré, Pa. Filed Sept. 4, 1890. Serial No. 363,979. (No model.)

Claim.—1. The machine for making axles from a bar or blank provided with dies recessed to form both the tapering journal and the collar thereof, one of the dies constructed to receive the bar and hold it during the longitudinal movement of the other die, the journal-die having a tapering recess which except at the mouth is smaller in diameter than the axle-bar, substantially as described.

2. Forming the collar and journal of an axle simultaneously by subjecting the end of a bar to endwise pressure to impart the form to the journal and collar by upsetting the bar, substantially as described.

602,941. PROTECTOR FOR TREES. JOHN A. HARVEY, Hancock, Md. Filed Apr. 14, 1897. Serial No. 632,113. (No model.)

Claim.—1. A tree or vine guard consisting of a wire fabric having a rod at one end, said rod being in contact with the fabric at its end only and forming a narrow space between the rod and the fabric, as set forth.

2. A tree or vine protector consisting of a wire fabric having a rod at one end, said rod having curved ends whereby a narrow space is formed for the insertion of the fabric, and a spring to fasten the parts together, as set forth.

3. A tree or vine protector consisting of a wire fabric having overlaid edges, a rod with curved ends fastened to one end of the fabric, and a spring to fasten the parts together, as set forth.

4. A tree or vine guard provided with a rod 6 having curved ends, said rod being fastened to one end of the fabric of which the guard is composed, a layer of cotton or similar material on its upper part carrying an insecticide, and adjusting-springs, as set forth.

602,942. IODIN DERIVATIVE OF MENTHOL AND THIOL. LOUIS G. HELMING, Hamburg, Germany, assignor to Ichthyol Gesellschaft, Cordes, Hermanni & Co., same place. Filed Sept. 10, 1897. Serial No. 651,244. (No specimens.) Patented in Germany June 3, 1893, Nos. 70,139 and 80,860; in France Oct. 26, 1893, No. 233,033; in England Oct. 26, 1893, No. 20,949; in Belgium Oct. 26, 1893, No. 104,910; in Italy Dec. 31, 1896, No. 53,036, and in Austria-Hungary Mar. 17, 1893, No. 86,910 and No. 86,153.

Claim.—1. The process of rendering iodin soluble in water, which consists in reacting upon it with a sulfonic-acid compound of a sulfureted hydrocarbon that is soluble in water, such as may be derived from ichthyol or thiol, substantially as set forth.

2. The process of rendering soluble in water iodin by reacting upon it with a compound of a sulfureted hydrocarbon soluble in water consisting of sulfonic acid and sulfone like constituents such as may be derived from ichthyol and thiol, substantially as described.

3. An iodin compound that is soluble in water, consisting essentially of iodin and a sulfonic-acid compound capable of rendering the iodin soluble in water, for the purpose set forth.

4. The compound consisting of iodin and sulfonic acid and sulfone-like constituents of a sulfureted hydrocarbon combined with sulfuric acid such as may be derived from ichthyol or thiol in such proportions as to render the said iodin soluble in water, substantially as set forth.

602,943. SAW-GUIDE. GERMAN H. HINSLEY, Milwaukee, Wis., assignor of one-half to The Edward P. Allis Company, same place. Filed Aug. 24, 1896. Serial No. 603,702. (No model.)

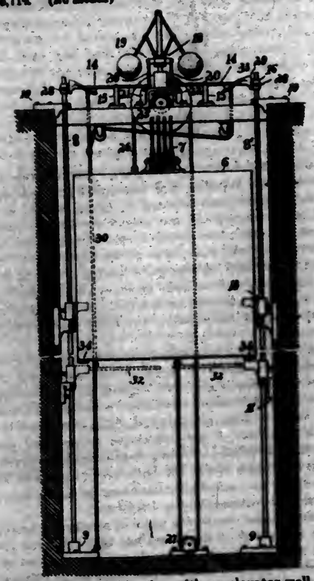
Claim.—1. In combination with a saw-blade, a guide-support and a saw-guide carried by said support and free when in working adjustment to recede before an advancing body moving in the horizontal plane of the guide.

2. In combination with the blade and frame of a sawmill; a head carried by said frame; a bracket in sliding engagement with said head; and a saw-guide carried by said bracket and free to move away from the saw when subjected to predetermined pressure in that direction.

3. In combination with the frame of a sawmill, a gravitating bracket adapted to move to and to be held in operative position by gravity and free to be moved from operative position by a force acting in opposition to gravity; and a saw-guide carried by said bracket.

4. In a sawmill, the combination of a normally-fixed arm or support; an inclined plate or guide carried thereby; a bracket mounted upon said guide and adapted to move downward thereon by gravity; and a saw-guide carried by said bracket and serving when acted upon by the moving blade to draw or urge the bracket downward upon its guide.

5. In combination with the arm or support C of a sawmill provided with slotted head *a*; plate D; bolt E connecting said plate and head; bracket G provided with overhanging flanges or ribs to engage with plate D and free to recede under pressure; and a saw-guide upon said bracket.



6. In combination with arm or support C and plate D carried thereby; bracket G adapted to engage with and to slide upon said plate; and a saw-guide carried by the bracket, and free to recede under pressure.

7. In combination with a normally-fixed arm or support, a bracket loosely connected therewith and provided with a saw-guide; and a supporting rope or band connecting the fixed support and the detachable bracket, and serving to sustain the latter when detached from the former.

8. In combination with arm or support C, loosely-attached bracket G provided with a spraying or jet device; a flexible supply-pipe K communicating with said spray or jet device; and a flexible band connecting the detachable bracket with the supporting-arm and serving to sustain the bracket when detached, and to prevent undue strain upon the hose or pipe.

9. In combination with arm or support C provided with head *a* having groove *b*; plate D provided with rib or tongue *c*; fastening-bolt E; bracket G loosely applied to plate D; and guide-arms *f* carried by the bracket G.

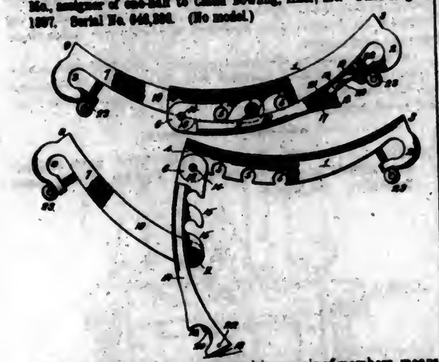
602,944. SAFETY-CHECK FOR ELEVATORS. JAMES HUSSELL and ROBERT W. HUSSELL, Brooklyn, N. Y. Filed Nov. 16, 1897. Serial No. 658,714. (No model.)

Claim.—1. The combination with an elevator-well, of horizontally-movable stops located at intervals throughout the length of the well and normally held out of the path of the car, and means for throwing said stops into the path of the car when it attains a dangerous speed.

2. The combination with an elevator well and car, of horizontally-swinging stops located at intervals throughout the length of the well, means for normally holding said stops out of the path of the car, and a tripping device for said stops actuated by the car when it attains a dangerous speed.

3. The combination with an elevator-well, of one or more vertical shafts located therein and carrying stops or feet adapted to project into the well and means for rotating said shafts to project said feet into the well.

4. The combination with an elevator well and car, of one or more vertical shafts located therein and having each a series of stops or feet projecting therefrom, means tending to throw said feet into the path of the car, a retaining device for holding them against such tendency, and means for tripping said retaining device for the purpose set forth.



5. The combination with an elevator well and car, of vertical shafts located therein and having feet or stops thereon, means for rotating said shafts to throw the feet into the path of the car, a retaining device for normally holding said shafts against rotation, and a governor actuated by the car for tripping said retaining device when the car starts to fall.

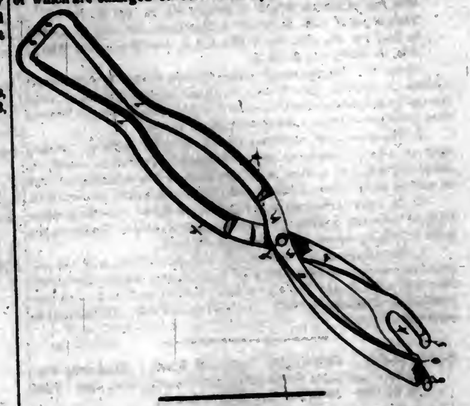
6. The combination with an elevator-well, of vertical rotary shafts therein having bearings at intervals throughout their length,

foot or stops connected to said shafts and projecting laterally therefrom, and means for rotating said shafts and stops, as and for the purpose set forth.

7. The combination with an elevator-well, of a vertical rotary shaft located therein, stops or feet projecting from the shaft and having a spring connection therewith, as and for the purpose set forth.

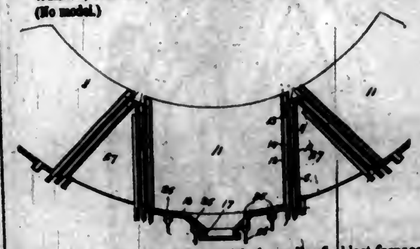
602,945. HAME-FASTENER. (CARROLL H. JOHNSON, Oak Grove, Mo., assignor of one-half to Claud Bowing, Hiler, Mo. Filed Aug. 3, 1897. Serial No. 646,891. (No model.)

Claim.—1. A hame-fastener comprising a pair of members, means for connecting them together, said members being provided with hooks 2 and 8 at their outer ends and horns and shoulders 3 and 9 above said hooks respectively, and pins or keys 23 for closing the open ends of said hooks, the heads of said pins or keys being depressed below the hooks, said heads of the keys and the horns or shoulders on the hooks being adapted to limit the swing of the members when disconnected from each other, by striking the opposite sides of the links connecting the members and hames, said links being of a size to closely fit the shank of the hook, substantially as described.



2. A hame-fastener, comprising a pair of members pivotally connected to the lower ends of the hames, one of them being grooved and provided with holes in the lower edge of said grooved portion, and the other being bifurcated to embrace externally the inner end of the first-named member and provided with a cross-pin at its inner end, and a lever pivoted to the first-named member and provided with a hooked rib projecting into the groove of the first-named member and registering with one of the holes of the same and holding the cross-pin of the last-named bifurcated member in said hole of the first named member, substantially as described.

3. A hame-fastener, comprising a pair of members pivotally connected to the lower ends of the hames, one of them being grooved and provided with holes in the lower edge of said grooved portion, and with a hole at its outer end, and the other being bifurcated to embrace externally the inner end of the first-named member and provided with a cross-pin at its inner end, a lever pivoted to the first-named member and provided with a hooked rib projecting into the groove of the first-named member and registering with the openings of the same and holding the cross-pin of the last-named bifurcated member in one of the holes of the first-named member, and a spring-catch carried by said lever and adapted to engage the hook at the outer end of the first-named member, substantially as described.

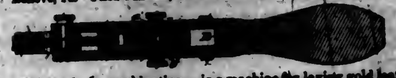


4. A hame-fastener, comprising a pair of members pivotally connected to the lower ends of the hame, one of them being grooved and provided with openings in the lower edge of said bifurcated portion, and the other being bifurcated to embrace externally the inner end of the first-named member, and provided with a cross-pin at its inner end, a lever pivoted to the first-named member and provided with a hooked rib projecting into the groove of the first-named member and registering with the openings of the same and holding the cross-pin of the last-named bifurcated member in one of the holes of the first-named member, a spring-catch fitted in the free end of the lever and adapted to engage the hook at the outer end of the first-named member, and a pin secured to the lever and adapted to limit the outward movement of said spring-catch, substantially as described.

602,946. FORCEPS. CARL E. JUSO, Bushong, Kans. Filed Aug. 17, 1896. Renewed Jan. 26, 1898. Serial No. 668,502. (No model.)

Claim.—The combination, substantially as hereinbefore described, to form an obstetrical forceps, of an arm 1, of compound-curve form, terminating at one end in an abutment 8, and at the other in a jaw 6, and a second arm, compound curve in form, which intersects and is pivoted to the first-named arm, and terminates at one end in an opposing abutment 8, and at its opposite end in a fork 4, the prongs of which are enlarged or bent lawardly at their inner sides.

602,947. BLAST-FURNACE. EDWARD KELLY and HARRY B. WEAVER, Port Oram, N. J. Filed Sept. 20, 1897. Serial No. 652,466. (No model.)



Claim.—1. The combination with the walls of a blast-furnace, of tuyers having parallel side walls arranged circumferentially thereof, the width of the several tuyers being such that their inner ends are nearly in contact so as to admit a circumferentially-continuous current of air to the furnace, said tuyers being composed of two chambers, whereby a water-space is formed, and being mounted in a casing which is fixed in the walls of the furnace, and which is also provided with a water-chamber, and the walls of the furnace being also provided with triangular casings which fill the spaces between said tuyers, and which are provided with means for circulating water therethrough, substantially as shown and described.

2. A blast-furnace constructed as herein described, and provided with tuyers which are arranged circumferentially therein, the side walls of the several tuyers being parallel, casings or blocks which are triangular in form and which are placed between said tuyers, the wider ends thereof being directed outwardly, and means for cooling said casings, substantially as described.

3. A blast-furnace provided with a circumferential row of tuyers having parallel side walls which are mounted in spaces between which are placed casings or blocks, said casings or blocks being triangular in form, and provided with means for circulating water therethrough, and cooling the same, and said tuyers being also provided with means for circulating water around the same, substantially as described.

602,948. TOOL FOR LAYING GOLD-LEAF. JOHN C. F. KNEELE, Reeves, Pa. Filed June 29, 1897. Serial No. 641,573. (No model.)

Claim.—1. In combination,—in a machine for laying gold leaf,—a handle provided with a carrying fork,—a delivery roll at the outer end of said carrying fork,—a package roll-frame pivotally applied within and at the inner end of said carrying fork, and formed with conical sockets and projecting bosses,—package roll removably applied to said package roll-frame and provided with an axial aperture,—and tension screws threaded through the side bars of the carrying fork and adapted to the conical sockets in the roll-frame,—substantially as and for the purpose set forth.

602,949. TOOL FOR LAYING GOLD-LEAF. JOHN C. F. KNEELE, Reeves, Pa. Filed Oct. 19, 1897. Serial No. 655,333. (No model.)

Claim.—1. In a hand tool for laying a strip of gold leaf, which is adapted to be manually moved over the surface to which the leaf is to be applied, the following elements in combination:—means for supporting a roll of foil-provided paper and for applying it to a surface to be decorated,—a receiving roll for the foil-denuded paper,—and a motor adapted to automatically occasion the rotation of said receiving roll,—substantially as set forth.

2. In a machine for laying gold-leaf, in combination with means for supporting a roll of foil-provided paper and for applying it to a surface to be decorated, a receiving roll for the foil-denuded paper, a spring motor adapted to occasion the rotation of said roll, and means for at will locking or releasing said motor, substantially as set forth.

3. In combination:—a main frame, devices mounted in said frame for supplying foil-provided paper and for presenting said foil-provided paper to a surface to be decorated, a paper-receiving core, a shaft upon which said core is mounted, a driven pinion mounted on said shaft, a spring controlled shaft, a spring mounted upon said shaft, a driving spur wheel loosely mounted upon said shaft and engaged with the driven pinion, a ratchet carried by said spring shaft, and a pawl carried by said spur wheel and engaged with said ratchet, substantially as set forth.

4. In a device for laying gold-leaf, in combination:—a pair of side plates, a package and delivery roll removably mounted between said plates, a receiving roll removably mounted between said plates, a motor adapted to rotate the receiving roll, and means for retarding the rotation of the package and delivery roll, substantially as set forth.

5. In a device for laying gold-leaf, in combination:—a pair of side plates, a package and delivery roll removably mounted between said plates, a receiving roll removably mounted between said plates, a motor adapted to rotate the receiving roll, means for retarding the rotation of the package and delivery roll, and a locking device which controls the rotation of the receiving roll, substantially as set forth.

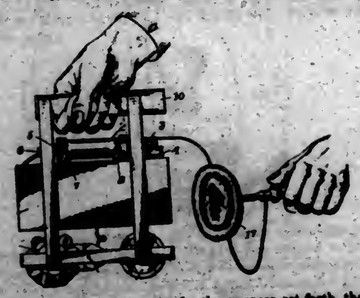
6. In a device for laying gold-leaf, in combination:—the main frame, the package and delivery roll, the receiving roll, the spring motor engaged with a driven pinion mounted on the axle of the receiving roller, and the locking plate, substantially as set forth.

7. In combination:—the front and back frame plates rigidly connected together, the intermediate plate mounted in parallelism between said plates, means for moving said intermediate plate between and in parallelism with said plates, said a package and delivery roll and a receiving roll journaled between said intermediate plate and one of said frame plates, substantially as set forth.

8. In combination:—the front and back frame plates rigidly connected together, the intermediate plate mounted in parallelism between said plates, means for moving said intermediate plate between and in parallelism with said plates, a package and delivery roll and a receiving roll journaled between said intermediate plate and one of said frame plates, and guide prongs formed as extensions of said intermediate plate and one of said frame plates, substantially as set forth.

9. In combination:—the front and back plates rigidly connected together, the intermediate plate mounted in parallelism between said plates, means for moving said intermediate plate toward and from the back plate, the package and delivery roll and the receiving roll journaled between said intermediate plate and said back plate, and a motor mechanism, for occasioning the rotation of the receiving roll, disposed between the intermediate plate and the front plate, substantially as set forth.

10. In combination:—the front and back plates rigidly connected together, the intermediate plate mounted in parallelism between said plates, means for moving said intermediate plate toward and from the back plate, the package and delivery roll and the receiving roll journaled between said intermediate plate and said back plate, a motor mechanism, for occasioning the rotation of the receiving roll, disposed between the intermediate plate and the front plate, and a locking device which controls the operation of said motor mechanism, substantially as set forth.



11. In combination:—the front and back plates rigidly connected together, the intermediate plate mounted in parallelism between said plates, means for moving said intermediate plate toward and from the back plate, the package and delivery roll and the receiving roll journaled between said intermediate plate and said back plate, a motor mechanism, for occasioning the rotation of the receiving roll, disposed between the intermediate plate and the front plate, a locking device which controls the operation of said mechanism, and a screw mounted in threaded engagement with a fixed portion of the apparatus and axially with respect to and against the package and delivery roll, and adapted to bear against the side face of the core of the package and delivery roll, substantially as set forth.

12. In combination:—the front and back plates, the receiving roll removably journaled between said front and back plates, a package and delivery roll having an axially-apertured core disposed between said front and back plates, and a screw-shaft in threaded engagement with the front plate, having its free end entered in the axial aperture of said core, and having a bearing plate adapted to bear against the side face of said core, substantially as set forth.

13. In combination:—the front and back plates, the receiving roll removably journaled between said front and back plates, a package and delivery roll having an axially-apertured core disposed between said front and back plates, a screw shaft in threaded engagement with the front plate, having its free end entered in the axial aperture of said core, and having a bearing plate adapted to bear against the side face of said core, and an intermediate plate supported between the front and back plates and adapted to be adjusted toward and from said back plate, and having openings through which the axle of the receiving roll and the screw shaft of the package and delivery roll freely extend, substantially as set forth.

14. In combination:—the front and back plates, means for securing said plates in parallelism, an intermediate plate adjustably secured to said front and back plates by screws which extend freely through said front and back plates but intermediately of their length are in threaded engagement with said intermediate plate, and a package and delivery roll and a receiving roll journaled between said intermediate plate and said back plate, substantially as set forth.

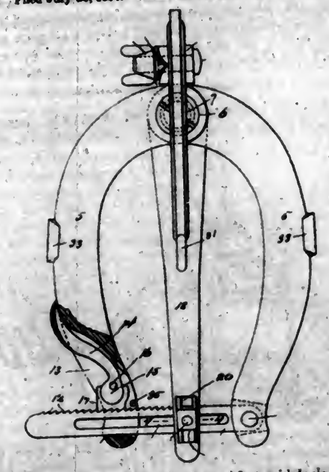
602,950. ELECTRIC MASSAGE APPLIANCE. FRED J. S. LAY, Kansas City, Mo. Filed July 22, 1897. Serial No. 645,093. (No model.)

Claim.—1. In an apparatus for the purpose set forth, the combination with a medical battery, of a frame supported below the same, a smooth roller, a fluted roller mounted within the same, a disk and a metal plate carried by the frame and having a sponge at its lower edge, said metal plate being connected to one wire from the battery, the other wire being connected to the disk, substantially as shown and described.

2. In an apparatus of the character described, the combination of a medical battery, a frame supported thereby, a plate therein, a disk, a smooth roller and a fluted roller mounted within the frame, the fluted roller presenting rubber projections, wires extending to the outer ends of the projections and electrically connected to the plate to which one wire from the battery is attached, the other wire being connected to the disk, substantially as shown and described.

3. In an apparatus for the purpose set forth, the combination of a medical battery, a frame secured thereto, a disk provided with a

handle, a fluted roller mounted within the frame, said fluted roller having wires which extend to the outer ends of the projections, and a plate to which said wires are electrically connected, one wire from the battery being attached to the plate and the other wire attached to the disk, substantially as shown and described.

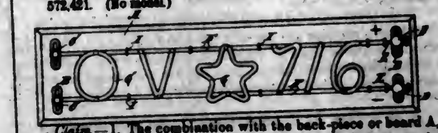


4. In an apparatus for the purpose set forth, the combination of a medical battery, a handle connected thereto, a frame supported by the battery, a smooth roller mounted within the frame, and fluted rollers also mounted within the frame; together with a plate interposed between the fluted rollers and carrying a sponge, and a separate disk, one wire from the battery being attached to the plate and the other wire to the disk, substantially as shown and described.

602,951. HARNESS-BUCKLE. JOHNSTON MEALEY, Howard Lake, Minn. Filed Jan. 13, 1897. Serial No. 619,095. (No model.)

Claim.—In a sliding harness-buckle, the combination, with the curved flat sides, of the cross-bars provided at the opposite ends of said sides and connecting the inner edges of the same, a second or middle pair of bars between said end bars connecting the outer edges of said sides, the space between said middle and end bars being sufficient to permit both ends of the loop to be passed one above the other through the buckle, said sides corresponding substantially in width to the thickness of said loop, the long and short stud provided upon said middle bars, one upon each, the longated extending through both the movable and stationary ends of the loop, and holding the former in position when in use and the short stud extending through the stationary end of the loop only, whereby the same is firmly secured within the buckle while the movable end is permitted to slide freely over the studs and through the buckle when it is desired to change the position of the same on the strap, and the cross-bar supporting said long stud being arranged near one of the bars at the end of said sides, for the purpose set forth.

602,952. DEVICE FOR LEVELING HORSES' FEET. FRANK A. MILLETT, Livermore Falls, Me., assignor to Millett & Brentham, same place. Filed July 23, 1897. Serial No. 645,962. (No model.)



Claim.—1. A device for leveling horses' feet, said device consisting of a shoe-shaped frame consisting of two parts, pivotally connected at the toe, by means of a pivot screw or bolt, one of said parts being provided at the heel of the frame with a pivoted cross-bar which passes through a slot in the opposite part, and which is provided with a longitudinal slot, and at the front edge thereof with ratchet-teeth, a cam-lever mounted in the slot through which the said pivoted bar passes, and provided with a ratchet-block which operates in connection with said bar, a longitudinal bar which is held in place by said pivot screw or bolt, at the front end of the frame, and the rear end of which is provided with a slot, a pin or bolt passing through said slot and through the slot in the said cross-bar, said longitudinal bar being provided at its forward end with upwardly-curved jaws in which is pivoted a quadrant gage or frame, and said separate parts of the frame being provided at their outer sides with clamps or jaws, substantially as shown and described.

2. A device for leveling horses' feet, said device consisting of a shoe-shaped frame consisting of two parts, pivotally connected at the toe, by means of a pivot screw or bolt, one of said parts being provided at the heel of the frame with a pivoted cross-bar which passes through a slot in the opposite part, and which is provided with a longitudinal slot, and at the front edge thereof with ratchet-teeth, a cam-lever mounted in the slot through which the said pivoted bar passes, and provided with a ratchet-block which operates in connection with said bar, a longitudinal bar which is held in place by said pivot screw or bolt, at the front end of the frame, and the rear end of which is provided with a slot, a pin or bolt passing through said slot and through the slot in the said cross-bar, said longitudinal bar being provided at its forward end with upwardly-curved jaws in which is pivoted a quadrant gage or frame, and said separate parts of the frame being provided at their outer sides with clamps or jaws, substantially as shown and described.

3. A device for leveling horses' feet, said device consisting of a shoe-shaped frame consisting of two parts, pivotally connected at the toe, by means of a pivot screw or bolt, one of said parts being provided at the heel of the frame with a pivoted cross-bar which passes through a slot in the opposite part, and which is provided with a longitudinal slot, and at the front edge thereof with ratchet-teeth, a cam-lever mounted in the slot through which the said pivoted bar passes, and provided with a ratchet-block which operates in connection with said bar, a longitudinal bar which is held in place by said pivot screw or bolt, at the front end of the frame, and the rear end of which is provided with a slot, a pin or bolt passing through said slot and through the slot in the said cross-bar, said longitudinal bar being provided at its forward end with upwardly-curved jaws in which is pivoted a quadrant gage or frame, and said separate parts of the frame being provided at their outer sides with clamps or jaws, one of the jaws between which the quadrant gage or frame is pivoted being also provided with a pointer which operates in connection with said quadrant gage or frame, and the bolt by which said quadrant gage or frame is connected with said jaws being provided at one end with a thumb-nut, substantially as shown and described.

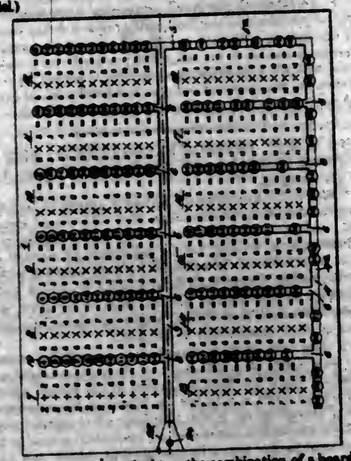
602,953. ELECTRIC LUMINOUS ALPHABET AND BOARD FOR SAME. DANIEL M. MOORE, Newark, N. J., assignor to the Moore Electrical Company, New York, N. Y. Filed Dec. 17, 1895. Serial No. 572,421. (No model.)

Claim.—1. The combination with the back-piece or board A, of the parallel wires F, stretched across said board and mounted adjustably thereon, suitable tension devices for said wires, and hollow vacuous receptacles provided with electrodes adapted to enter between the parallel wires for holding said receptacles in place, substantially as set forth.

2. The combination with the board or back-piece A, provided with parallel conductors F, adjustable laterally thereon, of illuminating characters consisting of translucent hollow vacuous receptacles provided with hollow rearwardly-extending projections surrounded by electrodes adapted to fit between the conductors F, and hold the receptacles in place, substantially as set forth.

3. An illuminating character consisting of a translucent hollow vacuous receptacle provided with hollow, lateral, rearwardly-extending projections in combination with separated terminals of an electric circuit adapted to removably hold one or more of said characters, substantially as and for the purpose set forth.

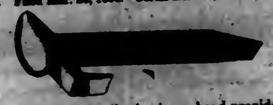
4. The combination with the apparatus-box, of a magnet located therein, and the interrupter secured to the cover of the box in a position such that when the cover is closed, the armature of the interrupter will be placed in the field of the magnet.



5. The combination with the apparatus-box, of an interrupter removably mounted on the cover thereof, two contacts mounted on said cover and electrically engaging or connecting with the terminals of the interrupter, and contact-plates located in the box to engage with said contacts when the cover is closed and complete the circuit through the interrupter.

6. The combination with the apparatus-box, of a clasp mounted therein, two contacts also mounted therein adjacent to the clasp, and an interrupter provided with exterior contacts connected to the terminals thereof and adapted to engage with the contacts in the box when the interrupter is inserted in the clasp.

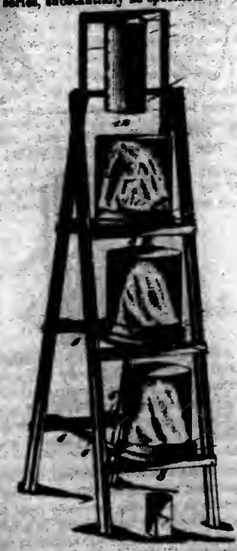
7. The combination with the interrupter and the magnet operating on the armature thereof, of a supplemental armature controlled by said magnet but out of its normal field, a circuit-breaker one member of which normally rests against the latter armature in circuit-closing position but moves therefrom and opens circuit when an extra strem of current flows in the coil of said magnet, and means for simultaneously controlling the circuit of the magnet and said circuit-breaker.



8. The combination with the interrupter and the magnet operating it, of another armature out of the normal field of said magnet, a circuit-breaker held normally closed by said armature but adapted to open when the armature is attracted, the key controlling the circuit of the magnet, and a projection on said key for restoring the circuit-breaker to the normal position.

602,954. MATHEMATICAL TOY. WILLIAM W. CROSIER, Kansas City, Mo., assignor of two-thirds to Frank B. Turner and David D. Looper, same place. Filed May 24, 1897. Serial No. 637,903. (No model.)

Claim.—In a mathematical toy, the combination of a board provided with a series of slots extending at right angles to each other, and all connected either directly or indirectly, and a double series of numbers to the left of each of the branch slots, separated by a mathematical sign and followed by the symbol of equality, and a series of numbered movable buttons occupying said slots, and provided with enlargements, whereby they cannot be accidentally displaced; the numbers of said buttons being adapted to correspond with the results obtained by the processes indicated by said mathematical signs, substantially as shown and described.



602,955. SPIKE. VAN B. PAGE, Hopkinton, N. H., assignor of two-thirds to Eliz. D. Pierce, Hillsborough, and Ezra K. Paige, Warner, N. H. Filed Mar. 26, 1898. Serial No. 674,906. (No model.)

Claim.—A railway-rail spike having a head provided with side flanges and a forwardly-extending lip the under side of which is inclined upwardly, a bridge integral with the spike, and a thin solid blade depending transversely from the extreme end of the bridge, the upper outer side of the blade being approximately at right angles to the bridge and the upper side of the latter being inclined on the line of inclination of the under side of the lip, whereby the outer sides of the bridge and blade are in conformity with the under side of the lip, substantially as and for the purpose described.

602,956. APPARATUS FOR COOLING MILK. LOUIS H. PORTER, Rockdale, Tex. Filed Aug. 27, 1896. Serial No. 604,144. (No model.)

Claim.—1. An apparatus of the class described, having a folding frame comprising pivotally-connected sections adapted to fold in a common plane and having side bars connected at corresponding intervals with cross-bars, a pivotal extension mounted upon the rear section and adapted to fold between the sides thereof, the forward-swinging movement of the extension being limited by a round forming the pivot of the sections, loose bars forming rests arranged upon said cross-bars, a reservoir for refrigerating liquid suspended upon said extension and provided with feeding devices, and receptacles arranged respectively upon said rests and each provided with means for dropping the surplus refrigerating liquid upon the next lower receptacle of the series, substantially as specified.

2. In an apparatus of the class described, the combination of a supporting-frame provided at different elevations with rests, shallow drip-pans supported by said rests, receptacles arranged within the drip-pans and provided with concave tops perforated adjacent to the outer edges, absorbent jackets arranged on the receptacles, and a reservoir located above the receptacles, substantially as specified.

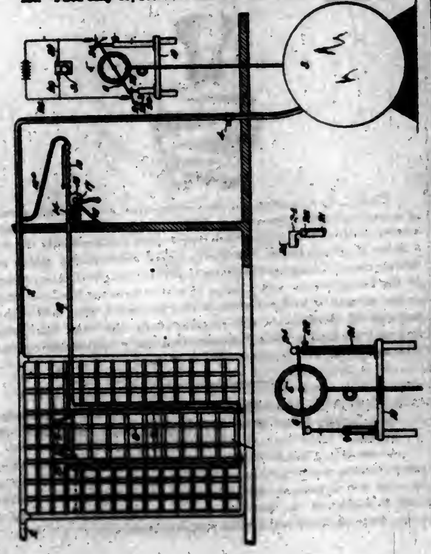
602,957. HAND-STAMP. HENRY O. REICH and COLIN I. VAN DYKE, Lattimer Mines, Pa. Filed July 30, 1897. Serial No. 645,988. (No model.)

Claim.—In a hand-stamp, the combination with a casing formed of connected spaced plates, of a series of shafts secured in the plates, a series of drums mounted on each shaft to turn independently thereon, a series of bridge pieces removably seated between the plates and having means to engage the plates to prevent longitudinal movement of the bridge-pieces, and a series of elastic printing-bands mounted on the drums and bridge-pieces, said bridge-pieces being held in their seats by the elasticity of the printing-bands, and each band being formed from a strip having its ends detachably connected together, substantially as and for the purpose specified.

602,958. DRAWERS-SUPPORTER. HOWARD H. RIGGLEMAN, New London, Conn. Filed Mar. 9, 1897. Serial No. 626,979. (No model.)

Claim.—1. A clip for the purpose described, consisting of a single piece of sheet metal having one end recurved and toothed, and its opposite end apertured, the last-named end being bent in substantially V shape and the aperture therein being crossed by a bar or web, substantially as and for the purpose described.

2. A clip for the purpose described, formed from a single piece of sheet metal, having one end reserved and toothed, and the opposite end apertured, a cross-bar extending across said aperture, and an auxiliary cross-bar connected and extending substantially at right angles to said first-mentioned cross-bar, substantially as and for the purpose described.



602,959. LUBRICATING JOURNAL-BOX. JOHN ROGERS, Kansas City, Kans. Filed July 1, 1897. Serial No. 643,094. (No model.)

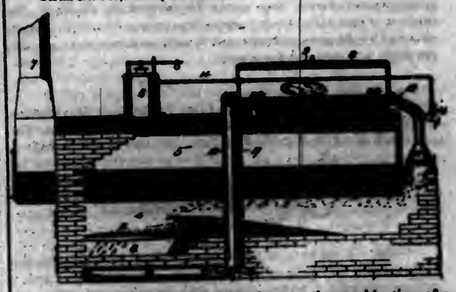
Claim.—1. A lubricating journal-box, comprising a reservoir provided with a central slot or opening in its top wall, a depending flange at one end of the same, and a vertical longitudinal rib projecting upwardly from its bottom and centrally of said slot or opening, and a vertically-adjustable wick-tube fitting snugly in said opening and provided with a recess 16 into which said guide-rib projects, substantially as described.

2. In a device of the character described, the combination with a car-axle box provided with an opening in its front end below its door, and horizontal ribs projecting internally from its sides coincidentally with the upper edge of said opening, of a lubricating journal-box fitting snugly within and upon the bottom of the car-axle box and provided with a rounded end and flange closing the opening in the front end of the box, and provided with a central slot or opening, and with a central rib projecting upwardly from its bottom; a double wick-tube fitting snugly in the slot or opening and provided with a recess fitting on said rib; and springs bearing upon the bottom of said box and exerting a constant upward pressure upon said tube, substantially as and for the purpose described.

602,960. AUTOMATIC ALARM-CELL. JULIUS ROSTER, Weston, Mo. Filed May 15, 1897. Serial No. 636,576. (No model.)

Claim.—1. An automatic alarm cell or vault, comprising, in combination, substantially as hereinbefore described, a cell composed of communicating hollow pipes and provided with a door-opening, a reservoir containing a fluid under pressure and connected to said cell, a door closing the opening of the cell and also composed of communicating pipes, a pipe forming a part or extension of said door, and provided with a flexible tubular portion which communicates with the reservoir either directly or indirectly, a track for the door, hangers connecting the door with said track, and means to open or close the door, substantially as described.

2. An automatic alarm-cell, comprising, in combination, substantially as hereinbefore described, a cell proper, having a door-opening and inclosed or partially inclosed by a fluid-filled chamber or chambers, a fluid-reservoir in communication with said chamber or chambers, a door controlling said opening, and also containing a fluid-chamber connected to the reservoir, means to slide the door to uncover or cover the door-opening, and fluid-containing guard-pipes 11, connected to the fluid-passage of the cell and adapted to prevent the door moving outward, substantially as described.

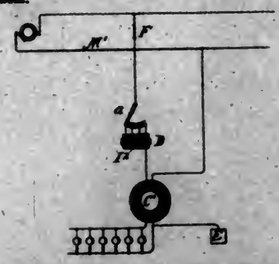


3. An automatic alarm-cell, comprising in combination, substantially as hereinbefore described, a cell proper, a sliding door controlling the opening of the cell, and formed with a fluid-chamber, a fluid-reservoir connected to the cell, a pipe provided with a rack-bar connected with the fluid-chamber of the door, a flexible pipe connection between the door-pipe and cell-pipe, and a worm-wheel engaging the rack-bar, substantially as and for the purpose described.

602,961. PROCESS OF MAKING ARTIFICIAL MUSK. CHARLES SCHEID, Brussels, Belgium. Filed Sept. 4, 1897. Serial No. 650,676. (No specimens.)

Claim.—1. The process for producing a musk-like substance consisting in subjecting to distillation with superheated steam certain fossil resins, such as copal, amber, or rotin resin, treating the products of distillation of wax-like or oily consistence by reagents of oxidation, such as a mixture of bichromate of potassium and sulfuric acid, neutralizing the filtered mass by ammonia and alcohol, heating the neutralized solution until all alcohol has been driven off, and finally extracting from the thus-obtained matter the musk-like substance by means of ether, substantially as described.

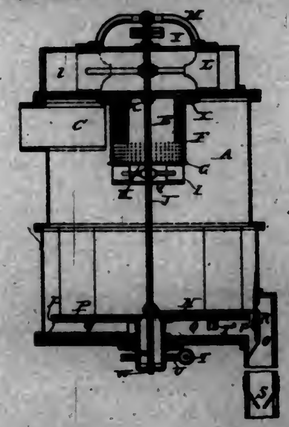
2. As a new article of manufacture, a musk-like substance derived from resins, thus differing from all known artificial musk-like substances which are nitro derivatives of compounds belonging to the aromatic series, and having the following characteristics: being a heavy orange-red oil, soluble in sulfuric ether, spirits colognes, and vegetable oils, such as cotton-seed oil, insoluble in petroleum benzene; it is colored darker brown by concentrated sulfuric and nitric acid and concentrated alkalies, substantially as described.



602,962. SMOKE-CONSUMING FURNACE. LEE A. SHARP, Nevada, Mo., and FRANK ESSE, Kansas City, Kans. Filed July 29, 1897. Serial No. 645,567. (No model.)

Claim.—In a smoke-consuming furnace, the combination of a reservoir 8 upon the rear end of the boiler, a pair of pipes 10, depending from the rear end of the reservoir and terminating in flared mouths or funnels 11, a pipe 13, extending through the wall of the furnace and arranged to discharge beneath the grate, a pipe 12, connecting the same with the reservoir, a pipe 14, connected to the dome of the boiler, and provided with branches, nozzles 15, and 16, for said branch pipes, projecting respectively into pipes 10 and 13, and valves controlling said nozzles, substantially as described.

602,963. DISTRIBUTION OF ELECTRIC CURRENTS. ELIHU THOMSON, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Dec. 6, 1886. Renewed Feb. 26, 1898. Serial No. 671,203. (No model.)



Claim.—1. The combination of a main or principal circuit carrying rapidly-varying electric currents derived from any desired source, induction-coils each having a continuous or closed magnetic circuit or core and whose primaries are connected to the main in multiple arc, translating devices connected in multiple arc to the secondary circuit, self-induction coils placed in the multiple-arc branches leading to the primaries of the induction-coils, and means for varying the number of coils in which the reaction is set up without short-circuiting them.

2. The combination of the main or principal circuit supplied with rapidly-varying currents, the local or independent circuits, induction apparatus having a continuous or closed magnetic circuit of iron placed between said main and local circuits and connected to the main in multiple-arc branches, self-inductive coils located in the multiple-arc connections to the induction apparatus, and means for varying the number of coils in which the reaction is set up without short-circuiting them.

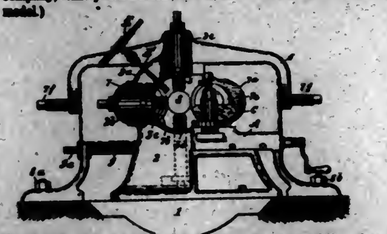
3. The combination with the main or principal circuit supplied with rapidly-varying electric currents, of a local or independent circuit, an induction apparatus placed between the mains and the local or independent circuit, reaction-coils in the primary circuit of said apparatus, and means for varying the number of coils in which the reaction is set up without short-circuiting them.

602,964. MACHINE FOR SEPARATING DUST FROM AIR. PIERRE VAN GELDER, Sowerby Bridge, England, assignor to William Phillips Thompson, Liverpool, England. Filed Sept. 3, 1896. Serial No. 604,770. (No model.) Patented in France Dec. 9, 1891, No. 217,941.

Claim.—1. In combination with a substantially cylindrical outlet E of a dust-separating chamber; a terminal disk G extending somewhat beyond the dependent outlet, and finely perforated near the center, and closing the mouth of said orifice except for said perforations near the center, and fan I for discharging the dusty air in the chamber E through the perforations of the disk.

2. In combination with a dust-separating chamber in which the dusty air forms a vortex, a dependent outlet E caused to rotate with the revolving air, substantially as described.

3. The combination with a dust-separating chamber in which the dusty air forms a vortex of a dependent rotating outlet perforated only near the bottom and fenced with a perforated disk substantially as described.



4. In a dust-separating chamber in which the dusty air forms a vortex, the combination of a rotatable dependent exit E with fan-blades I rotating with the effluent air and means for maintaining the axes of rotation in the vertical line.

5. In combination with a dust-separating chamber in which the dusty air forms a vortex, the combination of rotating outlet E perforated on its sides, a floor for said outlet perforated in the center, a fan below rotating with the outlet and the vortex of dusty air, and a disk below, preventing the uprising central current from entering.

6. In a dust-separating apparatus, a separating-chamber in which the dusty air forms a vortex formed cylindrical in its upper part and polygonal in its lower part, substantially as described.

7. In combination with a vortex dust-collector having a rotating scraper and exit-spout, a rotating tappet V' and valve R having an internal projecting surface V^3 whereby it is periodically opened.

602,965. ATTACHMENT FOR LATHES. THOMAS C. WALKER, Denver, Colo., assignor to the Midland Foundry and Machine Works Company, same place. Filed June 5, 1897. Serial No. 639,626. (No model.)

Claim.—1. In a lathe, in combination with the saddle, a housing attached to said saddle, adjustable roller-carriers within said housing, tapered rollers journaled to said carriers; and tool-holders, substantially as described.

2. In a lathe, in combination with the saddle, a housing adjustably and removably attached to said saddle, adjustable roller-carriers carried by said housing, and rollers journaled to said carriers, substantially as described.

3. In a lathe for turning, sizing and finishing shafting, a housing pivoted at one end to the carriage of the lathe and adjustably attached to said carriage at the opposite side, adjustable roller-carriers mounted on said housing, and tapered rollers journaled in said carriers, substantially as described.

4. In a lathe for finishing shafting, a housing adjustably attached to the saddle of the lathe, in combination with two adjustable roller-carriers mounted in said housing, and rollers having taper-faces journaled in said carriers, substantially as described.

5. In a lathe, the combination of a housing having an opening below and adjustably attached to the lathe-carriage and provided with two adjustable roller-carriers mounted therein, tapered rollers journaled in said carriers at their inner ends, and a collar-bolt passing through said housing in proximity to the said opening, substantially as described.

6. In a lathe, the combination, with the tool-holders and tools, of a yoke carrying adjustable steady-pins, and tapering rollers adapted to finish stock between them and facilitate the traverse of the lathe-saddle, substantially as described.

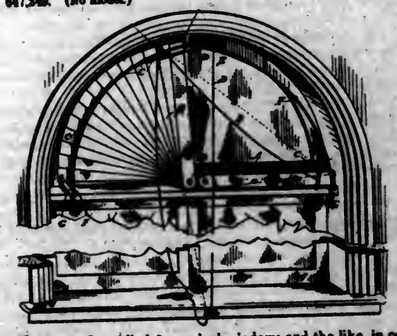
7. In a lathe, the combination, with a yoke carrying adjustable steadying-pins having non-abrasing ends, of a housing having therein adjustable roller-carriers, and tapering rollers carried by said carriers, substantially as described.

8. The combination of a bracket with yoke secured to the saddle of a lathe, steady-pins protruding inwardly from the yoke, and a roller-frame pivoted upon the saddle, said roller-frame carrying rollers having adjustment toward and from each other, substantially as described.

9. The combination of a bracket with a yoke secured to the saddle of a lathe, steady-pins projecting from the yoke toward its center, and a roller-frame pivoted upon the saddle, said roller-frame carrying rollers having adjustment toward and from each other, and a steady-pin carried by the roller-frame, substantially as described.

602,966. VACUUM-TUBE LANTERN. LEONARD WALLACE, New York, N. Y. Filed July 30, 1897. Serial No. 646,947. (No model.)

Claim.—1. A lamp or lantern consisting of parallel heads connected together by a rod and provided with a series of apertures, electric contacts located at said apertures and concealed within the heads, vacuum-tubes fitted to the apertures in said heads and provided with electrodes at their ends for engagement with the said con-



tacts, one electric conductor connected to the contacts in one head, the other conductor connected to the contacts in the other head, and caps covering the heads, the ends of the tubes and the electrical connections thereto, substantially as and for the purpose set forth.

2. The electric-light fixture consisting of the perforated plate B, the like perforated plate B', the supporting-plate C, the hollow rod D, connecting said plates together, the spring-contacts E, located above the plate B, and below the plate B', the vacuum-tubes A, inserted in said perforated plates with their electrodes in engagement with said contact, a conducting-wire branching from the lower contacts and the return conducting-wire branching from the upper contacts, passing through the rod D, and caps F and G, connected to said plates and cooperating therewith to conceal the electrodes, contacts and conductors.

602,967. COLLAPSIBLE BLIND FOR ARCHED WINDOWS.

GEORGE WELLS, Montreal, Canada. Filed Aug. 5, 1897. Serial No. 647,249. (No model.)

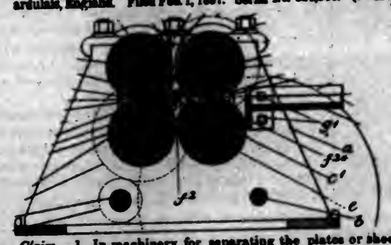
Claim.—1. In a blind for arched windows and the like, in combination a series of slats pivotally held in fan shape on a bolt substantially central to the arc of the arch and having their outer edges following such arc when open, a continuous band secured to the casing and looped successively around and attached to each slat and means for spreading the slats at their outer end as and for the purpose specified.

2. In a blind for arched windows and the like, in combination a series of slats pivotally held in fan shape on a bolt substantially central to the arc of the arch and having their outer edges following such arc when open, a continuous band secured to the casing and looped successively around and attached to each slat and a cord attached to an end slat and passing over a suitable pulley as and for the purpose specified.

3. In a blind for arched windows and the like, in combination a series of slats pivotally held in fan shape on a bolt substantially central to the arc of the arch and having their outer edges following such arc when open, a continuous band secured to the casing and looped successively around and attached to each slat, means for spreading the slats at their outer ends, and a slantingly-arranged arc-shaped guide-rod connected at both ends to the casing alongside the outermost ends of the slats as and for the purpose specified.

602,968. LAND-ROLLER. WILLIAM WILDMAN, Spadra, Cal. Filed Aug. 9, 1897. Serial No. 647,540. (No model.)

Claim.—1. In a land-roller composed of one or more hollow cylinders adapted to be filled with liquid, in combination with a motor-wheel located within the cylinder, substantially as described.



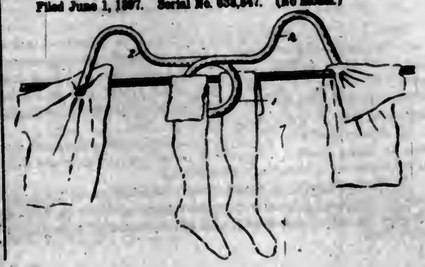
2. In a land-roller, a hollow cylinder provided with a central shaft fixed to revolve therewith, in combination with a motor-wheel fixed on the shaft intermediate of its ends, said wheel being provided with forwardly-curved fins or blades for the purposes substantially as described.

3. In a land-roller, the combination with a hollow cylinder, of a central shaft fixed within a cylinder, a motor-wheel fixed to revolve with the shaft and cylinder, said wheel being composed of a pair of separate circular disks having on their outer faces fins or blades, substantially as described.

4. In a land-roller, a hollow cylinder adapted to receive a liquid, in combination with a motor-wheel within a cylinder, whereby the level of the liquid is equalized during the revolution of the cylinder, substantially as described.

602,969. APPARATUS FOR SEPARATING METAL PLATES OR SHEETS. JOSEPH WILLIAMS, Gowerton, and GEORGE H. WHITE, Pontardulais, England. Filed Feb. 1, 1897. Serial No. 621,518. (No model.)

Claim.—1. In machinery for separating the plates or sheets of a pile, a waved or sinuous guide or channel formed of undulating plates or blocks, substantially as herein shown and described.



2. In machinery for separating the plates or sheets of a pile, the combination of a waved or sinuous guide or channel formed of undulating plates or blocks and means for forcing the pile through the guide substantially as herein shown and described.

3. In machinery for separating the plates or sheets of a pile the combination of a waved or sinuous guide or channel, a pair of feed or forcing rolls located in front of the waved guide for carrying the pile into the waved guide, a feed-table provided with a guide or guides for conducting the pile squarely to the feed-rolls, and a pair of drawing-rolls located at the rear of the waved guide for drawing the pile through the waved guide and assisting to flatten the plates substantially as herein shown and described.

4. In machinery for separating the plates or sheets of a pile the combination of a waved or sinuous guide or channel composed of two hollow plates or blocks, means for supplying water to the hollow blocks and means for forcing the pile through the guide substantially as herein shown and described.

5. In machinery for separating the plates or sheets of a pile the combination of a waved or sinuous guide or channel composed of two plates or blocks superposed one upon the other, means for separating the plates or blocks a given distance and means for forcing the pile through the waved guide substantially as herein shown and described.

602,970. CLOTHES-PIN. DAVID WILSON, Fort Gay, W. Va. Filed June 1, 1897. Serial No. 638,947. (No model.)

Claim.—A clothes pin or holder composed of a single piece of wire formed with a single central convolution of larger diameter as compared with the diameter of the clothes-line upon which it is to be placed, said convolution furnishing bearing-points between which and the clothes-line an article may be clasped and held, and having laterally-extending arms substantially in the same plane with the central convolution, the lateral extensions being bent upwardly to extend outside of or beyond the dimensions of the central convolution, and then downwardly and finally having their extremities turned or bent to form loops at right angles with the central convolution, the loops extending in opposite directions, substantially as described.

602,971. HAMMER. LELAND G. YOUNG, Muscatine, Iowa. Filed Aug. 6, 1896. Serial No. 601,861. (No model.)

Claim.—1. In a device of the class described, the combination of a magazine or tack-holder provided with a handle, and an oscillating bar mounted thereon and provided with a hammer-head arranged to swing freely transversely of the magazine or tack-holder, when the entire device is oscillated similar to an ordinary hammer, substantially as and for the purpose described.

2. In a device of the class described, the combination of a magazine or tack-holder provided with a longitudinal way, a reciprocating feed-bar mounted in the way and adapted to feed tacks to the outer end of the magazine or holder, an oscillating bar mounted on the magazine or holder and provided with a hammer-head adapted to swing freely transversely of the magazine or holder, when the entire device is oscillated similar to an ordinary hammer, and connections between the oscillating bar and the reciprocating feed-bar, whereby the latter will be operated by the independent movement of the former, substantially as and for the purpose described.

3. In a device of the class described, the combination of a stem or tack-holder provided with a longitudinal way, a reciprocating feed-bar mounted in the way, an oscillating bar mounted on the stem or holder and provided with a hammer-head, a link connecting the feed-bar with the oscillating bar, whereby the feed-bar will be reciprocated by the oscillating rod, and a spring interposed between the oscillating bar and the stem or holder for raising the hammer-head, substantially as described.

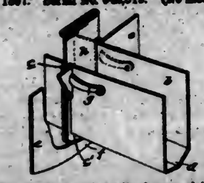
4. In a device of the class described, the combination of a magazine or tack-holder provided with a longitudinal way, a reciprocating feed-bar mounted in said way, oppositely-disposed pawls arranged in the way to engage the sides of a strip of tacks, one of the pawls being mounted upon the holder or magazine and the other pawl being carried by the feed-bar, an oscillating bar mounted on the magazine or holder and provided with a hammer-head arranged to swing transversely of the magazine or holder when the entire device is oscillated similar to an ordinary hammer, said hammer-head being provided with a cutting edge, and connections between the oscillating bar and the feed-bar, substantially as described.

5. In a device of the class described, the combination of a stem or holder having a longitudinal way and provided with a central longitudinal groove adapted to receive the shanks of tacks, a reciprocating feed-bar provided with side flanges, a resilient check-pawl mounted on the stem or holder and arranged in the way at one side thereof, a resilient actuating-pawl located at the opposite side of the way and carried by the feed-bar, and an oscillating bar carrying a hammer-head and connected with and actuating the feed-bar, substantially as described.

6. In a device of the class described, the combination of a substantially semicylindrical tubular stem or tack-holder provided with longitudinal parallel strips forming a central groove and having their outer longitudinal edges angularly bent to form L-shaped flanges, said L-shaped flanges connecting the strips and the sides of the stem or holder to provide shallow side grooves, a reciprocating feed-bar mounted on the stem or holder and having flanges fitting in the shallow side grooves thereof, pawls mounted on the stem or holder and on the feed-bar, and a movable hammer-head connected with and operating the feed-bar, substantially as described.

7. In a device of the class described, the combination of a magazine or tack-holder, a pair of parallel rods arranged at the front of the magazine, a flat spring disposed longitudinally of the magazine and secured at its inner end to the same, and an oscillating hammer mounted on the magazine and provided with a head and adapted to swing transversely of the magazine when the entire device is oscillated similar to an ordinary hammer to cause the head to pass between the rods, substantially as described.

8. A device of the class described, provided at its front with a resilient clip and having sockets at opposite sides, combined with rods removably fitted in the sockets and provided at their upper ends with hooks, substantially as described.

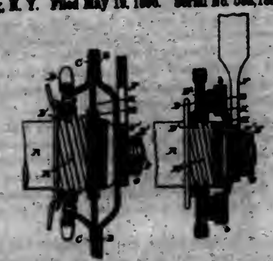


602,972. ARMOR-PIERCING PROJECTILE. HENRI A. BRESSLAIN, Unieux, France. Filed Dec. 16, 1897. Serial No. 662,128. (No model.) Patented in France Jan. 4, 1895, No. 244,105, and in England June 3, 1895, No. 12,200.

Claim.—1. A shell or projectile provided with a cap, the striking portion of which is of hard material and the portion in contact with the projectile of soft material.

2. A shell or projectile provided with a cap, the striking portion of which is of hard material and the portion in contact with the projectile of soft material, and the intermediate portion of graded hardness.

602,978. HEAD-GATE. JOHN H. BUTTERFY, Fort Collins, Colo. Filed June 28, 1897. Serial No. 642,519. (No model.)



Claim.—1. The head-gate described comprising the trough having the grooves *c*, in its side walls and the seat *c'*, in its bottom wall, laterally and downwardly extending wings connected to the trough, and the vertically-movable, slide-gate arranged in the grooves *c*, and seat *c'*, substantially as specified.

2. The head described comprising the trough having its side and bottom walls bent to form grooves *c*, and a seat *c'*, and also having its bottom wall inclined downwardly to its longitudinal center, laterally and downwardly extending wings connected to the trough, and the slide-gate arranged in the grooves *c*, and adapted to control the passage of water through the trough, substantially as specified.

3. The head described comprising the trough having its side and bottom walls bent to form internal grooves *c*, and an internal seat *c'*, and external flanges, the lateral and downwardly extending wings formed in one piece, and the cam-pieces pivotally connected to the side and bottom walls of the trough and adapted to press and hold the wings against the external flanges of the trough, substantially as specified.

602,974. BACK-PEDALING BRAKE. ROBERT H. CANFIELD, Corning, N. Y. Filed May 12, 1896. Serial No. 592,165. (No model.)

Claim.—1. In a bicycle or analogous machine, the combination with the frame, of a rotary driving member mounted thereon, a fixed brake-surface mounted on the axis thereof, a laterally-acting brake-wheel movable along the axis of said member and adapted to coact with the fixed brake-surface, and an adjustable device situated between the fixed brake-surface and the movable brake-wheel, and serving to limit the lateral movement of the latter.

2. In a bicycle or analogous machine, the combination with the

driving-wheel and driving means, of a fixed brake-disk mounted on the axis of said wheel, a laterally-moving brake-wheel mounted on the hub of the drive-wheel, and adapted to coact with the fixed disk, and an adjustable nut screwed on the end of the hub between the fixed brake-disk and the movable brake-wheel and serving to limit the lateral movement of the latter.

3. In a bicycle or analogous machine the combination with a rotary driving member, of a fixed brake-surface, a laterally-acting brake-wheel movable along the axis of the rotary member, an adjustable stop-nut situated between the fixed brake-surface and the movable brake-wheel, and a cushioning device independent of said brake device and situated between the stop-nut and the movable brake-wheel.

602,975. SILICID OF IRON. GUILLAUME DE CHALMOT, Louisville, N. C., assignor, by mesne assignments, to the Wilson Aluminum Company, New York, N. Y. Filed Sept. 6, 1895. Serial No. 561,660. (Specimens.)

Claim.—1. The described new ferrosilicid having the formula Si_2Fe_3, and containing approximately twenty-five per cent. of silicon.

2. The described new product being ferrosilicid containing upward of twenty-five per cent. of silicon, and consisting of a mixture in variable proportions of Si_2Fe_3 and Si_2Fe.

602,976. PROCESS OF PRODUCING SILICIDS OF IRON. GUILLAUME DE CHALMOT, Holcomb's Rock, Va., assignor, by mesne assignments, to the Wilson Aluminum Company, New York, N. Y. Original application filed Sept. 6, 1895. Serial No. 561,660. Divided and this application filed Sept. 23, 1897. Serial No. 652,620. (No specimens.)

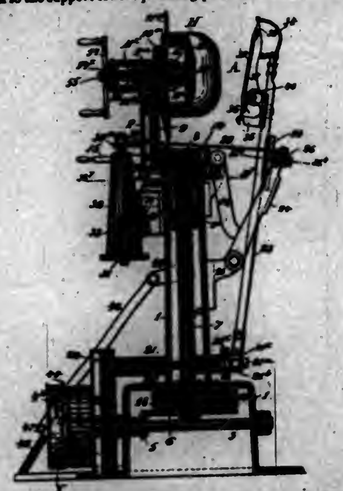
Claim.—1. The described process of producing ferrosilicids, which consists in subjecting a silicon compound with iron and carbonaceous matter to the heat of an electric furnace for a sufficient time to eliminate the carbonaceous matter, reduce the silicon compound, and form a substantially pure compound of silicon and iron, containing twenty-five per cent. or upward of silicon.

2. The described process of producing ferrosilicids of twenty-five to fifty per cent. or more of silicon, which consists in subjecting a silicon compound with iron and carbonaceous matter, the silicon compound being in excess, to the heat of an electric furnace until the carbonaceous matter is eliminated and the silicon compound is reduced, leaving a substantially pure compound of silicon with iron.

3. The described process of producing ferrosilicids, which consists in subjecting oxids of silicon and iron with carbonaceous matter and a flux, to the heat of an electric furnace, until the carbonaceous matter is eliminated and said oxids are reduced, leaving a substantially pure compound of silicon and iron.

4. The described process of producing ferrosilicids, which consists in subjecting silica and an iron containing silicon, with carbonaceous matter, to electric smelting until the carbonaceous matter is eliminated by reducing the silica, and the reduced silicon is alloyed with the iron to form a higher silicid.

5. The described new product, being ferrosilicid containing approximately fifty per cent. of silicon, and having the formula Si_2Fe.



602,977. POUNCING-MACHINE. GEORGE R. CLARKE, Montell, Tex., assignor to Henry H. Turner and Albert Turner, Danbury, Conn. Filed Feb. 1, 1896. Renewed Oct. 1, 1897. Serial No. 653,745. (No model.)

Claim.—1. In a hat-pouncing machine, the combination with mechanism for holding and rotating the hat about the axis of its crown and mechanism for simultaneously turning the hat about an axis substantially at right angles to the axis of its crown, of a pouncing-pad; automatic means for keeping said pad pressed up to the hat with a yielding pressure, and mechanism for imparting motion to said pad in a closed, curved path, substantially as set forth.

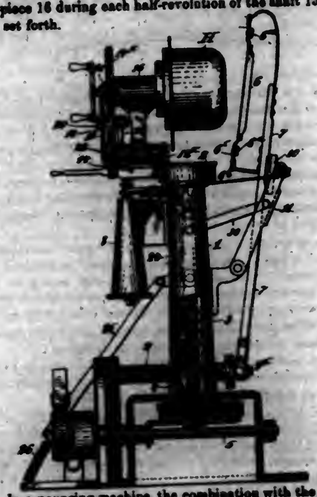
2. In a hat-pouncing machine, the combination with mechanism for holding and rotating the hat under under the pouncing-pad, of the said pad, comprising a yielding strip of flexible material and a holder for said strip, automatically-operating mechanism for holding said pad up to the hat with a yielding pressure, and mechanism for imparting motion to said pad in a closed, curved path, substantially as set forth.

3. In a hat-pouncing machine, the combination with mechanism for holding the hat and rotating it under the pouncing-pad, of the rotating crank-shaft 21, provided with a crank, the arm 23, pivotally connected to the pin of the crank, the pouncing-pad mounted on the free end of said arm, the hinged frame 24, the rocker 27, pivoted to said frame, the grooved guide-block 29, pivoted to said rocker, in which block the arm 23 is guided, and automatic means, substantially as described, for holding the pouncing-pad up to the hat with a yielding pressure, substantially as set forth.

4. In a hat-pouncing machine, the combination with mechanism for holding the hat and rotating it under the pouncing-pad, the said pad, the arm carrying the pad, and mechanism substantially as described for imparting motion to the pad, of the conical spring 33, the rotatively-mounted shaft 31, in said spring and connected with one end thereof, the arm 30, carried by said shaft, and the link coupling said arm to the support for the pouncing-pad, substantially as set forth.

5. In a hat-pouncing machine, the combination with the pedestal, the head 2, rotatively mounted on the same, the block-carrier mounted rotatively, mechanism for rotating said hat-holder and head, the swinging frame carrying the pouncing-pad, the said pad, and means for pressing the pad up in a yielding manner to the hat, of a pusher carried by the head, and a lever between the pad-carrying frame and said pusher, whereby, at the termination of the pouncing operation the pouncing-pad is pushed out of contact with the hat, substantially as set forth.

6. In a hat-pouncing machine, the combination with the pedestal, the head 2, mounted rotatively on the same, the main driving-shaft, driving mechanism intermediate said shaft, the rotating head 2, and the block-carrier, a shifter for starting and stopping the machine, and its spring, of the elbow-lever 49, the link coupling the shorter arm of said lever to the shifter, the setting-stud 50 on the head and adapted to actuate said lever 49 and operate the shifter when the head is turned back, the elbow-link 51, the link 52, connecting one arm of the link 51 with the lever 49, said links 51 and 52 forming a toggle to hold the lever 49 against movement, the tripping-lever 53, adapted to break the toggle when the pouncing operation is completed, and the pendent stud 43, on the head 2, adapted to operate said tripping-lever, substantially as set forth.



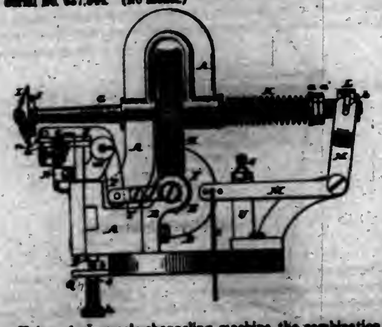
7. The combination with the arm carrying the pouncing-pad, of the upper hook 24, on said arm, the lower hook 25, mounted adjustably on said arm, the pouncing-pad coupled at its ends to said hooks, the reel 40, the strip of sandpaper on said reel, and means for clamping the strip of sandpaper on the pad, substantially as set forth.

8. The combination with the arm carrying the pouncing-pad, provided with hooks to hold said pad, and the reel for the strip of sandpaper, of the end plates 36, each having in it a slot for the passage of the strip of paper and provided with flat-faced clamping-rollers for said strip, and the flexible strip 37, secured at its ends to said end plates, substantially as set forth.

9. The combination with the pad-carrying arm, of a flexible pad coupled at its ends to supports on said arm and under longitudinal tension, said pad being loosely coupled to said arms whereby it is adapted to turn or rock about its longitudinal axis, substantially as and for the purposes set forth.

602,978. POUNCING-MACHINE. GEORGE R. CLARKE, Montell, Tex., assignor to Henry H. Turner and Albert Turner, Danbury, Conn. Filed Dec. 17, 1896. Renewed Oct. 1, 1897. Serial No. 653,746. (No model.)

Claim.—1. In a pouncing-machine, the combination with the head 2 and shaft 4, of mechanism for imparting to the hat an oval or elliptic rotary movement, said mechanism comprising the rocking bearing-piece 16, mounted on the head, the shaft 15 for carrying the hat mounted in said bearing-piece, gearing between the shafts 4 and 15, whereby the former drives the latter, and mechanism substantially as described for imparting an oscillatory movement to the said bearing-piece 16 during each half-revolution of the shaft 15, substantially as set forth.



2. In a pouncing-machine, the combination with the head 2, the rocking bearing-piece 16, mounted thereon, and the shaft 15, rotatively mounted in the latter, of the rotating shaft 13, mounted in the head parallel with the shaft 15, gearing between the said shafts whereby the former drives the latter, an eccentric on the shaft 13, the fixed fulcrum-arm 18 on the head, the lever 19, fulcrumed adjustably on the arm 18, a connecting-rod which couples the upper arm of the lever 19 with the shaft 15, and a connecting-rod coupling the said eccentric with the lower arm of said lever, substantially as set forth.

3. In a pouncing-machine, the combination with the head 2, and the rotating shaft 13, mounted rotatively in bearings therein, of the rocking bearing-piece 16, mounted at its foot as shown, the shaft 15, which carries the hat, mounted rotatively in said bearing-piece and parallel with the shaft 13, the gear-wheels 14 and 14×, on the respective shafts 13 and 15, mechanism for rotating the shaft 13 and through it driving the shaft 15, a lever 19, fulcrumed on the head, an eccentric on the shaft 13, a connecting-rod coupling said eccentric with one arm of the lever 19, and a connecting-rod coupling the other arm of said lever with the shaft 15, substantially as set forth.

4. In a pouncing-machine, the combination with the arm which carries the pouncing-pad, and mechanism for imparting motion to said arm and pad, of a flexible pad coupled at its ends to the arm and under longitudinal tension, said pad being provided with collared journals at both of its points of attachment whereby it is adapted to turn about its longitudinal axis, as set forth.

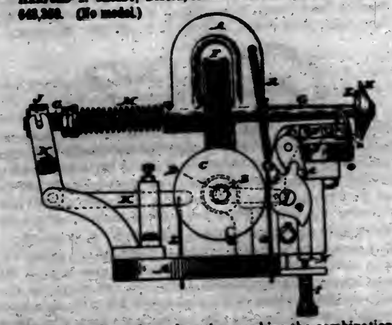
602,979. MACHINE FOR CHANNELING SOLES OF BOOTS OR SHOES. HANFORD T. CROSBY, Boston, Mass. Filed May 24, 1897. Serial No. 637,844. (No model.)

Claim.—1. In a sole-channeling machine, the combination of a work-feeding mechanism: a cutter-carrying lever constructed and arranged to vibrate in a plane which is at substantially a right angle to the plane in which lies the line of direction of the feed; and a cutter carried by said lever and having a straight cutting end at a right angle to the plane of vibration of said lever.

2. In a machine for channeling boot and shoe soles, the combination of a feeding mechanism; a fixed cutter arranged with its cutting edges in a plane at substantially a right angle to the vertical plane in which lies the line of direction of the feed; and a cutter constructed and arranged to be vibrated in a plane substantially at a right angle to the plane in which lies the line of direction of the feed, and the plane in which lie the cutting edges of the fixed cutter.

3. In a machine for channeling boot and shoe soles the combination of a feeding mechanism; a fixed cutter constructed and arranged as set forth; a pressure-gage arranged and operating as described; and a movable cutter constructed and arranged to vibrate in a plane substantially at a right angle to the plane in which lies the line of direction of the feed.

4. In a sole-channeling machine, a feeding mechanism comprising the driving-shaft C; the worm-wheel H; the worm F mounted on said shaft C, and engaging said worm-wheel; the shaft G carrying said worm-wheel, and movable endwise therein; the feed-disk I mounted upon said shaft G and having its rear face roughened; and the revoluble gage roll O mounted upon a vertical stud or bearing, all combined and arranged to operate substantially as described.



5. In a sole-channeling machine, the combination of the feed-disk I; the revoluble gage-roll O; the vertically-vibrating lever P; the cutter *n* adjustably mounted on said lever P to vary the angle of said cutter with relation to said lever P; and means for imparting a rapid vibration to said lever and cutter, in a plane substantially at a right angle to the plane in which lies the line of direction of the feed.

6. The combination of the shafts C and G; the worm F; the worm-wheel H; the feed-disk I; the revoluble gage-rolls J and O; the pivoted elbow-lever P; the cutter *n* adjustably secured to said lever; the crank-pin E; the link or connecting-rod T; the spring K on the shaft G; the nuts *a a* and the trunnioned collar L on said shafts; the lever M; means for moving said lever about its fulcrum; and a stop to limit its upward movement.

7. In a sole-channeling machine, the combination of a revoluble feed-disk; a vertically-movable slide; a rotary gage; a fixed horizontal cutter; a pressure-gage and a movable cutter-lever constructed and arranged to vibrate in a plane substantially at a right angle to the plane in which lies the line of direction of the feed, all mounted upon the head of said slide; a cutter carried by said vibrating lever; a spring to press said slide downward; means for raising said slide against the tension of said spring; and stops for limiting the upward and downward movements of said slide.

8. In a sole-channeling machine, the combination of a feed mechanism; and a channel-cutting blade constructed and arranged to vibrate in a plane substantially at a right angle to the plane in which lies the line of direction of the feed, and having a horizontal cutting edge at its lower end and an inclined cutting knife-edge on that edge thereof toward which the work is fed.

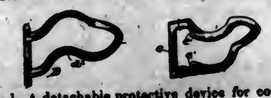
602,980. SOLE-CHANNELING AND FLAP-TURNING MACHINE. HANFORD T. CROSBY, Boston, Mass. Filed July 2, 1897. Serial No. 643,293. (No model.)

Claim.—1. In a channel-cutting machine the combination with a feeding mechanism of a vibratory lever made in two parts connected together and adjustable one upon the other by means of a pivot-pin, and a clamping-screw the latter passing through a slot in one of said parts concentric with the axis of said pivot-pin, and set in a fixed position in the other of said parts; a channel-cutting knife clamped to the movable end of said lever and adjustable in the direction of the length of said knife; and means for vibrating said lever in a vertical plane at right angles to the line of feed of the material.

2. In a channel-cutting and flap-turning machine the combination with a feeding mechanism and a fixed cutter arranged to cut a shallow incision in the material as it is fed past it, of a vibrating cutter moving in a vertical plane at right angles to the line of feed and adapted to cut a succession of incisions in the material at a slight angle to the face of material; and a flap-turning blade in close proximity to and movable with said vibrating cutter.

3. In a sole-channeling machine the combination with a feeding mechanism and a fixed cutter arranged to cut a shallow incision in the face of the material, as it is fed past it, of the vibratory lever P P' made in two parts pivoted together and adjustable one upon the other; the cutting-blade *h* and the turner *k k'* secured to the lever P P' and arranged relative to each other as set forth; and means for vibrating said lever in a vertical plane at right angles to the line of feed of the material to be acted upon.

4. In a sole-channeling machine the combination of the rotary feed-disk H; the revoluble gage-rolls I and O; the fixed pressure-gage *b*; the fixed cutter *a*; a vibratory lever movable in a vertical plane at right angles to the line of feed; the cutter *h* and the flap-turning blade *k* both carried by said lever; and means for imparting a short and rapid vibration to said lever. ..bstantially as described.



602,981. TRAVERSE-RING. WILLIAM DUNET, Brooklyn, N. Y. Filed Dec. 28, 1896. Serial No. 617,314. (No model.)

Claim.—1. A traverse-ring comprising a one-piece hollow ring *a* reduced in thickness at a plurality of places in its circumference to form journals *c*, and rings or rollers *f* surrounding and running upon the said journals *c* and comprising a plurality of sections secured together.

2. A traverse-ring comprising a one-piece hollow ring *a* reduced in thickness at a plurality of places in its circumference to form journals *c*, and rings or rollers surrounding and running upon the said journals, substantially as described.

602,982. PROTECTIVE DEVICE FOR METER-COUPLINGS. CHARLES ERBIS, Boston, Mass., assignor of one-half to Paul A. Mann, same place. Filed June 7, 1897. Serial No. 639,634. (No model.)

Claim.—1. A detachable protective device for couplings, comprising two separable members outwardly curved between their ends, and each having a straight, bar-like end, one of the members being increased in width and open adjacent said straight end to permit the passage therethrough of the other member, the latter member having projecting lugs at its straight end, to cooperate with and prevent withdrawal from the former member, substantially as described.

2. A detachable protective device for couplings, comprising two separable members, one of which is adapted to pass through the other and be pivotally interlocked at one end, and shaped to surround the coupling, the free ends of said members forming open loops adapted to be brought together substantially in the plane of the pivot to retain the device in place on the coupling, substantially as described.

3. A detachable protective device for couplings, comprising two open members bent outwardly between their ends, and each having a straight, bar-like end, one of the members being increased in width adjacent said straight end to permit the passage therethrough of the other member, the latter member having projecting lugs at its straight end, to cooperate with and prevent withdrawal from the former member, substantially as described.

602,988. SNOW-GUARD. GEORGE F. FOLSOM, Boston, Mass., assignor to Henry M. Rowson, manager, same place. Filed Sept. 20, 1895. Serial No. 563,138. (No model.)

Claim.—1. The combination with a snow-guard, of a roof-tile provided with a shoulder for engagement with and to hold said guard, the latter being arranged to engage said shoulder and be held thereby independent of the roof or tile support, substantially as described.

2. The combination with a roof-tile having a shoulder, of a snow-guard provided with a plurality of integral attaching-clamps adapted to embrace and be solely supported by said shoulder, and having an upright snow-stop portion to extend above the tile, substantially as described.

3. As an article of manufacture, a snow-guard provided with a plurality of integral attaching-clamps adapted to embrace and be solely supported by the shoulder of a tile, and having an upright snow-stop portion to extend above the tile, substantially as described.

4. A snow-guard adapted to be directly attached to and rigidly supported by an individual roof-tile, without preparatory alteration in the contour of said tile, substantially as described.

5. The combination with a roof-tile of usual contour, of a snow-guard attached directly thereto and retained in place solely by superficial contact therewith, substantially as described.

6. The combination with a roof-tile having a shoulder, of a snow-guard provided with an integral attaching-clamp adapted to embrace and be solely supported by superficial contact with said shoulder, and having an upright snow-stop portion to extend above the tile, substantially as described.

7. The combination with a roof-tile having a shoulder, of a snow-guard provided with a plurality of integral attaching-clamps adapted to embrace and be solely supported by superficial contact with said shoulder, and having an upright snow-stop portion to extend above the tile, substantially as described.

8. The combination with a roof-tile having a shoulder, of a snow-guard provided with resilient attaching means to receive and embrace said shoulder, substantially as described.

9. The combination with a roof-tile, of earthenware or other fragile material, of a snow-guard adapted to be positioned and retained in place on said tile without preparatory alteration in the contour of the latter, substantially as described.

10. A snow-guard for roofs composed of molded tiles; said guard consisting of a snow-stop portion adapted to extend above the roof, and an attaching portion adapted to enter the recessed portions in, or interstices between, said tiles, to engage and be supported by such salient portions of said tiles as the walls of said recesses or interstices, substantially as described.

602,984. GATE. JOHN W. GILBERT and HARRISS H. PARKER, Creek, Tex. Filed Jan. 27, 1897. Serial No. 620,822. (No model.)

Claim.—1. The combination with the post, the sheaves connected with the upper end thereof, the gate, the spring-hinges connecting

said post and gate, the latch pivoted to the gate, the post having a hook with which said latch engages, and the curved plate secured to said gate, of the weighted gravity-lever, the roller at the upper end thereof, the rope connecting said lever and the latch, the ropes passing over the said sheaves, and attached to the gravity-lever, the levers with which said ropes are connected, the posts to which said levers are pivoted, and the pulleys connected with said posts, substantially as described.

2. A gate mechanism, comprising a gate, a latch therefor, a pivoted weight-arm, cords coupling said weight-arm to the latch and gate and to actuating-levers, and uprights to which said actuating-levers are pivotally secured, combined with the arm 19 projecting from said weight-arm, and the roll 20 pivoted to said arm, in the manner and for the purpose described.

602,985. DEVICE FOR LAYING GOLD-LEAF. ROBERT R. HARTMAN, Philadelphia, Pa. Filed July 26, 1897. Serial No. 645,988. (No model.)

Claim.—1. In combination, an axially-apertured core for a roll of gold-leaf, a pair of shank-provided holding plates the shanks of which are entered from opposite ends within the aperture of the core, and a separating spring acting to separate the plates, substantially as and for the purpose specified.

2. In combination, an axially-apertured core for a roll of gold-leaf, a pair of shank-provided holding plates the shanks of which are entered from opposite ends within the aperture of the core, and a separating spring within said aperture normally acting against the inner end of the shanks to separate the plates, and a brake carried by the plates and acting upon the periphery of the roll, substantially as and for the purpose specified.

3. In combination, an axially-apertured core for a roll of gold leaf, a pair of shank-provided holding plates, the shanks of which are entered from opposite ends within the aperture of the core, a separating spring acting to separate the plates, and a brake connected with a holding plate, substantially as and for the purpose specified.

4. In combination, an axially-apertured core for a roll of gold leaf, a pair of shank-provided holding plates the shanks of which are entered from opposite ends within the aperture of the core, a separating spring acting to separate the plates, a brake shank movably connected to one of the holding plates and extending radially beyond the periphery of the core, and having a projection on its free end overhanging said periphery, substantially as set forth.

5. The combination with a core-provided roll of gold leaf, of a pair of holder plates provided with shanks adapted to be entered in the axial bore of the core of the roll, openings formed in said holding plates, brake shanks mounted in said openings and extending to the periphery of the roll, a brake shoe mounted upon the front extremities of said brake shanks, and a spring which operates to draw said brake shoe toward the core, substantially as set forth.

6. The combination, to form a device for holding and manipulating a roll of gold leaf, of a pair of holder plates having shanks and embodying openings, brake shanks mounted in said openings and arranged to extend to the periphery of the roll and bent toward each other to form an axle for a roller mounted on said inwardly turned ends, a roller, and a spring applied to the rear ends of said shanks between the holder plates and projections formed on said shanks, substantially as set forth.

602,986. DEVICE FOR LAYING GOLD-LEAF. ROBERT R. HARTMAN, Philadelphia, Pa. Filed Oct. 8, 1897. Serial No. 654,511. (No model.)

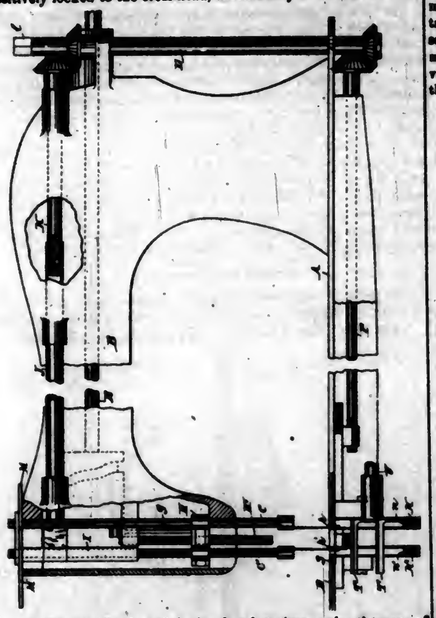
Claim.—1. In combination,—an axially-apertured core for a roll of gold-leaf,—a holding device for said core which embodies a transverse slot and is engaged in the aperture of said core to constitute an axle upon which the core-provided roll rotates,—and a brake consisting of a shoe provided with a bifurcated shank mounted in said slot, and adapted by its expansion against the wall of the slot to maintain itself and the shoe in selected positions of adjustment,—substantially as set forth.

2. In combination,—an axially-apertured core for a roll of gold-leaf,—a pair of shank-provided holding plates one of which embodies a slot and the shanks of which are entered from opposite ends within the aperture of the core,—a separating spring acting to separate the plates,—and a brake carried by one of the plates and acting upon the periphery of the roll, which consists of a shoe having a longitudinally split shank entered within the slot of the slotted plate,—substantially as and for the purpose specified.

3. In combination,—an axially-apertured core for a roll of gold-leaf,—a pair of shank-provided holding plates one of which embodies a slot and the shanks of which are entered from opposite ends within the aperture of the core,—a separating spring acting to separate the plates,—and a brake consisting of a shoe provided with a bifurcated shank of a normal diameter exceeding that of the slot, entered and compressed within said slot,—substantially as set forth.

602,987. SPINNING-SPINDLE. WILLIAM HIGHLIFFE, Huntsville, Ala., assignor to the Draper Company, Portland, Me., and Hopedale, Mass. Filed Nov. 20, 1897. Serial No. 660,042. (No model.)

Claim.—1. A supporting-case having an oil reservoir, a spindle-retaining hook, and an independently-mounted cover for the reservoir, provided with a detent to prevent accidental withdrawal of the hook.



2. A spindle-supporting case having an upturned oil-reservoir provided with ears, a reservoir-cover and a spindle-retaining hook, independently fulcrumed on said ears, and a projecting lug on the cover back of the hook, whereby the latter cannot be withdrawn when the cover is shut.

602,988. SEWING-MACHINE. FREDERICK O. JUBEAN, Liverpool, England. Filed Apr. 7, 1893. Serial No. 469,690. (No model.) Patented in England Feb. 24, 1893, No. 4,169.

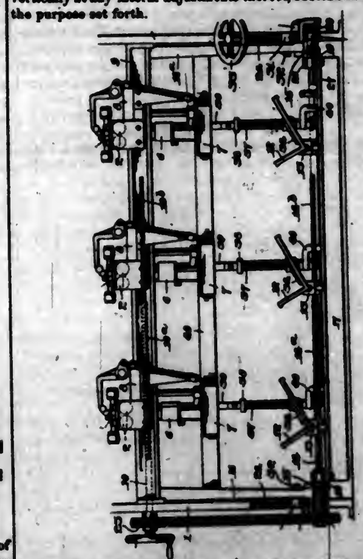
Claim.—1. In combination with a fixed head; a main needle-bar C and the horizontally-adjustable needle-bar C' mounted in said head; a slide-bar H'; a vertically-moving cross-head H mounted thereon with which needle-bar C is connected; a horizontally-sliding block A^2 for the lower end of the needle-bar C'; and means for moving said block laterally upon the cross-head.

2. The combination with the rotatable needle-bars C and C' provided with longitudinal and cross slots as described; of the cross-head H and means for imparting a reciprocating motion to said bars, said cross-head being provided with pins to engage the slots in the bars; said means comprising a crank-pin and connecting-rod for imparting

motion to the cross-head; and means for rotating the needle-bars about their axes, whereby one or more of the needle-bars may be positively locked to the cross-head, substantially as described.

3. The combination of the head and stationary pins thereon; of two needle-carrying bars C and C', the cross-head H, and means for releasing the said bars from the cross-head, and engaging the same with the stationary pins in the head, substantially as described.

4. In a sewing-machine, in combination with the fixed head and its pins; the needle-bars C C' having longitudinal slots *c c'* formed with cut-away portions as described, the cross-head H having feathers formed therein to enter the slots in the said bars, and means for rotating one or more of the needle-bars in an arc of forty-five degrees, whereby they can be released from or engaged by the fixed head and simultaneously engaged by or released from the cross-head, substantially as described.



602,989. THILL-COUPLING. THOMAS P. KENNEY and EDWIN W. LEACH, Pulaski, Tenn. Filed June 8, 1897. Serial No. 639,873. (No model.)

Claim.—In a thill-coupling, the combination of an axle-clip having an enlargement provided at its front with a tapering dovetailed groove and at its sides with grooves, a coupling-frame provided with a tapering arm interlocked with the dovetailed groove and supporting the coupling-frame, the latter being provided with rearwardly-extending side arms having bosses engaging the side grooves of the enlargement, and a spring-catch mounted on the enlargement and having its engaging portion at the top thereof in position to be automatically depressed by the dovetailed arm in assembling the parts, substantially as and for the purpose described.

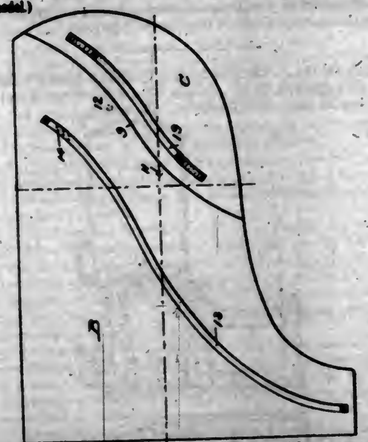
602,990. PAPER-FOLDING MACHINE. HOWARD K. KING, Philadelphia, Pa., assignor to the Chambers Brothers Company, same place. Filed May 1, 1897. Serial No. 634,726. (No model.)

Claim.—1. The combination of the sliding frames carrying the folding devices, the screw-threaded shaft for laterally adjusting said frames, a second similar threaded shaft, the pivoted hangers in which the latter shaft is journaled, the nut-brackets upon said shaft, the packing-troughs whose outer ends are supported by said brackets respectively, and whose inner ends are pivotally connected to said frames; means for adjusting said hangers in the arc of a circle; means for supporting and vertically adjusting the inner ends of the troughs together with the sprocket-chain or the like, connecting said screw-threaded shafts, whereby the said frames and packing-troughs may be adjusted laterally in concert, and the latter may be adjusted vertically at any lateral adjustments thereof, substantially as and for the purpose set forth.

2. In a folding-machine of the nature described, the combination of the sliding frames carrying the folding devices, the packing-troughs, means for laterally adjusting said frames and troughs in concert, simultaneously; means for supporting, and simultaneously adjusting the elevation of, the outer ends of the troughs, and means for supporting and adjusting the elevation of the rear or inner ends of said troughs, at any lateral adjustment thereof; said latter means consisting of the vertical screw-threaded shafts connected to the said sliding frames, the nuts on the said shafts respectively, to which nuts the ends of the troughs are pivoted; the horizontally-extending shaft, and the gear connections of said vertical shafts and horizontal shaft, all constructed, combined and adapted to operate substantially as and for the purpose set forth.

3. In a folding-machine of the class recited, the combination of the sliding frames, carrying the folding devices, the shoe-fly connected to said frames, respectively, the packing-troughs; means for supporting and adjusting said frames and adjuncts with relation to each other, and means for supporting and correspondingly adjusting said troughs, together with the bar adjacent to the shoe-fly tables and having its top in the same horizontal plane as that of the said tables, substantially as and for the purpose specified.

602,991. NURSING-BOTTLE HOLDER. ROBERT A. LAKE, Danbury, Conn. Filed Mar. 10, 1897. Serial No. 626,703. (No model.)



Claim.—1. In a device of the class described, the combination with a holder, of a tray located therein which is of greater length than the holder, said tray being provided with teeth at one end which are adapted to engage with the holder, and its other end being adapted to wedge against said holder, whereby to maintain the tray in inclined position.

2. In a device of the class described, the combination with a holder having an elongated slot through its side, of an adjustable tray located in the holder, and means for securing the tray at any point within the same, said tray being adapted to support the nursing-bottle inside of the holder and the slot to receive the neck of said bottle.

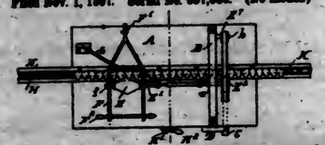
3. In a device of the class described, the combination with a box-like holder having a vertical slot through its side adapted to receive the neck of the nursing-bottle, of a nursing-bottle-holding tray of greater length than the holder and fitted therein, and prongs or teeth connected to the said tray at one end and adapted to engage with the end of the holder, the other end of the tray bearing directly against the other end of the holder, whereby said tray is rendered adjustable and adapted to maintain itself in inclined position.

602,992. SOUNDING-BOARD FOR PIANOS. WILLIAM F. LEONHARDT, Omaha, Nebr. Filed Nov. 8, 1897. Serial No. 657,868. (No model.)

Claim.—1. A sounding-board for pianos, comprising a supporting-frame, two sounding-boards arranged on parallel planes at different heights, the one sounding-board extending from one side of the frame and the other extending from the other side, respectively, with their free ends overlapping and extending diagonally across the frame, and supports projected from the frame to support the edge of the overlapping portion of the upper board.

2. A sounding-board for pianos, comprising a supporting-frame, two sounding-boards arranged on parallel planes at different heights, the one sounding-board extending from one side of the frame and the other sounding-board extending from the other side of the frame, with their free ends overlapping and extending diagonally across the frame, depending vertical flanges on the outer edges of each board to rest upon and be secured to the border-rail of the frame, supports for the free diagonal edge of the upper board, and string-bridges on the boards.

602,993. OVERSEAM SEWING-MACHINE. FRANK MALONE, Philadelphia, Pa., assignor to the Industrial Manufacturing Company, Camden, N. J. Filed Mar. 12, 1897. Serial No. 627,272. (No model.)



Claim.—1. In an overseam sewing-machine, having a reciprocating thread-carrying stitching-needle and its complemental actuating and feed mechanism, the combination with a thread-carrying looper and loop-spreader, of mechanism substantially as set forth for reciprocating said looper from the back of the needle and at an inclination to the travel of the work, and for reciprocating said loop-spreader from the front of the needle in an inclined path, that intersects the path of the said looper, whereby said looper and loop-spreader are caused to pass each other in close proximity, substantially as and for the purpose set forth.

2. In an overseam sewing-machine, having a reciprocating thread-carrying stitching-needle, its complemental actuating and feed mechanism and tongued presser-foot and throat-plate, the combination with a thread-carrying looper and loop-spreader having a crotched free end, of mechanism substantially as set forth for reciprocating said looper from the back of the needle and at an inclination to the travel of the work, and for reciprocating said loop-spreader from the front of the needle in a path that intersects the path of the said looper, whereby said looper and loop-spreader are caused to pass each other in close proximity, so that the free and crotched end of the loop-spreader engages the thread of the loop carried by the looper and carries the same over the top of the presser-foot, where it will be secured by the needle, substantially as and for the purposes set forth.

3. In a sewing-machine, in combination with a suitable feeding device, a reciprocating thread-carrying stitching-needle moving in the direction of and with the feed, a throat-plate and a presser-foot, a tongue on each of said throat-plate and presser-foot, of a thread-carrying looper, means for moving the said looper on one side of the stitching-needle only, said looper adapted to enter and hold a loop formed by the stitching-needle below the tongue of the throat-plate, a loop-spreader arranged independently of the said looper, means for moving the said loop-spreader in front of the stitching-needle, said loop-spreader adapted to engage the thread from the thread-carrying looper and bring it over the tongue of the throat-plate and presser-foot, so as to be fastened by the upper thread on top of the fabric, substantially as and for the purposes set forth.

4. In a sewing-machine, in combination with a main shaft, a suitable feeding device, a reciprocating thread-carrying stitching-needle moving in the direction of and with the feed, a throat-plate and a presser-foot each having a tongue, of a lower right-angular thread-carrying looper having its thread-carrying extremity moving in an arc and in back of the stitching-needle, a rock-shaft d^3 to which said looper is hinged, a loop-spreader arranged independently of the thread-carrying looper, a rock-shaft c^6 for said loop-spreader, and means such as eccentrics c^3 d^3 on the main shaft and eccentric-straps c^4 d^4 for actuating the said rock-shafts, and eccentrics c^5 d^5, straps c^6 d^6 and links c^7 d^7 for oscillating the thread-carrying looper and loop-spreader about their pivotal connection with their respective rock-shafts, substantially as and for the purposes set forth.

602,994. KNIFE-SHARPENER. FRANK R. MILLER, Springfield, Ill. Filed Nov. 1, 1897. Serial No. 657,008. (No model.)

Claim.—1. In a knife-sharpener the combination of a table, a standard on said table, a grinder-shaft turning on said standard, a pulley on said shaft, an idler-pulley on said standard, a belt traveling on said pulleys and driving said grinder-shaft, a knife-bar holder between the overrun and the underrun of said belt, a movable grinder-frame contiguous to said knife-bar holder, and a grinder on said grinder-frame and driven by said grinder-shaft, as set forth.

2. In a knife-sharpener, the combination of a table, a standard and a knife-holder on said table, a universally-movable grinder-frame, means for yieldingly supporting said grinder-frame, a shaft on said grinder-frame, a grinder on said shaft, a shaft on said standard, a universal coupling connecting said shafts, and means for rotating said shafts, as set forth.

602,995. TOILET-PAPER CABINET. JOHN H. MOSHER, Milwaukee, Wis., assignor of one-half to Lucas D. Dezonbeil, Chilton, Wis. Filed May 14, 1897. Serial No. 636,515. (No model.)

Claim.—1. The combination of a cabinet provided with a discharge-slot and adapted to contain a bound package of paper, an elastically-extensible belt located upon supporting-rollers within said cabinet and in relation to said discharge-slot, means for actuating one of said rollers and means for pressing the package of paper against said belt, whereby the movement of the latter, as actuated from the roller,

draws upon the paper with a slow movement, retarded by the stretching of the belt, followed by a quick positive movement due to the elastic reaction of the belt as the paper is released from its binding, substantially as described.

2. The combination of a cabinet, provided with a discharge-slot at one end, a removable frame located in the upper portion of said cabinet and provided with open-ended slots at each end, a pair of rollers provided with an elastically-extensible belt adapted to hold the same in the bearings formed by said slots, and means for raising the package of paper against said belt, substantially as described.

3. The combination of a cabinet, provided with a discharge-slot, an elastically-extensible belt located upon supporting-rollers within said cabinet and in relation to said discharge-slot, and means for pressing the package of paper against said belt, said rollers being tapered toward the ends so as to bear heaviest upon the paper at the center, substantially as described.

602,996. ROLLER-BRAKE. WILLIAM H. MORGAN, Peabody, Kans. Filed Mar. 24, 1897. Serial No. 629,105. (No model.)

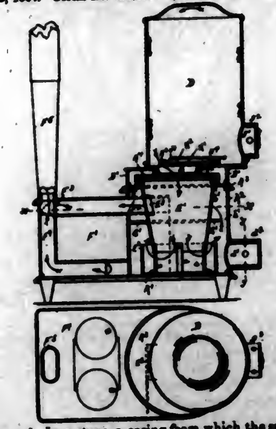
Claim.—The combination in a brake-wheel of two rims, telescoping, one within the other, the rims tapering so that the closer they are adjusted together the greater the friction between them; means for thus adjusting them by nuts and check-nuts on the axle; a coiled spring, the inner rim being connected with the fixed or non-revolving axle by the said spring; the outer rim covered with a periphery suitable to engage the periphery of the wheel it is intended to retard, substantially as described.

602,997. COMBINED MAILING-SIGNAL AND DOOR-BELL. CHARLES P. NELSON, Galesburg, Ill., assignor of one-half to Joseph H. Bloomfield, same place. Filed Oct. 26, 1897. Serial No. 656,279. (No model.)

Claim.—1. In a combined mailing-signal and door-bell, and in combination, plates 6 and 9, having telescoping flanges 11 and 12 respectively, a tilting lid 14 hinged to the plate 6, a curved rack-bar mounted on said tilting lid, and a bell-pull with a rack-bar fixed thereon, whose teeth mesh with teeth of said curved rack-bar, substantially as described.

2. In a combined mailing-signal and door-bell, and in combination, plates 6 and 9, having telescoping flanges, 11 and 12 respectively, a tilting lid 14 hinged to the plate 6, a curved rack-bar mounted on said tilting lid, a hollow standard 23 with a stop or shoulder 25, a slotted hollow standard 20, and a bell-pull comprising a rack-bar 26 whose teeth mesh with the teeth of said curved rack and an adjustable knob 31, a spring 28, and adjustable pin 29, substantially as described.

3. In a combined mailing-signal and door-bell, and in combination, a hollow standard 23 with a stop or shoulder 25; a slotted standard 20, and a bell-pull comprising a rack-bar 26, an adjustable knob 31, a spring 28, adjustable pin 29, a set-screw 33, and circumferential grooves 34, substantially as described.



4. In a combined mailing-signal and door-bell, and in combination, a hollow standard 23 with a stop or shoulder 25, a slotted standard 20, and a bell-pull comprising a rack-bar 26, an adjustable knob 31, a spring 28, adjustable pin 29, a set-screw 33, and circumferential grooves 34, and a collar 35, substantially as described.

5. In a combined mailing-signal and door-bell, and in combination, a bell-pull, a tilting lid for a mail-receiving orifice, a rack on said bell-pull, a curved rack on the lid the teeth of which mesh with the teeth of the bell-pull rack, an alarm-bell comprising an arm connected with the axis of the escapement-anchor, and a detent connected with to be operated by said tilting lid and bell-pull, substantially as described.

6. In a combined mailing-signal and door-bell, and in combination, a bell-pull, a tilting lid or cover for a mail-receiving orifice, a rack on said bell-pull, a curved rack on said lid the teeth of which mesh with the teeth of the bell-pull rack, an alarm-bell, a detent connected with to be operated by said tilting lid, and means cooperatively connecting said detent and the train of mechanism of said alarm, whereby said train is released and free to move when the tilting lid is swung to open the mail-receiving orifice, substantially as described.

7. In a combined mailing-signal and door-bell, and in combination, a tilting lid or cover for a mail-receiving orifice, having a pivot-pin secured thereto, a detent secured to said pivot-pin, a bell-pull operatively connected to said tilting lid, and a motor-driven alarm-bell comprising an escapement, adapted to be released by said detent upon the opening of said lid or pull of said bell-pull.

602,998. COMBINED WOOD AND STRAW BURNING HEATING AND COOKING STOVE. SAMUEL B. PALMER, Lockhart, Minn. Filed May 25, 1897. Serial No. 638,153. (No model.)

Claim.—1. In a stove, a casing from which the smoke-flue leads, and with an opening in its top, a fuel-magazine supported upon said casing and with an opening in its bottom registering with the opening in said casing, and a conical combustion-chamber supported in said casing and down through and around which the products of combustion pass, substantially as and for the purpose set forth.

2. In a stove, a casing from which the smoke-flue leads and with an opening in its top, a fuel-magazine supported upon said casing and with an opening in its bottom registering with the opening in said casing, a conical combustion-chamber supported in said casing and down through and around which the products of combustion pass, and a deflecting-plate between said casing and combustion-chamber, to retard the products of combustion, and increase the radiating-surface, substantially as set forth.

3. In a stove, a casing having an opening in the top surrounded by an upwardly-projecting rim b', an annular plate A^4 surmounting said opening and with a flange on its lower side embracing said rim b', said annular plate having an upwardly-projecting rim b^2, a frame B' supported upon said casing, and a fuel-magazine supported upon said frame B', and with a bottom opening registering with said rim b^2, substantially as and for the purpose set forth.

4. In a straw-burning stove the fuel-magazine having an opening in the bottom, a wing-valve section H' pivoted to be moved to partially project across said opening, a wing-valve section H^3, pivoted to be moved to partially project across said opening, and means for coupling said wing-valve sections, whereby when one section has reached a certain predetermined point in its movement it will engage the other section and move it forward until the said opening is fully covered, substantially as and for the purpose set forth.

5. In a straw-burning stove, a casing, a fuel-magazine communicating therewith, a conical combustion-chamber supported removably in said casing, and an ash-pan suspended from and adapted to be removed with said conical combustion-chamber, substantially as and for the purpose set forth.

602,999. WHEEL. ANDREW J. VANDERCLIFT, St. Louis, Mo. Filed Feb. 8, 1897. Serial No. 622,804. (No model.)

Claim.—1. The combination in a wheel of a rim; a flexible tire; and a series of return-bend springs, each having one or more spirals between bearing-points, whose axes are substantially parallel with the nearest portion of the tire and said springs being arranged side by side between the rim and tire and said spirals answering as stops.

2. The combination of a flexible strip; and a series of return-bend springs for cushioning it arranged side by side with corresponding bearing-points alternating from one side to the other.

3. The combination of a strip of flexible material and a series of return-bend springs arranged transversely and inclined alternately first to one side thereof, then the other and forming a zigzag series.

4. The combination of a strip of flexible material and a series of laterally-inclined return-bend springs with zigzag arms between bearing-points, arranged side by side for cushioning the strip.

5. The combination of a strip of flexible material and a series of return-bend springs arranged transversely side by side and laterally inclined, for cushioning said strip, with corresponding bearing-points alternating from side to side.

6. The combination in a wheel, of a rim; a flexible tire, and a series of return-bend springs arranged transversely side by side between the rim and tire, with corresponding bearing-points of the members of the series alternating from one side of the wheel to the other; and said springs being laterally inclined alternately first to one side thereof and then the other, and forming a zigzag series attaching the rim and tire together.

7. The combination in a wheel, of a rim, a flexible tire; a series of return-bend springs having zigzag arms between bearing-points, arranged side by side, and laterally inclined, between the rim and tire; and means securing said springs to the rim and tire, substantially as described.

8. The combination in a wheel, of a rim; a flexible tire; and a series of return-bend-spring trusses arranged side by side between the rim and tire.

9. The combination in a wheel of a rim; a flexible tire; and a series of return-bend-spring trusses, arranged side by side transversely between the rim and tire and soldered to the rim.

10. The combination in a wheel, of a rim; a flexible tire; and a series of return-bend-spring trusses with the springs thereof inclining away from each other and joined at their tops by a rigid yoke, and said trusses being arranged transversely between said rim and tire, with their respective yokes toward the tire.

11. The combination in a wheel, of a rim; a flexible tire; and a series of return-bend-spring trusses with the springs of each truss inclining away from each other laterally from bottom to top and joined at their tops by a rigid yoke; and said tire resting upon the truss-yokes; and said trusses being soldered to the rim.

12. The combination in a wheel, of a rim; a flexible tire; and a series of spring-trusses arranged transversely between the rim and tire; each of said trusses consisting of two return-bend springs arranged oppositely, side by side in a triangular form and approaching closely and having their abutting arms surrounded at the apex of the triangle by a sheath to which and to each other they are soldered; and their outer arms at the base of the triangle being secured together by a rigid yoke to which they are soldered.

13. The combination in a wheel, of a rim; a flexible tire; and a series of return-bend-spring trusses each having a hook at each end at top and bottom; and said truss being arranged transversely between the rim and tire, with the top hooks of the trusses embracing the edges of the tire and the bottom hooks, the edges of the rim.

14. The combination in a wheel, of a rim; a flexible tire; and a series of return-bend-spring trusses, with the springs of each truss inclined away from each other laterally from bottom to top and joined together at top by a yoke; and each truss having a hook at each end at top and bottom; and said trusses being arranged transversely between the tire and rim with the tire supported by their springs and yokes and their top hooks embracing the edges of the tire and their bottom hooks the edges of the rim.

15. The combination in a wheel of a rim; a flexible tire; and a series of return-bend-spring trusses, with the springs of each truss inclined away from each other laterally from bottom to top and joined together at the top by a yoke; and each truss having a hook at each end at top and bottom and said trusses being arranged transversely between the tire and rim with the tire supported upon their springs and yokes and their top hooks embracing the edges of the tire and their bottom hooks embracing the edges of the rim and said bottom hooks being soldered to the rim.

16. The combination in a wheel, of a rim; a flexible tire; and a series of spring-trusses arranged transversely between the rim and tire and each having its springs inclined away from each other laterally and joined at their most widely separated parts by a yoke and each having a hook at each corner of the yoke, and at the opposite extremity of the truss, a hook at each end and the hooks at the bottom of the truss embracing the edges of the rim, and those at the top of the truss embracing the edges of the tire.

17. The combination of a pair of return-bend springs each having one or more spirals between bearing-points, with transverse openings and said springs being arranged side by side with their respective corresponding bearing-points at opposite ends; and means for connecting said springs together and holding them in position and said spirals answering as stops.

18. The combination in a wheel of a rim; a tire; and a series of return-bend supporting-springs each having a spiral whose axis is substantially parallel with the portion of the tire which it supports and which springs are arranged transversely side by side between the rim and tire, and each spring having its spiral at a side of the wheel opposite the side on which the corresponding spirals of the adjoining springs appear, and said spirals answering as stops.

19. The combination in a wheel of a rim; a tire; and a series of return-bend springs arranged between the rim and tire, transversely, side by side and inclined laterally to the right and left alternately, and said springs being attached to the rim and tire and holding the latter in position and each spring having at one end thereof a spiral whose axis is substantially parallel with the portion of the tire which such spring supports and said spirals acting as stops.

20. The combination of a pair of return-bend springs, arranged side by side, at an angle to a central vertical plane between them; and means for yoking them together at top and bottom and so forming a spring-truss, substantially as described.

21. The combination of a pair of return-bend springs arranged side by side, at an angle to a central vertical plane between them, means for yoking them together at top and bottom and so forming a spring-truss; a hook at the top, and a hook at the bottom of the truss substantially as described.

22. The combination of a pair of return-bend springs arranged oppositely side by side at an angle to a central plane; means for holding them in position at the top and bottom and four hooks where the springs are most widely separated substantially as described.

23. The combination of a spring-truss F, composed of a pair of return-bend springs arranged oppositely side by side at an angle to each other; a sheath embracing the apex of the truss and soldered thereto, and a yoke soldered to the springs at the base of the truss.

24. The combination in a spring-truss of a pair of return-bend springs arranged side by side at an angle to each other and each spring having its arms arranged between bearing-points in a zigzag manner.

25. The combination of a flexible article and a series of return-bend-spring trusses with the springs of each truss arranged side by side at an angle to each other and with their respective arms between bearing-points arranged in a zigzag manner.

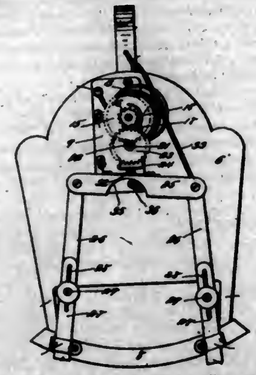
26. The combination in a wheel, of a rim; a tire; and a series of return-bend springs arranged between the rim and tire, transversely, side by side and inclined laterally to the right, and left alternately; and said springs being attached to the rim and tire and holding the latter in position.

603,000. PRODUCE-CARRIER. REGA C. WELTNER, Bezaleel, W. Va., assignor of one-half to A. B. Jordan, Spencer, W. Va. Filed Feb. 12, 1897. Serial No. 623,056. (No model.)

Claim.—1. In a carrier of the kind specified, a frame having a winding-drum consisting of a shaft provided with radial spokes, cross-pieces connecting the ends of said spokes, outwardly-extending pins upon said cross-pieces, said pins being arranged in two rows and in the central portion of the cross-pieces, a crank for turning the shaft of the winding-drum, a cable connected with said winding-drum between the two sets of pins thereon and provided at its outer end with

means for attaching the same to a stationary part, and a tightening-cable connected with said winding-drum.

2. In a carrier, an inclined cable securely fastened at its opposite ends, and a traveling carrier mounted upon said inclined cable and consisting of a frame comprising two side pieces having a roller at their upper ends, a pivot-pin pivoted to the lower ends of one of said side pieces, and a pivoted latch secured to the other side of said pieces and provided at its lower end with a groove or shoulder to engage the free or swinging end of said pivoted pin, and one end of said pivoted latch extending outwardly and above the upper end of said frame.

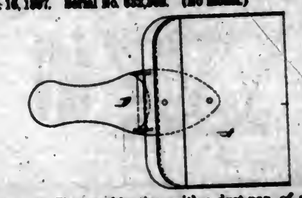


608,001. WATERPROOF FABRIC. WILLIAM H. WOOD, East Orange, and JOHN H. STEVENS, Newark, N. J., assignors to The Celluloid Company, New York, N. Y., a Corporation of New Jersey. Filed Feb. 12, 1896. Serial No. 670,032. (No specimens.)

Claim.—1. A waterproof fabric having two or more successive coatings of a flexible pyroxylin compound, the under coating being more flexible than the upper coating or coatings, substantially as described.

2. The article of manufacture herein described, consisting of a flexible base permeated with a flexible pyroxylin compound and having a superposed flexible surface coating of a pyroxylin compound less flexible than the permeated base, substantially as described.

3. The article of manufacture herein described, consisting of a flexible permeable base, having a coat of nitrocellulose compound of the character described, which coating has an inner stratum rich in oil, and an outer stratum less rich in oil which forms a continuous surface covering the face of the base, substantially as described.

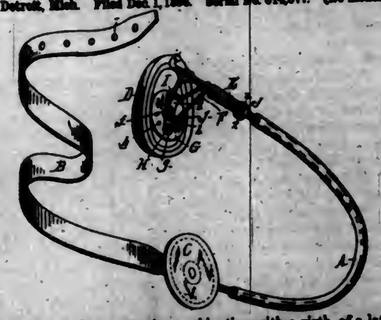


608,002. ROCKING CRADLE OR SIMILAR ROCKER. JOHN ALLRED, Rockingham, N. C. Filed July 20, 1897. Serial No. 644,773. (No model.)

Claim.—1. In a mechanism for rocking cradles or other rockers, the combination with a plate and a yoke adapted to be secured to the cradle or other rocker, of a revolvable shaft mounted in said plate and said yoke, a spring the ends of which are secured respectively to said shaft, and to said plate, a ratchet-wheel rigidly mounted on said shaft, a gear-wheel loosely mounted on said shaft, a pawl on said gear-wheel whereby it may be rotated in one direction only with said ratchet, a second shaft, a pinion mounted thereon, an escapement-wheel, a lever, an escapement whereby in conjunction with said escapement-wheel said lever is oscillated, legs pivoted to said lever whereby the energy of said spring may be exerted on the floor to oscillate the entire structure and means whereby the length of said legs may be increased or diminished to regulate the extent of oscillation of said structure, substantially as described.

2. In a mechanism for rocking cradles or other rockers, the combination with a plate and a yoke adapted to be secured to the cradle or other rocker, of a revolvable shaft mounted in said plate and said yoke, a spring, the ends of which are secured respectively to said shaft and to said plate, a ratchet-wheel rigidly mounted on said shaft, a gear wheel loosely mounted on said shaft, a pawl on said gear-wheel, whereby it may be rotated in one direction only with said ratchet, a second shaft, a pinion mounted thereon, an escapement-wheel, a lever, an escapement, whereby in conjunction with said escapement-wheel, said lever is oscillated, legs pivoted to said lever whereby the energy of said spring may be exerted on the floor to oscillate the entire structure, extensions to said legs, said legs and said extensions being provided with slots adapted to register, and a set-screw whereby the said legs may be lengthened or shortened, and the extent of oscillation of said structure regulated, substantially as described.

608,008. DUST-PAN. LAURA M. BLAKE, San Antonio, Cal. Filed Apr. 16, 1897. Serial No. 632,362. (No model.)



Claim.—1. The combination, with a dust-pan, of a slipper connected with and projecting rearwardly from the dust-pan, said slipper comprising a horizontal bottom plate and an upwardly-ranging toe-plate upon which the pan is mounted, and having a projecting member or portion arranged transversely at its bottoms and intermediately between the front and rear ends of the slipper portion, whereby the latter may be operated as a lever upon the fulcrum formed by said roller or projection to raise or lower the front edge of the dust-pan with relation to the floor, substantially as and for the purpose set forth.

2. The combination, with a dust-pan, of a slipper connected with the under rear part of the dust-pan, said slipper comprising a bottom plate and a toe plate or portion to which the pan is connected, and a projecting member or portion carried by and extending beneath the bottom plate of the slipper and relatively arranged to serve as a fulcrum upon which the slipper may be rocked to raise or lower the dust-pan with relation to the floor, substantially as and for the purpose set forth.

3. The combination with a dust-pan, of a slipper comprising a bottom plate and an upwardly-ranging toe-plate, said dust-pan being secured upon the top of the toe-plate whereby its rear end is elevated, and its front edge depressed, a roller mounted upon the under surface of the bottom plate, to serve as a fulcrum whereby the forward edge of the pan may be depressed or elevated, and a spring between the toe-plate and the dust-pan, against which the toe of the slipper is depressed, substantially as shown and described.

4. As an improved article of manufacture, a dust-pan, a slipper secured thereto adjacent to the rear end thereof, said slipper being projected under said pan whereby the rear portion is held in an elevated position, and a spring mounted between the toe of said slipper and the said dust-pan, substantially as and for the purpose described.

608,004. TRUSS. THOMAS W. BOOTH, Windsor, Canada, assignor, by direct and mesne assignments, to the Oscillating Truss Company, Detroit, Mich. Filed Dec. 1, 1896. Serial No. 614,077. (No model.)

Claim.—1. In a truss, the combination with a girth, of a lateral spring-arm connected to the girth, a pad hingedly secured to the end of the arm, and a brace having a loose connection with the girth and also having a loose connection with the pad.

2. In a truss, the combination with the girth, of a spring-arm extending laterally from said girth, a pad hinged to said arm, a brace hingedly connected to the girth and having a sliding connection with the pad.

3. In a truss, the combination with a girth, of a laterally-extending spring-arm connected to the girth, a pad hingedly connected to the end of said arm, and a bracing means for holding the pad in proper position at the end of the arm.

4. In a truss, the combination with the girth comprising the bent frame A and strap B, of a coil-spring sleeved upon the frame A and

secured thereto at one end, an arm projecting laterally from the other end of said coil-spring and movable relative to the frame A, and a pad hingedly secured to the end of said arm.

5. In a truss, the combination with the girth, comprising the C-shaped frame A and connecting-strap B, of the collar J longitudinally adjustably secured upon the forward arm of said frame, the coil-spring E sleeved upon said arm and rotatably adjustably secured to the collar J, the looped arm F formed at the opposite end of said coil, and the pad hinged to the end of said loop.

6. In a truss, the combination with the girth and the pad, of a lateral spring-arm movably secured to said girth and hinged to said pad and the folding brace I connecting said girth and pad.

7. In a truss, a girth comprising the C-shaped frame A having the hook K at the end of its forward arm, the part *a* longitudinally adjustably secured to the back arm of said frame, the back pad O swiveled upon said part and the strap B secured at one end to said pad and adapted to engage with the hook K.

8. In a truss, the back pad C comprising a disk of leather or similar material having the central aperture *c*, the front plate *c* secured to said disk, the transversely-apertured post *e* swiveled in the plate *c* and adapted to be sleeved upon the girth, and the set-screw *d* in said post in line with the aperture *c*.

608,005. BRAKE FOR CHILDREN'S CARRIAGES. FRANK R. CALDWELL, Brooklyn, N. Y. Filed July 16, 1897. Serial No. 644,709. (No model.)

Claim.—1. The combination with one of the wheels of a baby-carriage, of a brake comprising a spool carried by the hub of the wheel and a brake-band mounted in position to engage and disengage the said spool, an operating-clutch mounted to rotate upon the handle-bar of the carriage and connected with the said brake-band, whereby the rotation of the clutch serves to operate the brake and a pin-and-recess connection between the said clutch and the handle-bar for locking the clutch in any of its rotary positions, substantially as set forth.

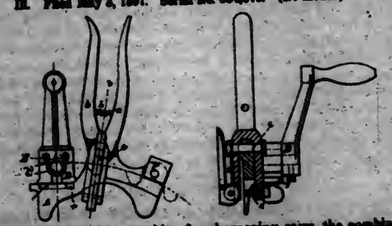
2. The combination with a brake carried by the hub, of one of the wheels of a baby-carriage, of an operating-clutch connected therewith for operating the brake, comprising a stationary part and a movable part mounted at or near the handle-bar the one provided with a series of recesses and the other with a series of pins adapted to enter the series of recesses, the said movable part having a sliding movement toward and away from the stationary part and a spring for yieldingly holding the movable part in engagement with the stationary part, substantially as set forth.

3. A brake for baby-carriages, comprising a spool carried by the hub of one of the wheels of the carriage, the said spool having a corrugated periphery and a brake-band mounted in position to engage and disengage the said spool, the said brake-band having corrugations corresponding to the corrugations upon the periphery of the spool and means located at or near the handle-bar of the carriage connected with the said band for operating the brake, substantially as set forth.

608,006. SKETCH BLANK. DAVID T. DEHANEY, Alexandria, Va. Filed Apr. 28, 1897. Serial No. 633,555. (No model.)

Claim.—1. The herein-described blank for a bicycle-frame consisting of a single piece, having the end portions, intermediate side portions, connecting the end portions and separated from each other, and the central arm intermediate the side portions, substantially as described.

2. A bicycle having its frame consisting of the main bars, the side portions continuous therewith connecting the rear ends of said bars and bent to form the rear fork, the vertically-disposed central bar connected to one of said main bars and the sleeve secured to the forward ends of the main bars, said main bars, continuous side portions and central bar being formed of one piece, substantially as described.



3. A bicycle having its frame consisting of the main bars, the side portions continuous therewith connecting the rear ends of said bars, separated from each other and bent to form the rear fork, the vertically-disposed central bar connected to the lower of said main bars, and having its upper end connected to the juncture of the upper main bar with said side portions, and a sleeve connected to the forward ends of said main bars, said main bars, continuous side portions and central bar being formed of one piece, substantially as described.

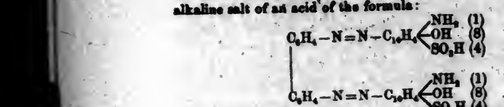
4. A bicycle comprising among its members, the main bars, the separated side portions continuous therewith, connecting the rear ends of said bars, and bent to form the rear fork the vertically-disposed central bar extending from the rear end of the lower main bar and secured to the juncture of the upper main bar with said continuous side portions, said main bars, continuous side portions and central bar, being formed of one piece, and a front fork having its steering-post pivotally connected to the forward ends of said main bars, substantially as described.

5. A bicycle comprising among its members the main frame-bars, the separated side portions continuous therewith connecting the rear ends of said main bars, bent to form the rear fork and provided with means for supporting the rear wheel the central bar extending from a point intermediate said side portions at one end of the same upwardly and connected to the juncture of the upper main frame-bar and the other ends of said side portions, said main bars, side portions and central bar being formed of one piece, a sleeve rigidly secured to the forward ends of said main bars and the brace-plate having portions secured to the lower main frame-bar, the lower end of said central bar and said side portions and provided with a crank-hanger, substantially as described.

6. A bicycle comprising among its members, the main frame-bars, the side portions continuous therewith connecting the rear ends of said main bars, separated and bent to form the rear fork, the central bar extending from the juncture of the lower main frame bar with said side portions, upwardly, and secured to the juncture of the upper main frame-bar with said side portions, said main bars, side portions and central bar being formed of one piece, said central bar having a sleeve on its upper end, and a reduced portion within said sleeve, the hollow saddle-post engaging said reduced portion, within said sleeve and means for clamping said hollow saddle-post to said reduced portion of the bar between said sleeve and said bar, substantially as described.

608,007. SAW-SHARPENER. CHARLES H. DOUGLAS, Chicago, Ill. Filed May 3, 1897. Serial No. 634,870. (No model.)

Claim.—1. In a machine for sharpening saws, the combination of a frame adapted to be clamped to a saw, with a sliding head, a filing-tool mounted thereon, said frame and head being provided respectively with a curved tongue and a corresponding curved groove upon their meeting surfaces, and means for clamping said head upon the frame in any required position, substantially as described and for the purpose specified.

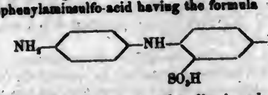


2. In a machine for sharpening saws, the combination with a main frame of a cutter O, plate E and movable handle *b*, pivoted to the main frame and provided with a forked end, one fork having a projection or screw *d*, and the other a cam, substantially as specified.

3. In a device of the character specified, the combination with a frame, and means for clamping the same to the saw, of a milling-cutter, its shaft, means for rotating said shaft, the head in which said shaft is journaled, and means for securing said head to the frame, said means being constructed and arranged so that the shaft may be set at any desired angle to the face of the saw, and so that the cutter will remain in the same relative position on the saw at whatever angle the shaft may be set, substantially as described.

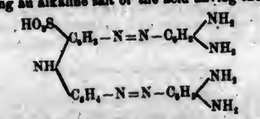
608,008. VIOLET AZO DYE. MYRTIL KAHN, Elberfeld, Germany, assignor to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Nov. 19, 1897. Serial No. 659,193. (Specimens.)

Claim.—1. The process for producing a new coloring-matter by combining in an acid solution one molecule of a tetrazodiphenyl salt and two molecules of 1.8 amidonaphthol and 4 monosulfo-acid substantially as described.



2. As a new article of manufacture the new dyestuff being an alkaline salt of an acid of the formula:

and which is a black powder of a bronze-like luster soluble in water with a violet color and in concentrated sulfuric acid yielding a blue solution from which a blue flaky precipitate is obtained on the addition of a sufficient quantity of ice, dyeing unmordanted cotton violet shades which when treated with solutions of diazotized parasitranilin and sodium acetate change into black shades fast to acids and to washing substantially as described.



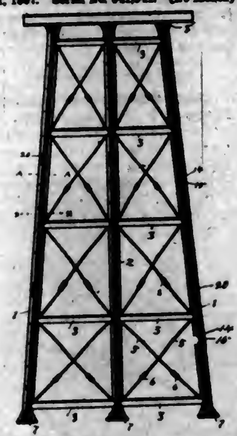
608,009. BLUISH-RED DYE. MYRTIL KAHN and FRIEDRICH RUSSER, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Nov. 19, 1897. Serial No. 659,197. (Specimens.) Patented in England Dec. 4, 1894, No. 23,584; in France Apr. 20, 1895, No. 246,760, and in Italy June 30, 1895, XXX, 36,754, LXXVI, 51.

Claim.—1. The process for producing a new tetrazo coloring-matter by combining one molecule of the tetrazo derivative of the diamidodiphenylaminsulfo-acid having the formula

with two molecules of metaphenylenediamin substantially as described.

2. As a new article of manufacture the new tetrazo coloring-matter obtainable from one molecule of the tetrazo derivative of diamidodiphenylaminsulfo-acid with two molecules of metaphenylenediamin being an alkaline salt of the acid having the formula

and which is a dark-brown powder, soluble in water yielding a red solution from which a black precipitate is obtained on the addition of dilute hydrochloric or sulfuric acid, soluble in concentrated sulfuric acid (66° Baumé) with a bluish-black color which turns into violet on the addition of a small quantity of ice while a black flaky precipitate is obtained on the addition of a larger quantity of ice to the sulfuric-acid solution, yielding on unmordanted cotton intense-bluish-red shades which when treated with a solution of diazotized parasitranilin and sodium acetate change into intense-brown shades fast against washing substantially as described.



608,010. HYDROCARBON-OIL-GAS STOVE. HOSEA W. LIBBEY, Boston, Mass. Filed June 12, 1896. Serial No. 595,247. (No model.)

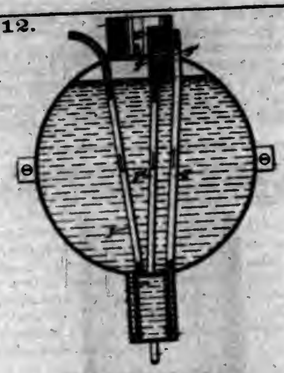
Claim.—1. A hydrocarbon-oil-gas stove comprising a reservoir, the bottom of which is provided with a segmental annular opening, three tubes secured to the bottom with the ends of the inner tubes lying adjacent to the walls of the opening, a passage leading through the outer tubes to the inner tube directly above the portion of the bottom between the ends of the opening, and a vaporizing-chamber at the upper end of the inner tube provided with a burner, said tubes being adapted to receive wicks the outer wick being so situated as to heat the chamber, substantially as set forth.

2. A hydrocarbon-oil-gas stove comprising a reservoir, three sets of tubes secured to the bottom thereof and projecting above the top of the reservoir, a passage leading through the outer tubes to the inner tube of each set, a vaporizing-chamber at the top of each set of tubes, a segmental burner for each chamber, said burners lying substantially end to end and forming a circle above the top of the reservoir, said tubes being adapted to receive wicks, the outer wick being so situated as to heat the chamber and means for admitting air to the space between the inner and the next adjacent tube, substantially as set forth.

608,011. TOWER. HERBERT H. MACARTHUR, Kendallville, Ind. Filed June 21, 1897. Serial No. 641,541. (No model.)

Claim.—1. In a metallic tower, the pillow-blocks provided on their upper faces with the integral cross-flanges 9, the angular lugs 11, and the angular lugs 10, substantially as shown.

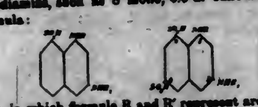
2. In a metallic tower, the pillow-block 7 having formed integral therewith the vertically-rising but slightly-inclined cross-flanges 9, the upright angular lugs 11, and the angular lug 10, combined with the sectional uprights formed of four L-shaped angle-irons which are bolted to the cross-flanges 9, substantially as described.



3. In a metallic tower, the pillow-blocks provided with cross-flanges 9, the uprights formed of four L-shaped angle-irons which are separated from each other and connected by the cross-plates 14 and 15, the longitudinal connecting-plates 20, bolts which are passed through the uprights and the plates, and the tie-rods having their lower ends placed between two of the L-shaped sections of the uprights and secured in position by means of bolts, combined with the struts 3 secured horizontally to the uprights, and the beams 4, the parts being arranged and constructed, substantially as shown and described.

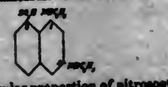
608,012. DISINFECTING APPARATUS. FREDERICK J. MITCHELL, New York, N. Y. Filed Feb. 9, 1897. Serial No. 622,690. (No model.)

Claim.—1. In a disinfecting apparatus the combination of a supply-reservoir, a discharge-chamber at the bottom of said reservoir, a duct leading from said reservoir to the lower part of said chamber, a valveless opening between said duct and the bottom part of said chamber, a discharge-duct leading from the lower part of the discharge-chamber and an air-forcing device connected with the upper part of the discharge-chamber, substantially as shown and described.



2. In a disinfecting apparatus the combination of a supply-reservoir, a discharge-chamber at the bottom of said reservoir, a connection between said supply-reservoir and the lower part of the discharge-chamber, a measuring-chamber, a discharge-duct leading from the lower part of the discharge-chamber to said measuring-chamber, a duct leading from the measuring-chamber to the point of application and an air-forcing device connected with the upper part of the discharge-chamber, whereby sufficient pressure may be created in the discharge-chamber to force a portion of the liquid therein into the measuring-chamber, substantially as shown and described.

608,012.

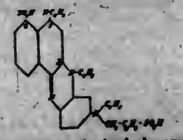


608,018. BLUE AZIN DYE. PHILIPP ORT and THEO KROSSER, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Sept. 14, 1897. Serial No. 651,982. (Specimens.) Patented in Germany Apr. 15, 1896, No. 78,497; in England May 8, 1896, No. 8,895; in France June 6, 1896, No. 250,666; in Italy Dec. 31, 1896, XXVIII, 36,622, LXVIII, 426; in Austria June 15, 1896, No. 46,699, and in Hungary June 12, 1896, No. 98,981.

Claim.—1. The herein-described process for producing new azin dyestuffs by condensing sulfo-acids of symmetrically-disubstituted 1.3 naphthylenediamins, such as 8 mono, 6.8 di sulfo-acid, having the general formula:

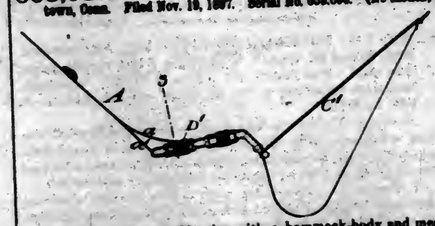
respectively, in which formula R and R' represent aromatic radicals, such as phenol, tolyl, with the sulfo-acids of paranitroso derivatives of secondary and tertiary aromatic amins, substantially as described.

2. The herein-described process for producing a new azin dyestuff, which process consists in condensing one molecular proportion of diphenylnaphthylenediamin sulfo-acid of the formula



with one-and-a-half molecular proportion of nitrosoethylbenzylanilin-sulfo-acid, having the formula

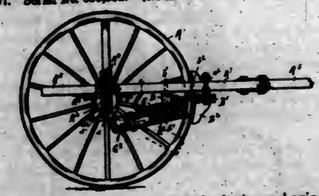
substantially as described.



3. As new articles of manufacture azin dyestuffs obtainable from sulfo-acids of symmetrically-disubstituted 1.3 naphthylenediamins, such as 8 mono, 6.8 di sulfo-acid, with sulfo-acids of paranitroso derivatives of secondary and tertiary aromatic amins, representing when dry and pulverized dark powders, dissolving in water with a blue color, soluble in concentrated sulfuric acid with a green color, dyeing unmordanted wool in acid-baths bright-blue shades which are fast to acids and alkalies and also pretty fast against the action of light, substantially as described.

4. As a new article of manufacture the specific azin dyestuff obtainable from diphenyl 1.3 naphthylenediamin 8 sulfo-acid and nitrosoethylbenzylanilinsulfo-acid, being an alkaline salt of the acid, having the formula

representing when dry and pulverized a dark powder, soluble in water with a blue color, dissolving in concentrated sulfuric acid with a green color which turns into violet on the addition of a small quantity of ice, while a dark-blue precipitate is obtained on adding a larger quantity of ice, insoluble in a ten-per-cent. solution of sodium carbonate and in strong soda-lye, dyeing wool in acid-baths bright-blue shades which are fast to acids and to alkalies and also pretty fast against the action of light, substantially as described.



608,014. HAMMOCK ATTACHMENT. ISAAC R. PALMER, Middletown, Conn. Filed Nov. 19, 1897. Serial No. 659,096. (No model.)

Claim.—1. The combination with a hammock-body and means for suspending it, of a seat-frame for interrupting the natural curve of the body of the hammock and fastening devices located in position to secure the opposite edges of the hammock-body to the opposite side of the seat-frame to hold the frame in different adjustments longitudinally along the hammock-body, substantially as set forth.

2. The combination with the hammock body provided with tabs or flaps projecting from its opposite edges, of a seat-frame adapted to interrupt the natural contour of the body of the hammock, the said seat-frame being provided at its opposite sides with slots for the reception of the said tabs or flaps for holding the seat-frame in different adjustments longitudinally along the body of the hammock, substantially as set forth.

608,015. BRAKE FOR VEHICLES. HENRY E. ROLFE, St. Paul, Minn., assignor of one-half to John D. Burt, same place. Filed Nov. 23, 1897. Serial No. 659,552. (No model.)

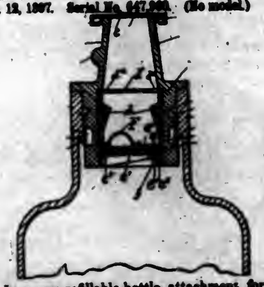
Claim.—1. In a vehicle-brake, a brake-beam having shoes and adapted to be set against the wheels of the vehicle, a series of teeth upon one of the hubs of one of the wheels of the vehicle, a bar connected by one end to the brake-actuating mechanism and supported beneath the teeth upon said hub, a ball poised to hold said toothed bar out of engagement with said hub-teeth when the vehicle is moving on substantially level ground, and adapted to trip said toothed bar into engagement with said hub-teeth when the vehicle moves down a certain predetermined grade, substantially as set forth.

2. In an automatic vehicle-brake, a beam having shoes and adapted to be set against the wheels of the vehicle, a series of teeth upon one of the hubs of one of the wheels, a lever connected to said beam and pivoted by one end to the running-gear of the vehicle, an arm connected to said lever and extending beneath said series of teeth and with teeth adapted to be engaged by said hub-teeth, a rod journaled beneath the running-gear of the vehicle and with a crank extending beneath said arm and adapted to actuate said arm when revolved, a counterpoise associated with said rod, and means whereby said counterpoise is rendered effective to revolve said rod only when said vehicle runs down a certain predetermined grade, substantially as set forth.

3. In an automatic vehicle-brake, a brake-beam having shoes and adapted to be set against the wheels of the vehicle, a series of teeth upon one of the hubs of one of the wheels of the vehicle, a lever connected to said beam and pivoted by one end to the running-gear of the vehicle, an arm connected to said lever and extending beneath said series of teeth, and with teeth adapted to be engaged by said hub-teeth, a rod journaled beneath the running-gear of the vehicle and with a crank extending beneath said arm and adapted to actuate said arm when revolved, a tube coupled to said rod, and a ball within said tube, substantially as set forth.

4. In an automatic vehicle-brake, a brake-beam having shoes and adapted to be set against the wheels of the vehicle, a series of teeth upon one of the hubs of one of the wheels, a lever connected to said beam and pivoted by one end to the running-gear of the vehicle, an arm connected to said lever and extending beneath said series of teeth, and with teeth adapted to be engaged by said hub-teeth, a rod journaled beneath the running-gear of the vehicle and with a crank extending beneath said arm and adapted to actuate said arm when revolved, a tube coupled to said rod and a ball within

said tube, and a coiled spring within said tube, substantially as set forth.

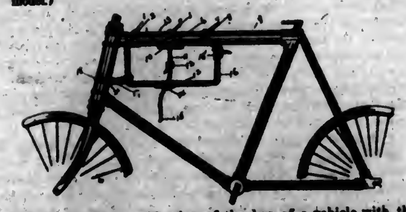


608,016. TRIPHENYLMETHANE-BLUE DYE. ARNOLD STRICKER, Basle, Switzerland, assignor to Chemische Fabrik, vormals Sandoz, same place. Filed June 29, 1897. Serial No. 642,800. (Specimens.) Patented in France July 4, 1896, No. 257,587, and in England Dec. 30, 1896, No. 30,015

Claim.—1. The process of producing violet to blue dyestuffs consisting in first combining the alkylated derivatives of phenyl-beta-naphthylamin with tetralkylated diamido-benzophene and afterward sulfonating the so-obtained compound substantially as described.

2. The process of producing violet to blue dyestuffs consisting in first combining the alkylated derivatives of phenyl-beta-naphthylamin with tetralkylated diamido-benzophenone next adding phosphorous oxychlorid and keeping an elevated temperature and finally sulfonating the obtained compounds substantially as described.

3. The sulfonated blue-violet dyestuff having the constitution of a triphenyl-methane coloring-matter and containing an alkylated derivative of phenyl-beta-naphthylamin, dissolving easily in concentrated sulfuric acid with a red-brown shade and in water and ethyl alcohol with a violet shade and the aqueous solution of which heated with caustic soda turns first blue and then almost colorless, and may have the unchanged dyestuff precipitated from it by acids, substantially as herein described.



608,017. BOTTLE. DESIDERIO P. ARRILLAS, Santiago, Cuba. Filed Aug. 12, 1897. Serial No. 647,999. (No model.)

Claim.—1. In a non-refillable-bottle attachment for bottles, embodying an outer casing secured in the neck thereof, an interior casing comprising a chamber having zigzag side walls, outlet-passages in the top and a bottom passage leading into said chamber; a centrally-pivoted weighted valve having flanges on the upper side thereof seated in said passage, substantially as shown and described.

2. A non-fillable attachment for bottles, comprising a casing having a top extension, means for sealing the same and an indicating device thereon, lateral flanges extended from the walls thereof, recess in two opposite walls, spring-catches depending over said recesses, a valve and outlet mechanism secured in said casing forming a compartment and embodying zigzag side walls, a top part having passage-ways therein leading into the casing and a bottom part having an outlet communicating with the body of the bottle, a weighted valve pivoted in said outlet and a spring secured in the bottom part of the compartment bearing upon said valve, in combination with a bottle having internal flanges in the neck thereof, substantially as shown and described.

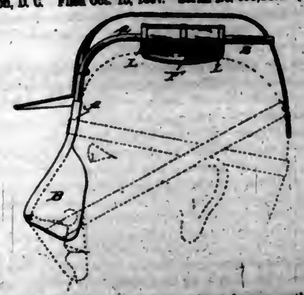
608,018. LUGGAGE-CARRIER FOR BICYCLES. CHARLES H. REED, Baltimore, Md. Filed May 18, 1897. Serial No. 637,112. (No model.)

Claim.—1. The combination of the bar of a vehicle with the clamps 2 and 8 securing a main adjustable strap to said bar, either of said clamps being movable along the bar when adjusting the said main strap; the clamp 5 securing the crosswise-adjustable strap 11 to said bar, said clamp 5 being also movable along the bar when adjusting the straps and means for adjusting and fastening the straps around the luggage, substantially as described.

2. The combination with the bar of a vehicle and a main adjustable strap longitudinally fastened thereto; of a crosswise-adjustable strap fastened by a clamp to said bar and provided with a buttonhole at one end; and a plate secured to said clamp provided with a button to engage said buttonhole; substantially as described.

608,019. BOTTLE. OSCAR V. BLAKER, Gillette, N. J., assignor of one-half to William A. Woodruff, Plainfield, N. J. Filed Feb. 18, 1897. Serial No. 623,370. (No model.)

Claim.—The coupon-holder having beveled edges and a central circular projection and a tubular cap fitting said projection, and a coupon held between the parts, and the holder secured in the bottle by the glass around the beveled edges, substantially as specified.



608,020. FRUIT OR OTHER JAR. REUBEN H. BOEHLHAHN, Newark, N. J., assignor of one-half to Herman Powell, same place. Filed May 26, 1897. Serial No. 638,316. (No model.)

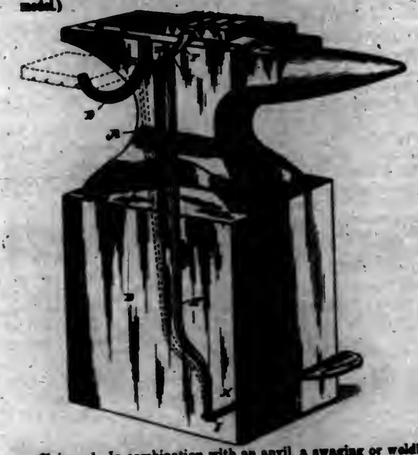
Claim.—1. As a new article of manufacture a fruit or other jar and cover, said cover having a hole near its center, a plug fitting said hole, channel-cut corrugations on the under side of said cover and lugs, said jar being encircled near its top by a groove and shoulder, said groove containing a filling substance and adapted to admit and hold said lugs, substantially as described.

2. In a fruit or other jar a cover having a hole near its center, a plug fitting said hole, channel-cut corrugations on its under side and lugs, in combination with a jar, said jar encircled near its top by a groove and shoulder, said groove containing a filling substance and adapted to admit and hold said lugs, substantially as described.

608,021. THERMAL INSPIRATOR. CHARLES F. DOREY, Washington, D. C. Filed Oct. 15, 1897. Serial No. 655,249. (No model.)

Claim.—1. In combination, a cap adapted to cover the nasal passages and a chamber filled with heat-absorbing materials such as copper, a tube connecting said cap and chamber, said chamber having air-passages through it and opening to the air whereby the air may be exhaled and inhaled through said chamber, substantially as described.

2. In combination, a tube leading to a heat-storing chamber, and a lead strip connected to said tube and forming a frame on the side which bears against the face and a covering for said tube and frame, the whole forming a nasal cap, substantially as described.



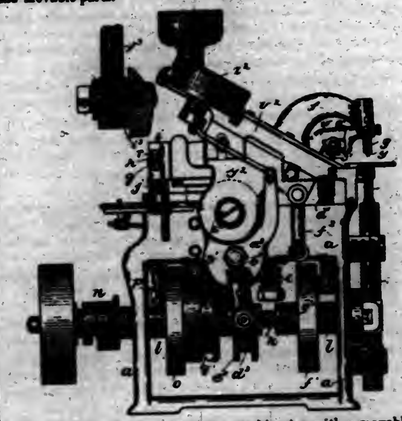
3. The chamber for storing heat consisting of the heat-retaining fillings such as copper with interstices, combined with an asbestos covering and case and with a nasal cap and a connecting-tube, substantially as described.

4. In combination, the cap, the heat-storing chamber, and the devices for supporting said chamber, adapted to be included in a hat, said device consisting of a flexible band lapping at its ends, and the band *x* having openings for the tubes with which it is combined, all substantially as described.

5. In combination, the cap, the storing-chamber adapted to be heated by the air exhaled and auxiliary heating means for said chamber consisting of a lamp, the inclosing walls, the gauze around the lamp-burner and the draft-tubes, all substantially as described.

6. In combination, the cap, the heat-storing chamber forming a passage for the inhaled and exhaled air and means for directing said exhaled and inhaled air through independent passages within said chamber, substantially as described.

608,022. WELDING OR SWAGING ATTACHMENT FOR ANVILS. OTIS G. DUNBAR and ATWELL M. IRELAND, Lewiston, Me. Filed Feb. 24, 1897. Renewed Jan. 14, 1898. Serial No. 666,716. (No model.)



Claim.—1. In combination with an anvil, a swaging or welding block adapted to rest upon the upper surface of said anvil and having a series of grooves formed therein for the reception of the calk or clip, a shank projecting from said block, a support-rod to which the shank is pivoted, said rod having a support-top, a connecting-rod pivoted to the shank and a lever for operating the connecting-lever, substantially as described.

2. In combination with an anvil, a swaging or welding block having grooves formed in one surface thereof, a shank projecting from said block, a support-rod to which said shank is pivoted, a treadle, and a rod for connecting said treadle with the block, whereby the movements of the latter may be effected by the foot, as specified.

608,028. EYELETING-MACHINE. SEYMOUR FIELD, Quincy, Mass., assignor to the Power Eyeleting Machine Company, Boston, Mass. Filed July 27, 1896. Serial No. 600,673. (No model.)

Claim.—1. A machine for setting eyelets, comprising in its construction punching devices, a movable-set lever, a stationary set, means for moving the punching devices and the set-lever, for causing the work to be fed forward, means for changing the position of the set-lever and the punching devices relatively to the stationary set, to increase or decrease the path of movement of the said parts, and devices for simultaneously adjusting the last said means to vary the increased or decreased path of movement of the said parts.

2. A machine for setting eyelets, comprising in its construction punching devices, and a movable set lever journaled on the same vertical axis; a stationary set; means for moving the punching devices and the set-lever in unison about their axis, to cause the work to be fed forward to the stationary set after it is punched; means for increasing or decreasing the play of the said punching devices and set-lever; and a lever under the control of the operator for adjusting the last said means to vary the increased or decreased movement of the said movable parts.

3. In an eyeleting-machine, the combination with a movable-set lever, punching devices, a stationary set, means for moving said lever and punching devices in unison toward and from said stationary set, movable means for moving said punching devices and set-lever relatively to each other, and adjustable devices for simultaneously limiting the movement of the last said means.

4. In an eyeleting-machine, the combination with a movable-set lever, punching devices, and a stationary set, of means for moving said set-lever and said punching devices simultaneously toward and from the stationary set, movable means for moving said punching devices and said set-lever relatively to each other and to the stationary set, a lever for operating the last said means, and an adjustable gage for limiting the movements of the last said lever.

5. In an eyeleting-machine, the combination with an oscillating set-lever, oscillating punching devices, and a stationary set, of a rocking arm pivoted by a single pivot to said lever and to said punching devices, and means for moving said pivot toward and from the axis of the rocking arm, to vary the throw of said lever and devices.

6. In an eyeleting-machine, the combination with a set-lever, punching devices, a stud around which said lever and said punching devices oscillate, and a stationary set, of a slotted rocking arm, a pivot slidable in said slot to connect the arm to said lever and said punching devices and a lever for moving said pivot along said slot toward and from the axis of the rocking arm.

7. In an eyeleting-machine, the combination with a movable-set lever, and movable punching devices, of a rocking arm connected to the set-lever by a pivot, means for moving the pivot toward and from the axis of the rocking arm, and means for simultaneously moving the punching devices toward and from the movable-set lever.

8. In an eyeleting-machine, the combination with a movable-set lever, and movable punching devices both movable around the same axis, of a rocking arm having a slideway, a slide connected to said set-lever and said punching devices, and means for moving said slide along said slideway to increase or diminish the path of movement of said set lever and said punching devices about said pivot.

9. In an eyeleting-machine, the combination with a movable-set lever, and movable punching devices, both oscillating about the same axis, of a rocking slideway, a slide pivoted to the set-lever, a lever on the axis of said slideway, and a link connecting the slide with the lever.

10. In an eyeleting-machine, the combination with a stud having a head, a set-lever pivoted in said head, punching devices movable around said stud, a rocking arm, a plate movable along the head and pivoted to said rocking arm, a cam-and-pin connection between the said plate and said punching devices, and means for moving said pivot along the rocking arm, whereby the path of movement of the punching devices and the set-lever is varied, and the punching devices are moved relatively to the set-lever.

11. In an eyeleting-machine, the combination with a stud having a head, a set-lever pivoted in said head, punching devices movable around said stud, a rocking arm, a plate movable along the head and pivoted to said rocking arm, means for moving said pivot along the rocking arm, whereby the path of movement of the punching devices and the set-lever is varied and the punching devices are moved relatively to the set-lever, and a gage for limiting the movement of the last said means.

12. In an eyeleting-machine, the combination with a stud having an elongated head forming a guideway, a set-lever pivoted to said head, a movable plate slidable in said guideway and having a slot at an angle to the lever, a punch-lever and abutment-bar movable about said stud, said punch-lever and abutment-bar having a pin entering said slot in the movable plate, a rocking slideway, a slide pivoted to the plate, and a lever for moving said slide in said slideway.

13. In an eyeleting-machine, the combination with a movable-set lever, punching devices, a stationary set, a rocking arm pivoted to said lever and punching devices, and means for moving the pivot toward and from the axis of the rocking arm, of a lever under the control of the operator to actuate the said means for moving the pivot in one direction, and a spring to actuate the said means for moving the pivot in the other direction.

14. In an eyeleting-machine, the combination with the movable-set lever, the movable punching devices, means for moving them simultaneously, means for varying the play of the set-lever and the punching devices, and means connected therewith for adjusting the punching devices relatively to the set-lever, of a lever for operating the last two said means.

15. In an eyeleting-machine, the combination with the movable-set lever, the movable punching devices, means for moving them simultaneously, means for varying the play of the set-lever and the punching devices, and means connected therewith for adjusting the punching devices relatively to the set-lever, of a lever for operating the last two said means, and a gage for limiting the play in either direction, of said lever.

16. In an eyeleting-machine, the combination with the laterally-movable set-lever and punch, a rock-shaft having an arm, and a link connecting the arm with the said lever, of an eccentric-sleeve interposed between the link and the arm, whereby when the sleeve is turned the position of the link is changed relatively to the arm, or vice versa.

17. In an eyeleting-machine, the combination with a punch, a movable-set lever, a stationary-set lever, and means for varying the positions and play of the punch and set-lever to form small-spaced holes or larger-spaced holes, of a raceway for eyelets, means for bodily moving the raceway longitudinally to withdraw it when the parts are in the positions to make holes with said larger spaces between them, and a single lever for directly and positively operating the two said means simultaneously.

18. In an eyeleting-machine, the combination with two sets, of a raceway for delivering eyelets to said sets, a pivot for supporting the raceway upon the frame of the machine, a treadle, and means between said treadle and the pivot for adjusting the latter to move the raceway from the sets.

19. In an eyeleting-machine, the combination with the frame, a shaft, and a cam thereon, of two sets, a raceway for the eyelets, a lever in operative connection with the cam and connected with the raceway for reciprocating the raceway, a pivot for the raceway and means additional to the aforesaid parts for shifting said pivot to draw said raceway and bodily away from said sets.

20. In an eyeleting-machine, the combination with the sets, a raceway, a lever to which the raceway is pivoted, an eccentric-pivot for the said lever, and means for turning said pivot to move the raceway from the sets.

21. In an eyeleting-machine, the combination with the sets, a raceway, a lever to which the raceway is pivoted, a link pivoted to the frame of the machine and to the raceway, an eccentric-pivot for said lever, and a cam operating the free end of the said lever, of means under the control of the operator for rocking the eccentric-pivot.

22. In an eyeleting-machine, the combination with the sets, and a raceway pivoted upon the frame of the machine and movable toward and from the sets, of a link also connecting the raceway with the frame, and means for adjusting the link relatively to the frame.

23. In an eyeleting-machine, the combination with the sets, and a raceway pivoted upon the frame of the machine and movable toward and from the sets, of a link also connecting the raceway with the frame, and a pivoted eccentric interposed between the link and the frame to adjust the link vertically relatively to the frame.

24. In an eyeleting-machine, the combination with a movable-set lever, a stationary set, and punching devices, of means for increasing or decreasing the play of the movable set and the punching devices, a swinging lever for operating the said means, a sector-like plate having serrations, and a dog mounted in guides on said lever and adapted to engage the serrations on the sector-like plate.

25. In an eyeleting-machine, the combination with a top-set lever, a rock-shaft having a rocking arm, a movable pivot connected to the said top-set lever, a hand-lever connected to the said pivot and movable about the said rock-shaft as a pivot, a stationary sector-like plate, a movable dog in the hand-lever adapted to engage the plate, and a thumb-lever mounted on said hand-lever for operating the dog.

608,024. BELT. HENRY J. GARMAN, New York, N. Y. Filed June 30, 1896. Serial No. 597,519. (No model.)

Claim.—1. In a belt, a strap having one or more prongs or projections at its end, combined with a hollow cup-like frame having said prongs or projections laid within it, and its edge or edges pressed over and upon said prong or prongs, substantially as described.

2. In a belt, a strap having prongs at its end, combined with a hollow cup-like frame within which said prongs are placed, the metal at the inner and outer edges of the side walls of said frame being pressed upon said prongs, a space being left between said inner and outer edges so that the material of said prongs will be seen, as and for the purposes specified.

3. A frame having a concentric recess in one face and material within said recess, the metal at the inner and outer edges of said frame overlying said material, said overlying edges being spaced apart to allow the material within said recess to be seen between said edges, substantially as described.

4. A frame of cup-like shape having material within it and the metal at the inner and outer edges of said frame extended over said material, a space being left between the inner and outer edges of said frame to allow said material to be seen between said edges, substantially as described.

5. A frame of cup-like shape, and material therein, the metal at the inner and outer edges of said frame being extended over said material, a space being left between the inner and outer edges of said frame to allow said material to be seen, and a strengthening-frame within the first-mentioned frame and located behind said material, substantially as described.

6. A frame having a recess and material within said recess, part of the metal of said frame overlying the material within said recess, said overlying part of the frame covering a portion only of said material to permit the material within the recess to be seen, substantially as described.

608,025. WORK-HOLDER FOR METAL-WORKING MACHINES. ROBERT W. LOAR, Bath, Me. Filed Nov. 5, 1897. Serial No. 657,547. (No model.)

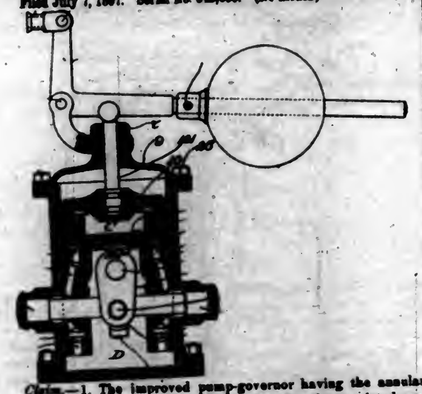
Claim.—1. A strap for holding work having a chock pivotally attached thereto, at one end, and means for clamping the other end of said strap upon the work, substantially as described.

2. A strap for holding work having a polygonal chock pivotally attached thereto, at one end, and means for clamping the other end of said strap upon the work, substantially as described.

3. A strap for holding work, in combination with a chock having sides affording supports of different heights for said strap, and means for clamping the other end of said strap upon the work, substantially as described.

4. A strap for holding work, having a bifurcated end, and a polygonal chock pivoted therein, and means for clamping the other end of said strap upon the work, substantially as described.

5. A strap for holding work having a polygonal chock eccentrically pivoted thereto, at one end, and means for clamping the other end of said strap upon the work, substantially as described.



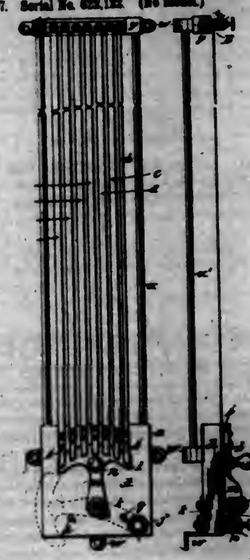
6. A strap for holding work having a polygonal chock pivoted thereto by a pin which passes through said chock at a point lying at different distances from the several sides of the polygon, and means for clamping the other end of said strap upon the work, substantially as described.

7. The combination with a chock, of a strap pivoted thereto on an axis offset from the plane of the body of the strap, substantially as described.

8. The combination with a chock, of a strap having eyes offset so as to lie substantially in the plane of one side of the strap, and a pin passing through said eyes and the chock, substantially as described.

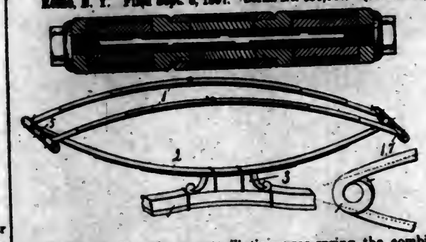
9. The combination with a polygonal chock E, of a strap D having one end slotted, as at *d*, and the other end bifurcated and provided with eyes *d'*, and a pin F passing through the eyes *d'* and eccentrically through the chock E, substantially as described.

608,026. GOVERNOR FOR STEAM-PUMPS. WILLIAM H. MASON, Boston, Mass., assignor to The Mason Regulator Company, same place. Filed July 7, 1897. Serial No. 643,695. (No model.)



Claim.—1. The improved pump-governor having the annular pressure-chamber, the central dash-pot chamber, the restricted passage-way between the said chambers and the hollow piston inclosing said dash-pot chamber, the disk of said piston coacting with the contents of the said dash-pot chamber and the annular portion of said piston closing the said pressure-chamber, substantially as described.

2. The improved pump-governor having the annular pressure-chamber, the central dash-pot chamber, the restricted passage-way between the said chambers and the hollow piston, covering the said dash-pot chamber, coacting with the contents of its own interior and of the said dash-pot chamber and also provided with the annular portion closing or substantially closing the said pressure-chamber, substantially as described.



3. The improved pump-governor having the annular pressure-chamber, the central dash-pot chamber, a passage-way communicating between the pressure-chamber and the dash-pot chamber and formed in the fixed parts, a regulating-valve applied to the said passage-way, and the hollow piston, inclosing the said dash-pot chamber, coacting with the contents of its own interior and of the said dash-pot chamber and also provided with the annular portion closing or substantially closing the said pressure-chamber, substantially as described.

608,027. RHEOSTAT. ROSCOE W. HAY, New Rochelle, N. Y., assignor to the Zucker & Levett & Loeb Company, of New York. Filed Feb. 5, 1897. Serial No. 622,122. (No model.)

Claim.—In a rheostat, a suitable supporting-frame, end pieces, and two bars which connect the pieces together, a metallic strip secured to the upper end piece, and to which is attached a binding-post; and the resistance-strips, combined with suitable contact parts to which the ends of the resistance-strips are secured, but which contacts parts are electrically separated from each other; the binding-post as *j'*, and the connecting-strip as *k* connected to the post, and a switch which has its edge to pass under the ends of the contact parts, substantially as shown.

608,028. WAGON-SPRING. HENRY K. PELL and HENRY W. PELL, Rome, N. Y. Filed Sept. 6, 1897. Serial No. 650,967. (No model.)

Claim.—1. In a three-part elliptic wagon-spring, the combination of the three springs, having eyes at their ends, of three interlocking caps for receiving the eyes at each end, and of a bolt for securing the parts in position.

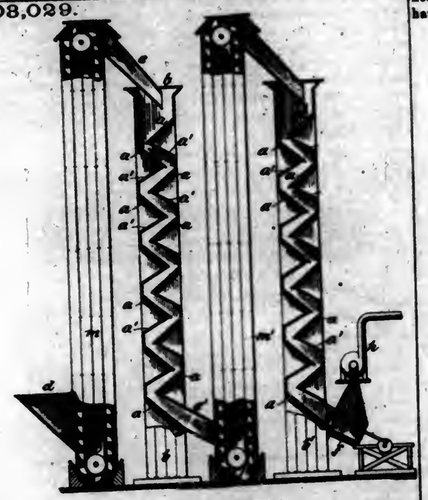
2. In a three-part elliptic spring, the combination of the three springs, having eyes at their ends, and three interlocking caps substantially cylindrical in form, and opening inwardly to receive the eyes of the springs, and bolts for securing the parts in position.

3. In a three-part wagon-spring, the combination of the three springs, having eyes at their ends, three interlocking caps at each end substantially cylindrical in form and having solid outer faces and openings on their inner faces for receiving the eyes of the springs into their hollow interiors, and bolts extending through said eyes, and interlocking caps for retaining the parts in position.

4. In a three part wagon-spring, the combination of the three springs, having eyes at their ends, three interlocking caps at each end for receiving the eyes, the outer caps correspondingly formed with extensions extending inwardly through openings in the inner cap to engage with the eyes of the inner spring, and of bolts for securing said parts in position.

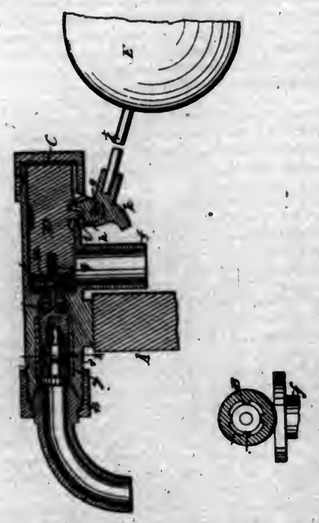
5. In a three-part elliptic spring, the combination of the three springs having eyes at their ends, of three interlocking caps at each end for receiving the eyes of said springs, the inner caps having circular openings through their ends, and the outer caps correspondingly formed with circular extensions extending inwardly through said openings a short distance into the interior of said middle cap to engage with the eyes of the inner spring, and bolts passing through said caps and eyes for securing the parts together.

6. In a three-part elliptic spring, the combination of the three springs having eyes at their ends, of three interlocking caps substantially cylindrical in form, having solid outer faces and cut-outs on their inner faces to receive the eyes of the springs into their hollow interiors, the inner caps having circular openings through their ends, the outer caps correspondingly formed with circular extensions fitting said circular openings and extending inwardly therethrough a short distance into the interior of said middle caps to engage with the eyes of the inner spring and to prevent movement of said spring on the bolts, and of bolts securing the parts together.



7. In combination of a three-part elliptic wagon-spring, the three springs having eyes at both ends of each, said eyes centering on the axis of the main plate of their respective springs, interlocking caps for receiving the eyes, and bolts passing through said caps and eyes.

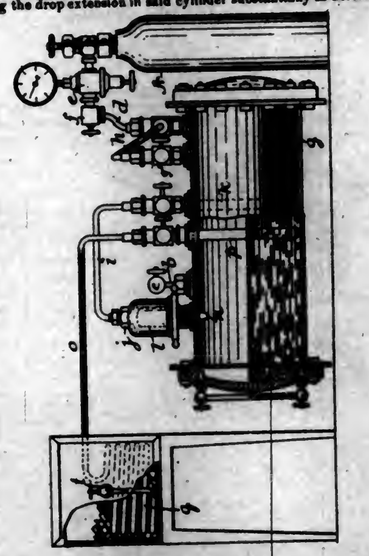
8. In combination, in a three-part elliptic wagon-spring, the upper springs provided with eyes and formed with short downward bends adjacent to the eyes, the lower spring also provided with eyes on its ends and having short upward bends adjacent to said eyes, interlocking caps for receiving said eyes, and bolts for securing the parts in position.



608,029. STEMMING AND CLEANING FRUIT. GEORGE PETTIT, Jr., Fresno, Cal. Filed June 9, 1897. Serial No. 639,973. (No model.)

Claim.—The process of detaching and separating the stems from fruit and cleaning the fruit which consists in causing the fruit under the action of gravity to move in a thin layer over an inclined elongated sieve-surface of sufficient fineness to exclude the whole fruit, substantially as set forth.

603,029.

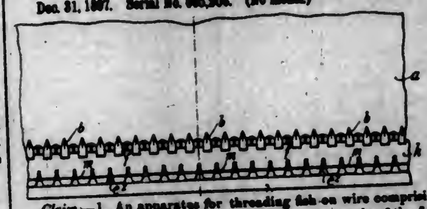


603,030. AUTOMATIC SHUT-OFF BALL-COCK. THOMAS W. RYAN, Concord, Mass. Filed Oct. 17, 1894. Serial No. 526,189. (No model.)

Claim.—An automatic float-valve comprising a casing provided interiorly with two valve-seats, and provided also at one end with exterior screw-threads and with a slot extending inward from the end, a valve on the inlet side, a valve on the discharge side having a projection entering the slot in the casing, and a screw-cap adapted to be placed on the screw-threaded end to retain in position the valve on the discharge side, substantially as described.

603,031. APPARATUS FOR CARBONATING LIQUIDS. OTTO W. ACKERMAN, New York, N. Y. Filed May 15, 1897. Serial No. 636,606. (No model.)

Claim.—The combination in carbonating apparatus, of the liquid and gas receiving cylinder, having suitable liquid and gas inlet connections, the cylinder for reception of the carbonated liquid, branch pipe for admitting gas to the latter cylinder, pressure-regulating cock in said branch pipe, porous percolator detachably mounted on the cylinder for reception of the carbonated liquid, and the pipe connecting the liquid-receiving cylinder with the percolator, said pipe having the drop extension in said cylinder substantially as described.



603,032. ALARM FOR BICYCLES. EARL C. AKERS, Port Huron, Mich., assignor of one-half to Ransom E. Moss, same place. Filed Mar. 16, 1897. Serial No. 627,742. (No model.)

Claim.—An audible alarm for vehicles, consisting of a bar bifurcated to form parallel arms, a toothed wheel journaled between the lower ends of said arms, and a spring-tongue having one end adjustably secured to the bar, whereby the volume of sound may be varied, said spring-tongue normally lying against the edges of the parallel arms and forming in conjunction with said arms a resonator, substantially as set forth.

603,033. APPARATUS FOR SECURING FISH UPON WIRES IN REGULAR ROWS. EDVARD ANDERSEN, Stavanger, Norway. Filed Dec. 31, 1897. Serial No. 665,206. (No model.)

Claim.—1. An apparatus for threading fish on wire comprising separable clamping members to hold and align the heads of the fish, said members having an aperture between them through which a wire may be passed, substantially as described.

2. In combination, the parts *d* and *h* adapted to be separated and having an opening between them for receiving a threading-wire for engaging the fish and the elastic ribbon *f* against which the fish bear when the parts are brought together, substantially as described.

3. In a fish-threading device, a table, a series of knobs projecting therefrom and means for holding the fish in the notches formed between the said knobs, apertures being left for the introduction of a wire, substantially as described.

4. A threading device for fish comprising the socketed part to receive the fish separately with their heads in line and apertured to receive a threading-wire, substantially as described.

603,034. BOTTLE-STOPPER. JOSEF BERENS, Langenbielau, Germany. Filed July 15, 1897. Serial No. 644,674. (No model.)

Claim.—In a bottle-closure the combination of a rubber cap having a closed end for insertion into the bottle, a separate cork or stopper placed in the said end, a ring around said cap at a point immediately above the stopper, a thick upper rim to the said cap and rings *c* and *d* to tighten the turned-down upper part of said cap above and below the bottle-neck bead, substantially as described.

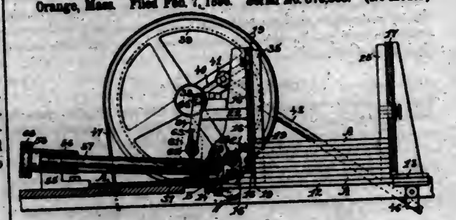
603,035. SEALING DEVICE FOR BOTTLE-STOPPERS. JOSEF BERENS, Langenbielau, Germany. Filed Nov. 5, 1897. Serial No. 657,533. (No model.)

Claim.—A sealing device for bottle-stoppers thereby so characterized that the cork *a* is combined with a rubber sleeve *c*, being in engagement with a circumferential groove of the cork *a* and adapted to be held by means of a rubber ring *d*, arranged immediately above the stopper, said rubber sleeve being adapted to be turned over twice, downwardly and upwardly respectively, thus covering the rim of the bottle-neck *h*, whereby it is held in position by rubber rings *g* and *g'*.

603,036. RESILIENT TIRE. MICHAEL BERNDT, New York, N. Y. Filed Aug. 10, 1897. Serial No. 647,967. (No model.)

Claim.—1. A tubular spring for resilient tires, formed of spring-wire bent to have circular turns and the wire crossing each circular turn twice, on curved lines, substantially as herein shown and described.

2. A tubular spring for resilient tires, formed of spring-wire bent to form a series of continuous circular turns, the wire extending transversely across each turn on curved lines, which curved lines cross each other within the circle, substantially as herein shown and described.



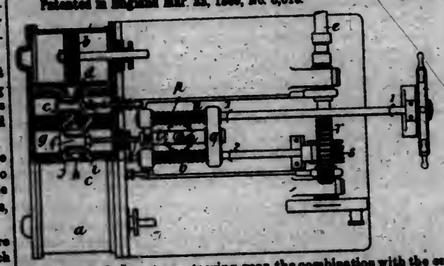
3. A tubular spring for resilient tires formed of a spring-wire bent to form a series of continuous circular turns, and forming two diametrically opposite loops within each circle and the wire of the circle extending across the same on curved lines between said loops, substantially as herein shown and described.

4. A tubular spring for resilient tires formed of a spring-wire bent to form a series of continuous circular turns the wire for each circular turn being bent to form a half-circle, then extending on a curved line across the open part of said half-circle, then forming the opposite half-circle and extending on a curved line across the open part of said second half-circle and so on, substantially as herein shown and described.

5. The combination with a tubular wire spring having continuous circular turns each circle having two opposite interior loops and the wire of the circle crossing the same on curved lines between said loops, a rod passed through one set of loops and a rubber tube through the other set and a tubular rubber tire enveloping said tubular spring, substantially as herein shown and described.

6. The combination with a helical spring having two diametrically opposite loops in each circular turn and the wires of the circular turn extending across the circle on curved lines between said loops, a wire passed through one set of loops, an externally circumferentially-corrugated rubber tube passed through the outer set of loops and a rubber tire surrounding the helical spring, substantially as herein shown and described.

603,037. WOODWORKING MACHINERY. JOHN R. CRAGG, Orange, Mass. Filed Feb. 7, 1896. Serial No. 578,208. (No model.)



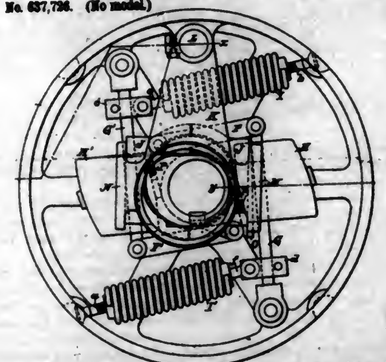
Claim.—1. In a thumb-hole machine, the combination with the frame 56 pivotally mounted in the brackets 55 and 55', the cutter-shaft journaled longitudinally in the frame, and the cutters on the free end of the shaft, of the feeding device and connections intermediate the same and the frame 56, whereby the cutter-frame is raised at the operation of the feeding device.

2. The combination with the screw-threaded shaft 29, and the guide-arms 32 and 33 having bearings engaged with the screw-shaft and provided with the vertical ways 34 and 35 and the tension-springs 36 and 37, of the vibratory cutting device, as described.

3. In a thumb-hole machine, the combination with the cutter-shaft frame pivotally mounted and operated by the pulley 39 through the link 64, the cutter-shaft journaled longitudinally in the frame, a pulley on one end of said cutter-shaft and the cutter on the opposite end thereof, of the driving-pulley, the shaft on which the driving-pulley is mounted, the guide-pulleys, a belt working over the driving-pulley, the guide-pulleys and the pulley 58, and a belt working over the pulley 39 from the drive-shaft, substantially as and for the purpose herein shown and described.

4. In a thumb-hole machine, the combination of the following instrumentalities: the hopper provided with adjustable guides, the guide-arms provided with vertical members and pressure-springs, the spring-finger 16', the shaft 26 for adjusting the guide-arms 32 33, the pivoted frame 56, the cutter-shaft supported in the pivoted frame and provided with the pulley 58 at one end and the cutter at the other end, the pulley 39 connected to the pivoted frame by the link, the reciprocal feed-block 13, and means, substantially as herein shown, for operating the pulleys 58 39 and the reciprocal feed-block 13, as and for the purpose described.

603,038. STEAM STEERING-GEAR. WILLIAM H. HARFIELD, London, England. Filed Oct. 29, 1897. Serial No. 656,793. (No model.) Patented in England Mar. 23, 1899, No. 5,013.



Claim.—1. In a steam steering-gear, the combination with the engine-cylinder, piston and driving-shaft, of a valve-chamber provided with a steam-inlet and ports communicating with said cylinder on both sides of the piston, of a controlling and reversing valve normally closing said ports, a valve-rod connected to said valve and provided with a worm-wheel, a worm shaft operated by the steering-wheel and provided with a worm engaging said worm-wheel, and a worm-shaft

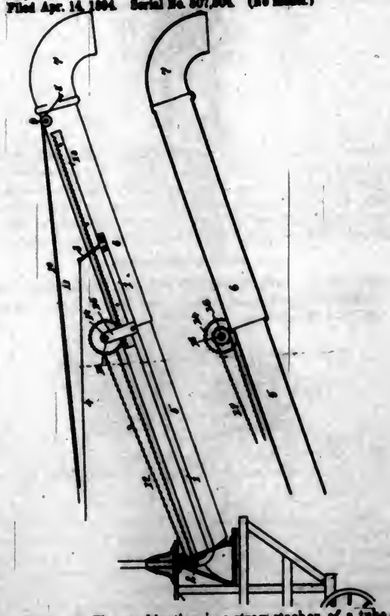
operated by the engine-shaft provided with a worm engaging said worm-wheel for moving said valve back to its normal position, substantially as described.

2. In a steam steering-gear, the combination with the engine-cylinder, of a controlling and reversing valve therefor, a valve-rod connected with said valve and provided with a worm-wheel, a worm operated by the steering-wheel, engaging said worm-wheel for moving said valve in either direction, and a worm driven by the engine, engaging said worm-wheel for moving said valve back into its initial position, substantially as described.

3. In a steam steering-gear, the combination with the engine-cylinder, piston and driving-shaft, of a controlling and reversing valve, a longitudinally-movably bar connected to said valve, said bar being mounted in stationary guides, and provided with a worm-wheel, a worm engaging said worm-wheel on one side, and operatively connected with the steering-wheel, and a worm engaging said worm-wheel on the opposite side and operatively connected with the engine, substantially as described.

608,089. GOVERNOR. CHARLES O. HEDGES, Massillon, Ohio, assignor to the Russell & Co., same place. Filed May 23, 1897. Serial No. 637,736. (No model.)

Claim.—1. In a governor, the combination with the engine-shaft and a governor-casing fixedly secured thereto, a main and an auxiliary eccentric, lever connections between the latter eccentric and casing, weights carried by the levers, tension-springs normally retaining the weights in their innermost positions, and weight-starting devices, comprising springs interposed between the weights and the auxiliary eccentric, and acting simultaneously upon both, while under compression, for the purpose of setting said weights in motion before, or at the time, the engine reaches its maximum speed.



2. In a governor, the combination with the engine-shaft and the governor-casing fixedly secured thereto, a main eccentric, an auxiliary eccentric provided with ears E E', lever connections between the latter eccentric and the casing, weights carried by the levers, and provided with recesses formed within their inner edges adjacent to the ears or lugs, tension-springs normally retaining the weights in their innermost positions, and weight-starting devices, comprising coiled springs fixedly secured within the recessed weights and acting, while under compression, directly against said weights and against the ears of the auxiliary eccentric, substantially as described.

3. In a governor, the combination with the engine-shaft and the governor casing fixedly secured thereto, an auxiliary eccentric loosely sleeved upon the shaft outside the casing, a strap, said strap loosely mounted upon the auxiliary eccentric being provided with flat bearing-faces, *g* and *h*, a main eccentric having formed integral therewith T-shaped extension-pieces M and N, inwardly-extending flanges integral with each extension as described, adapted to fit over the flat faces of the strap, an inclined face *k* upon one of the flanges, and a key or wedge for securing the strap to the main eccentric, all as described and shown.

4. In a governor, the combination with an engine-shaft, and a governor-casing fixedly secured thereon, a main eccentric having a pivotal connection with the casing, an auxiliary eccentric carrying integral therewith a hub D and ears or lugs E and E', and lever connections between the lugs or ears and the casing, weights, recessed in the manner described, carried by the levers, tension-springs, and auxiliary spiral springs housed within the recessed weights, adapted to act, while under compression, simultaneously against the weights and the lugs of the auxiliary eccentric.

5. In a governor, the combination with an engine-shaft, of a governor-casing fixedly secured thereon, an auxiliary eccentric loosely sleeved upon the shaft, a strap loosely mounted upon the eccentric and provided with flat bearing-faces *g* and *h*, a main eccentric having a pivotal connection with the casing and carrying integral therewith T-shaped extensions M and N, inwardly-extending flanges projecting from the extensions as described and adapted to fit over the faces of the strap, and means for securing one of said flanges to one of the faces in the manner described and shown.

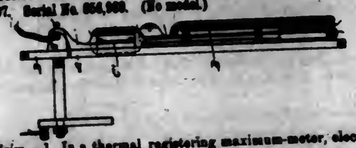
608,040. STRAW-STACKER. WILLIAM A. HINKLE, Forsyth, Ill. Filed Apr. 14, 1894. Serial No. 507,804. (No model.)

Claim.—1. The combination, in a straw-stacker, of a tube composed of a plurality of telescoping sections, a rack-bar on one of the sections, a pinion connected with another section and in mesh with the rack-bar, and means for rotating the pinion, substantially as set forth.

2. The combination of a track, a tube composed of two or more sections one telescoping on the other, a rack bar or bars, connected with the outer section and resting on the track, a pinion or pinions meshing with the rack bar or bars, and means for rotating the pinions in either direction, substantially as set forth

608,041. ELECTROSTATIC GENERATING-MACHINE. ADRIAN H. HOYT, Penacook, N. H. Filed Aug. 9, 1897. Serial No. 647,880. (No model.)

Claim.—1. In an electrostatic generator, the combination with the terminals for the working circuit, of spark-gap arms adapted for longitudinal and rotative adjustment within their posts, substantially for the purpose set forth.



2. In an electrostatic generator, the combination with a horizontally-rotative standard carrying terminals for the working circuit, of spark-gap arms adapted for longitudinal and rotative adjustment within their posts, substantially for the purpose set forth.

3. In an electrostatic generator, the combination of stationary glass plates mounted in suitable insulated supports and having armatures composed of tin-foil secured to their adjacent faces, friction-plates adapted to revolve in contact with said glass plates, suitable means for driving said friction-plates at a high rate of speed, a horizontally-rotative standard carrying terminals for the working circuit, spark-gap arms electrically connected with suitable brushes forming contact with said friction-plates, the said brushes located at a point opposite one end of said armatures, and collectors formed of thin metal having one edge serrated and located at a point opposite that end of said armatures most remote from said brushes, substantially for the purpose set forth.

4. In an electrostatic generator, brush-holders comprising a suitable yoke-piece to the free ends of which the brushes are secured, and clamping-plates within and at the opposite end of said yoke, one of said plates being rigidly fastened to said yoke and the other being swiveled to a screw which is threaded to the yoke opposite to said rigid plate.

5. In an electrostatic generator, comprising Leyden jars or condensers, a circuit-breaker consisting of a perforated stud in electrical connection with each jar and a suitable rod fitting the perforations of said studs and adapted to connect or disconnect the said jars.

608,042. HINGE CONNECTION FOR ELECTRICAL MEASURING INSTRUMENTS. ADRIAN H. HOYT, Penacook, N. H. Filed Nov. 1, 1897. Serial No. 656,969. (No model.)

Claim.—1. In a thermal registering maximum-meter, electrical connections for the stationary and movable parts of the instrument consisting of flexible metal strips or ribbons.

2. In a thermal registering maximum-meter, a hinge comprising a stationary and movable portion, and a copper ribbon having one end electrically connected to the stationary and the other end to the movable part of the hinge, substantially for the purpose set forth.

3. An electrically-connected hinge comprising a stationary member composed of two blocks of metal joined by a hollow shaft or cylinder one of said blocks having a small perforation or socket near the opening leading to said hollow shaft, a movable member having an arm projecting from its edge adjacent to the stationary member provided near its outer end with a lateral projection fitting the small socket in said stationary member, a copper ribbon passing spirally around said hollow shaft and having its ends soldered or otherwise rigidly attached one to said shaft and the other to said movable member, and set-screws threaded to perforations in the stationary member and communicating with the opening in its shaft.

608,048. BLOW-OFF COCK. WILLIAM MCINTOSH, Winona, Minn. Filed Oct. 11, 1897. Serial No. 654,869. (No model.)

Claim.—1. In a blow-off cock, the combination of a valve-casing having communication with a boiler and the atmosphere, a fluid-pressure-actuated piston in the casing, a stem for the piston and a valve controlled by the piston and governing the passage through the casing from the boiler to the atmosphere, such valve being removably secured to the piston-stem and having a substantially universal adjustment thereon.

2. In a blow-off cock, the combination of a valve-casing having a passage from a boiler to the atmosphere, a fluid-pressure-actuated piston in the casing, a stem therefor, a valve controlling said passage and removably connected to the piston-stem and having a movement thereon, and a removable seat on which the valve seats.

3. In a blow-off cock for a boiler and the like, the combination of a valve-casing having a passage from a boiler to the atmosphere, and formed in two parts, a fluid-pressure-actuated piston in the casing, a valve controlled by the piston and governing said passage, means for clamping the parts of the casing together, and a removable inverted cup-shaped seat within the casing on which the valve seats, such seat being held in place by said clamping means.

4. In a blow-off cock for a boiler and the like, the combination of a hollow plug adapted to be secured in the blow-off port of a boiler, a casing having a passage from the boiler to the atmosphere, a removable valve-seat having an annular flange adapted to be held between the casing and plug, means for securing said parts together, a valve governing said passage and adapted to fit upon such seat and means for actuating said valve.

5. In a blow-off cock for a boiler and the like, the combination of a hollow plug 1 adapted to be secured to the blow-off port of a boiler, a casing 2 having a passage from the boiler to the atmosphere, a removable valve-seat 15 having an annular flange adapted to be held between the casing and plug, a clamping-ring 20 adapted to secure the plug, casing and annular flange together, a valve 14 governing the said passage and fitting upon said seat, a piston 17 having a stem 18 actuating said valve and a spring 27 for normally holding the valve seated.

6. A blow-off cock comprising a foundation-plug secured in the blow-off port of a boiler, a valve-casing providing, in conjunction with the plug, a passage-way from the boiler to the atmosphere through a discharge-port in the casing, valve mechanism governing such passage-way, a removable valve-seat and a ring for clamping the plug and casing together and permitting the casing to be adjusted and secured to the plug so as to discharge to the atmosphere in any desired direction.

7. In a blow-off cock, the combination of a casing, a valve therein for normally closing the blow-off port and having a depending stem, means for operating the valve, and a yoke or frame connected to the casing and having a guide to receive the depending valve-stem.

8. A blow-off cock comprising a foundation-plug secured in the blow-off port of a boiler, a valve-casing providing, in conjunction with the plug, a passage-way from the boiler to the atmosphere through a discharge-port in the casing, valve mechanism governing such passage-way, a removable valve-seat and means for clamping the plug and casing together and holding the removable valve-seat in place.

9. In a blow-off cock for a boiler and the like, the combination of a casing communicating with the boiler, a valve therein for governing such communication and having an extended stem 10, a yoke 5 connected to end of the casing within the boiler and provided with a central opening 6 adapted to receive and guide the stem 10 and means for actuating the valve.

10. In a blow-off cock, the combination of a casing in two sections, one section being secured in the blow-off port, a coupling-ring for clamping or connecting the sections together, a valve in the casing for normally closing the blow-off port and means for operating the valve.

11. In a blow-off cock, the combination of a valve casing in two sections, one being the outer section and the other the inner or foundation-plug, the casing having a passage from the blow-off port to the atmosphere and also having a cylinder, a piston therein having a stem, a valve for governing said passage, means for removably securing the valve to the stem, and a second valve governing the blow-off port and adapted to be unseated by contact with the first valve.

12. The combination of a valve, a stem therefor and means for removably securing the valve to the stem comprising flanges or extensions on the valve engaging the stem, and a bolt passing through the valve and contacting the stem for retaining the valve upon the stem.

13. The means for removably securing a valve to a stem comprising a shoulder on the stem, an extension on the valve for engaging the shoulder and a bolt passing through the valve and entering the stem.

14. The means for removably securing a valve to a stem comprising an end shoulder on the stem and having a central hole or recess in its end, two substantially semicircular flanges partially encompassing the stem and engaging the end shoulder and a screw-bolt passing through the valve-body and entering the hole in the end of the stem.

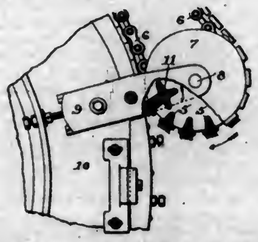
15. The means for removably securing a valve to a stem comprising an end shoulder 20 on the stem and having an end hole or recess, circular flanges 21 extending from the valve and whose inner faces are separated a distance equal to the diameter of the stem above

the end shoulder and a screw-bolt 22 having a reduced end or point 23 entering the hole in the end of the stem.

16. In a blow-off cock, the combination of a casing having a passage from the boiler to the atmosphere, a fluid-pressure-actuated piston in the casing, a stem therefor having an end shoulder, a valve controlling said passage and provided with an extension engaging the shoulder, and a screw-bolt passing through the valve-body and entering the stem.

17. In a blow-off cock, the combination of a casing having a passage from the boiler to the atmosphere, a fluid-pressure-actuated piston, a stem therefor having a shoulder and end recess, a valve controlling said passage and having flanges engaging the shoulder and a bolt with a reduced end, the bolt passing through the valve and entering the recess.

18. In a blow-off cock, the combination of a casing having a passage from a boiler to the atmosphere and also having a cylinder, a piston therein, a piston-stem integral therewith, a valve governing the blow-off port, a second valve removably connected to the stem for governing said passage and a removable valve-seat for such second valve.



19. In a blow-off cock, the combination of a valve-casing secured in a blow-off port of a boiler and having a passage therefrom to the atmosphere, an inner valve in the casing and seated upon the blow-off port proper, means for guiding such valve, an outer valve also in the casing and governing said passage to the atmosphere, and fluid-pressure mechanism for operating the valves and comprising a piston and a stem removably connected with the outer valve said outer valve having a substantially universal movement on its stem.

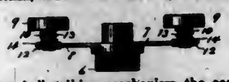
20. In a blow-off cock, the combination of a valve-casing in two sections, one being the outer section and the other the inner or foundation-plug, the casing having a passage from the boiler to the atmosphere, and also having a cylinder, a piston located in the cylinder and having a stem, a valve removably secured to the stem and governing said passage, a second valve also governing such passage and adapted to be operated by the movement of the first valve, a yoke upon the plug within the boiler and having a central opening and a stem upon the second valve adapted to be received by the central opening in the yoke.

21. In a blow-off cock, the combination of a valve-casing having a passage from the boiler to the atmosphere and also having a cylinder, valve mechanism for governing said passage, fluid-pressure mechanism for actuating the valve mechanism, a removable end plate or head for the cylinder and a clamping-ring for securing the end plate to the casing.

22. The combination with a boiler and the like, of a foundation-plug secured in the boiler blow-off port, a casing communicating with the plug and forming therewith a passage from the boiler to the atmosphere through a discharge-opening at one side of the casing, valve mechanism within the casing for regulating said passage and means for securing the casing upon the plug in any adjusted position.

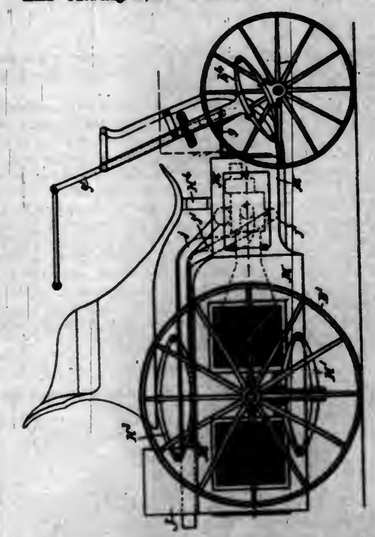
608,044. CLEARER-ROLL FOR CARDING-MACHINES. EPHRAIM H. ORRELL, Ware, Mass., assignor to the Whitin Machine Works, Incorporated, Whitinsville, Mass. Filed Sept. 30, 1897. Serial No. 653,594. (No model.)

Claim.—1. The combination with the top-flats of a revolving-flat carding-machine, of a clearer-roll provided with radial ribs, supported on the flats, disconnected from any part of the machine and free to tumble over the moving flats, whereby the rotation of the clearer-roll brings the radial ribs in contact with the surfaces of the top-flats and wipes the same, as described.



2. In a revolving-flat carding-machine, the combination with the chain, the top-flats secured to the chain, and the disks supporting the ends of the flats, of a tumbler consisting of a central core and radially-projecting ribs covered with clearer-cloth, disconnected from any part of the machine and free to tumble over the surfaces of the moving flats, whereby the tumbler may be readily inserted and removed and the flats cleaned, as described.

608,045. REPAIR DEVICE FOR PNEUMATIC TIRES. JOHN F. PALMER, Riverside, Ill. Filed Mar. 10, 1897. Serial No. 626,819. (No model.)

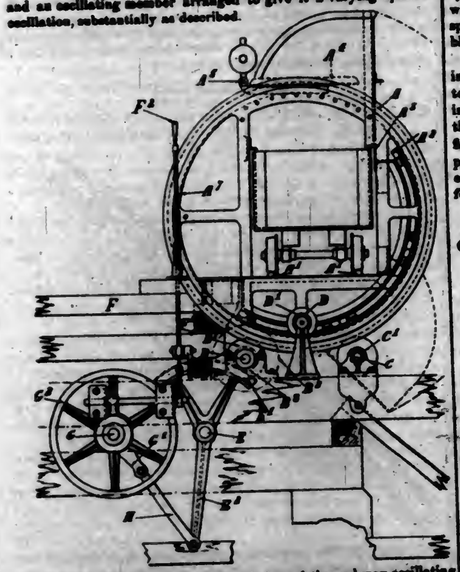


Claim.—A repair device for pneumatic tires comprising a cylinder and a piston movable therein, a flexible solution-tube within the cylinder, an outlet for the solution having a tapering end, elongated longitudinal apertures in said tapering end, and a cap covering the tapering end and serving to inclose the solution-tube and its outlet entirely within the cylinder, substantially as described.

608,046. STRIKING MECHANISM FOR BELLS. JOHN G. PIERSON, New Britain, Conn. Filed Nov. 20, 1897. Serial No. 659,204. (Model.)

Claim.—In a bell-striking mechanism, the combination of the revolving striker-carrier with the strikers having shanks 9 loosely mounted in said carrier, and springs arranged between the striker-heads and the broad side of the striker-carrier, the same being combined with the broad sides of the striker-heads and confronting side of the striker-carrier widely separated to permit the strikers to rock or tip freely on said carrier, substantially as described.

608,047. MOTOR-VEHICLE. WILLIAM H. PICKERING, Cambridge, Mass. Filed Aug. 31, 1896. Serial No. 604,361. (No model.)



Claim.—1. In a motor-vehicle a clutch-operating mechanism consisting of the sliding bars, F F'; the clutch-levers *f f'*; and means under the control of the operator for moving either sliding bar endwise, all combined to operate substantially as described.

2. In a motor-vehicle the combination of the water-jacket of the motor; a reservoir to supply that jacket elevated above the jacket; supply-pipes *j'* from the reservoir to the jacket and a plurality of upflow-pipes *j* from the jacket to the reservoir, the pipes *j* arranged to form a radiator and thus facilitate the circulation of the water substantially as described.

3. In a motor-vehicle a motor with a casing M, with ventilating-apertures covered with a screen composed of small-mesh fabric *m*, between two sheets *m' m²* of fabric of a larger mesh, substantially as and for the purpose specified.

608,048. OSCILLATING TIPPLER. JAMES REES, London, England. Filed Aug. 13, 1897. Serial No. 648,190. (No model.)

Claim.—1. The combination with a tippler, of a crank, a link and an oscillating member arranged to give it a varying speed of oscillation, substantially as described.

2. An automatically-operating balanced throughway oscillating side tippler having a counterbalanced door the oscillation being controlled by a brake-wheel and spur or friction gear as shown.

3. An automatically-operating balanced throughway oscillating side tippler having a counterbalanced door the oscillation being controlled by a brake.

4. In combination with an oscillating tippler, a counterbalanced door carried thereby, substantially as described.

5. In combination with an oscillating tippler, a plate A^3 and a counterbalanced door, substantially as described.

608,049. COW-MILKER. REUBEN D. ROYE, Mummasburg, Pa. Filed Sept. 14, 1897. Serial No. 651,586. (No model.)

Claim.—1. In a cow-milker, the combination of a double series of yielding cylinders arranged a short distance apart in vertical lines, a pair of blocks adapted to be grasped in the hand of the operator, wires extending from the outer series to the first block, wires extending from the inner series through the first block and to the second block, and springs between the blocks to normally hold them and the series of cylinders apart, substantially as shown and described.

2. In a cow-milker, the combination of two series of short sections of flexible tubing arranged in vertical lines, two blocks adapted to be pressed together by the hand of the operator, a spiral spring in each of the sections of the tubing comprising the outer series having its ends extended and secured to the outer block, a spiral spring in each of the sections of tubing, comprising the inner series having its wires extended through the first block and secured to the second block, and springs for normally holding the blocks and series of sections of tubing apart, substantially as shown and described.

3. In a cow-milker, the combination of a series of short flexible cylinders arranged in a vertical line, two blocks adapted to be pressed together by the hand of the operator, a spiral spring in each of the flexible cylinders, the ends thereof being extended to and secured to the first block before being coiled to form a spring intermediate of the cylinder and the block, a second series of flexible cylinders arranged in a line parallel with the first-named series, a spiral spring in each of said cylinders, its ends being bent backward through the springs in the wires before described and coiled around said wires in the form of springs, and passing through the first block and secured to the second block, substantially as shown and described.

4. In a cow-milker, the combination of two series of flexible cylinders arranged in vertical lines, two blocks adapted to be pressed together by the hand of the operator, and spiral springs in each cylinder of each series, the ends whereof are extended toward the blocks, the extension of the springs in the first series being connected to the first block and the extension of the springs of the second series being passed through the first block and connected to the second, and springs encircling the extension of the second series of blocks to normally force them apart, substantially as shown and described.

608,050. NUT-LOCK. JUDITH B. SARGENT, West Lebanon, N. H. Filed Dec. 27, 1897. Serial No. 663,805. (No model.)

Claim.—1. In a nut-lock, the combination with the nut having a groove or grooves on the under face, of a plate having a lug to engage the groove and also having one end bent to engage the nut on its outer edge.

2. In a nut-lock, the combination of the nut having a groove or grooves on its under face, of the curved spring-plate having its ends bent in opposite directions to engage the nut and base-plate and having a lug for engaging the groove of the nut.

608,051. CIGAR-HOLDER. WALTER W. RAHAN, New York, N. Y., assignor of one-half to George W. Clark, same place. Filed Apr. 21, 1897. Serial No. 633,148. (No model.)

Claim.—1. In a holder for cigars or other articles, the combination with a bow-shaped band, of a cigar-carrying envelop separate from the band and arranged below a horizontal part of the same, and a single spring attached centrally to said band and connected to said envelop, whereby the envelop in its entirety is suspended by said spring from said band, as and for the purposes described.

2. In a holder for cigars, or the like, the combination with a supporting-band, of a carrying-envelop separate from the band, and an attaching-spring connected to said band and arranged in connection with said envelop to normally place the same under transverse tension, whereby the envelop is adapted, by frictional engagement with its contents, to hold the latter in place, as set forth.

3. In a holder for cigars or other articles, the combination with a supporting-band, of a carrying-envelop provided at its edge with a reinforcement wire or strip, and a single attaching-spring fastened to said band and detachably connected to said strip or wire of the envelop, whereby the envelop may be removed in its entirety from the band and said spring, as and for the purposes described.

4. A holder or case for cigars or other articles comprising a band to be arranged inside the hat, an envelop having a pocket to receive the cigars or other articles, and spring-arms carried by the band and connected at their ends to the edges of the envelop at opposite sides of the pocket thereof, said arms being arranged to hold the sides of the envelop under tension to retain the cigars or other articles in place therein, substantially as set forth.

5. In a holder for cigars, or the like, the combination with a supporting-band, of an open-ended envelop having it edges reinforced by a marginal wire, and attaching-springs fastened to said holder and engaging with said reinforcing-wires of the envelop to strain the latter transversely, as and for the purposes described.

6. A holder for cigars and the like comprising an envelop having a pocket for containing the cigars or other articles, a strip of spring material connected to the edge of the envelop on each side of said pocket, and means for securing said strip inside the hat, said strip being arranged to hold the sides of the envelop under tension to retain the cigars or other articles in the pocket, substantially as set forth.

7. As a new article of manufacture, a holder for cigars, and the like, comprising a supporting-band, an attaching-spring fastened, at

a point intermediate of its length, to said bar, and terminating, at its ends, in elastic arms which are free from engagement with said band, and an envelop separate from the band and engaged, at its side edges, with the elastic arms of said attaching-spring, as set forth.

8. As a new article of manufacture, a holder for cigars, and the like, comprising a continuous supporting-band provided with the transverse bar 5, a spring fastened centrally to the band and terminating in free, elastic arms, an open-ended envelop connected at its side edges to the free ends of said spring, and a clip 14 attached to the band at one side of the spring and the envelop, as set forth.

608,052. SHOE-FASTENER. GEORGE W. BURFORD, Verona, Pa. Filed Mar. 15, 1897. Serial No. 627,600. (No model.)

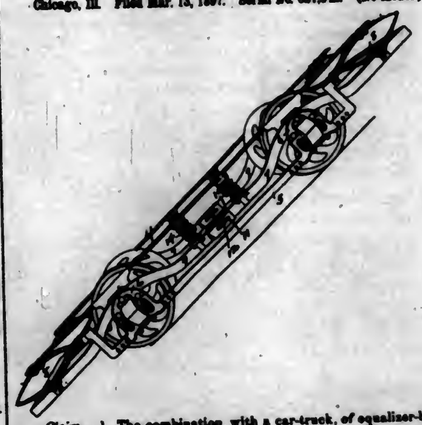
Claim.—1. A fastener for shoes or other articles, consisting of the plates bent one upon the other, each provided with a circular opening said plates being joined together, one of the plates being provided with a slot, the other being provided with a lip, and a staple attached to said lip for pivotally attaching the fastener to the shoe or other article, substantially as described.

2. A fastener for shoes or other articles consisting of the two plates joined together by a narrow strip and bent one upon the other, a centrally-located circular opening in each of said plates, one of said plates being provided with a lip, a staple attached to said lip whereby the fastener is pivotally attached to the shoe or other article, the other plate being provided with a slot in the periphery thereof, substantially as described.

608,053. CURTAIN-POLE. AXEL M. CHRISTIANSEN, Chicago, Ill. Filed June 26, 1897. Serial No. 642,444. (No model.)

Claim.—1. The curtain-hanger herein described, consisting of the horizontal portion I, having downward projections H, with eyes G, at the lower end thereof, and the points D, projecting from the angular portions E, of the cross-bar F, said cross-bar being pivotally secured in the eyes G, of the parts H, substantially as described.

2. A knob or end finish for curtain-poles consisting of a knob or sphere provided with a frusto-conical extension secured within the outer end of said frusto-conical extension having longitudinal slots forming spring-fingers to fit over the end of the pole, the outer ends of said fingers being bent inward and the inner ends thereof turned radially inward to serve as stops to prevent the knob or finish from being pressed too far upon the pole.



608,054. COMBINED SPROUT-PULLER AND WAGON-JACK. DAVID E. COFF, Woodstock, Va. Filed Dec. 31, 1897. Serial No. 665,009. (No model.)

Claim.—1. A sprout-puller comprising a base, the uprights or standards attached to said base, one of said standards being projected forwardly and then bent laterally at its projected end, a handle-bar pivoted between the uprights or standards and adapted to contact at its forward end with the laterally-bent end of the projected standard, and the plates attached to the sides of the handle-bar near the forward end, said plate projecting above and below the upper and lower face of the said handle-bar and provided with means for attaching a block above and a prop below said bar, substantially as described.

2. A sprout-puller comprising a base A, the upright B provided with horizontal flanges B' and bolted to the base, the upright C provided with a horizontal flange and bolted to the base a short distance from and parallel with the upright B, the forward extension D to the upright C having its outer end bent laterally and provided with teeth D^2 on its lower edge, the handle-bar F pivoted between the uprights B and C and projecting beyond the pivot, a metal plate H secured to the top of the handle-bar and having teeth H' in position to coact with the teeth D^2, and the plates J and K rigidly secured on opposite sides of the handle-bar F at an inclination to its upper and lower surfaces, projecting above and below the handle-bar and having holes adapted to receive the pins for attaching the block L and prop N when desired, substantially as described.

608,055. EQUALIZER FOR CAR-TRUCKS. EDMUND A. CURTIS, Chicago, Ill. Filed Mar. 13, 1897. Serial No. 627,342. (No model.)

Claim.—1. The combination, with a car-truck, of equalizer-bars pivotally mounted between their ends in the vertical plane of the axles and having their inner adjacent ends pivotally connected, each equalizer-bar having both of its ends free to move relatively to the car-body, and body-supporting springs mounted one at each end of each bar and interposed between said bar and the car-body, substantially as described.

2. In a car-truck, the combination, with a truck-frame, of equalizer-bars pivoted thereon between their ends in the vertical plane of the axles, the inner ends of said equalizer-bars having a sliding pivotal connection with each other, each equalizer-bar having both of its ends free to move relatively to the car-body, and body-supporting springs mounted on each end of said equalizer-bars and interposed between said bars and the car-body, substantially as described.

608,056. INCANDESCENT ELECTRIC LAMP. MARK W. DEWEY, Syracuse, N. Y., assignor to the Dewey Corporation, same place. Filed July 22, 1891. Serial No. 400,573. (No model.)

Claim.—1. In an incandescent electric lamp, the combination of a light-giving electric conductor, a receiver made entirely of glass and completely inclosing said conductor, and from which receiver the air is exhausted, and an electric conductor outside of said receiver and in inductive relation to the inclosed conductor.

2. The combination of a carbon filament, with a receiver made entirely of glass and completely inclosing said filament, and from which receiver the air has been exhausted, and a coiled electric conductor outside of said receiver and in inductive relation to the inclosed filament.

3. The combination of a closed electric circuit formed substantially entirely of carbon, with a receiver made entirely of glass and inclosing said circuit, and from which receiver the air has been exhausted, and an electric conductor in inductive relation to said electric circuit for the purpose described.

4. The combination of a closed electric circuit made entirely or substantially entirely of carbon, with a receiver made entirely of glass and inclosing said circuit, and from which receiver the air has been exhausted, and an electric conductor in inductive relation to the circuit or a portion thereof.

5. The method of causing incandescence in an electric glow-lamp, which consists in subjecting a ring or closed-coil filament inclosed in a substantially exhausted receiver to the inductive influence of the field produced by varying currents in an external electric conductor, substantially as described.

6. The method of causing incandescence in an electric glow-lamp, which consists in disposing the filament of said lamp as the secondary of an induction coil or transformer and causing a varying current to traverse the primary of said transformer, substantially as described.

7. The combination in an electric glow-lamp, of a filament in ring or closed-coil form, and a means of producing a varying field of force; the said filament being located in said field and receiving a current by induction therefrom, substantially as described.

8. The combination of an electric glow-lamp having filament in ring or closed-coil form, a coil and a source of varying electric current connected with said coil; the said filament and said coil being disposed in inductive proximity, substantially as described.

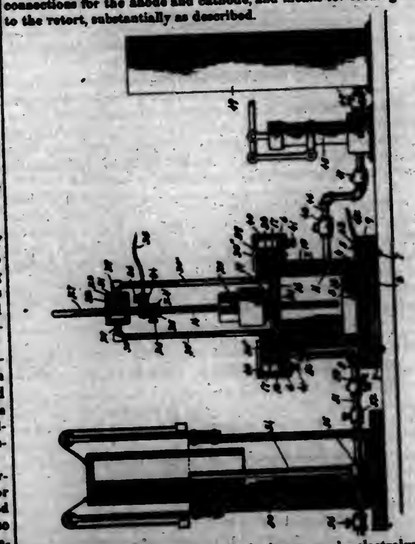
9. The combination in an electric glow-lamp, of a receiver of translucent material and a filament without leading-in wires in the form of a ring or closed coil inclosed therein, substantially as described.

10. In an electric illuminating apparatus, a support, a means of producing a variable field of force combined therewith, a glow-lamp receiver adapted to be held upon said support, and a filament in ring or closed-coil form inclosed within said receiver, the aforesaid parts being constructed and arranged so that when said receiver is held upon said support said filament shall be in said variable field, substantially as described.

11. In an electric illuminating apparatus, a primary coil, a glow-lamp receiver adapted to be supported thereon, and a filament in ring or closed-coil form inclosed within said receiver, the aforesaid parts being constructed and arranged so that when said receiver is supported on said primary coil, said filament shall become a secondary thereto and be caused to glow by the induced current, substantially as described.

12. In an electric illuminating apparatus, a primary coil, a glow-lamp receiver adapted to be supported thereon, a filament in ring or closed-coil form inclosed within said receiver with reference to said primary coil; the aforesaid parts being constructed and arranged so that when said receiver is supported on said primary coil said filament shall become a secondary thereto and be caused to glow by the induced current, and also so that by the movement of said receiver as aforesaid said induction effect, and hence the intensity of the glow, may be varied, substantially as described.

13. In an incandescent lamp, the combination of a light-giving conductor, a suitable receiver completely inclosing said light-giving conductor, and from which receiver air is exhausted, and an electric conductor outside of said receiver and in inductive relation to the light-giving conductor.



608,057. ADVERTISING DEVICE. MATTHEW DEFFNER, Allegheny, Pa. Filed Apr. 5, 1897. Serial No. 630,801. (No model.)

Claim.—As a new article of manufacture, a toy consisting of a shaft, a cross-piece a secured to one end, hemispherical bodies of unequal weight secured to the ends of said cross-piece, said hemispherical bodies being provided with openings a^2 in which are secured reeds, sleeve provided with an opening to receive the shaft, a central chamber, an opening through the side of the sleeve communicating with said chamber, an operating-string passing through said opening and secured to the shaft, a ball attached to the lower end of the shaft, said hemispherical bodies producing a noise when the operating-string is pulled.

608,058. ELECTRICAL REPEAT. HILLIARY ELDRIDGE, DANIEL J. CLARK, and SYLVAIN ELDE, Galveston, Tex. Filed June 30, 1897. Serial No. 642,701. (No model.)

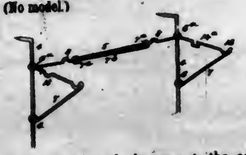
Claim.—1. In a plant for manufacturing hydrogen gas by electrolysis, a retort having a closed chamber and a conducting-bottom, a base insulated electrically from said retort, a closure or head also insulated from the retort, a cathode seated in electrical contact with the conducting-bottom of said retort, and a packed insulating stuffing-box mounted on the head, in combination with an anode, electrical connections for the anode and cathode, and means for feeding water to the retort, substantially as described.

2. In a plant for manufacturing hydrogen gas by electrolysis, the retort having a conducting-bottom and closed chamber, a disk-like cathode seated on the conducting-bottom of the retort and in electrical contact therewith, an annular bottomless lining secured within the retort-chamber to surround the cathode and having the water-induction port and the gas-eduction port, a stuffing-box supported on the head or cover of the retort above the cathode and carrying the vertically-alined insulated bushings, an anode movable within said bushings of the stuffing-box and insulated thereby from electrical contact with said stuffing-box, a feed mechanism for the anode, and electrical conductors in contact with the retort and the anode, combined with a feed-pump connected with the water-induction port, a gasometer, and connections between the gasometer and the gas-eduction port from the retort and its refractory lining, substantially as and for the purposes described.

3. In a plant for manufacturing hydrogen gas by electrolysis, a retort comprising a metallic vessel having a head or cover, a two-part stuffing-box having one member rigid with said retort-head and the other member forming a removable gland, insulating-bushings fixed within the members of said stuffing-box and arranged in vertical alinement with each other, and a packing confined between the vertically-alined bushings, combined with an anode movable through the bushings and packing of the stuffing-box and insulated by said bushings from electrical contact with the stuffing-box, a cathode confined within the retort, and suitable electrical connections, substantially as and for the purposes described.

4. In a plant for manufacturing hydrogen gas by electrolysis, a retort having a head or cover, a stuffing-box having one member rigid with said head or cover and provided with an interior insulating-bushing, a stuffing-box gland coupled to the rigid stuffing-box member, another insulating-bushing secured within the stuffing-box gland and having a vertical opening in alinement with a similar opening in the rigid member of the stuffing-box, and a packing interposed between the insulating-bushings and confined by a gland within the stuffing-box, in combination with an anode movable through said alined bushings and insulated thereby from electrical contact with the stuffing-box, a cathode within the retort-chamber, and electrical connections, substantially as and for the purposes described.

5. In a plant for manufacturing hydrogen gas by electrolysis, a retort having a chamber and a cathode confined therein, a head or closure insulated from said retort, a two-part stuffing-box carried by said head or closure and containing vertically-alined insulating-bushings and a packing confined between said bushings, a supporting-frame insulated from the head or closure, and clamps for holding said closure on the supporting-frame rigidly upon the retort, combined with a



feed mechanism mounted in the supporting-frame, an anode passing through the bushings of and insulated from electrical contact with a stuffing-box, and suitable electrical connections for the retort and said anode, substantially as and for the purposes described.

6. The combination with a retort vessel having a closure, and a cathode therein, of a supporting-frame resting upon, but insulated from, the retort closure, a clamp embracing said retort vessel and the supporting-frame, but insulated from the latter, an anode, a carrier for said anode and provided with a guide-rack, a boxing supported on the frame, and a shaft carrying an adjusting-pinion, as and for the purposes described.

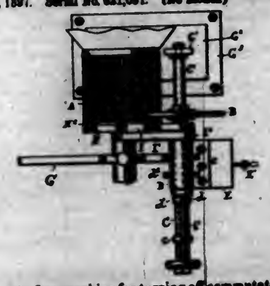
7. In a plant for manufacturing hydrogen gas by electrolysis, a retort having a tightly-closed chamber, and a two-part stuffing-box mounted on said retort and provided with insulating-bushings and a packing, combined with an anode movable through the stuffing-box and insulated by the bushings therein, a cathode within the retort, electrical connections for said cathode and anode, and means for feeding a liquid to said retort, substantially as described.

8. In an apparatus for manufacturing hydrogen gas by electrolysis, a retort having an insulated cover, an upright frame clamped to said retort and provided with a guide-head, and a stuffing-box mounted on the cover and having insulating-bushings in line with the guide-head, combined with an anode passing through the guide-head and stuffing box, a feed mechanism for said anode, a cathode, and electrical connections for said anode and cathode, substantially as described.

603,059. WINDOW-SHADE SUPPORTER. JAMES A. HILLMAN and HARRY M. REED, Homestead, Pa. Filed May 7, 1897. Serial No. 635,552. (No model.)

Claim.—1. In a window-shade support, the combination with the vertical guides 4 and the pulleys 11 9ª and 10ª arranged substantially as shown, of the supporting member, comprising two sections having a telescopic connection, whereby the sections can be extended laterally, each section having an eye 7ª, a bend 8 having one end bent outward at right angles to form a bracket 7, said bracket having a seat for the curtain-pintles and having eyes 6 and 6ª to engage the guides 4, and the cords 9 10 and 12, all being arranged substantially as shown and described.

2. The combination with the side guides, of the combined curtain and shade support, consisting of the wire frame composed of two sections each consisting of a single wire member having one end bent to form an eye 7ª, its opposite end being bent outward at right angles to form a horizontal bracket member and bent downward and backward to form a brace, the lower end of which terminates in the eye 6, said wire member being bent at an angle to form an eye 6ª and also bent to form a bend 8 at a point between the eyes 7ª and 6ª, all being arranged substantially as shown and described.



603,060. ELECTRIC RAILWAY. CHARLES F. HOLTHAUS and CHARLES BURGMANN, Pittsburg, Pa. Filed Aug. 5, 1897. Serial No. 647,212. (No model.)

Claim.—1. In an electric railway, a series of separated successively-arranged contact-boxes, a fixed interior metallic contact-plate arranged longitudinally within the bottom of each box and provided at its ends with upwardly-disposed contact lugs or projections, a normally spring elevated straight track-section arranged longitudinally above each box, each track-section being of a U shape in cross-section and carrying a depending connecting-post, and a horizontal contact-bar fitted between its ends to the lower extremity of said connecting-post and provided with oppositely-located pairs of keeper-plates adapted to engage with said contact lugs or projections, substantially as set forth.

2. In an electric railway, a series of successively-arranged contact-boxes provided with removable cover-plates and formed at their opposite ends with integral vertically-disposed spring casings or pockets, said cover-plate having a central and end insulated guide-openings, insulating-linings fitted within each contact-box and the spring casings or pockets thereof, a fixed interior metallic contact-plate fitted within the bottom of each contact-box and provided with separate oppositely-located contact lugs or projections, springs housed within said casings or pockets, a normally-elevated straight track-section arranged longitudinally above each box, and provided with a central depending connecting-post working through the central insulated guide-opening, and at its ends with depending stems working through the end guide-openings and having buffer-collars resting on the springs within said casings or housings, a horizontal straight contact-bar fitted centrally between its ends to the inner lower extremity of said connecting-post, and provided at each end with a pair of spaced keeper-plates adapted to work over and engage with the contact lug or projection therebeneath, and a feed-wire connection with said ieterior metallic contact-plate, substantially as set forth.

603,061. DEVICE FOR TURNING OFF COMMUTATORS OF DYNAMOS OR MOTORS. WILLIAM H. JORDAN, Brooklyn, N. Y. Filed Jan. 28, 1897. Serial No. 621,081. (No model.)

Claim.—1. In a machine for turning off commutators of dynamos or motors, the combination of a tool carried by a rotating and longitudinally-movable shaft, a bearing for said shaft adjustable toward and away from the commutator, a driving-wheel adapted to be journaled on either end of said bearing and by means of which the shaft is rotated and through which driving-wheel the shaft is longitudinally movable, and a driving connection between said wheel and the commutator, substantially as and for the purpose set forth.

2. In a machine for turning off commutators of dynamos or motors, the combination of a tool carried by a rotating and longitudinally-movable shaft, a bearing for said shaft adjustable toward and away from the commutator, a support for said bearing, a driving-wheel journaled on said bearing and by which the shaft is rotated and through which the shaft is longitudinally movable, a driving connection between said driving-wheel and the commutator, and an extra adjustable bearing for one end of the tool-shaft, substantially as set forth.

3. In a machine for turning off commutators of dynamos or motors, the combination of a tool carried by a rotating and longitudinally-movable shaft, a bearing for said shaft adjustable toward and away from the commutator, a driving-wheel adapted to be journaled on either end of said bearing and by means of which the shaft is rotated and through which driving-wheel the shaft is longitudinally movable, a driving connection between said wheel and the commutator, and means for limiting the longitudinal movement of the shaft through the bearing, substantially as and for the purpose set forth.

4. In a machine for turning off commutators of dynamos or motors, the combination of a tool carried by a rotating and longitudinally-movable shaft, said shaft being tubular at the one end, a bearing for said shaft adjustable toward and away from the commutator, a support for said bearing, a driving-wheel supported by said bearing and by which the shaft is rotated and through which the shaft is longitudinally movable, a driving connection between said driving-wheel and the commutator, and an adjustably-supported rod entering the tubular end of the shaft to form an additional bearing, substantially as set forth.

5. The combination with an apparatus for turning off commutators, of an adjustable support therefor adapted to be clamped to the base of dynamos or motors, said support comprising a clamping-plate G^3, a plate G^2 adjustable thereon, and a standard G' on said last-named plate, upon which the turning-off apparatus is adapted to be secured, substantially as set forth.

603,062. CAR-COUPLING. EDWARD B. JOY, Dexter, Kans. Filed Aug. 28, 1897. Serial No. 649,579. (No model.)

Claim.—1. A car-coupler, comprising a longitudinally-yielding draw-bar and a suitable frame for said bar, said draw-bar having its forward end bifurcated and provided with a slot in its forward end, a spring-pressed coupling-pin adapted to be passed through said slot, a lever pivotally supported from the draw-bar and adapted to be rocked to elevate the coupling-pin to uncouple the cars, a sliding spring-actuated member adapted to engage the pin and keep the same normally elevated, said member being provided at its rear end with an arm adapted to engage the frame when the cars come together, to release the pin and permit the same to be forced downwardly through the slots in the companion coupler, said draw-bar being also provided with the registering slots adapted to receive the coupling-pin of the companion coupler, and means for keeping the draw-bar normally forced upward, substantially as described.

2. A car-coupler, comprising a rearwardly-yielding draw-bar, a suitable frame for said draw-bar having stude passing through elongated slots in the rear portion thereof to limit the horizontal movement of the draw-bar, said draw-bar being provided with bifurcated forward end having vertical slots therein for the passage of the coupling-pin carried by the draw-bar, and the coupling-pin carried by the companion coupler, a spring-pressed coupling-pin in the slot in the forward end of the draw-bar, a lever pivoted upon the draw-bar and having its forward and connected with the coupling-pin, whereby the same is elevated, a spring-actuated sliding arm having its forward end in engagement with the coupling-pin, whereby the same is maintained in elevated position, said member having an arm at its rear end adapted to engage the draw-bar frame when the cars are brought together and thereby permit the coupling-pin to be forced downwardly, substantially as described.

603,063. RHEOSTAT. HARRY W. LEONARD, East Orange, N. J. Filed July 24, 1896. Serial No. 600,742. (No model.)

Claim.—1. The combination of a support covered by a layer of partially-vitrified insulating material, a layer of vitreous insulating material on said layer, and a conductor held to the insulated side of the support by a layer of non-vitrified insulating material.

2. The combination of a cast-iron support covered by a layer of partially-vitrified insulating material, a layer of vitreous insulating material on said layer, and a conductor held to the insulated side of the support by a layer of non-vitrified insulating material.

3. The combination with two plates or supports having a layer of partially-vitrified insulating material, and a covering-layer of vitreous insulating material, of a conductor held between said insulated plates.

4. The combination with two plates or supports having a layer of partially-vitrified insulating material, and a covering-layer of vitreous insulating material, of a conductor held between said insulated plates, and a filling of non-vitrified material between the adjacent sections of the condector.

5. The combination with two cast-iron plates or supports having a layer of partially-vitrified insulating material, and a covering-layer of vitreous insulating material, of a conductor held between said insulated plates.

6. The combination of a metal support, covered by a layer of insulating material, applied as a powder and made by heat into a coherent mass adhesive to the support, a glazing of vitreous material on said layer, and a conductor held to the support by a layer of non-vitrified insulating material.

7. The combination of a cast-iron support, covered by two layers of insulating material, the first layer being applied as a powder and made by heat into a coherent mass adhesive to the support, the second layer being applied in the form of powdered glass which by heat is caused to fuse and produce a glaze on the first layer, and a conductor held to the support by a layer of non-vitrified insulating material.

8. The combination of a metal support covered by a layer of vitreous insulating material, and a conductor held to the support by a layer of non-vitrified insulating material.

9. The combination of a metal support, covered by a layer of vitreous insulating material, and a conductor held to the support by a layer of cement.

10. The combination of a cast-iron support, covered by a layer of partially-vitrified insulating material, a layer of vitreous material on the first layer, and a conductor held to the support by a layer of cement.

11. The combination of a conductor carried by a support of insulating material and a metal plate placed in close proximity thereto, said plate being insulated from said conductor by a layer of vitreous material.

12. The combination of a conductor carried by a support of insulating material and a metal plate placed in close proximity thereto, said plate being insulated from said conductor by a layer of vitreous material, and a filling of non-vitreous material between adjacent sections of the conductor.

13. The combination of a conductor carried by a support of insulating material, and a cast-iron plate placed in close proximity thereto, said plate being insulated from said conductor by a layer of partially-vitrified material covered by a second layer of vitreous material, and a filling of non-vitreous material between the adjacent sections of the conductor.

14. The combination of a conductor carried by a support of insulating material, and two metal plates between which said support with the conductors is placed, the inner surfaces of said plates being insulated from said conductor by a layer of vitreous material.

15. The combination of a conductor carried by a support of insulating material, and two metal plates between which said support with the conductor is placed, the inner surfaces of said plates being insulated from said conductor by a layer of vitreous material, and a filling of non-vitreous material between the adjacent sections of the conductor.

16. The combination of a conductor carried by a support of insulating material, and two cast-iron plates between which said support with the conductor is placed, the inner surfaces of said plates being insulated from said conductor by a layer of partially-vitrified material covered by a second layer of vitreous material, and a filling of non-vitreous material between the adjacent sections of the conductor.

17. The combination of a metal support having upon its surface two layers of adherent insulating material, each separately applied as a powder and made adherent by heat, and a heating-conductor insulated from the metal support by said insulating-layers but free to expand without affecting the said insulating-layers.

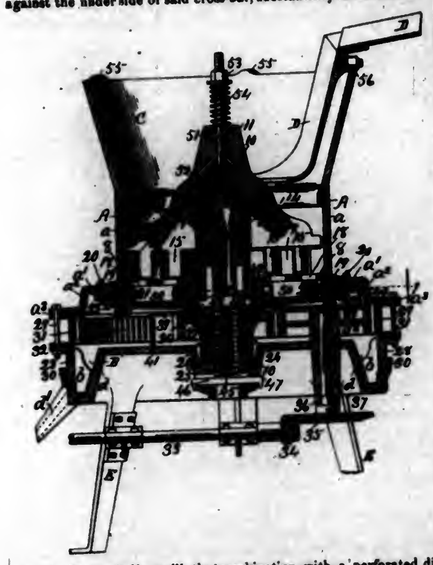
18. The combination of a metal support, a ground coat applied as a powder and made adherent by heat, a glaze upon said ground coat and a conductor in contact with said glazed surface but free to expand without affecting the said glazed surface.

19. A conductor held in position by a thin layer of insulating material between two metal surfaces, each of the two surfaces being coated by an adherent layer of insulating material applied as a powder and made adherent to the surfaces by heat.

20. The combination of a box-like support coated on the inside with a layer of insulating material, a conductor arranged on said layer of insulating material, and a plate placed over said support and whose inner side is covered by a layer of insulating material.

21. The combination of a cast-iron box-like support coated on the inner side by a layer of partially-vitrified material, a coating of vitreous insulating material on said first layer, a conductor arranged on said vitreous layer, and a plate placed over said box-like support and coated on its inner side with a layer of insulating material.

603,064. GRINDING-MILL. JOHN G. MOLE, Batavia, Ill. Filed Aug. 20, 1896. Serial No. 603,235. (No model.)



Claim.—1. In a grinding-mill, the combination with a revoluble casing, provided with a perforated diaphragm having breaker-teeth and a vertical bearing-sleeve formed integral therewith, of a base part, provided with a hollow stationary axial spindle extending up through said sleeve on the diaphragm, and a cap, mounted on said spindle and having laterally-projecting arms provided with breaker-teeth, arranged parallel to the corresponding teeth on said diaphragm, substantially as described.

2. In a grinding-mill, the combination with a revoluble casing, of the upper grinding-ring, secured therete, a rotatable carrier, the lower grinding-ring, secured to said carrier, the hollow axial spindle, a driving gear-wheel, loosely mounted thereon and having a frictional engagement with said carrier, and means for transmitting motion to said gear-wheel, substantially as described.

3. In a grinding-mill, the combination with a revoluble casing, of a ring, the lower edge of which extends down into the base part, and is connected to the lower flanged edge of said casing by a number of bolts and leaving a space between, a hubless gear-wheel clamped in between the casing and ring and filling said space, the wings, secured to said ring, and means, for transmitting motion to said hubless gear-wheel, substantially as described.

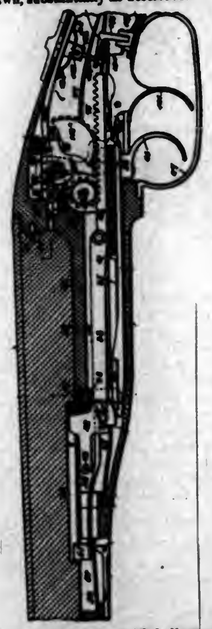
4. In a portable mill, the combination with the revolable casing and its perforated diaphragm, of a vertical sleeve, an axial spindle,

a ring 42, a cross-bar on which said ring rests, and a spring, bearing against the under side of said cross-bar, substantially as described.

5. In a grinding-mill, the combination with a perforated diaphragm, having an annulus formed on the under side thereof, of the grinding-rings, and the feed-arms, secured at their inner ends to said annulus, the outer ends stopping short of the edges of the grinding-rings, substantially as described.

6. In a grinding-mill, the combination with a revoluble hopper, provided around its upper edge with a number of ridges, of a feed-spout, and a friction-roller, journaled in said spout and adapted to have contact with said ridges, substantially as described.

608,065. FLY-TRAP. JOHN C. NIXON, Texarkana, Ark. Filed Sept. 8, 1897. Serial No. 650,866. (No model.)



Claim.—1. A fly-trap comprising a base-plate, a motor inclosed in a casing at one end thereof, and a standard at the other end, a standard mounted centrally on the base and provided at its upper end with a curved plate, hooks projecting from the inner side of the casing and the top of the standard, a roller journaled in the standard and the side of the casing, one end of its shaft projecting into the casing and being connected with the motor, and a cylindrical cage having end rods with eyes, mounted upon the curved plate with the eyes of its end rods engaging the hooks before mentioned, substantially as described.

2. The cage herein described consisting of circular or disk-shaped end pieces having curved notches in one side, and the wire-netting secured on said ends, beginning at one edge of the curved notches and extending around the circular ends into the opposite side of the curved notches, leaving a space between the ends of the netting extending from end to end of the cage, substantially as described.

608,066. MAGAZINE-FIREARM. WILLIS H. OUTERBRIDGE, Boston, Mass. Filed Oct. 8, 1896. Serial No. 608,263. (No model.)

Claim.—1. In a gun, the combination, with the firing-triggers provided with extensions within the frame of the gun, of a barrel-releasing bar having sliding movement beneath the trigger extensions, the said bar when the barrels are locked being clear of the trigger extensions, permitting the triggers to have free movement, but wherein when the barrels are opened the said bar will intervene the trigger extensions and the bottom of the frame, preventing the triggers being drawn, substantially as described.

2. In a gun, the combination, with indicators having movement in the breech and having rack-surfaces, the indicators being provided with ejecting-carriers, a rack, moving barrels for operating the rack, a driving pinion engaging with the said rack, and shifting pinions adapted for driving connection with the driving-pinion and arranged for engagement with the rack-surfaces of the indicators, of shifting plates having sliding movement one upon the other, controlling the movement of the shifting pinions, latches controlling the movement of the shifting plates, tension devices exerting downward tension on the said latches, and crank-arms arranged to elevate the latches, being operated by the forward movement of the hammers of the gun, as and for the purpose set forth.

3. In a gun, the combination, with indicators having movement in the breech and having rack-surfaces, the indicators being provided with ejecting-carriers, a rack, moving barrels for operating the rack, a driving-pinion connected with the aforesaid rack, and shifting pinions adapted for driving connection with the driving-pinion and arranged for engagement with the rack-surfaces of the indicators, of shifting plates having sliding movement one upon the other, controlling the movement of the shifting pinions, latches controlling the movement of the shifting plates, tension devices exerting downward tension on the said latches, crank-arms arranged to elevate the latches, being operated by the forward movement of the hammers of the gun, and a spring-controlled wedge operated by the closing movement of the barrels and arranged when the barrels are closed to laterally separate the said shifting plates, as and for the purpose set forth.

4. In a gun, the combination, with a rack, and moving barrels for operating the rack, of a segment meshing with the said rack, crank-arms connected with the said segment, and hammers provided with shoulders for engagement by the crank-arms, the relation of the crank-arms to the shoulders of the hammers being such that at the forward movement of the barrels the hammers will be carried to a cocked position, as and for the purpose specified.

5. In a gun, the combination, with a frame, sliding barrels, the hammers and ejecting devices, of a driving-pinion operated by the movement of the barrels, a shifting pinion at each side of the driving-pinion, arranged for clutch engagement therewith, shifting plates connected with the shifting pinions, a wedge having its movement

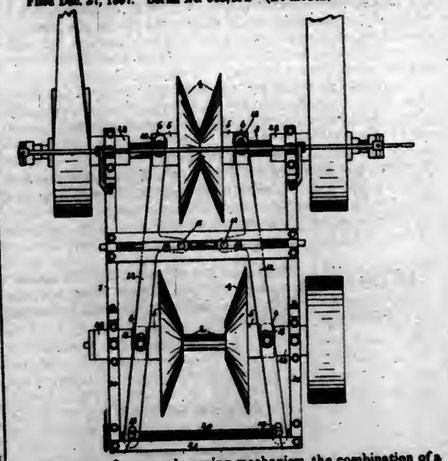
controlled by the movement of the barrels, which wedge engages with the shifting plates, normally holding the shifting pinions from the driving-pinion, latches arranged for engagement one with each shifting plate, cranks connected with the latches, and projections upon the hammers arranged to engage with the cranks and lift the latches when the hammers are cocked, shoulders located on the hammers above the projections, and offsets upon the latches for engagement by said shoulders on the hammers when the said hammers have been thrown in firing, as and for the purpose set forth.

6. In a gun, the combination, with the frame, sliding barrels, the hammers and ejecting devices, of a driving-pinion operated by the movement of the barrels, a shifting pinion at each side of the driving-pinion, arranged for clutch engagement therewith, shifting plates connected with the shifting pinions, a wedge having its movement controlled by the movement of the barrels, the wedge being arranged for engagement with the shifting plates, normally holding the plates from connection with the driving-pinion, tension-controlled latches arranged one for engagement with each shifting plate, offsets secured upon the latches, having a crank-arm at each end, one crank-arm of each shaft being in lifting engagement with a latch, the other crank-arm having free movement near the opposite latch, projections upon the hammers, adapted to engage with the free crank-arms, and shoulders upon the hammers, arranged for sustaining engagement with the offsets on the latches, as and for the purpose set forth.

7. In a gun, the combination, with a frame, barrels held to slide to and from the frame, ejecting devices, and a driving-pinion operated by the movement of the barrels, of a shifting pinion at each side of the driving-pinion, arranged for clutch engagement therewith, shifting plates connected with the shifting pinions, a wedge having its movement controlled from the barrels, being arranged for engagement with the shifting plates, normally holding them disconnected from the driving-pinion, tension-controlled latches arranged for engagement with each shifting plate, offsets secured upon the latches, shafts journaled below the latches, having a crank-arm at each end, one crank-arm being in lifting engagement with each of the latches, the other crank-arm having free movement near the opposite latch, hammers for the gun, each provided with a pin and a shoulder, said pins being in lifting engagement with the free crank-arms when the hammers are cocked, the arrangement of the crank-arms, offsets upon the latches, the pins and shoulders upon the hammers being such that when the right-hand barrel is fired the shoulder of the right-hand hammer will hold the right-hand latch elevated, the pin upon the right-hand hammer at the same time releasing the lifting-crank from its lifting engagement with the left-hand latch, substantially as described.

8. In a gun, the combination, with ejecting devices, a driving-pinion, sliding barrels operating said pinion, a shifting pinion at each side of the driving-pinion, and shifting plates connected with the shifting pinion, of latches having offsets, lifting-cranks for the latches, hammers provided with shoulders and projections, the projections serving to hold the latches raised when the hammers are cocked, the shoulder of a hammer being adapted when the hammer is tripped to hold the latch raised at the same side of the frame at which the hammer is located, the pin of the tripped hammer at the same time releasing the latch of the opposite or cocked hammer, substantially as described.

9. In a gun, the combination, with a frame, the fore-end of the same, barrels mounted to slide on the fore-end, a limiting-bar, a rack connected with the limiting-bar and operated by the movement of the barrels, a releasing-bar, a trigger connected therewith, and guide projections upon the releasing-bar, causing said bar to move parallel with the movement of the barrels, of an arm operated by the releasing-bar, said arm being passed at one end through the limiting-bar and provided at its opposite end with teeth, a lock-latch pivoted in the fore-end, adapted for engagement with the barrels and having teeth arranged for engagement with the teeth of the said arm, a stop carried by the latch, adapted for engagement with the limiting-bar, a flexible extension for the forward end of the limiting-bar, a head-block upon said extension adapted to enter a slot in the fore-end and a slot between the barrels, a spring arranged to engage with the head, and a lever having a cam-head arranged to engage with said spring and maintain said head-block in engagement with the barrels, as and for the purpose specified.



10. The combination, with the trigger of a gun having forward extensions, of a releasing-bar for the barrels of the gun, which releasing-bar at its releasing movement passes under the trigger extensions, as and for the purpose set forth.

11. The combination, with the triggers of a gun having forward extensions, of a releasing-bar for the barrels of said gun, a limiting-bar for the barrels cooperating with the releasing-bar, the rear portion of said releasing-bar when carried rearward to a position releasing the barrels being arranged to pass beneath the extensions of the triggers, preventing the triggers from being operated, as and for the purpose specified.

12. In a gun, the combination, with the sears, of a rocking lock extending over said sears, preventing the two triggers from being simultaneously thrown, the said rocking lock being operated by the elevation of the sears in firing, sliding barrels, a releasing-bar for the barrels, triggers having their forward inner ends extending beyond their pivots, beneath which inner forwardly-extending ends of the triggers the releasing-bar is carried when the barrels are released by said bar, as and for the purpose specified.

13. In a gun, the combination, with the sears, each sear being provided with an inwardly-extending flange, of a forked locking device mounted to rock in the frame of the gun, the members of the aforesaid fork extending over the flanges of the sears, whereby either of the sears may be raised, one after the other, but wherein both sears cannot be elevated at one and the same time, thereby preventing both barrels of the gun from being simultaneously discharged, a sliding safety-plate, and an arm projecting from said plate, terminating in a foot of a width for engagement with the flanges of both sears, as and for the purpose set forth.

608,067. SPEED-VARYING MECHANISM. MILTON O. REEVES, Columbus, Ind., assignor to the Reeves Pulley Company, same place. Filed Dec. 27, 1897. Serial No. 663,464. (No model.)

Claim.—1. In a speed-varying mechanism, the combination of a frame, two parallel shafts mounted therein; a pair of cone-shaped driving elements splined to each shaft, the individual members of each pair adapted to slide toward or from each other upon their respective shafts; means for simultaneously sliding the approaching pair of disks at a gradually-decreasing speed, and the receding disks at a gradually-increasing speed, and a belt connecting the pairs of disks, substantially as and for the purpose set forth.

2. In a speed-varying mechanism, the combination of a frame, two parallel shafts mounted therein; a pair of cone-shaped driving elements splined to each shaft, the individual members of each pair adapted to slide toward or away from each other upon their respective shafts; levers pivoted between the shafts and connected with the driving elements so as to simultaneously slide the approaching disks at a gradually-decreasing speed and the receding disks at a gradually-increasing speed; a belt connecting a pair of driving elements, and means for actuating the levers, substantially as and for the purpose set forth.

3. In a speed-varying mechanism, the combination of a frame, two parallel shafts mounted therein; a pair of cone-shaped driving elements splined to each shaft, individual members of each pair adapted to slide toward or from each other upon their respective shafts; means for simultaneously sliding the approaching pair of driving elements at a gradually-decreasing speed and the receding elements at a gradually-increasing speed and arranged so as to slide the receding pair slower than the approaching pair through a part of their movement and slide the receding pair faster than the approaching pair through the remainder of their movement, and a belt connecting the disks, substantially as and for the purpose set forth.

4. In a speed-varying mechanism, the combination of a frame; two parallel shafts mounted therein; a pair of cone-shaped driving elements splined to each shaft; a belt connecting the pairs; levers pivoted between the shafts and connecting thrust collars, taking against the corresponding elements of each pair; said lever-pivots

being out of line, with the points of contact of the lever upon the thrust-collars, in the direction of the driving elements; substantially as and for the purpose set forth.

5. In a speed-varying mechanism, the combination of a frame; two parallel shafts mounted therein; a pair of cone-shaped driving elements splined to each shaft; a belt connecting the pairs; thrust-collars mounted on the shafts, taking against the driving elements and provided with diametrically-projecting lugs; levers provided with slotted openings taking over said lugs and having an inwardly-projecting toat or boss between the shafts adapted to pivot upon the frame; substantially as and for the purpose set forth.

6. In a speed-varying mechanism, the combination of a frame; two parallel shafts mounted therein; a pair of cone-shaped driving elements splined to each shaft; a belt connecting the pairs; thrust-collars mounted on the shafts, taking against the driving elements and provided with diametrically-projecting lugs; shoulders upon said thrust-collars and adjacent said lugs; levers provided with slotted openings taking over said lugs and resting upon said shoulders; caps secured to said lugs and taking over the levers and an inwardly-projecting toat or boss between the shafts, adapted to pivot upon the frame; substantially as and for the purpose set forth.

7. In a machine of the class described, a thrust-collar consisting of a cupped portion provided with diametrically-projecting lugs, a hardened track supported within said cupped portion, a second hardened track adapted to take against a driving element, and balls supported between said tracks and within the cupped portion; substantially as and for the purpose set forth.

8. In a speed-varying mechanism, the combination of two parallel shafts; boxes supporting said shafts; side rails connecting said boxes; bars parallel with the shafts and connecting the side rails; a pair of cone-shaped driving elements mounted on each shaft; levers pivoted between the shaft and adapted to actuate a pair of driving elements; extensions upon said levers; nuts 19, connected with said levers; a right and left hand threaded screw, 20, supporting said nuts, and bars, 21, taking over said levers and against said nuts; substantially as and for the purpose set forth.

608,068. APPARATUS FOR SPINNING TEXTILE FIBERS.

RICHARD TODD, Heaton Chapel, and JESSE A. STOTT, Manchester, England. Filed Nov. 10, 1896. Serial No. 611,649. (No model.) Patented in England Nov. 7, 1895, No. 21,056.

Claim.—1. In combination the spindle to carry the cop, the ferrule arranged about the spindle at a point below the position of the cop, and the whip-traveler attachably and detachably secured to the ferrule below the cop and extending up along the cop with its free end directed upwardly, the attachment between the traveler and the ferrule being rigid while the said whip is flexible and adapted to bend throughout its length.

2. In combination, the ferrule on the whip-traveler arm, said ferrule having an extended bearing or socket adapted to receive the lower end or butt of the arm and afford an extended bearing thereto, said arm-butt being formed as a spring to engage with and be easily disengaged from the extended bearing, substantially as described.

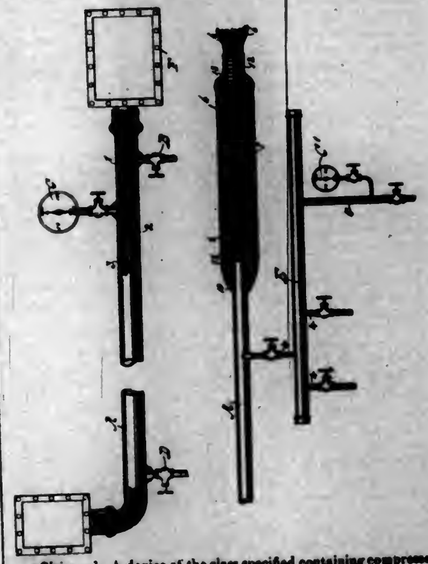
3. In combination with the rotary foot or ferrule with means for supporting the same, the arm extending laterally from said ferrule having a terminal-bearing part at its end, and the flexible arm or traveler arranged to turn about the spindle with said rotary ferrule, said arm being detachably connected with the terminal-bearing part of the said ferrule, substantially as described.

4. In combination, the ferrule having a socket, and the flexible arm or whip-traveler having a spring portion to fit therein, substantially as described.

5. In combination the ferrule having a socket with a lateral cavity, and a flexible arm or traveler having a laterally-extending portion fitting into said cavity, substantially as described.

6. In combination, the ferrule having a socket with a lateral cavity, a flexible arm or whip-traveler having a spring end provided with a laterally-extending portion to fit the cavity, substantially as described.

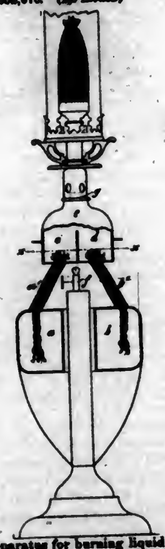
7. In combination, the ferrule having a laterally-extending arm with a terminal bearing, and a flexible arm or whip-traveler having a spring end detachably engaging the same, substantially as described.



8. In combination with the socket-ring and its cover forming a race between them and the ferrule having the fingers adapted to the race and its sides recessed to permit the insertion or removal of the ferrule, substantially as described.

9. In combination, the socket, the cover, the whip-traveler and the ferrule, one of said parts, the cover or the ferrule being laterally recessed to permit the insertion or removal of the ferrule by tilting the same.

10. In combination, the socket-ring, the cover, and the clips J for holding the same in place, substantially as described.



608,069. ELECTRIC CABLE.

NATHANIEL G. WARTH, Indianapolis, Ind. Filed Oct. 25, 1897. Serial No. 656,207. (No model.)

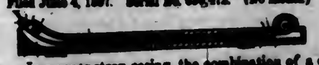
J
J
J

securing the handle in place in said sleeve and brush-head, substantially as described.

608,072. APPARATUS FOR BURNING HYDROCARBON OILS WITH BLUE FLAME. FRITZ ALTHAUS, Berlin, Germany. Filed Sept. 22, 1897. Serial No. 652,670. (No model.)

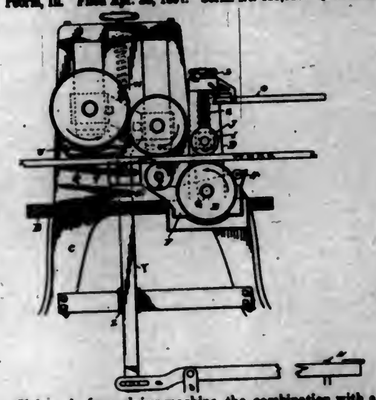
Claim.—1. An apparatus for burning liquid hydrocarbons with a blue flame, the same consisting of two separate chambers, one being an oil-chamber and the other a water-chamber, placed in close proximity and constructed to provide a central space between them, separate retorts connected with said chambers, a mixing-chamber connecting and arranged above said chambers and retorts, and a source of heat arranged below and intermediate of said retort, whereby the retorts are heated so that the vapors and steam produced in the same are commingled in the mixing-chamber and conducted from the same to the burner, substantially as set forth.

2. An apparatus for burning liquid hydrocarbons with a blue flame, the same consisting of two separate chambers, one being an oil-chamber and the other a water-chamber placed in close proximity and constructed to provide a central space between them, separate retorts connected with said chambers, a partition separating the retorts, a mixing-chamber above the upper ends of the retorts, a burner above the mixing-chamber, and a source of heat for heating the retorts, substantially as set forth.



608,073. APPARATUS FOR GENERATING ACETYLENE GAS. ESTEBAN ARMANET, Mexico, Mexico. Filed Aug. 18, 1897. Serial No. 648,634. (No model.) Patented in Mexico Aug. 11, 1897, No. 1,069.

Claim.—1. In an apparatus for generating acetylene gas, a generator composed of an exterior vessel, an interior bell-shaped water-sealed vessel provided with transverse partitions having alternating inclined shelves at opposite sides, a charging-tube extending downwardly from the top of the bell-shaped vessel, a cover for said charging-tube, a screen-bottom between the transverse partitions and below the lower shelf, outlet-pipes at the upper part of the interior vessel and a discharge-pipe at the bottom of the exterior vessel, substantially as set forth.

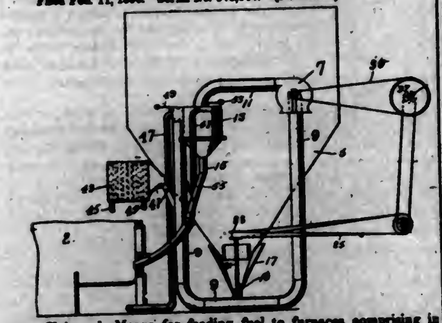


2. In an apparatus for generating acetylene, a generator consisting of an exterior vessel having a dished bottom, an interior bell-shaped and water-sealed vessel provided with a charging-opening in its top part, transverse partitions in said interior vessel, alternating inclined shelves extending from opposite sides of said partitions one below the other, a charging-tube connecting the charging-opening with the upper shelf, a screen at the bottom of the interior vessel between the partitions, openings in said partitions below each shelf and at the upper end of said partition, substantially as set forth.

608,074. RAZOR-STROP CASING. JOHN W. BROWN, Fort Wayne, Ind. Filed June 4, 1897. Serial No. 639,472. (No model.)

Claim.—In a razor-strop casing, the combination of a case having a length suitable to contain the strop; a spring-actuated drum mounted at the bottom of said case; a ribbon wound upon said drum; the said drum and ribbon being adapted to draw the strop within said case; and suitable means for connecting the strop to said ribbon, substantially as shown and described.

608,075. GLUE-SPREADING MACHINE. EDWARD F. COMPTON, Peoria, Ill. Filed Apr. 26, 1897. Serial No. 633,898. (No model.)



Claim.—1. In a gluing-machine, the combination with a series of lower stationary, power-driven rolls, and the frames D and A, of an upper, power-driven yielding pressure-roll journaled in said frame D, springs K K for regulating pressure of same, a lever O pivoted on the said frame for controlling the said roll, the upper spreading and supplying rolls P and R respectively, mounted in the frame A, the springs W W for controlling pressure of said rolls, a foot-power mechanism for raising the rolls from the work without the stopping of the machine, and means for automatically throwing same out of gear when in the raised position substantially as set forth and described.

2. In a gluing-machine, the combination with a table B with its legs C, of a glue-fount supported thereon, a steam-jacket surrounding the same, the supporting-frame D mounted on said table, a lower power-driven gluing-roll journaled on the table, a rolling scraper H in contact with said roll, a yielding adjustable power-driven pressure-roll above said gluing-roll, a hand-lever O pivoted on said frame D for controlling said pressure-roll, a supplying-frame A, a supporting-roll X journaled therein, a power-driven yielding gluing-roll P above said supporting-roll, a power-driven glue-supplying roll having contact with said glue-spreading roll, in fixed relation thereto, a steam-jacketed glue-receptacle located under said roll, a rolling scraper V journaled in said glue-receptacle in contact with the said supplying-roll, a foot-lever mechanism for raising the rolls P and R simultaneously, a catch *c* for holding the lever, springs W for regulating the pressure of the rolls upon the work and means for automatically throwing said rolls out of gear when raised out of position as set forth and described.

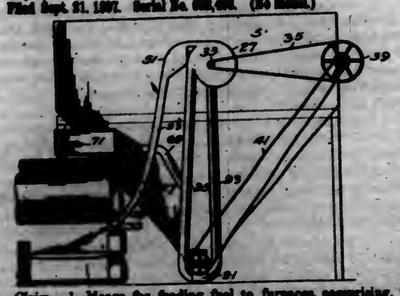
3. In a gluing-machine, the combination with the rolls P and R the vertical arms Y supporting the same, the lever *a* and catch *c*, for controlling the said vertical arms, the frame A a pin or lug *w*, on the said frame of the automatic gear-releasing mechanism consisting of the loose pulley *m* on the shaft of the roll P and having the apertures

s, the collar or sleeve *o* on said shaft, the pins *t* on said sleeve, the fork *r* straddling the said sleeve *o* and pivoted to the roll-bearing, and the spring *y* surrounding the shaft, all substantially as and for the purposes herein set forth and described.

608,076. FUEL-FEEDER. HENRY L. DAY, Minneapolis, Minn. Filed Feb. 11, 1898. Serial No. 670,067. (No model.)

Claim.—1. Means for feeding fuel to furnaces, comprising in combination, means for producing a continuous air-current or air-belt, means for directing the fuel into said air-current, and means for separating the fuel from said air-current and directing it into a suitable furnace.

2. Means for feeding fuel to furnaces, comprising in combination, mechanism for producing an air-belt or continuous air-current, means for feeding the fuel into said current, means for separating the fuel from said current and directing it into a suitable furnace, and means for supplying air to said air-belt to take the place of the air which passes into the furnace with the fuel.



3. Means for feeding fuel to furnaces, comprising in combination, a fan or blower, a separator, pipes connecting said fan and separator, whereby a continuous air-current or air-belt may be produced, means for delivering fine fuel into one of said pipes, to be separated from said air-current by said separator, and means for conducting such fuel from said separator to said furnace.

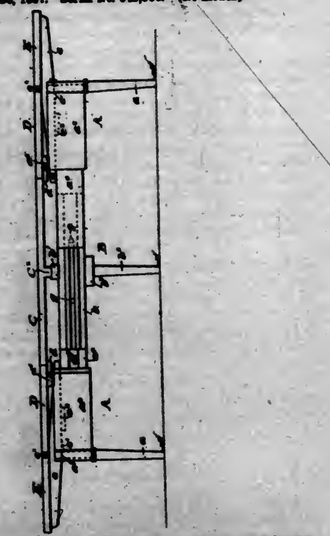
4. The combination, with the fan of the separator, the pipes connecting said fan and said separator, whereby a continuous air-current may be produced, a pipe extending from said separator to the furnace, and means for feeding the fuel into one of the pipes connecting the fan and separator, for the purposes specified.

5. The combination, with the fan and separator, of the pipes connecting said fan and separator, means for supplying air to one of said pipes, a pipe connecting the separator with the furnace, and means for feeding the fuel into one of the pipes between the fan and separator.

6. The combination, with the fan and separator, of pipes connecting said fan and separator, whereby a continuous air-current may be formed, means for feeding the fuel from the separator to the furnace and means for supplying heated air to the pipe between the separator and the fan, to compensate for that which passes through the pipe into the furnace, and means for feeding the fuel into one of the pipes between the fan and the separator.

608,077. FUEL-FEEDER. HENRY L. DAY, Minneapolis, Minn. Filed Sept. 21, 1897. Serial No. 652,499. (No model.)

Claim.—1. Means for feeding fuel to furnaces, comprising, in combination, a suitable fan or blower, air-conductors connected to the inlet and outlet of the casing of said fan or blower and communicating with each other, means for directing fuel into said air-conductors, means located in said fan-casing for separating the fuel from the air-current, and means for directing said fuel into a suitable furnace, for the purpose set forth.



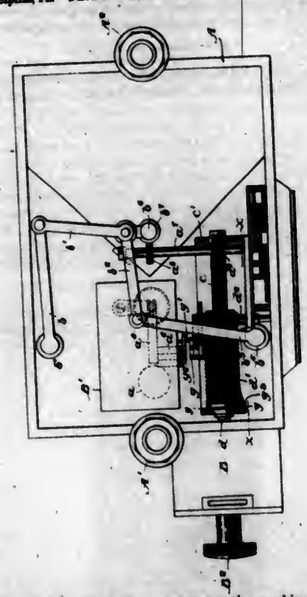
2. Means for feeding fuel to furnaces, comprising, in combination, a suitable fan or blower, a fan-casing provided with a spiral duct leading from its central portion and having an unbroken peripheral surface, a suitable wall dividing said duct into an outer and an inner part, a pipe or conductor connected to the inner part of said duct and communicating with a pipe or conductor leading to the inlet of the fan-casing, means for feeding fuel into said conductors and means for directing the fuel from the outer part of said duct into a suitable furnace.

3. Means for feeding fuel to furnaces, comprising, in combination, a suitable fan or blower, a fan-casing provided with a spiral wall 43 forming a spiral duct 45 having an unbroken peripheral surface divided by the wall 47 into an inner duct 50 and an outer duct 49, an air-conductor 25 connected to the duct 50, an air-conductor 23 with which the conductor 25 communicates, said conductor 23 leading into the inlet of the fan-casing, a pipe 53 connected to the outer duct 49 and arranged to conduct material received therefrom into a suitable furnace, and means for feeding fuel into the conductor 23, for the purpose set forth.

4. Means for feeding fuel to furnaces, comprising, in combination, a suitable fan or blower, a fan-casing provided with a spiral wall 43 forming a spiral duct 45, the transverse wall 47 dividing said duct into inner and outer ducts 50 and 49, the fuel hopper and pocket 21, the air-conductor 25 leading from the duct 50 to said pocket, the air-conductor 23 leading from said pocket to the inlet of the fan-casing, the expansion-chamber 51 with which the duct 49 communicates, and a pipe leading from said expansion chamber to a suitable furnace.

5. Means for feeding fuel to furnaces, comprising, in combination, a suitable fan or blower, a fan-casing provided with a spiral duct leading from its central portion and having an unbroken peripheral surface, a suitable wall dividing the said duct into an outer and inner part, an air-conductor connected to the inner part of said duct and communicating with another conductor that leads to the inlet of the fan-casing, means for feeding fuel into said conductors, an expansion-chamber with which said outer duct communicates, a return-pipe from said expansion-chamber to the inlet of the fan-casing, and a pipe leading from said expansion-chamber into a suitable furnace.

608,078. EXTENSION-TABLE. ADOLPH ECKHEIM, Philadelphia, Pa. Filed Aug. 26, 1897. Serial No. 649,560. (No model.)



Claim.—1. An extension table consisting of an extensible supporting framework, composed of end pedestals, and an intermediate pedestal, said end pedestals having end rails embodying recesses, and being provided with guide bars having slots in their upper faces, and a table top comprising a vertically adjustable central section, two structurally independent intermediate sections, provided with locking blocks, and two structurally independent end sections, provided

with supporting arms, the locking blocks of the intermediate sections being, when the table top is extended to its full length, engaged in the guide bars of the pedestals, and the supporting arms of the end sections being engaged in the recesses of the end rails of the pedestals, substantially as set forth.

2. An extension table consisting of an extensible supporting framework, composed of end pedestals, and an intermediate pedestal, said end pedestals having end rails embodying recesses, and being provided with guide bars having slots in their upper faces, and a table top comprising a vertically adjustable central section, two structurally independent intermediate sections, provided with locking blocks, and two structurally independent end sections, provided with supporting arms, carrying stop blocks, the locking blocks of the intermediate sections being, when the table top is extended to its full length, engaged in the guide bars of the pedestals, and the supporting arms of the end sections being engaged in the recesses of the end rails of the pedestals, substantially as set forth.

3. An extension table consisting of an extensible supporting framework, composed of end pedestals, and an intermediate pedestal, said end pedestals having end rails embodying recesses, and being provided with guide bars having slots in their upper faces, and a table top comprising a vertically adjustable central section, two structurally independent intermediate sections, provided with locking blocks, and two structurally independent end sections, provided with supporting arms, said sections being capable of three arrangements, to wit, an extended position in which they are all placed side by side, an intermediate position in which the end sections are disposed beneath the intermediate sections, and a closed position in which the intermediate sections and end sections are all disposed beneath the central section,—the locking blocks of the intermediate sections being, when the table top is in its extended position, engaged in the guide bars of the pedestals, and when said top is in its intermediate position engaged in recesses in the inner edges of the end sections, the supporting arms of the end sections being engaged in the recesses of the end rails of the pedestals, substantially as set forth.

608,079. PREPAYMENT GAS-METER. EBENEZER P. GRIFFITHS, Philadelphia, Pa. Filed Oct. 13, 1897. Serial No. 655,041. (No model.)

Claim.—1. In a prepayment gas-meter, the combination of the disk *e*, notch e^2 and lip or extension e' thereon adjacent to said notch, mounted on a shaft and connected with mechanism for turning, with the oscillating finger *f*, provided with a concaved bearing-surface f^2 adapted to fit and rest upon the periphery of the disk *e*, and a finger or extension f'' located at one end of said concaved portion, and adapted to enter the notch e^2 in the disk *e* to instantly close the valve a^2 to which it is suitably connected, as set forth.

2. In a prepayment gas-meter, the combination of the disk *e*, having a suitable notch e^2 therein, and mounted on a suitable shaft and connected with mechanism for turning; with the oscillating finger *f* having a bearing-surface f^2 and a lip or extension f'' at one end of the said bearing-surface, said finger being secured upon a shaft and connected with means for imparting movement to the valve-operating mechanism, the disk *e* sliding in the bearing-surface f^2 to hold the valve positively open and the lip f'' entering the notch e^2 to instantly close the said valve, as set forth.

3. In a prepayment gas-meter, the disk *e*, shaft d^3, spur-wheel d^2, cylindrical rack d'', having on the end thereof the stop g^4, in combination with the oscillating finger *f*, having thereon the extending lip f'', support g^3, having thereon the projection g^4, against which the pin or projection g^3, will impinge, and the shaft f^3, connected with mechanism for opening and closing the valve a^2, substantially as shown and described.

4. In a prepayment gas-meter the combination of the disk *e*, having thereon the extending lip e', mounted on a shaft and connected with mechanism for turning the same, with the oscillating finger *f*, having thereon the lip or extension f'', the shaft f^3, suitably supported and having on one end thereof the crank *g*, and arm g', fitting into the forked arm or lever g^3, the shaft a^3, forked lever a^4, and valve a^2, having the extending valve-stem a^5, fitting into the arm a^4, and provided with the stop 11, substantially as shown and described.

5. In a prepayment gas-meter the disk *e* mounted on a shaft and having in the periphery thereof a notch e^2, an extended lip or projection e' to one side thereof and connected with suitable mechanism for turning, in combination with the oscillating finger *f*, mounted on a shaft and having the two ends thereof in contact with and resting upon the periphery of the disk *e* and lying upon opposite sides of a line joining the centers of said shafts, said finger being mounted on a shaft and connected with means for imparting movement to the valve-operating mechanism, as set forth.

6. In a prepayment gas-meter the combination of the disk *e*, mounted on a shaft and connected with suitable mechanism for turning, with the oscillating finger *f* mounted on a shaft and having the two ends thereof in contact with and resting upon the periphery of the disk *e* and lying upon opposite sides of a line joining the centers of said shafts, said finger being mounted on a shaft and connected with means for imparting movement to the valve-operating mechanism, as set forth.

608,080. MACHINE FOR MAKING LOOM-HEDDLES. GEORGE W. HARRIS and WILLIAM B. HARRIS, Lowell, Mass. Filed Apr. 27, 1895. Serial No. 547,357. (No model.)

Claim.—1. In a machine for making loom-heddles, the combination with means for holding the rig-bands, of knot forming and tightening devices arranged and operated to form the heddle-knots about and tighten the same directly upon the rig-bands, substantially as described.

2. In a machine for making loom-heddles, the combination with rig-band-holding devices between which the rig-bands are tightly held, and means for moving the said holding devices in unison, whereby the bands are held always under substantially the same tension, of knot forming and tightening devices arranged and operated to form the heddle-knots about and tighten the same directly upon the said rig-bands, substantially as described.

3. In a machine for making loom-heddles, the combination with means for holding the rig-bands, and the points about which and said bands the heddle-knots are formed, of the knot forming and tightening devices arranged and operated to form the knots about said points and bands, and thereafter slip said formed knots onto and tighten the same directly upon said bands above said points, substantially as described.

4. In a machine for making loom-heddles the combination with means for holding the rig-bands, and the points about which and said bands the knots are formed, of the knot-tying devices, and the nippers arranged on a level with or slightly above the tops of said points, whereby tightening of the knots causes the latter to be slid up from the points upon and to be tightened directly on the said bands, substantially as described.

5. In a machine for making loom-heddles, the combination with means for holding the rig-bands and tokening-thread mechanism for arranging a tokening-thread adjacent to a rig-band, of mechanism for tying the heddles around the rig-band and the tokening-thread.

6. In a machine for making loom-heddles, the combination with means for holding the rig-bands and tokening-thread mechanism for arranging a tokening-thread adjacent to a rig-band as desired, of mechanism for tying some of the heddles around the rig-band and tokening-thread, and other of the heddles around the rig-band alone.

7. In a machine for making loom-heddles, the combination with suitable means for holding the rig-bands, knot-forming points, and depressors, of the swans, their carriers, pins connecting the same, and means independent of said depressors to successively depress said pins to clear said depressors, substantially as described.

8. In a machine for making loom-heddles, the combination with suitable means for holding the rig-bands, knot-forming points, and depressors, of the swans, their carriers, pins connecting the same, and means independent of said depressors to successively depress said pins to clear said depressors and thereafter raise said pins, substantially as described.

9. In a machine for making loom-heddles, the combination with suitable means for holding the rig-bands, the knot-forming points, and depressors, of the swans, their carriers, pins connecting the same, and cams to depress and raise the said pins to clear said depressors, substantially as described.

10. In a machine for making loom-heddles, the combination with the rig-band posts, and the end and center depressors, of an eye-former having an enlarged portion, and means to force the heddle-eye upon said enlarged portion to thereby expand said eye and tighten the eye-knots, substantially as described.

11. In a machine for making loom-heddles, the combination with the rig-band posts, and the end and center depressors, of a stationary eye-former having an enlarged portion, and means to force the heddle-eye upon said enlarged portion, and thereby expand said eye and tighten the eye knots, substantially as described.

12. In a machine for making loom-heddles, the combination with the rig-band posts, and the end and center depressors, of an eye-former having an enlarged portion, and a lifter to raise the heddle-eye upon said enlarged portion to thereby expand the eye and tighten the eye-knot, substantially as described.

13. In a machine of the class described, the combination with an eye-former having an enlarged portion, of knot-tying devices to form an eye about a reduced portion of the said former and partially tighten the eye-knots, and means to subsequently force the said eye upon the enlarged portion of said former to expand the said eye and further tighten the knots, substantially as described.

14. In a machine for making loom-heddles, the combination with the rig-band posts, and the end and center depressors, of an eye-former having a reduced middle portion about which the eye is formed, and means to force the eye first upon the enlarged portion at one side said reduced portion and subsequently upon the enlarged portion at the opposite side thereof, substantially as described.

15. In a machine for making loom-heddles, the combination with the rig-band posts, knot-forming points, and depressors, of means to expand the completed eye to tighten the eye-knots for the purpose described.

16. In a machine for making loom-heddles, the combination with the rig-band posts, knot-forming points, and depressors, of the swans, their carriers, and movable switches for both the swans and their carriers, and means to positively shift the said switches, substantially as described.

17. In a machine for making loom-heddles, the combination with the rig-band posts, knot-forming points, and depressors, of the swans, their carriers, movable switches for both the swans and their carriers, and means to move some of the said switches, the remainder to be automatically moved by the swans and their carriers, substantially as described.

18. In a machine for making loom-heddles, the combination with the rig-band posts, the knot-forming points, and depressors, of the swans, their carriers, connecting-pins therefor, and movable switches having cam-surfaces to cause positive movement of said pins, substantially as described.

19. In a machine for making loom-heddles, the combination with the rig-band posts, the knot-forming points, and depressors, of the swans, their carriers, connecting-pins therefor, the movable switch-segments and racks to shift the same, substantially as described.

20. In a machine for making loom-heddles, the combination with the rig-band posts, knot-forming points, and depressors, of the swan-carriers, switches therefor, and pointed swans having concaved sides to provide at least three bearing-points to hold the swans in position, substantially as described.

21. In a machine for making loom-heddles, the combination with suitable means for holding the rig-bands, and the depressors, of the swans, their carriers, devices connecting the said swans and their carriers, and cams for raising the said devices after passing said depressors, substantially as described.

22. In a machine for making loom-heddles, the combination with the swans, and carriers therefor, of the swan-carrying spools or bobbins, and the string-delivering guides in front and to deliver the string in advance of the said spools or bobbins, substantially as described.

23. In a machine for making loom-heddles, the combination with the rig-band posts, knot-forming points, and depressors, of the swans, and carriers therefor, connecting-pins, the string-carrying spools located back of the swan-centers, and string-delivering guides arranged forward of the same and in advance of said spools, substantially as described.

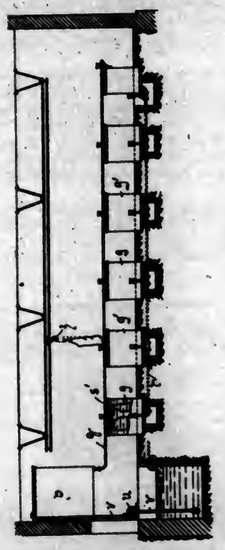
24. In a machine for making loom-heddles, the combination with suitable means for holding the rig-bands, and the depressors, of the swans, their carriers, devices connecting the said swans and carriers, cams to raise the said devices after clearing said depressors, and a supporting-plate to act upon and positively hold the said devices in their elevated positions connecting the swans and their carriers during movements of the same between the depressors, substantially as described.

25. In a machine for making loom-heddles, the combination with suitable means for holding the rig-bands, and the depressors, of the swans, their carriers, devices connecting the same, springs to depress said devices, and means independent of said depressors and springs to raise the same after clearing the said depressors, substantially as described.

608,081. CAKE-MACHINE. PEMBROKE D. HARTON, Philadelphia, Pa. Filed Dec. 5, 1896. Serial No. 614,541. (No model.)

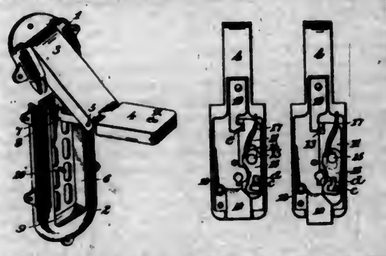
Claim.—1. In a machine for making layer-cakes or crackers, a chamber having an elongated, narrow bottom discharge-opening, a discharge-nozzle dividing the chamber and discharging centrally into said opening, an inlet into one side of the top of the chamber, said nozzle formed with transverse passages therethrough, substantially as and for the purpose described.

2. In a layer-cake or cracker machine, the combination of a chamber inclosing the discharge-opening of the hopper, said chamber having an elongated central bottom discharge-opening, a nozzle depending through and dividing said chamber with its discharge end within and dividing said opening and forming therewith three parallel discharge-slits, said chamber having an inlet on one side of said nozzle, the nozzle having a plurality of transverse passages for the passage of the material in the chamber to the opposite side of the nozzle, all substantially as and for the purposes set forth.



3. In a sheet-forming device for layer-cake machines, the combination of a chamber inclosing the discharge opening of the hopper, said chamber having a series of openings in its top communicating with one discharge-passage from said hopper, and a separate inlet communicating with a separate discharge from the same, separated nozzles from said series of openings merging into a single nozzle a distance below the same and depending through the chamber so that the openings one side of the chamber to the other, are formed between the nozzle, said nozzle having a bottom discharge between and opening into and dividing a bottom discharge-opening from the chamber from both sides of the nozzle, all substantially as and for the purposes set forth.

4. In a sheet-forming device for cake-machines, the combination of a chamber inclosing the discharge-opening of the hopper, said chamber having a bottom wall with a tapering opening across an intermediate portion thereof, and a top wall having an inlet-opening on one side and another inlet adjacent thereto, a nozzle from said last-mentioned inlet depending from the wall and dividing the chamber into two compartments and having its lower discharge end centrally arranged in the said tapered opening and dividing the same into two passages from said compartment, respectively, said nozzle formed to permit the material discharged into one compartment being forced laterally into the other compartment, all substantially as and for the purposes described.



608,082. APPARATUS FOR PICKLING MEATS. GUSTAV HEINE, Cassel, and HERMANN VON ROH, Stuttgart, Germany. Filed June 28, 1895. Serial No. 554,221. (No model.)

Claim.—In a plant for pickling meat, the combination of a main pickle-tank, a series of vats, a distributing-pipe leading from the main tank to the vats, return-pipes leading from the vats to the main tank, a pump for establishing circulation from the vats to the tank and back to the vats, an overhead track, and means substantially as described for immersing and withdrawing the meat and for suspending

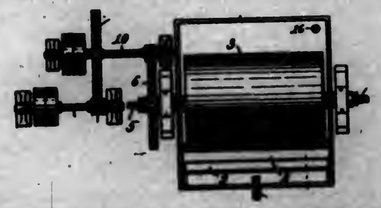
and moving it on the track, substantially as and for the purpose set forth.

603,083. TRUNK-FASTENING. ROSE A. HENRY, Portland, Me., administratrix of William John Henry, deceased. Filed Oct. 28, 1897. Serial No. 656,647. (No model.)

Claim.—1. A lock for trunks consisting of a swinging tongue attached to the lid, having on the under side thereof a lock consisting of a lock-bolt and shank and actuating-spring, tumblers and means for automatically locking them when the bolt is shot, a notch in said shank and a spring with projection suited to enter said notch when the bolt is withdrawn and a plate on said trunk having a pin suited to engage said last-named spring, substantially as described.

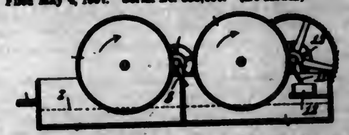
2. In combination with a trunk and lid, a plate attached to said lid having hinged thereon a tongue consisting of two parts hinged together, said tongue being provided with an arm capable of being inclosed in the upper part of said tongue and provided with a hook, a plate attached to the trunk having a hook adapted to receive the hook upon said tongue and a stud adapted to engage the spring controlling the lock-bolt of the lock in the lower part of said tongue, together with a locking device consisting of a spring and lock-bolt, whereby said lid is brought into position and said trunk locked automatically, substantially as described.

3. A fastening for trunks consisting of a swinging tongue attached to the lid having a lock provided with a bolt and an actuating-spring, means for locking the bolt when shot, means for holding the lock-bolt when withdrawn and a plate on said trunk having an aperture to receive said bolt and a pin or other means suitable to engage and release said means for holding the bolt when withdrawn, substantially as described.



4. In combination with a trunk and lid the plate 1, the plate 2 with slot 6, the tongue consisting of the parts 3 and 4, the projection 8 on the part 4, the hook 7 and stud 20 in the plate 2, the latter being adapted to engage the spring 19 and the spring 19 provided with means for receiving and holding the lock-bolt 10, substantially as described.

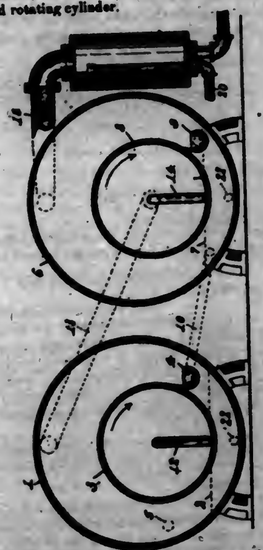
608,084. TONGS. VERNON G. HOUGH, Waddington, O.L. Filed Feb. 20, 1897. Serial No. 624,202. (No model.)



Claim.—A pair of tongs comprising a jaw having a slot extending longitudinally thereof, a screw seated in the rear wall of said slot and entering the slot, a gripping-surface upon the jaw extending at an angle to the portion provided with the slot, a second jaw lying across the slot of the first jaw and having a gripping-surface substantially parallel with the gripping-surface of the first jaw, a pivot-pin upon the second jaw passing through the slot of the first jaw, the before-mentioned screw being adapted to engage said pivot-pin, and handles extending from both jaws upon opposite sides of and substantially parallel with the screw; substantially as described.

608,085. MACHINE FOR THICKENING LIQUIDS. OMAR T. JOSLIN, New York, N. Y., and HERMAN B. SCHMIDT, Cincinnati, Ohio, assignors of one-half to the Black & Clawson Company, Hamilton, Ohio. Filed May 4, 1897. Serial No. 635,093. (No model.)

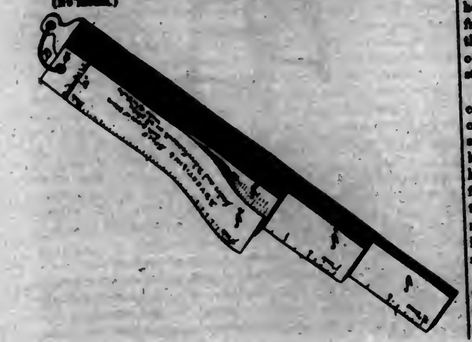
Claim.—In a machine for thickening liquids, the combination, substantially as set forth, of a vat to hold the liquid before, during, and after thickening, a hollow metallic cylinder mounted for rotation in said vat with its lower portion dipping into the liquid therein, inlet and outlet pipes for passing a thermic agent through said cylinder, a doctor in contact with the surface of said cylinder and disposed above the liquid in the vat and arranged to discharge its scrapings back into the liquid in the vat whereby the cylinder mixes said scrapings with said liquid and continues to act on the mixed mass, a driving mechanism arranged to turn said cylinder, and a second driving mechanism arranged to similarly turn said cylinder but at a lower rate of speed than said first-mentioned driving mechanism, whereby portions of the thin liquid are thickened into a film, the filmed matter returned to the thin liquid to form a somewhat thickened mixture in the vat, the somewhat thickened mixture still further thickened by returning to it portions withdrawn from it and thickened by filming, and finally thickened by filming at relative low rate of procedure to produce a film of excessive depth.



608,086. MACHINE FOR THICKENING LIQUIDS. OMAR T. JOSLIN, New York, N. Y., and HERMAN B. SCHMIDT, Cincinnati, Ohio, assignors of one-half to the Black & Clawson Company, Hamilton, Ohio. Filed May 4, 1897. Serial No. 635,096. (No model.)

Claim.—In a machine for thickening liquids, the combination, substantially as set forth, of a vat adapted to receive the liquid to be dealt with, a hollow metallic cylinder mounted for rotation in said vat with its lower portion dipping into the liquid therein, a second cylinder mounted to turn in said second vat at a lower speed than the first cylinder, a doctor engaging the first cylinder and arranged to scrape the coating therefrom and deliver it to the second vat, and a doctor engaging the second cylinder and arranged to deliver its scrapings to a suitable receiver.

608,087. MACHINE FOR THICKENING LIQUIDS. OMAR T. JOSLIN, New York, N. Y., and HERMAN B. SCHMIDT, Cincinnati, Ohio, assignors of one-half to the Black & Clawson Company, Hamilton, Ohio. Filed May 20, 1897. Serial No. 636,691. (No model.)



Claim.—1. In a machine for thickening liquids, the combination, substantially as set forth, of a vat adapted to receive the liquid to be dealt with, a hollow metallic cylinder mounted for rotation in said vat with the lower portion of its periphery dipping into the liquid in the vat, means for charging the interior of said rotating cylinder with a heating agent, a doctor engaging said rotating cylinder as it approaches the liquid in the vat and adapted to scrape the coating from the cylinder, and means for producing a partial vacuum in said vat over said rotating cylinder.

2. In a machine for thickening liquids, the combination, substantially as set forth, of a vat adapted to contain the liquid to be dealt with, a hollow metallic cylinder mounted for rotation within said vat and dipping the lower portion of its periphery into the liquid therein, means for charging the interior of said rotating cylinder with a heat-transferring agent, and a trough-shaped doctor engaging said cylinder as it approaches the liquid in the vat and having a discharge connection to the exterior of said vat.

3. In a machine for thickening liquids, the combination, substantially as set forth, of a vat adapted to receive the liquid to be dealt with, a hollow metallic cylinder mounted for rotation in said vat with the lower portion of its periphery dipping into the liquid therein, a doctor disposed within said vat and arranged to scrape said cylinder and discharge the scrapings exterior to said vat, means for producing a partial vacuum in said vat over said cylinder, a second vat, a cylinder therein, a doctor in the second vat, a conduit from the first-mentioned doctor to the second vat, and a conduit from the first vat to the second-mentioned cylinder.

608,088. TRANSFERRING STRIP AND SCALE. WILLIAM D. KENDALL, Milwaukee, Wis. Filed Nov. 25, 1896. Serial No. 613,269. (No model.)

Claim.—1. As an article of manufacture, a measuring and mark-transferring device, consisting of a plurality of strips of paper, or analogous material, arranged in sets, the strips of the different sets being of unequal length, but the strips of each set being of the same length and arranged together, and all of said several sets of strips blocked or fastened together at one end, and each strip throughout the series having a detaching-line or perforations across the blocked portion, said detaching-line or perforations being at the same point of each strip, to adapt each strip to be detached at the same point, and each strip also having a scale of measurements along one edge.

2. As an improved article of manufacture, a measuring and mark-transferring device, consisting of a plurality of strips of paper, or analogous material, arranged in sets, the strips of the different sets being of unequal length, but the strips of each set being of the same length and arranged together, and all of said several sets of strips blocked or fastened together at one end, and provided at said end with a suitable suspending device, and each strip throughout the series having a detaching-line or perforations across the blocked portion, said detaching-line or perforations being at the same point of each strip to adapt each strip to be detached at the same point, and each strip having a scale of measurements along one edge, and having the other edge of the scale-face of the strip and the longitudinal edges of the opposite face of the strip free from printing or other markings.

608,089. BOILER AND FURNACE. JOSEPH J. DE KINDER and ALBERT C. WOOD, Philadelphia, Pa. Filed Dec. 27, 1897. Serial No. 663,863. (No model.)

Claim.—1. In the combination of a boiler and furnace, a drum, a water-column leading downward from said drum, two or more superposed oppositely-inclined banks of ascending tubes having communication with said water-column and leading by constantly-ascending passages to said drum, and means for directing the gaseous products of combustion along the course of said banks of tubes and in a constantly-ascending direction, substantially as specified.

2. In the combination of a boiler and furnace, a drum, one or more water-columns leading downward from said drum, a water-leg or header, water-passages connecting said water column or columns and header, a second header and a bank of ascending tubes leading thereto from said first header, a third header and a bank of constantly-ascending tubes leading thereto from said second header, ascending water-passages connecting said third header and drum, and means for directing the gaseous products of combustion along the said ascending water-courses and in a constantly-ascending direction, substantially as specified.

3. In the combination of a boiler and furnace, a drum, water-columns leading downward from said drum, a horizontal water-box connecting said water-columns, a water-leg or header and water-passages leading thereto from said water box and columns, a second header and a bank of ascending tubes leading thereto from said first header, a third header and a bank of ascending tubes leading thereto from said second header, ascending water-passages connecting said third header and drum, and means for directing the gaseous products of combustion along the said ascending water-courses and in a constantly-ascending direction, substantially as specified.

4. In the combination of a boiler and furnace, a drum, water-columns leading downward from said drum, a horizontal water-box connecting said water-columns, a water-leg or header and water-passages leading thereto from said water box and columns, a second header and a bank of ascending tubes leading thereto from said first header, a third header and a bank of ascending tubes leading thereto from said second header, ascending water-passages connecting said third header and drum, water-columns leading upward to and communicating with said drum, and horizontal side-wall tubes connecting said downward water-columns with said upward water-columns, substantially as specified.

5. In the combination of a boiler and furnace, a drum, water-columns leading downward from said drum, a horizontal water-box connecting said water-columns, a water-leg or header, a grate comprising water-tubes leading from said water-box to said header, a

second header and a bank of ascending tubes leading thereto from said first header, a third header and a bank of ascending tubes leading thereto from said second header, ascending water-passages leading from said third header to said drum, and means for directing the gaseous products of combustion along the said ascending water-courses and in a constantly-ascending direction, substantially as specified.

6. In the combination of a boiler and furnace, a drum, water-columns leading downward from said drum, a horizontal water-box connecting said water-columns, a water-leg or header, a grate comprising water-tubes leading from said water-box to said header, a second header and a bank of ascending tubes leading thereto from said first header, a third header and a bank of ascending tubes leading thereto from said second header, water-columns leading upward to and communicating with said drum, and horizontal side-wall tubes connecting said downward water-columns with said upward water-columns, substantially as specified.

7. In the combination of a boiler and furnace, a drum, water-columns leading downward from said drum, a horizontal water-box connecting said water-columns, a water-tube grate, a water-leg communicating with said water-tube grate and forming a bridge-wall therefor, water-passages connecting said horizontal water-box with said water-tube grate and water-leg, a header connected with said water-tube grate, and ascending water-passages leading from said header to said drum, substantially as specified.

8. In the combination of a boiler and furnace, a drum, a water-tube grate and water-passages leading thereto from said drum, a water-leg communicating with said water-tube grate and forming a bridge-wall therefor, a header connected with said water-leg and one or more banks of ascending tubes leading therefrom to said drum.

9. In the combination of a boiler and furnace, a drum, an upper water-tube grate and water-passages leading thereto from said drum, a lower grate comprising water-tubes, water-passages leading to said lower water-tube grate from said drum, a header connected with said water-tube grates, and one or more banks of ascending tubes leading therefrom to said drum.

10. In the combination of a boiler and furnace, a drum, a water-tube grate, water-passages leading to said water-tube grate from said drum and water-passages leading therefrom to said drum, a bridge-wall for said grate, a lower grate comprising water-tubes, a water-leg communicating with said lower water-tube grate and forming a bridge-wall therefor, water-passages leading to said lower water-tube grate from said drum, and water-passages leading from said water-leg to said drum, substantially as specified.

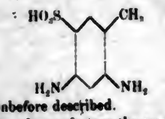
11. In the combination of a boiler and furnace, a drum, water-columns leading therefrom, a water-box connecting said water-columns, a grate, a water-leg forming a bridge-wall for said grate, water-passages leading from said water-columns and water-box to said water-leg, a header and water-tubes leading to said header from said water-leg, a second header and a bank of tubes leading thereto from said first header, a third header and a bank of tubes leading thereto from said second header, and water-passages leading from said third header to said drum, substantially as specified.

12. In the combination of a boiler and furnace, a drum, one or more passages leading downward from said drum, a header communicating with said water passage or passages, a bank of ascending tubes having their lower ends connected with said header, a second header connected with the upper ends of said bank of tubes, a second bank of ascending tubes having their lower ends connected with said second header, a third header connected with the upper ends of said second bank of ascending tubes and located above said first header, passages connecting said third header with said steam-drum, means for directing the products of combustion into active contact with said tubes and headers, and an escape therefor located between the vertical planes of said second and third headers.

13. In the combination of a boiler and furnace, a header, a bank of ascending tubes having their lower ends connected with said header, a second header connected with the upper ends of said bank of ascending tubes, a second bank of ascending tubes having their lower ends connected with said second header, a third header located above said first header and connected with the upper ends of said second bank of ascending tubes, a passage between said first and third headers, means of directing the gaseous products of combustion into active contact with said tubes and headers, and an escape therefor located between the vertical planes of said second and third headers, as specified.

603,090. BROWN TRISAZO DYE. KARL KEHRMANN and EDUARD MARTI, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, New York, N. Y. Filed Nov. 23, 1897. Serial No. 659,583. (Specimens.) Patented in Germany Sept. 15, 1891, No. 65,362; in England Dec. 28, 1891, No. 22,641; in France Apr. 28, 1892, No. 221,233; in Italy June 30, 1892, XXVI, 32,191, LXIII, 186, and in Austria-Hungary Oct. 3, 1892, No. 1,943 and No. 16,870.

Claim.—1. The process for producing new trisazo dyestuffs by combining one molecule of the diazo derivative of a tetrazo body of the general formula



Parsdiamin (tetrazotized) { Orthooxycarbonic acid / Clève's naphthylaminsulfo-acid

with one molecule of a metadiamin of the benzene series such as metaphenylenediamin, metatolylenediamin or a sulfo-acid thereof substantially as hereinbefore described.

2. The process for producing a new trisazo dyestuff by combining the diazo derivative of the tetrazo body having the formula

Benzidin (tetrazotized) { Salicylic acid / Clève's naphthylaminsulfo-acid

with one molecule of the metatolylenediaminmonosulfo-acid having the formula

substantially as hereinbefore described.

3. As new articles of manufacture the new trisazo dyestuffs obtainable from the diazo derivative of the tetrazo body of the general formula:

Paradiamin (tetrazotized) { Orthooxycarbonic acid / Clève's naphthylaminsulfo-acid

by combination with a metadiamin compound of the benzene series, such as metaphenylenediamin, metatolylenediamin and sulfo acids thereof, being dark powders soluble in water with a color varying from reddish brown to dark brown, dyeing cotton from reddish-brown to dark-brown shades which when treated with solutions of chromium and copper salts become more yellowish brown and faster to washing and against the action of light.

4. As a new article of manufacture the specific dyestuff obtainable from the diazo derivative of the tetrazo body having the formula:

Benzidin (tetrazotized) { Salicylic acid / Clève's naphthylaminsulfo-acid

by combination with one molecule of metatolylenediaminmonosulfo-acid, being an alkaline salt of an acid having the formula:

Benzidin (tetrazotized) { Salicylic acid / Clève's naphthylaminsulfo-acid (diazotized) — metatolylenediaminsulfo-acid

representing in the form of the sodium salt a dark-brown powder soluble in water with a reddish-brown color being dissolved by concentrated sulfuric acid with a blue color from which solution a reddish-brown precipitate is obtained on the addition of a sufficient quantity of ice, dyeing cotton reddish-brown shades which when treated with solutions of chromium and copper salts become more yellowish brown and faster to washing and against the action of the light.

603,091. CHURN. ANDREW M. LARUE and FRANKLIN J. PLOUGH, Bellowsville, Pa. Filed Sept. 20, 1897. Serial No. 652,232. (No model.)

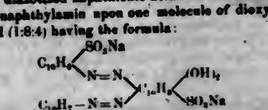
Claim.—1. An improved churn, including a base or track, a rocker-frame adapted to oscillate thereon, said frame consisting of rockers E, each having depending arms F, the corresponding arms of the rockers being connected by rods G, whereby a transversely-rigid frame is formed with unobstructed space between the rockers proper, and a churn-body removably seated between and sustained by the rockers, substantially as shown and described.

2. An improved churn, including a base or track portion, separated rockers adapted to oscillate on the base, a churn-body between the rockers, and brackets I on the outer sides of the body near the top adapted to embrace the upper edges of the rockers and removably support the churn-body therebetween, substantially as shown and described.

603,092. SIGN. CHARLES E. STARR, Jr., Camden, N. J., assignor to Walter E. Harrington, same place. Filed June 5, 1897. Serial No. 639,549. (No model.)

Claim.—In a car-sign the combination of two panels longitudinally joined together in planes forming an obtuse angle approximating one hundred degrees, whereby when one sign is in display position the other is lifted from all interference therewith, means for pivotally supporting said panels and means for securing same in the required position, substantially as described.

603,093. BLACK DISAZO WOOL-DYE. GEORG STEINKE and FRIEDRICH BONHOFF, Höchst-on-the-Main, Germany, assignors to the Farbwerke, vormals Meister, Lucius & Brüning, same place. Filed July 22, 1899. Serial No. 451,222. (Specimens.) Patented in Germany Nov. 6, 1891, No. 73,170, and May 16, 1893, No. 79,644.



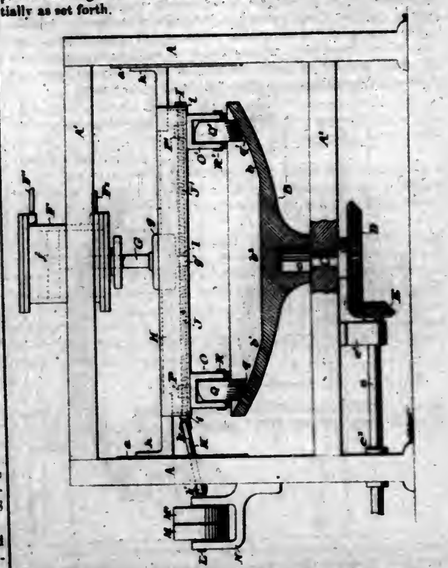
Claim.—1. The process herein described of producing black disazo dyestuffs for wool of the general constitution:

Dioxynaphthalene-sulfonic acid S { Diazotized naphthylaminsulfonic acid / Diazotized amin of the benzene or naphthalene series,

by the action of one molecule of a diazotized naphthylaminsulfonic acid and one molecule of a diazotized amin of the benzene or naphthalene series upon one molecule of dioxynaphthalenemonosulfonic acid S of the United States Patent No. 444,679, substantially as described.

2. As new products, the black disazo dyestuffs for wool, obtained by the action of one molecule of a diazotized alpha-naphthylaminsulfonic acid and one molecule of a diazotized amin upon one molecule of dioxynaphthalenesulfonic acid S of the United States Patent No. 444,679, being dark powders of bronze-like luster, soluble in water with a violet color, insoluble in benzene, soluble in concentrated sulfuric acid, and dyeing wool black in an acid-bath, substantially as set forth.

3. As a new product, the dyestuff obtained by the action of one molecule of diazotized naphthionic acid and one molecule of diazotized alpha-naphthylamin upon one molecule of dioxynaphthalenesulfonic acid (1:8:4) having the formula:



and forming a dark powder of bronze-like luster, easily soluble in water with a violet color, soluble with difficulty in alcohol with a reddish-blue color and insoluble in benzene, the aqueous solution of which turns redder on addition of ammonia, while in concentrated sulfuric acid the dyestuff is soluble with a pure-blue color and is separated on addition of water as a reddish-violet precipitate, and dyes wool blue-black in an acid-bath, substantially as set forth.

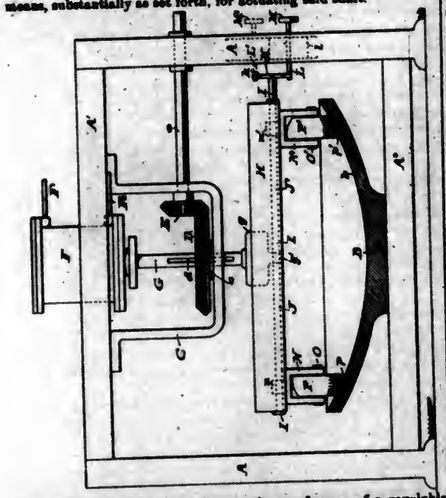
603,094. MACHINE FOR DISHING METAL. JOHN S. WORTH, Coatesville, Pa. Filed Oct. 19, 1897. Serial No. 655,697. (No model.)

Claim.—1. The combination, with a rotatable former provided with actuating mechanism, of a bodily-movable presser-beam arranged with relation to the former, substantially as set forth; actuating mechanism connected with said presser-beam, whereby the same may be shifted toward or from the former; a shaft mounted in said presser-beam and provided at different portions with oppositely-inclined screw-threads; actuating mechanism for said shaft; a pair of bodily-movable roller-carriers mounted on said beam to slide longitudinally thereon and directly engaging respectively with the threaded portions of said shaft; and forming-rollers mounted in said carriers, whereby, during the travel of said roller-carriers longitudinally upon said presser-beam, said rollers are directly thrust against the metal by the movement of the presser-beam with relation to the former, substantially as set forth.

2. The combination, with a rotatable former provided with actuating mechanism; of a bodily-movable presser-beam arranged with relation to the former substantially as set forth; vertical guides for said presser-beam; actuating mechanism for said presser-beam adapted to move the same in the direction of the axis of rotation of the former; a rotatable shaft mounted in said presser-beam, said shaft having portions threaded in opposite directions; a toggle-coupling connected with said shaft; a rotating driving-shaft connected with said toggle-coupling; a pair of traveling roller-carriers engaging operatively with the respective threaded portions of said shaft; and a pair of forming-rollers mounted in said carriers respectively, substantially as set forth.

3. The combination, with a rotatable former provided with actuating mechanism, of a bodily-movable presser-beam arranged with relation to the former, substantially as set forth; actuating mechanism connected with said presser-beam; an elongated open frame carried by said presser-beam and pivotally mounted at or near its longitudinal center upon an axis transverse to said presser-beam; and an elongated forming-roller rotatably mounted in said frame upon an axis transverse to the aforesaid pivotal axis of the frame, whereby, during the movement of the presser-beam with relation to the former, said roller may freely adapt itself to the desired configuration of the metal while positively dishing the same, substantially as set forth.

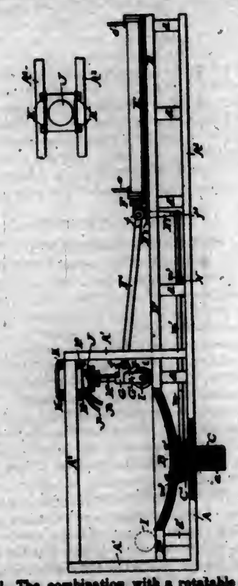
4. The combination, with a rotatable frame provided with actuating mechanism, of a bodily-movable presser-beam arranged with relation to the former, substantially as set forth; actuating mechanism connected with said presser-beam; a rotatable shaft mounted longitudinally in said presser-beam, said shaft having portions threaded in opposite directions; a pair of traveling roller-carriers freely movable longitudinally upon said beam and directly engaging respectively with the threaded portions of said shaft; a pair of swiveling frames pivotally mounted at or near their longitudinal centers upon said carriers and freely movable with relation thereto; and a pair of elongated forming-rollers rotatably mounted in said frames upon an axis transverse to the aforesaid pivotal axis of the frame, substantially as set forth.



603,095. MACHINE FOR DISHING METAL. JOHN S. WORTH, Coatesville, Pa. Filed Oct. 20, 1897. Serial No. 655,773. (No model.)

Claim.—1. The combination, with a stationary former having a concave upper surface, of a revoluble presser-beam bodily movable toward and from said former; means substantially as described for effecting said movements of the presser-beam; a pair of forming-rollers journaled upon axes transverse to the direction of movement of the presser-beam; traveling carriages for said rollers; and means, substantially as set forth, for shifting said rollers in a direction transverse to the axis of revolution of the presser-beam.

2. The combination, with a stationary former, of a revoluble presser-beam, bodily movable toward and from said former; means, substantially as set forth, for affecting the described movements of the presser-beam; a longitudinal shaft carried by said presser-beam and having oppositely-threaded portions; a pair of roller-carriages engaging respectively with said threaded portions of the shaft; forming-rollers mounted in said carriages; and an actuating device for said shaft adapted to engage with a stationary member at intervals during the revolution of the presser-beam, whereby said shaft is automatically actuated and the travel of the roller-carriages effected during revolution of the presser-beam, substantially as described.



3. The combination, with a stationary former, of a hydraulic cylinder and plunger; a presser-beam carried by said plunger and

revoluble with relation to said cylinder; a gear-wheel operatively connected with said plunger to permit longitudinal movement thereof during rotation of said gear-wheel; driving mechanism for said gear-wheel; a pair of roller-carriages mounted on said presser-beam; forming-rollers journaled in said carriages; a shaft having oppositely-threaded portions engaging respectively with said carriages; and means, substantially as set forth, for actuating said shaft.

4. The combination, with a stationary former, of a revoluble presser-beam, bodily movable toward and from said former; means, substantially as set forth, for effecting the described movements of said presser-beam; a pair of swiveling roller-carriers mounted on said presser-beam, said carriers comprising a frame pivotally supported upon trunnions; and a pair of rollers mounted in said frames respectively, substantially as described.

603,096. MACHINE FOR DISHING OR FORMING METAL. JOHN S. WORTH, Coatesville, Pa. Filed Oct. 22, 1897. Serial No. 656,017. (No model.)

Claim.—1. The combination, with a rotatable former provided with actuating mechanism, substantially as set forth; of a roller-carrier and forming-roller; a track adapted to support said roller and arranged adjacent to said former; means, substantially as set forth, for shifting the roller diametrically with relation to said former and onto the said track; and means, substantially as set forth, for rotating said former in the described relation to the movements of the roller.

2. The combination, with a rotatable former provided with actuating mechanism, substantially as set forth; of an overhanging track; a roller-carrier and forming-roller; a roller-track adapted to support said roller when shifted clear of said former; means, substantially as set forth, for shifting the roller diametrically with relation to the former and onto said roller-track; and means, substantially as set forth, comprising mechanism carried upon the overhanging track, for shifting said roller in a direction substantially parallel to the axis of rotation of the former.

3. The combination, with a rotatable former provided with actuating mechanism, substantially as set forth; of an overhanging track; a hydraulic cylinder adapted to travel along said track; a vertical plunger for said cylinder; a roller-carrier mounted upon said plunger; a forming-roller journaled in said carrier; a hydraulic cylinder and horizontal plunger also connected with roller-carrier; a roller-track adapted to support said roller when shifted clear of said former; and a rod connected with said second hydraulic plunger and also with the rotating mechanism for the former, and adapted to actuate said mechanism in the described relation to the movements of the roller-carrier, substantially as set forth.

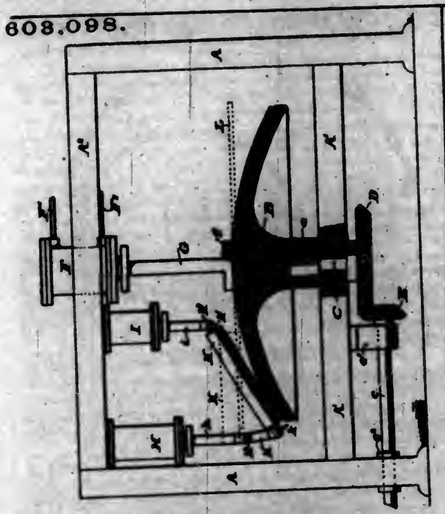
4. The combination, with a rotatable former supported upon a stem, of a ratchet-wheel intermediate between said stem and the body of the former; a pawl-carrier having a pawl adapted to engage with said ratchet-wheel; a connecting-rod and actuating mechanism for said pawl-carrier; a forming-roller; and means, substantially as set forth, for shifting said roller diametrically across and beyond said former in the described relation to the rotary movement thereof.

603,097. RESERVOIR ATTACHMENT FOR PENS. MARY C. WORTH, New York, N. Y. Filed Dec. 11, 1896. Serial No. 615,315. (No model.)

Claim.—1. A pen-reservoir comprising a tube adapted to receive the pen, and having an extended shank adapted to lie in contact with the pen and be inserted with the same into the holder, substantially as described.

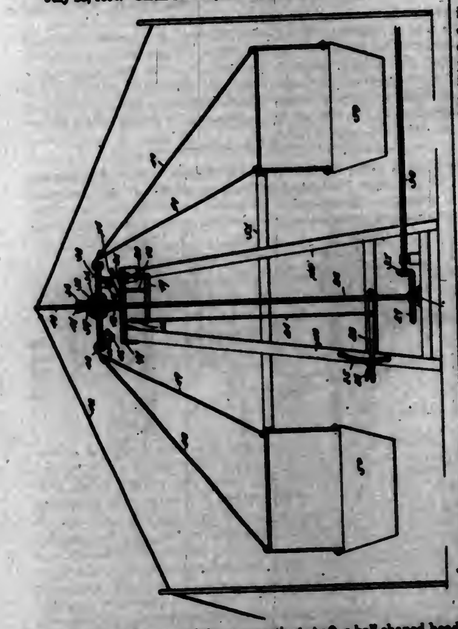
2. In a pen-reservoir, the combination with a flattened tube adapted to receive the pen, and closed along a portion of its forward end so as to leave only a pen-point opening, of an extended split shank mounted on said tube and adapted to lie against the pen so as to be inserted with the latter into the holder, substantially as described.

3. A pen-reservoir comprising a tube adapted to receive the pen, and having an extended split shank adapted to lie in contact with the pen and be inserted with the same into the holder, substantially as described.



4. In a pen-reservoir, the combination with a tube adapted to receive the pen and closed along a portion of its forward end so as to leave only a pen-point opening, and having an extended shank mounted on said tube and adapted to lie against the pen so as to be inserted with the latter into the holder, substantially as described.

603,098. MACHINE FOR DISHING METAL. WILLIAM P. WORTH, Coatesville, Pa. Filed Nov. 9, 1897. Serial No. 657,987. (No model.)



Claim.—1. The combination, with a rotatable former provided with suitable actuating mechanism; of a presser-block; means substantially as set forth for moving said block toward or from said former, while permitting the rotary movement of said block along with said former; a forming-roller arranged in the described relation to said former; and means substantially as set forth whereby the respective ends of said forming-roller may be independently moved toward or from the former, substantially as set forth.

2. The combination, with a rotatable former having a convex upper surface and provided with suitable actuating mechanism; of a presser-block; means substantially as set forth for shifting said presser-block toward or from said former while permitting the rotary movement of said block along with said former; a pair of plungers movable toward and from the surface of said former; a pivoted link connected with one of said plungers; a forming-roller supported at its respective ends upon the other plunger and said link; and means substantially as set forth for shifting said plungers independently of one another.

603,098.

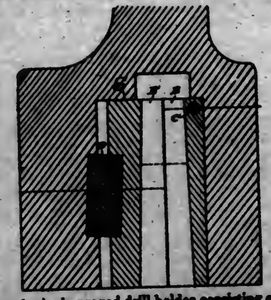
603,099. ROUNDABOUT. JOHN ASHTON, St. Louis, Mo. Filed July 28, 1897. Serial No. 646,713. (No model.)

Claim.—1. In a roundabout, a vertical shaft, a ball-shaped head removably mounted upon said shaft, a rotating plate having a socket to receive said head, in which socket-wall are formed slots, pins projecting from said head into said slots, a second socket fixed to the ball-shaped head and extending upwardly through the first-mentioned socket, a center post removably seated in said second socket, guy-ropes attached to the upper end of said center post and carriages attached to and carried by the rotating plate, substantially as specified.

2. In a roundabout, the combination of a suitable framework, a shaft arranged to rotate vertically in said framework, a horizontal rotating plate, a ball-and-socket connection between said shaft and said plate, rollers carried by the under side of said plate, pins projecting from the ball into slots formed in the socket, a second socket seated in the ball and extending upwardly through the first-mentioned socket, a center post removably seated in said second-mentioned socket, guy-ropes attached to the upper end of said center post, and the vertically-adjustable track-plate secured to the frame below the rotating plate, substantially as specified.

3. In a roundabout, a vertical rotating shaft, a ball shaped head upon said shaft, a horizontal rotating plate, a socket attached to said plate to receive said head, a socket attached to said head and extending upwardly through the first-mentioned socket and a center pole mounted with its lower end in the last-mentioned socket, substantially as specified.

4. In a roundabout, a rotating plate, rollers under said plate, a track-plate pivotally mounted under said rollers, and means of raising and lowering one end of said track-plate, substantially as specified.

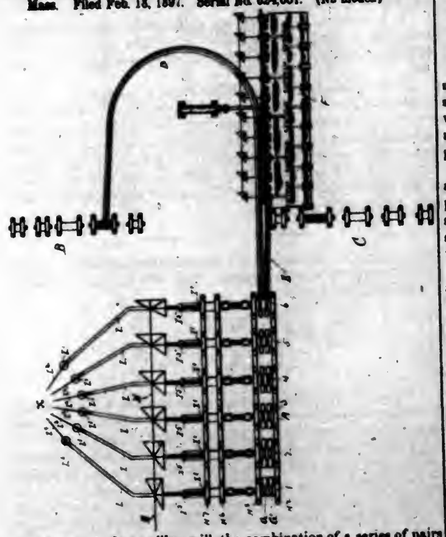


5. In a roundabout, a suitable frame, a track-plate pivotally mounted at one of its ends upon said frame, means of raising and lowering the free end of said track-plate, a vertical rotating shaft, a ball-shaped head upon said shaft, a plate mounted upon said head, connections between said head and said plate as required to allow the plate to rock and prevent the head from rotating independent of the plate, and rollers under said plate and engaging said track-plate, substantially as specified.

603,100. NEEDLE-GUARD FOR SEWING-MACHINES. OLIVIER BELLEMARE, Montreal, Canada. Filed Mar. 23, 1897. Serial No. 628,770. (No model.)

Claim.—The combination, with a curved needle having a groove in one side, of a needle-guard for the said needle to slide in, said guard comprising a hub provided with a projecting arm having a groove in its end fitting against the inner one-half of the needle, and a retaining-piece secured to the said arm and provided with a laterally-projecting cap bearing on the end of the said arm and having a groove opposite the said groove in the arm and a projection engaging with the said groove in the needle, substantially as described and shown.

603,101. ROCK-DRILL CHUCK. ERWIN H. ROSNER, Downieville, Cal. Filed July 6, 1897. Serial No. 643,897. (No model.)



Claim.—1. An improved drill-holder consisting of a drill-socket, a segment in one side of said socket having an inclined or tapered inner wall and a straight outer wall to fit closely for its entire length the corresponding wall of the socket, a second segment in the opposite side of the socket, having an inclined or tapered inner wall and a straight outer wall, the inner ends of both segments abutting against an internal shoulder in the drill-socket, a pin driven transversely through the upper end of the first-named segment and the socket, and permanently securing said segment in place, and a single wedge-shaped key centrally placed behind the other segment and having a portion of reduced diameter which is adapted to be moved in line with the said movable segment to release the drill-shank, said movable segment and socket having adjacent faces channeled to receive said key whereby the segment will remain in place when the key is moved to bring its reduced portion behind the same, substantially as and for the purpose specified.

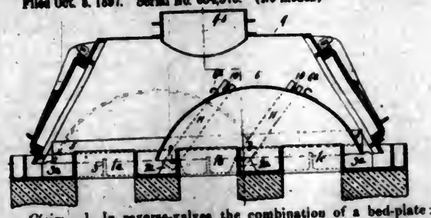
2. An improved drill-holder consisting of a drill-socket formed as a single integral structure and extended at one side of the center of its shank a greater distance than at the opposite side, to form a thickened portion, said socket having also an internal shoulder; opposing segments in said socket each having a tapering inner wall, one of

said segments being permanently secured in the socket and the other readily removable, a pin passing through one end portion of the permanent segment and a single wedge-shaped drive-key centrally located behind the movable segment and seated in corresponding recessed portions in the contiguous faces of the segment and the inner wall of the socket whereby the movable segment is secured and the drill locked in place.

603,102. ROLLING-MILL. VICTOR R. EDWARDS, Worcester, Mass. Filed Feb. 18, 1897. Serial No. 624,001. (No model.)

Claim.—1. In a rolling-mill, the combination of a series of pairs of rolls arranged to act successively upon a billet, means for the instantaneous separation of the rolls in one or more of said pairs during the operation of the mill and an adjustment-stop whereby the separation of the rolls is predetermined, substantially as described.

2. In a rolling-mill the combination of a series of pairs of rolls arranged to act successively in the reduction of a billet, means for the instantaneous raising or lowering of the lowermost roll in one or more of said pairs of rolls and an adjustable stop whereby the vertical movement of said roll is predetermined, substantially as described.



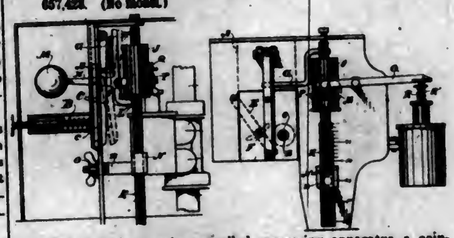
3. In a rolling-mill for rolling billets comprising a series of pairs of rolls arranged to act successively upon the billet, the combination with one or more of said pairs of rolls, of a series of sliding plates provided with inclined surfaces supporting the boxes of the lowermost rolls, means for the individual movement of said sliding plates whereby said lowermost rolls are simultaneously raised or lowered, substantially as described.

4. In a rolling-mill comprising a series of pairs of rolls arranged to act successively upon a billet, the combination with the pairs of rolls, of sliding plates having an inclined surface supporting the boxes at one end of the lowermost rolls in said pairs, wedges supported on said sliding plates and supporting the boxes at the opposite ends of said lowermost rolls, means for the adjustment of said wedges relatively to said sliding plates, means for the instantaneous movement of said sliding plates whereby said lowermost rolls are raised or lowered, and adjustable stops whereby the sliding movement of said plates is predetermined, substantially as described.

5. In a rolling-mill comprising a series of pairs of rolls arranged to act successively upon a billet, the combination with the lowermost rolls in said pairs of a mechanism for raising or lowering said rolls, a series of hydraulic cylinders connected with said raising and lowering mechanism, valve mechanisms connected with said hydraulic cylinders and placed in juxtaposition, and a series of hand-levers whereby the mechanisms for raising or lowering said rolls are controlled by a single attendant, substantially as described.

6. In a rolling-mill, the combination of two finishing-mills, a roughing-mill having rolls provided with two sets of circumferential grooves, means for conducting the billets from said roughing mill to either of said finishing-mills, mechanism for instantaneously raising or lowering the lowermost rolls of said roughing-mill, and a series of hydraulic cylinders by which said raising or lowering mechanisms are actuated, substantially as described.

603,103. REVERSE-VALVE. SAMUEL PORTER, New Castle, Pa. Filed Oct. 8, 1897. Serial No. 654,575. (No model.)



Claim.—1. In reverse-valves, the combination of a bed-plate; means for adapting said bed-plate to act as a water seal; ports in said bed-plate; projections on said bed-plate of less height than the walls of the water seal; a valve-shell resting on said projections; means for oscillating said valve-shell, and a casing resting on said projections.

2. In reverse-valves, the combination of a bed-plate; means for adapting said bed-plate to act as a water seal; ports in said bed-plate; projections on said bed-plate of less height than the walls of the water seal; a valve-shell resting on said projections; means for oscillating said valve-shell, and a casing resting on said projections, at an interval within the walls of said water seal.

3. In reverse-valves the combination of a bed-plate, means for adapting said bed-plate to act as a water seal; ports in said bed-plate; bearings erected on said bed-plate and of less height than the walls of the water seal; oscillating shafts resting on said bearings; ribs on said bed-plate of less height than the walls of said water seal; a valve-shell resting on said ribs; links operatively connecting said shell and said shafts; a reversing-lever connected to one of said links, and a casing resting on said ribs at an interval within the walls of the water seal.

4. In reverse-valves the combination of a bed-plate; means for adapting said bed-plate to act as a water seal; projections on said bed-plate of less height than the walls of the water seal; a valve-shell resting on said projections; means for causing said valve-shell to oscillate and a casing resting on said projections; said operating parts being removable through an aperture in said casing without disturbing the same.

603,104. COIN-CONTROLLED METER. JOSEPH HERBERT, Oakland, Cal. Filed Feb. 6, 1897. Renewed Nov. 4, 1897. Serial No. 657,428. (No model.)

Claim.—1. In a coin-controlled measuring apparatus, a coin-chute, an adjustable stop in the line of the chute, by which the coin is arrested, a gate movable transversely with relation to the coin-chute and having a hole made through it, a rod or stem standing in line with said hole, so that it operates upon the gate only when the coin is in position between the rod and the gate, an arm connected and movable with the gate, a vertical screw-threaded shaft having a loosely-slidable weight movable upon it, a lever-arm carrying a screw-threaded segmental nut adapted to engage the screw-threaded shaft and retain the weight in position, a contact portion of the lever against which the gate-actuated arm presses when the gate is moved, whereby the segmental nut is disengaged from the screw and the weight allowed to drop.

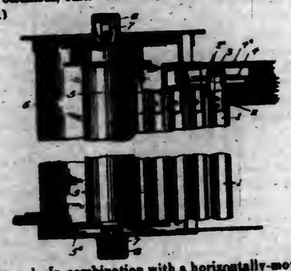
2. A coin-actuated measuring device, comprising a vertical screw, connections by which said screw is rotated by the passage of the fluid to be measured, a weight surrounding and loosely movable upon said screw, a weighted lever fulcrumed to the movable weight carrying at one end a segmentally-threaded nut which normally engages the screw and holds the weight in position with relation thereto, a vertical contact-bar connected with the weighted lever, an arm fixed to a swinging gate adapted to move the contact-bar and the lever when the gate is swung inwardly so that by said movement the segmental screw is disengaged and the weight allowed to drop, a stop by which the weight is arrested at the determined point and the segmental nut allowed to again engage the screw-threads whereby the rotation of the shaft will cause the nut and the weight to travel upward while the shaft continues its rotation.

3. A coin-controlled measuring device consisting of a vertical screw-threaded shaft and connections with the meter whereby the flow of the fluid to be measured through the meter will cause the revolution of the shaft, a weight loosely slidable upon the shaft, a weighted arm fulcrumed to the slidable weight, carrying at one end a segmental nut which engages the threads of the screw and at the other end a weight by which this contact is normally maintained and a vertical contact-bar fixed to the lever, a hinged swinging gate with an arm adapted to engage the contact-bar and move the weighted lever so as to disengage the segmental nut and allow the weight to drop until the gate arm has passed above the contact-bar and allowed the nut to again engage the screw, a coin-chute and means for arresting the coin at a determined point, a stem movable at right angles with the position of the coin whereby its action presses the coin to one side to move the gate and operating mechanism and at the same time allow the coin to drop into a receptacle beneath and a valve controlling the flow of the fluid, said valve being released by the dropping of the weight, and closed when the weight has been again returned to its normal position.

4. In a coin-controlled measuring apparatus, an inlet pipe or passage through which the fluid to be measured is adapted to flow, a vertically-movable valve with a spring by which the valve is normally retained in an open position, a lever-arm fulcrumed so that one end is adapted to act upon the valve-spindle, a vertical screw, means for rotating it by the action of the flow of gas through the meter, a weight with a disengaging nut, coin-controlled mechanism by the action of which the nut is disengaged to allow the weight to drop to a predetermined stop and a stop carried by and adjustable upon the weight so as to contact with the valve-actuating lever when the weight has reached a point determined by the amount of fluid passing through the meter whereby the valve is closed and the movement of the parts arrested.

5. In a coin-controlled measuring apparatus, an inlet pipe or passage through which the fluid to be measured is adapted to flow, a vertically-movable valve with a spring by which the valve is normally retained in an open position, a lever-arm fulcrumed so that one end is adapted to act upon the valve-spindle, a vertical screw, means for rotating it by the action of the flow of gas through the meter, a weight with a disengaging nut, coin-controlled mechanism by the action of which the nut is disengaged to allow the weight to drop to a predetermined stop and a stop carried by and adjustable upon the weight so as to contact with the valve-actuating lever when the weight has reached a point determined by the amount of fluid passing through the meter whereby the valve is closed and the movement of the parts arrested, said stop being adjustable to regulate the closure of the valve.

603,105. AIR DISTRIBUTER OR SPREADER. JOSEPH JAGOE, Meriden, Conn., assignor to the Bradley & Hubbard Mfg. Co., same place. Filed Oct. 11, 1897. Serial No. 654,811. (No model.)



Claim.—1. In an air distributer or spreader, the combination with an inverted cup-like deflector having a perforated body and an imperforate flange, of an air-tube upon which the deflector is supported, which is enough smaller in external diameter than the internal diameter of the body of the deflector to form a downwardly-opening air-passage, and which is formed at its upper end with air-ports from which air taken at its lower end issues into the interior of the body of the deflector from which it is jetted through the perforations therein.

2. In an air distributer or spreader, the combination with an inverted cup-like deflector having a perforated body and an imperforate flange, of an air-tube upon which the said deflector is supported, and which is provided at its upper end with air-ports which open into an annular downwardly-opening air-passage formed between the upper end of the tube and the body of the deflector; and a screw passing through the body of the deflector and downward into the upper end of the tube for securing the deflector thereto.

3. In an air distributer or spreader, the combination with an inverted cup-like deflector having a perforated body formed with a centrally-arranged opening, and with an imperforate annular flange extending outwardly from its lower edge, of a tube having its upper end internally threaded, supporting the said deflector, and made smaller in external diameter than the internal diameter of the body of the deflector so as to form a downwardly-opening annular passage through which air rises into the said body from which it is jetted through the perforations therein, and a retaining-screw passing downward through the central opening in the body of the deflector, and entering the internally-threaded upper end of the said tube to which it secures the deflector.

603,106. METAL DOOR, PARTITION, &c. WILLIAM R. KINNEAR, Columbus, Ohio. Filed May 27, 1897. Serial No. 638,287. (No model.)

Claim.—1. In combination with a horizontally-movable, flexible curtain, a vertically-arranged roller having a disk at its lower end with an inclined upper surface, substantially as described.

2. In combination with a horizontally-movable, flexible curtain, having hangers, a track upon which said hangers run, a vertically-arranged roller having at its base a disk with an inclined upper surface upon which said curtain is supported when the curtain leaves the track, substantially as described.

3. In combination with a curtain-roller, a flexible curtain connected to said roller, wheels or supports for said curtain, a track upon which said wheels or supports run, consisting of a stationary part and a movable part near said curtain-roller for automatically guiding said wheels or supports onto the stationary part, substantially as described.

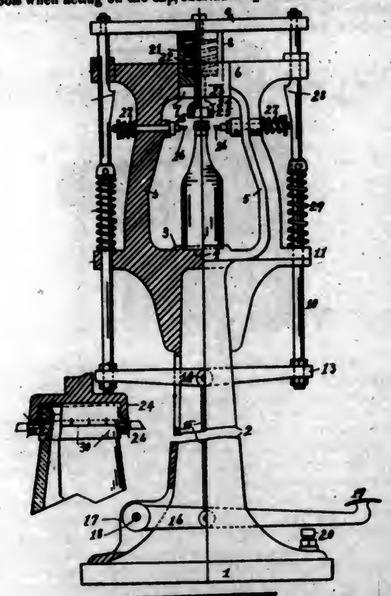
4. In combination with a curtain-roller, a flexible curtain connected therewith, wheels or supports for said curtain, a track upon which said wheels or supports run, consisting of a stationary part 4 and a flared mouth constructed to guide the curtain wheels or supports onto the track, substantially as described.

5. In combination with a curtain-roller, a flexible curtain connected therewith, wheels or supports for said curtain, a track consisting of a stationary part 4, and a mouth for guiding the wheels or supports onto the track having walls 9 and 9^a, wall 9^b and projecting edge 9^c, substantially as described.

6. In combination with a curtain-roller, a flexible curtain connected therewith, wheels or supports for said curtain, a track upon which said wheels or supports run, consisting of a stationary part 4, and a mouth adapted to guide said wheels or supports onto said track hinged or pivoted at the end of said track, substantially as described.

7. In combination with a casing having a guide or way 8, a roller and curtain thereon, said guide containing a bearing or support for the roller-spindle arranged and adapted to freely move in said guide or way, whereby the roller is automatically adjusted in its position with respect to the curtain inlet and outlet as the curtain wound or unwound, substantially as described.

8. In combination with a curtain-roller, a flexible curtain connected therewith, wheels or supports for said curtain, a track consisting of a stationary part 4, and a mouth for guiding the wheels or supports onto the track having wall 9^b with edge 9^d and a flaring wall 9^a, substantially as described.



603,107. MACHINE FOR CAPPING BOTTLES. PHILIP LEBENHEIM, Baltimore, Md., assignor to the Monarch Manufacturing Company of Baltimore City. Filed Oct. 25, 1897. Serial No. 656,260. (No model.)

Claim.—1. In a machine for fastening caps upon bottles the combination of a die adapted to embrace a bottle-cap seated on and surrounding the bottle-head, mechanism for pressing said die upon the cap on a bottle, means for holding the bottle and die in suitable relation to each other, transversely-movable tools adapted to bend separate portions of the cap-flange into engagement with depressions in the bottle-neck, the intermediate portions of the cap-flange being held against the neck by the die, and mechanism for forcing said tools against the cap, substantially as described.

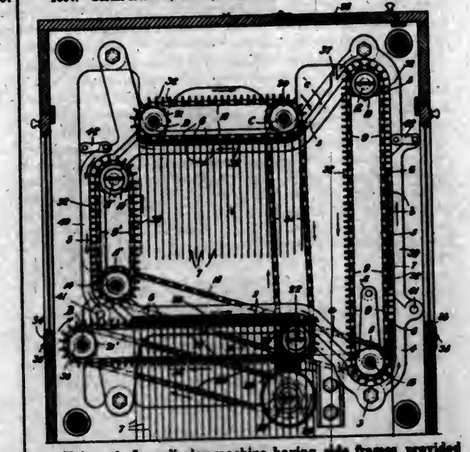
2. In combination, the main frame, the die, the die-operating frame comprising rods 10, and the transversely-movable tool-bars supported to slide in the main frame, said rods having cams to move the tools, and tool-retracting springs, substantially as described.

3. In combination, a die to press a cap upon a bottle-head, trans-

versely-movable tool-bars to force separate portions of the cap-flange into engagement with the bottle-head, and mechanism for operating the die and tools, said die having side openings to receive the ends of the tools when acting on the cap, substantially as described.

603,108. BOTTLE. PHILIP LINDMEYR, Baltimore, Md., assignor to the Monarch Manufacturing Company of Baltimore City. Filed Apr. 20, 1897. Renewed Mar. 24, 1898. Serial No. 675,042. (No model.)

Claim.—1. The combination of the frusto-conical cap with a bottle having a similarly-shaped top, said cap having a groove 7 in its vertex, and contiguous corrugations 10 surrounding its top below said groove, the exterior of said corrugations being situated within the greatest circumference of the cap to permit withdrawal of a die and providing receptacles for packing and an exterior holding-surface for the fingers in rotating the cap, substantially as described.



2. The combination of the frusto-conical cap with a bottle having a similarly-shaped top, said cap having a groove 7 in its vertex, and contiguous corrugations 10 surrounding its top below said groove, the exterior of said corrugations being situated within the greatest circumference of the cap to permit withdrawal of a die and providing receptacles for packing and an exterior holding-surface for the fingers in rotating the cap, a plastic packing, a paper cover for the same, said groove and corrugations affording communicating receptacles for the plastic packing, substantially as described.

3. The combination of the frusto-conical cap having vertical corrugations 10 and a horizontal communicating groove 7 situated directly over the bottle-lip and integral fingers 4, with the bottle having a frusto-conical top and grooves 6 terminating in transverse grooves 1, a packing situated in said groove and corrugations, and parchment or the like situated between the bottle-lip and the packing, substantially as described.

4. In a bottle the combination of a cap with a packing of plastic wax and a cover of parchment, prepared paper or the like, to prevent the cutting of said wax, the parchment being interposed between the wax and the bottle-lip, substantially as described.

5. The combination of a bottle provided with inclined shoulders thereon, a cap provided with a circumferential groove and with pendent spring-fingers adapted to engage under the shoulder, a packing of plastic wax, and a paper cover for the bottom of the packing and between it and the wax to obviate the cutting of the same, the cap being adapted in cooperation with the bottle-mouth to press the plastic material into the groove, said material remaining fixed in the groove, substantially as described.

608,109. DISPLAY-MACHINE. ALFRED F. C. LOUIS, Pittsburg, Pa., assignor of one-half to George Kurtz, same place. Filed Jan. 26, 1897. Serial No. 620,598. (No model.)

Claim.—1. In a display-machine having side frames provided with oppositely-located endless circulating grooves disposed in vertical, horizontal and inclined planes, with branch grooves leading therefrom, and apron-supporting rods having their ends inserted in such grooves: conveying-chains provided with pins for engaging the rods disposed in positions conforming to the horizontal and vertical grooves, and means for actuating the conveying-chains, substantially as set forth.

2. In a display-machine, the combination of side frames provided with oppositely-located endless circulating-grooves disposed in vertical horizontal and inclined planes, apron-supporting rods having their ends in constant engagement with such grooves, conveying-chains disposed in positions conforming to the horizontal and vertical grooves provided with projecting pins adapted to engage the ends of the rods, supporting sprocket-wheels and means for actuating the wheels and chains, substantially as set forth.

3. In a display-machine, the combination of side frames provided with oppositely-located endless circulating-grooves disposed in vertical, horizontal and inclined planes, apron-supporting rods having their ends in constant engagement with such grooves, conveying-chains disposed in positions conforming to the horizontal and vertical grooves provided with projecting pins adapted to engage the ends of the rods, supporting sprocket-wheels and means for actuating the wheels and chains at varying speeds, substantially as set forth.

4. In a display-machine, the combination of side frames provided with oppositely-located endless circulating-grooves having approximately vertical and horizontal directions with intervening gravity-inclines and branch grooves leading therefrom, apron-supporting rods having their ends inserted in such grooves, vertically-arranged display-chains coinciding with the vertical grooves, and horizontally-arranged storage-chains coinciding with the horizontal grooves provided with teeth for engaging the rods, and means for imparting motion to the chain at variable speeds, substantially as set forth.

5. In a display-machine, the combination of side frames provided with oppositely-located framework, endless circulating-grooves arranged therein disposed in vertical, horizontal and inclined planes, branch grooves leading therefrom, apron-supporting rods having their ends in engagement with the grooves, conveying-chains provided with projecting pins disposed in positions conforming to the horizontal and vertical grooves mounted on supporting sprocket-wheels and adapted to engage the rods by means of the pins and to advance them through the grooves, and a power-shaft with connecting gearing by which the vertical chains are driven at a given speed and gearing connected therewith by which motion is transmitted to the horizontal chains at a reduced speed, substantially as set forth.

608,110. NON-REFILLABLE BOTTLE. JOHN B. MARSHALL, Fresno, Cal. Filed June 9, 1897. Serial No. 640,081. (No model.)

Claim.—1. The combination of a bottle provided at its bottom with an annular recess and having a depending tube arranged within the same, threaded at its lower portion and provided with a smooth upper portion having a groove or gutter, and a sealing-cap interiorly threaded and arranged on the threaded portion of the tube, said cap being provided with a smooth extension arranged on the smooth portion of the tube and depressed exteriorly and forced into the said groove or gutter and permanently locking the cap on the tube, substantially as described.

2. The combination of a bottle provided at its bottom with an annular recess and having a depending tube arranged within the same, threaded at its lower portion and provided with a smooth upper portion having a longitudinal groove, a sealing-cap interiorly threaded and arranged on the threaded portion of the tube and provided with a smooth extension, the latter covering the smooth portion of the tube and being depressed into the groove thereof to lock the cap permanently thereon, and a sealing substance filling the said recess and concealing the cap and the tube, substantially as described.

603,111. COIN-OPERATED DEVICE. JOSEPH MASIN, New York, N. Y., assignor to the American Mutoscope Company, same place. Filed Dec. 10, 1896. Serial No. 615,113. (No model.)

Claim.—1. In a coin-operated device the combination of a rotatable spool, mechanism for rotating the same, a crank, a coin-chute and a clutch-operating mechanism adapted to be operated by the coin, the clutch connecting the crank with the spool-rotating mechanism, substantially as described.

2. The combination of a movable carrier, a series of resilient picture-cards mounted thereon and projecting therefrom, means for holding the outer end of each card momentarily for the purpose of exposing it to view, mechanism for moving said carrier at the option of the observer, and coin-controlled means for throwing said mechanism into gear, substantially as described.

3. The combination of a rotatable spool, a series of resilient picture-cards radially mounted thereon, means for holding the outer end of each card momentarily for the purpose of exposing it to view, mechanism for rotating said spool at the option of the observer, and coin-controlled means for throwing said mechanism into gear, substantially as described.

4. In a coin-operated device the combination of a driven shaft, a driving-shaft, a sliding clutch mechanism which may connect the two, and a coin-operated mechanism for throwing the clutch into gear, substantially as described.

5. In a coin-operated device the combination of a driven shaft, a driving-shaft, a sliding clutch mechanism which may connect the two, a skeleton worm mounted on the driving-shaft and adapted to receive a coin between two adjacent sections and inclosing within its coils a portion of a movable operating member of the clutch mechanism, whereby when the worm is rotated the coin is brought into contact with said clutch-operating member, and a chute which delivers the coin between two adjacent sections of the worm, substantially as described.

6. In a coin-operated device the combination of a driven shaft, a driving-shaft, a sliding clutch mechanism which may connect the two, a skeleton worm mounted on the driving-shaft and adapted to receive a coin between two adjacent sections and inclosing within its coils a portion of a movable operating member of the clutch mechanism, whereby when the worm is rotated the coin is brought into contact with said clutch-operating member, and a chute which delivers the coin between two adjacent sections of the worm, together with a guide-rib for retaining the coin in position till it has traveled a predetermined distance, substantially as described.

7. A clutch-tripping device composed of the following parts in combination: a driving-shaft, a driven shaft, a sliding clutch mechanism which may connect the two, a tripping-rod adapted to be forced forward a predetermined amount by the rotation of the driven shaft, a spring which returns the tripping-rod to its normal position, and a catch on the tripping-rod which withdraws the sliding clutch mechanism on such return motion, substantially as described.

8. A clutch-tripping device composed of the following parts in combination: a driving-shaft, a driven shaft, a sliding clutch mechanism which may connect the two, a worm on the driven shaft, a worm-wheel and cam operated by said worm, a tripping-rod operated by said cam, and a catch on the tripping-rod which withdraws the sliding clutch mechanism from engagement, substantially as described.

9. A clutch-tripping device composed of the following parts in combination: a driving-shaft, a driven shaft, a sliding clutch mechanism which may connect the two, a worm on the driven shaft, a worm-wheel and cam operated by said worm, a tripping-rod operated by said cam, and a catch on the tripping-rod which withdraws the sliding clutch mechanism from engagement, together with a stop which lifts said catch from engagement at the end of such withdrawal, substantially as described.

10. In a coin-operated clutching device the combination of a driven shaft with projections thereon, a driving-shaft, a clutch-piece which engages the projections and which slides on the driving-shaft but turns therewith, a coin-operated clutch-controlling piece, and a spring connection between said clutch-piece and such controlling-piece, substantially as described.

11. In a coin-operated device the combination of a rotating spool, a driving mechanism therefor, a driving-shaft, a coin-operated clutch which may convey motion from the driving-shaft to said spool-driving mechanism, and a clutch-shifting mechanism which permits the spool to make two or more revolutions before said clutch is disengaged, substantially as described.

12. A clutch-tripping device composed of the following parts in combination: a driving-shaft, a driven shaft, a sliding clutch mechanism which may connect the two, a worm on the driven shaft, a worm-wheel and cam operated by said worm, a tripping-rod operated by said cam, and a catch on the tripping-rod which withdraws the sliding clutch mechanism from engagement, together with a second worm rotated by said shaft, and a spool provided with a worm-wheel driven thereby the number of teeth of the first-mentioned worm-wheel being a multiple of the number of teeth of the second worm-wheel, substantially as described.

13. In a coin-operated mutoscope the combination of a spool bearing a series of picture-cards, a stop or detent which momentarily arrests the movement of the several cards, successively, mechanism for rotating the spool, a coin-controlled clutch for throwing said mechanism into gear, and an automatic clutch-tripping mechanism which simultaneously rotates the spool backward through an angle sufficient to relieve the picture-cards in proximity to the detent from strain and curvature and disengages said clutch, substantially as described.

14. In a coin-operated mutoscope the combination of a spool bearing a series of picture-cards, and a stop or detent which momentarily arrests the movement of the several cards, successively, mechanism for rotating the spool, a coin-controlled clutch for throwing said mechanism into gear, and an automatic clutch-tripping mechanism which simultaneously rotates the spool backward through an angle sufficient to relieve the picture-cards in proximity to the detent from strain and curvature, and disengages said clutch, said stop being pivoted and spring-actuated, to cause it to adjust itself tangentially to the adjacent card, substantially as described.

15. In a coin-operated mutoscope the combination of a spool bearing a series of picture-cards, a stop or detent which momentarily arrests the movement of the several cards, successively, mechanism for rotating the spool, a coin-controlled clutch for throwing said mechanism into gear, and an automatic clutch-tripping mechanism which

simultaneously rotates the spool backward through an angle sufficient to relieve the picture-cards in proximity to the detent from strain and curvature, and disengages said clutch, said stop being pivoted and spring-actuated, to cause it to adjust itself tangentially to the adjacent card, substantially as described.

16. A clutch-tripping device composed of the following parts in combination: a driving shaft, a driven shaft, a sliding clutch mechanism which may connect the two, a worm on the driven shaft, a worm-wheel and cam operated by said worm, a tripping-rod, operated by said cam, and a catch on the tripping-rod which withdraws the sliding clutch mechanism from engagement, together with a spool, and worm-wheel driving the same, a second worm which meshes therewith and is sleeved on the driven shaft, and connections from the tripping-rod to the sleeved worm which causes the latter to move back with the tripping-rod as the clutch is tripped and thereby rotate the spool backward through a fraction of a revolution, substantially as described.

17 In a coin-controlled mutoscope the combination of a spool carrying a series of picture-cards, a sleeve on which said spool is mounted, mechanism for rotating the sleeve, an adjustable arm removably mounted on said sleeve, and a driving-lug on the spool against which said adjustable arm rests, substantially as described.

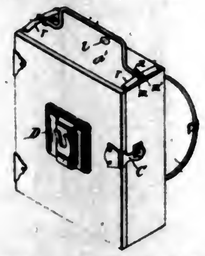
18. In a coin-controlled mutoscope the combination of a spool, a sleeve on which said spool is mounted, said sleeve having its projecting end slotted, mechanism which rotates the sleeve, an adjustable arm which slips over said projecting end of the sleeve and which has a feather fitting into the slot, a nut which holds said arm in place, and a driving-lug on the spool against which the adjustable arm bears, substantially as described.

19. In a coin-operated device the combination of a driving-shaft, a skeleton worm mounted on and surrounding said shaft, and a stationary guide-rib so located with reference to the shaft that a given coin delivered to the worm will rest and slide upon said guide-rib and shaft under control of the worm, substantially as described.

20. In a mutoscope the combination of a spool and a series of resilient picture-cards carried thereby, means for rotating the spool, and a pivoted, spring-controlled stop which adjusts its working face tangentially to the face of the impinging card, substantially as described.

21. In an exhibiting apparatus an automatic shutter mechanism which consists of the combination of the following parts: a rotating member which gives motion to the objects to be exhibited, an actuating mechanism which gives said member a partial backward rotation at the end of each predetermined period of motion, a shutter carried by said rotating member, and a one-way clutch mechanism between the two, substantially as described.

22. In an exhibiting apparatus the combination of the following parts: a rotating sleeve, mechanism which gives said sleeve a partial backward rotation, at the end of each predetermined period of motion, a shutter carried by a radial arm which has a bearing on said sleeve, a portion of said bearing being cut away so as to leave a face eccentric to the sleeve, and a pin which rolls between said eccentric face and said sleeve and forms an eccentric friction-clutch adapted to be thrown into gear upon the beginning of said partial backward rotation of the sleeve, substantially as described.



23. In a coin-operated device the combination of a driven shaft, a driving-shaft, a sliding clutch mechanism which may connect the two, a skeleton worm mounted on and surrounding the driving-shaft, and a guide-rib for retaining in position a coin inserted between two adjacent sections of the worm until it has traveled a predetermined distance, substantially as described.

24. In a coin-operated device the combination of a driven shaft, a driving-shaft, a sliding clutch mechanism which may connect the two, a skeleton worm mounted on and surrounding the driving-shaft, and a guide-rib for retaining a coin inserted between two adjacent sections of the worm in place until it has traveled a predetermined distance, said guide-rib having a portion of its face cut away to permit a coin of less than standard diameter to slip by, substantially as described.

25. In a coin-operated device the combination of a driven shaft, a driving-shaft, a sliding clutch mechanism which may connect the two, a skeleton worm mounted on and surrounding the driving-shaft, and a guide-rib for retaining a coin inserted between two adjacent sections of the worm in place until it has traveled a predetermined distance, said guide-rib having a portion of its face cut away to permit a coin of less than standard diameter to slip by, and said worm also having two or more adjacent sections opposite this cut-away part of the rib so disposed as to positively grasp the coin and push it through the cut-away portion of the rib, substantially as described.

608,112. ELECTRIC LAMP. DAVID MIRELL, New York, N. Y., assignor, by mesne assignments, to the American Electrical Novelty and Manufacturing Company, of New York. Filed Oct. 9, 1897. Serial No. 654,660. (No model.)

Claim.—1. An improved electric lamp, comprising a casing, a battery carried thereby, a lamp in connection with one pole of said battery, a conductor extending from said connection to a contact conductor or post exteriorly arranged upon the casing, a handle in connection with the other pole of the battery, and bowed spring-plates bearing with relation to the handle and operating to maintain it in either a normal upright position or in a horizontal position in contact with said pin or post, whereby the handle operates to make or break the circuit and is held in positive position for both purposes, substantially as and for the purpose set forth.

2. An improved electric lamp, comprising a casing, a battery arranged therein, a lamp in connection with one pole of said battery, a conductor extending from said connection to an exteriorly arranged contact pin or post, a handle journaled upon the casing and in connection with the other pole of the battery, said handle having rectangular-faced gudgeons, and bowed spring-plates bearing with relation to said gudgeons, whereby the handle is positively maintained in either normal upright position or in horizontal position in contact with the pin or post and serves to either make or break the circuit, substantially as and for the purpose set forth.

3. An improved electric lamp, comprising a casing, a battery carried thereby, an exteriorly-arranged contact pin or post in connection with one pole of said battery, and a lamp comprised in the circuit, in combination with a journaled handle in connection with the other pole of the battery, and means for retaining said handle in either normal upright position or in horizontal position in contact with said pin or post, whereby the circuit is automatically maintained in either opened or closed condition by the fixed position of the handle, substantially as and for the purpose set forth.

4. An improved electric lamp, comprising a casing, a battery carried thereby, an exteriorly-arranged contact pin or post in connection with one pole of the battery, and a lamp comprised in the circuit, in combination with a journaled handle in connection with the other pole of the battery, said handle adapted to be brought into contact with said pin or post, and spring devices for locking the handle in said contact position, whereby the handle serves as an automatic circuit-maker, substantially as and for the purpose set forth.

5. An improved electric lamp, comprising a casing, a battery carried thereby, a lamp in connection with one of the poles of said battery, a bowed-spring contact-plate in connection with the other pole of the battery, and a handle in operative connection with the lamp and said spring contact-plate, whereby a positive circuit connection against jarring or jolting is provided, substantially as and for the purpose set forth.

608,113. STOVE. JOEL H. MOORE, Oneida, Kans. Filed June 4, 1897. Serial No. 639,377. (No model.)

Claim.—1. In a heating-stove, the combination with the base, the top formed with holes or openings, the fire-box and the grate, of the outer drum seated on said base, the inner drum consisting of the semicircular hinged sections formed with interior grooves or depressions intermediate the ends, the perforated open ring having a flange engaging with said grooves or depressions, the damper and the depending posts at the lower end of said inner drum resting on the top of the base, substantially as described.

2. In a heating-stove, the combination with the base, the top with openings therein, the fire-pot, the rotatable grate, and the ring on said plate formed with corresponding holes and curved slots, of the outer drum seated on said base, the inner drum consisting of the semicircular hinged sections formed with interior grooves or depressions intermediate the ends, the open ring having openings therein and provided with a flange engaging with said grooves, the depending, supporting posts, and the perforated ring-diaphragm between said drums, substantially as described.

3. In a heating-stove, the combination with the base, the top plate having holes or openings therein, the fire-pot and grate, of the outer drum or shell the inner drum, the posts at the lower end thereof and the perforated openings, substantially as described.

608,118.

608,114. SAFETY-BOTTLE. JOHN J. MCCORMICK, New York, N. Y. Filed Apr. 13, 1897. Serial No. 631,999. (No model.)

Claim.—1. In a non-refillable bottle, a fragile rod having one end permanently secured to the neck of the bottle, and provided with a free projecting portion carrying an end disk or ball, adapted to bear upon the cork or stopper of the bottle, substantially as and for the purpose set forth.

2. In an improved safety-bottle, a fragile rod having its lower end secured to the bottle and embodying a free projecting portion connected with the secured end by an outward bend or curve of reduced diameter, the projecting portion of said rod carrying a disk or ball at the free end adapted to bear upon the cork or stopper, substantially as and for the purpose set forth.

3. As an improved safety device for a bottle, a fragile rod adapted to be attached to a bottle, having its lower end secured to the neck of the bottle and embodying a free projecting end, said rod embodying a distinctive design, whereby the said rod cannot be broken without destroying the integrity thereof, substantially as and for the purpose set forth.

608,115. CAR-VENTILATOR. JAMES NEELING and CHARLES E. JOHNSON, Chicago, Ill., assignors to George R. Robbins, Hinsdale, Ill. Filed Nov. 18, 1896. Serial No. 612,544. (No model.)

Claim.—1. In a car provided with an aperture, a hood B^2 formed at one side of the said aperture; a screen E adapted to slide into the said hood, and to be tilted upright when out of the same; side wings hinged to, and adapted to fold upon, the said screen; and a lid C adapted to swing down on top of the said side wings and screen into an inclined position, and hold the ventilator in place.

2. In a ventilator for refrigerator-cars, the combination, with a car having an ice-hole in its roof near the end thereof at one side of the median line of the car, of an insulating-cover permanently hinged to the edge of the ice-hole, a hood or pocket in the car-roof below the upper surface thereof, opening into the ice-hole below the said upper surface and extending in the plane of the roof longitudinally of the car, ways extending along the lateral portions of said hood or pocket and of the ice-hole, a screen having folding angular side wings hinged thereto and provided with lateral lugs engaging said ways, said screen being adapted to be inserted in said hood or pocket and to be swung upward into a vertical position on said lugs as pivots when withdrawn therefrom to form a support for the cover, and a shield or guard hinged to the mouth of the hood or pocket and adapted to close the same when the screen is inserted therein and to engage and hold in place the side wings when the screen is in operative position, substantially as described:

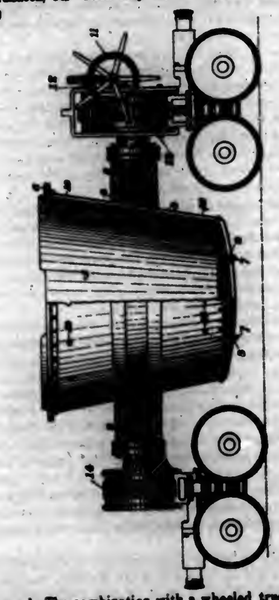
3. In a car provided with an ice-aperture, the hood B^2 formed at one side of said aperture; the screen E adapted to slide into said hood, and to be raised into a perpendicular position with its rearmost end downward and resting on the side of the aperture opposite the hood when withdrawn therefrom; side wings hinged to and adapted to fold upon the upper side of said screen; and the lid C hinged to said aperture at the hood side and adapted to swing down upon said side wings and screen when they are in their perpendicular position, substantially as described.

4. In a car provided with an ice-aperture B, the hood B^2 formed in the roof of the said car adjacent to the aperture, the sides of the said aperture and hood being provided with the guideway *b*; the screen E, provided with the lugs e^2; the side wings F hinged to the said screen; and the lid C adapted to swing down into an inclined position upon the said screen and side wings, when the same are in vertical position, and hold the same in place.

5. In a ventilator for refrigerator-cars, the combination, with a car having an ice-hole in its roof near the end thereof at one side of the median line of the car, of an insulating-cover permanently hinged to the edge of the ice-hole, a hood or pocket in the car-roof below the upper surface thereof, opening into the ice-hole below the said upper surface and extending in the plane of the roof longitudinally of the car, ways extending along the lateral portions of said hood or pocket and of the ice-hole, a screen having folding angular side wings hinged thereto and provided with lateral lugs engaging said ways, said screen being adapted to be inserted in said hood or pocket and to be swung upward into a vertical position on said lugs as pivots when withdrawn therefrom to form a support for the cover, and means for locking the cover to said screen when raised, substantially as described.

6. In a car provided with an ice-aperture B, the hood B^2 formed in the roof of the said car adjacent to the aperture, the sides of the said aperture and hood being provided with the guideway *b*; the screen E, provided with the lugs e^2; the side wings F hinged to the said screen; the pivoted shield D adapted to close the mouth of the hood; and the lid C adapted to swing down into an inclined position upon the said screen and side wings, when the same is in vertical position; and hold the same in place.

7. In a car provided with an ice-aperture B, the hood B^2 formed in the roof of the said car adjacent to the aperture, the sides of the said aperture and hood being provided with the guideway *b*; the screen E, provided with the lugs e^2; the side wings F hinged to the said screen; the pivoted shield D adapted to close the mouth of the hood; and the lid C provided with the strips C^2 and the cross-strip C^3.



608,116. LAMP-BURNER. JAMES H. O'BRIEN, St. Louis, Mo. Filed Dec. 21, 1897. Serial No. 662,956. (No model.) Patented in England May 14, 1897, No. 11,205; in France May 15, 1897, No. 267,086; in Belgium June 16, 1897, No. 130,910, and in Austria Oct. 6, 1897, No. 3,492.

Claim.—In a lamp-burner, a pair of shafts mounted in horizontal parallel positions, a wick-tube mounted between said shafts, a toothed wheel upon one of said shafts and extending through a slot in one wall of said wick-tube near one of its edges and to the opposite wall of the wick-tube, a second toothed wheel upon the other one of said shafts extending through a slot in the opposite wall of the wick-tube near the opposite one of its edges and to the first-mentioned wall, said slots having each a long vertical slit 3 extending to the lower end of said wick-tube, and a shorter slit 4 extending to a point adjacent said lower end, whereby the metal 5 between said slits may be bent inwardly and permit the end of the said tube to be slipped over the said toothed wheels and then said metal may be bent outwardly again after the tube has been placed in position, and finger-wheels upon said shafts and upon opposite sides of the burner as required to raise and lower the corners of the wick independently of each other and as required to raise or lower the entire wick by manually

grasping one finger-wheel in each hand and exerting a twisting motion of the hands relative to each other, substantially as specified.

608,117. CINDER-CAR. EDWIN R. SLICK and THOMAS MORRISON, Braddock, Pa. Filed July 19, 1897. Serial No. 645,089. (No model.)

Claim.—1. The combination with a wheeled truck, of a tilting cinder vessel carried thereon and comprising an outer shell and a separable inner cinder-tight vessel removably supported upon the upper part of the outer shell, with an air-space surrounding the bottom portion of the inner vessel and having free communication with the outer air to permit a circulation and cooling of the inner vessel.

2. The combination with a wheeled truck, of a tilting cinder vessel carried thereon and comprising an outer shell, and a separate inner cinder-tight vessel having a lateral flange at its top which rests upon the upper end of the outer shell, with an intervening air-space surrounding the inner vessel and having free communication with the outer air.

3. The combination with a wheeled truck, of a tilting cinder vessel mounted thereon, said vessel comprising an outer shell having a closed bottom, and an inner cast vessel having a lateral flange resting upon the upper end of the outer shell, with an air-space surrounding the lower portion of the inner vessel, the outer shell having inlet and outlet openings to give an air circulation between the shells and produce a rapid cooling of the cinders.

4. The combination with a wheeled truck, of a tilting cinder vessel carried thereon and comprising an outer shell, and a separable inner cinder-tight vessel having a removable bottom connected with the vessel by a cinder-tight joint, said inner vessel being removably supported upon the upper part of the outer shell, with an air-space surrounding its bottom portion and having free communication with the outer air to permit a circulation and cooling of the inner vessel.

608,118. STAMP-MONEY AND LETTER PACKET. CHARLES A. THOMPSON, Washington, D. C., assignor to Miletus J. Wise, same place. Filed May 13, 1897. Serial No. 636,395. (No model.)

Claim.—1. An improved article of manufacture, comprising an oblong plate formed with a depression in one portion thereof to receive money or postage-stamps, a lid hinged to the plate to lie over the depression, a spring to hold the lid down, and a spring-clamp secured to the plate to lie across and hold articles on the plate.

2. An improved article of manufacture, comprising an oblong plate formed with a depression in one portion thereof, to receive money or stamps, a tablet in the depression, a lid hinged to the plate to lie over the depression, a spring to hold the lid down, and a spring-clamp secured to the plate to lie across the same and hold articles thereon.

608,119. WIND-WHEEL. ELIAS H. THOMPSON, Newark, Cal. Filed Aug. 4, 1897. Serial No. 647,095. (No model.)

Claim.—1. In a wind-wheel, the combination with the hub, spokes and rim thereof, of a series of buckets secured to said rim and each comprising a curved back and two sides, said sides differentiated in size and having their lower edges to which the backs are secured differentially curved, substantially as described.

2. In a wind-wheel, the combination with the hub, spokes and rim thereof, of a series of buckets each comprising a back and two sides, said sides differentiated in size and having their lower edges to which the backs are secured differentially curved, the smaller side secured to the said rim, a band surrounding said buckets, and bolts connecting said rim and band and supporting said buckets, substantially as described.

608,120. STRAINER. CHARLES C. WORTHINGTON, Irvington, N. Y. Filed June 10, 1897. Serial No. 640,118. (No model.)

Claim.—1. The combination with a chamber having an inlet and an outlet, of a strainer having a plurality of substantially vertical sections lying in planes oppositely inclined to the direction of flow of the fluid and forming a partition between the inlet and outlet, substantially as described.

2. The combination with a chamber having an inlet and an outlet, of a strainer having a plurality of substantially vertical sections lying in planes oppositely inclined to the direction of flow of the fluid, and the edges of the strainer embracing the inlet-opening, substantially as described.

3. The combination with a chamber having an inlet and an outlet and extending below said inlet and outlet, of a strainer having two or more substantially vertical sections lying in planes oppositely inclined to the direction of flow of the fluid and forming a partition between the inlet and outlet, substantially as described.

4. The combination with a chamber having an inlet and an outlet, of a strainer having two substantially vertical sections lying in planes oppositely inclined to the direction of flow of the fluid, and the edges of the strainer embracing the inlet-opening, substantially as described.

5. The combination with a vertical cylindrical chamber having an inlet and an outlet and extending below said inlet and outlet, of a strainer in said chamber having two substantially vertical sections lying in planes oppositely inclined to the direction of flow of the fluid, and the edges of the strainer embracing the inlet-opening, substantially as described.

6. The combination of a casing having an inlet and an outlet on opposite sides of the casing and said casing extending below the inlet and outlet, and the hollow-wedge-shaped strainer B, substantially as described.

7. The combination of the cylindrical casing A having an inlet and an outlet, the hollow-wedge-shaped strainer B, and guides 17 for said strainer, substantially as described.

8. The combination of the cylindrical casing A having an inlet and an outlet on opposite sides of the casing and said casing extending below said inlet and outlet and having a removable cover 12, and the hollow-wedge-shaped strainer B having the bottom 15, substantially as described.

9. The combination of a casing having an inlet and an outlet, and the strainer B formed of the perforated plates *b* and *b'*, bottom 15 and uprights 16, substantially as described.

10. The combination of a casing having an inlet and an outlet on opposite sides of the casing and said casing extending below said inlet and outlet, and the hollow-wedge-shaped strainer B having the bottom 15 provided with an upwardly-extending flange 17 on its edge corresponding with the open side of the strainer, substantially as described.

608,121. POULTRY-HOUSE. SAMUEL C. ARMSTRONG, Caledonia, Miss. Filed Feb. 26, 1897. Serial No. 626,192. (No model.)

Claim.—1. The combination, with an inclosed frame supported on upright posts, and having a roof thereon, and means for entering the inclosed structure, of pendent guard-doors inclining toward each other and forming a bottom wall for the structure, and roosts above said wall, substantially as described.

2. The combination, with an inclosed rectangular frame supported on upright posts, and having a roof thereon, and means for permitting entrance of fowls to the inclosed structure, of sets of pendent doors within the structure, normally inclined toward each other in pairs and secured together at their lower edges, and roosts between the sets of doors and above the upper set of doors, substantially as described.

3. A poultry-house provided with hinged guard-doors below the roosts, said guard-doors inclining toward each other and having their lower edges detachably connected together, substantially as and for the purpose set forth.

4. The combination, with a roosting-house, supported on posts and having a roof thereon, of a set of guard-doors hinged to the posts and normally inclined toward each other at their lower edges, means for detachably securing said edges of the doors together, and roosts in said house above the guard-doors, substantially as described.

5. The combination, with a roosting-house having hinged and inclined guard-doors as a bottom wall, and roosts above said doors, of troughs hung below the space between said doors, and a receptacle for excrement, arranged at the exits of the troughs, substantially as described.

6. The combination, with a frame supported on posts and having a roof thereon, of coops pendent from said frame and each having tiers of nests therein, sliding doors for protecting the lower tiers of said nests, galleries at the sides of the coops, and means of access for fowls to said galleries, substantially as described.

7. The combination, with a frame supported on posts, and having a roof thereon, and coops pendent from the frame and each having tiers of nests therein, of doors for the coops adapted to slide, keeper-bars for locking the doors, a locking-bar for the keeper-bars, and galleries at the sides of the coops, arranged to afford access to said coops, substantially as described.

8. The combination, with a frame supported on posts, of nesting and hatching coops hung at the sides of the frame, galleries at the sides of said coops, sliding doors on the coops, a securing device for said doors, and runways leading from the ground to the galleries, substantially as described.

9. The combination, with a frame supported on posts, of nesting and hatching coops pendent from the frame, sliding doors for said coops, a device arranged to secure all of said doors in closed adjustment, galleries at the sides of the coops and giving access to the nests, inclined runways leading to said galleries, each runway having a hinged section secured to a swinging gate, and a guard-trap connected with the lower ends of the runways, substantially as described.

10. In a poultry-house, substantially as described, the supporting-posts that sustain the structure removed from the ground, and sheet-metal guard-disks on said posts, each having a Z-shaped slit near its center to facilitate the attachment of said disk to a post, substantially as described.

11. In a poultry-house, the combination of hinged doors below the roosts and inclining toward each other, said doors being adapted to be locked together, and inclined troughs below the lower edges of the said doors, substantially as described.
